I have seen references in the *Journal* about double-cylinder motors being worked with one coil. Could you favour me with a sketch of the arrangement of the wiring, because a good single coil would cost less than a double one, the contact breaker being the ordinary wipe contact, with cam of vulcanite and brush.—Yours truly,

Apprentice Engineer.

[To work a double-cylinder engine with a single coil, "Apprentice Engineer" would require a special type of coil and contact breaker, which would cost as much as an ordinary double-coil. The price of a single trembler multiple induction coil for a two-cylinder engine is £6, whilst an ordinary two-cylinder coil can be purchased for £4 10s. The multiple induction coils are a new development, which enables a single trembler coil to do the work of a 2, 3, or 4 cylinder engine, but it is not possible to to do the same thing by any arrangement of wiring with an ordinary coil, and as the cost is the chief item in "Apprentice Engineer's" case, an ordinary double coil must be used.]

CHAUFFEUR OR DRIVER.

To the Editor of *The Motor-Car Journal.*

Sir,—"Chauffeur" has struck the right chord at last as regards a suitable person. For my part, I would not give a snap for a man from a big works, who has been used to nothing but department work all his life. Such a man is no good in private service, he may be an excellent workman as far as his particular job goes, but he knows nothing of the hundred and one little and important things in connection with the modern car, and, besides, having always relied on his foreman, he seems paralysed when called upon to act for himself; and, again, his sudden access to a responsible position very often partially turns his brain, the result being a proud and sometimes positively insolent personage who does really more harm than good to his profession. On the other hand, a man who has served his time or worked a few years at one of our repair shops or general engineering works is essentially the man for the job. He is often entrusted with both intricate and delicate repairs, which, undertaken as it is often fifty or sixty miles from home, demands that he should work on his own; he also knows that if he can detect a hitherto unseen fault it is to his benefit to do so, thus his penetrative powers are developed. Then, again, the variety of the work, from the repair of an electrical generator to the fixing of a new pump ram on a gentleman's estate, or perhaps the re-tubing of a boiler, stamps him at once as one who, with a little practice, which he is already speedily obtaining, is the right man to keep in thorough working order a costly and high-powered car.

It is this keeping in tune, so to speak, which shows up the true work of a man, and not so much the ability to effect a repair after the damage is done, although this, too, is needed. The man for private service must be, like the true artist and musician, able to detect a fault, and remedy the same before it becomes palpable to the less experienced mind. At least such is the opinion of—Yours truly,

Electron.

Charging Accumulators from a Dynamo.—The omission of a decimal point rendered our reply to Mr. Tinsley's letter in the last issue of the *Journal* somewhat misleading. Instead of 8 c.p. lamps taking 4 amperes each, ·4 amperes should be read.

Cars for Devonshire.—Replying to the query of "Would-be Motorist" as to cars for Devonshire, V. E. B. writes:—"I have driven a Turner-Miesse 10-h.p. steam car since the beginning of August, and I consider it very satisfactory on the hilly Devonshire roads."

Darracq Cars.—"Margate" writes:—"Would any of your readers give their opinion of the 24-h.p. Darracq? Is it reliable? Does it require much attention as compared with a 10-h.p. Panhard, and is the water circulation efficient?"

IMPORTS OF AUTOMOBILES.

Below we publish our monthly official list of the imports of motor-cars, motor-cycles, and the parts thereof, into the United Kingdom during the month of February, 1904:—

BELGIUM.

CLUBS AND ASSOCIATIONS.

VICTORIA.

With a view of holding an invitation motor sports and social gathering at an early date, a sub-committee of the Automobile Club of Victoria recently visited several of the horseracing tracks around Melbourne, so that the most suitable grounds for fast motor travelling could be secured. After trying the speed capabilities of several of the grass racing tracks, the Maribyrnong course was decided on as being the fastest and most suitable. Speed tests carried out on this track showed it to be fast and the corners easily negotiated. The course is wide and flat and of good even surface, and, furthermore, only six miles from Melbourne.

SOUTH LINCOLNSHIRE.

The members of the South Lincolnshire Motor Club held a most pleasant meet at the popular Lincolnshire watering place (Woodhall Spa) on Whit Monday. Fine weather again favoured the motorists, and the run through this picturesque rural district was a most enjoyable experience. The following is a list of the members and friends present:—Mr. R. Holland, Mr. G. Holland, Mrs. C. and Miss Holland, 8-h.p. Peugeot; Mr. and Mrs. Holloway and family, 5-h.p. Baby Peugeot; Mr. T. W. Mayes, 12-h.p. Wolseley; Dr. and Mrs. Crompton, 5-h.p. Baby Peugeot; Mr. A. H. Holland, Minerva Tri-car; Dr. South and Miss Stafforth, 5-h.p. Baby Peugeot; Dr. and Mrs. Miller, 4½-h.p. De Dion; Mr. S. G. and Miss Lovell, 5½-h.p. Wolseley; Dr. and Mrs. Mason, 5-h.p. Baby Peugeot; Mr. Pilley, Dr. R. Tuxford, and Mr. C. Holland, 6½-h.p. Peugeot; Mr. and Mrs. F. and the Misses Richardson, 10-h.p. Wolseley. Tea was provided at 4.30 at the Royal Hotel, and about six o'clock a start was made for home, most of the motorists making a detour through Horncastle, the run amidst the lovely woodland scenery bringing a very enjoyable day's outing to a close. The next meet will be held at "The Shades," Spilsby, on Thursday, June 2nd.

WOLVERHAMPTON AND DISTRICT.

The opening of the new club premises in London Buildings, Lichfield Street, Wolverhampton, took place on Monday, the 9th inst. Mr. J. O. Evans (president) in declaring the club rooms open, congratulated the members upon the large increase of membership, the interest displayed by them in automobilism, and the bright prospects of the club. In the course of three years the club had attained a membership of about 100, and, as the result of efforts made by the committee, he ventured to think club rooms second to none in the provinces had been secured.

On Saturday, the 14th inst., about thirty members journeyed to Bridgnorth, where, after tea was partaken of, the run was continued to Shifnal and thence home, a most enjoyable afternoon being spent.

FINED FOR NOT STOPPING.

At the Lambeth Police Court, on May 10th, before Mr. Hopkins, Henry Richard Pope appeared on two adjourned summonses—(1) charging him with driving his motor-car in a manner which was dangerous to the public, and whereby he was alleged to have knocked down an old man named Martin, and (2) for not stopping his motor-car. The magistrate on the previous occasion expressed his intention of committing the defendant for trial, but the evidence for the prosecution was dealt with in such a manner by Mr. Staplee Firth as to convince the magistrate that there was no act of negligence on the part of Mr. Pope. When the case was called on for hearing on the adjourned hearing, Mr. Hopkins intimated to Mr. Firth that he should deal with the summonses under the provisions of the Motor Car Act, and not send the case for trial. Upon this, Mr. Firth went into the facts fully, and the police having agreed that Mr. Pope had dealt with the matter as a gentleman and sportsman, Mr. Hopkins dismissed the charge of driving to the danger of the public, but stated that, with regard to the other summons, viz, for not stopping his motor-car, he must find against the defendant, and therefore imposed a penalty of £10 and £3 3s. costs.

KEEP AWAY FROM LAMPPOSTS.

At Walsall last week, J. Moran, Birmingham, was summoned for unlawfully and accidentally damaging a certain lamp belonging to the Corporation of Walsall, on the 11th April, to the amount of £1 14s. 1d. —Defendant did not answer the summons.

Mr. Smith, Corporation gasworks' manager, appeared in support of the summons, and stated that the motor-car, alleged to have been driven by defendant, while passing a lamp in the Bloxwich Road, knocked the lamp down, doing damage to the amount mentioned. Asked how he got jurisdiction if it was an accident, Mr. Smith replied that it was under the Gas Clauses Act of 1847.

He pressed the summons, as the Corporation had had so many cases in which damage had been done by motorists and the drivers had cleared off. The Bench made an order for the amount of damage and costs.

THE MOTOR-CAR ACT.

James Lavell, a job master, of New Church Road, Camberwell, has been summoned by P.S. Hopper, 62 P, to answer the complaint that he, "being a dealer in motor-cars, did not keep a record of the distinguishing number A 7 L, placed or annexed to the identification plate and the name and address of the person driving the same." Arising out of the case there was also a summons against George Edward Lavell, a son of the other defendant, for driving a car which was not registered, or on which the identification mark was not fixed. It was admitted by the police that there was no offence if the car was being used "after completion, or on trial by an intending purchaser"—if, in other words, it was a car coming under the dealer's licence held by Mr. Lavell, sen., but the police contended that the car was not out on a trial trip or on a trial by an intending purchaser, their point being that a trial trip meant a trip after the building of the car. Mr. Robinson, for the defence, contended that a car could be taken out on a trial trip after repairs had been executed, and stated as a matter of fact this car was sent out on a trial trip after being overhauled prior to its sale, which took place two days afterwards. A dealer, he submitted, was always entitled to send a car on a trial trip after it had been overhauled. With regard to the registration summons Mr. Robinson said the police called shortly after the car had gone out, and before Mr. Lavell had had time to make the necessary entry in the register. It was not necessary, Mr. Robinson contended, for the entry to be made before a car was sent out. It could be done as soon after as was conveniently possible. In the result the magistrate dismissed both summonses.

Walter Oddy, 22, Bridge Road, Battersea, was summoned at the South Western Police Court for driving an unregistered motor-car at Streatham High Road, and using an identification mark which did not conform to the regulations. Theo Clark, manager to Mark Mayhew, Limited, of Battersea, was summoned for aiding and abetting the offence of driving an unregistered car, and T. Thornycroft, of Chiswick, was summond for fraudulently allowing Oddy to use an identification plate, and for failing to keep the required record of the number used.—After a deal of complicated evidence, Thornycroft was fined 5s. on his second summons, and acquitted of fraud; Clark was directed to pay 2s. costs, and Oddy was fined 29s., including costs.

At Bow Street Police-court, Daniel Weigel, managing director of the British Automobile Syndicate, Ltd., Long Acre, W.C., has been fined 20s. and 2s. costs for failing to keep a record of the distinguishing number and the name and address of the driver of a motor-car which was being used for trial purposes. Defendant said the usual entry was not made in the book kept for the purpose owing to several members of the staff being at the Law Courts to give evidence in a case in which the company was concerned.

For a similar offence John de Solla, manager to Evart Hall, Limited, motor-car dealers, 38, Long Acre, W.C., was ordered to pay 40s. and 2s. costs. Defendant said there was nothing in the Act—the Motor Car Act of 1903—to show when the record was to be made. In this case the car had only been out for thirty-three minutes, and during that time he (defendant) was engaged with a customer. Mr. Marsham said he had no doubt the record should be made immediately the car went out, or even before.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Glasgow	Using unregistered motor-bicycle	5s., etc.
Manchester	Furious driving of motor-cycle	20s., etc.
Lewes	No light	5s., etc.
Epsom.....	Beyond legal limit	£2 18s.
Builth	Insufficient light	£1.
Margate	Furious driving	£4.
Ipswich	Excessive speed	£5.
Kingston.....	Dangerous speed	£5.
Llandudno	Reckless driving	£5.
Stratford.....	Improper numbering	4s.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JUNE 4, 1904. [No. 274.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

FROM the way in which the Sheffield Club is keeping its members informed of the progress made in the arrangements for the united meet of automobile clubs at Buxton on Saturday next, a goodly attendance of motorists from that part of the country may be expected. The Manchester Club has made excellent arrangements with the management of the Empire Hotel at Buxton for the accommodation of owners and their cars, and it is evident that a successful meet is assured, provided the weather is fair and favourable. In and about Buxton there are ascents which will give drivers good opportunities of trying their capabilities as well as testing the power of their vehicles. This annual event will have added interest by the presence of several notable cars.

◆ ◆ ◆

The Automobile Mutual Protection Association.

A MEETING of the committee of this Association was held at the registered offices, Cecil Chambers, Strand, W.C., on Tuesday, the Earl of Shrewsbury and Talbot (president) in the chair. The report of the sub-committee, appointed at the last annual general meeting to revise the articles of association, was received and adopted. The principal recommendation was that a finance and general purposes committee should be formed, and this will be submitted to an extraordinary general meeting to be held early this month. The present nominations are Lord Shrewsbury, Messrs. Charles Cordingley, Charles Friswell, E. Lisle, J. J. Mann, W. H Maudslay, A. Rawlinson, J. R. Richardson, Henry Spurrier, jun., and J. D. Siddeley, which leaves four seats yet to be filled. These vacancies are held over because there has recently been a considerable accession to the membership of the Association, which will elect representatives later. Sir David L. Salomons, Bart., and Col. R. E. Crompton, C.B., have intimated their willingness to accept offices as vice-presidents.

◆ ◆ ◆

The New Secretary.

IT was reported that the funds of the association now exceed two thousand pounds, and the current income exceeded current expenditure. The principal object of the Association is to protect the motor industry against actions of the Maybach and Seldon class, where it is sought to impose master patent terms on manufacturers and users alike. The committee finally approved an agreement with Messrs. Cordingley and Company in respect of the Royal Agricultural Hall Motor-Car Exhibition which will now be under the auspices and patronage of the Association, by which specially advantageous terms are secured to the members. Mr. E. Shrapnell Smith, who has recently undertaken the joint office of Secretary and Treasurer to the Association, reported on various matters of interest, and it was decided to hold an extraordinary general meeting of members on Friday, June 10th.

Our Identification Card.

THE demand for the Identification Card recently given as a Supplement to the *Journal* increases, and every post continues to bring applications for the same. We shall be pleased to send supplies to the officers of the various automobile organisations for distribution to their members on hearing the number they can usefully dispose of. The curiosity as to the places from which passing cars come seems an almost universal feeling among motorists.

◆ ◆ ◆

An Annoyance to Motorists.

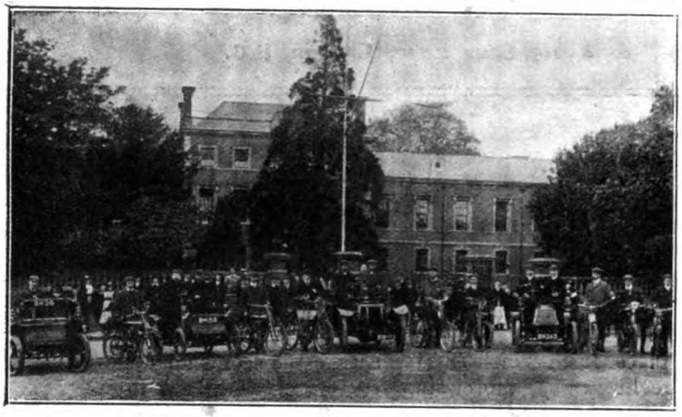
AT the Lymington County Petty Sessions, John William Wise, of Southampton, was summoned, as the driver of a carriage at Efford Hill, for not keeping on the left side of the road, and thus allowing free passage to a motor-car, owned and driven by Dr. A. D. Pithie, of Lymington.—Dr. Pithie stated that he was driving his motor-car along the Milford Road, when he saw the defendant in front of him driving a carriage in the middle of the road. Witness repeatedly sounded his horn and shouted, but defendant refused to give way, and he had to run into the ditch to pass him. Defendant saw him in the ditch, and even then refused to pull in. Defendant gave his name and address to a constable, saying he would not get out of the way of the car, as motor-cars monopolised the whole of the road. P.C. Ward deposed that when he asked the defendant for his name he said he did not intend to get out of the way of the car, as motor-cars were a nuisance on the highways. The defendant was fined 10s. and 6s. costs, the Chairman remarking that the Bench took a lenient view of the case as it was defendant's first offence. A few more cases of this kind will save motorists much discourtesy on the road.

◆ ◆ ◆

Scotland and the Act.

DURING the last few days the Right Hon. A. Graham Murray, the Secretary for Scotland, has been touring over a large number of the roads in Perthshire, his object being to obtain personal knowledge of these roads before formally approving of the proposed regulations for motor-cars. The right hon. gentleman, accompanied by Mr. A. Robertson, the Central District surveyor, drove in his motor-car over a large extent of the county. His Lordship, who drives his own car, has been "doing" all the other districts of the county as well, and seemed thoroughly conversant with most of the roads traversed. It would be well if all having anything to do with the administration of the Motor Car Act were equally as practical as the Secretary for Scotland.

◆ ◆ ◆



At an Agricultural Show.

LAST year's show at Southport was signalised by the introduction of a section for motor-cars. A couple of classes were devoted to this feature last week, but it cannot be said that they proved a popular attraction. Only a couple of motor-cars out of three entries put in an appearance for the class for the best-appointed and best-driven motor-car,

Digitized by Google

the competitors being Mr. H. Bell and Dr. Pollard, the former of whom steered for himself, while the latter had the services of a youthful driver in the person of his son, Master John Pollard, who is not fifteen years old, and who managed the car with great dexterity. In the tour round the ring Dr. Pollard in his Mercedes defeated his rival, who piloted a Lanchester, by a second, while in some intricate manœuvring backwards and forwards between hurdles he was 8 secs. better. The first prize, a cup value £5 5s., the gift of Mr. Leonard Williamson, went to the doctor, and Mr. Bell gained a silver-gilt medal.

◆ ◆ ◆

The Inaugural Meet of the Aylesbury Automobile Club.

◆ ◆ ◆

New Motor Clubs.

Of the making of clubs there is no end. Last week we briefly mentioned the formation of the Stockton and District Automobile Club, of which Mr. Leonard Ropner has been elected captain, with Mr. J. Nattrass as hon. sec. and treasurer. The committee consists of Drs. L. Blandford and T. R. Smith, Messrs. T. E. Atterby, N. Downing, E. Stephenson, and T. G. Wrightson. The subscription is to be one guinea per annum, the meetings to be held in the surgery of Drs. Smith and Talbot. The first meet was announced to be held at the Hardwicke Arms, Sedgefield, on the 2nd inst. Away in the south the Aylesbury Club has held its inaugural meet to Oxford and back *via* Bicester. The members were photographed in front of the entrance gates to the Royal Bucks Hospital. The motorists present included Dr. T. G. Parrott (4½-h.p. De Dion), Messrs. P. Young (4½-h.p. Swift), J. Kingham (4½-h.p. De Dion), J. G. West (10-h.p. Panhard). Mr. C. J. Seed, the captain, was mounted on a 3¾-h.p. Bat motor-bicycle, Mr. T. P. Hedges, the vice-captain, being on a 2¾-h.p. machine of the same make, and Mr. A. C. de Frame, the hon. sec., on a 2¾-h.p. Aster. Messrs. G. Adams, P. Brisker, P. Lucas, C. J. Stanley, R. Neill, and A. G. Bower were other Aylesbury motor-cyclists present, the company being completed by the presence of Mr. J. Franklin, of Thame, and Mr. C. Jacobs, of Princes Risborough.

◆ ◆ ◆

Progress in Norfolk.

The automobile industry seems to be making great progress at King's Lynn, and Messrs. Johnson and Sons have just erected extensive new works at the rear of St. James's Street, in that Norfolk town, which are admirably adapted for the purpose of a garage, as well as of repair works. A fashionable company assembled at the opening ceremony, and Miss Ridley, of Docking Hall, drove the first car into the garage. The mayor of the town and many of the Norfolk gentry were present, and congratulated Messrs. Johnson and Sons upon the energy with which they have developed the motor-car business during the last few years. Motorists touring in Norfolk are certainly well provided for in the matter of garage accommodation, most of the principal towns and villages having their motor repairers as well as accommodation for cars.

The Education of Officials.

It is a useful custom, and one worthy of adoption wherever motorists abound, to hold, at least once a year, an official club run. This is the practice of the Burnley Club, who invite as guests the mayors, town clerks, magistrates' clerks, and chiefs of police of Burnley, Padiham, Nelson and Colne. The result is not only to give the leading officials of those towns some automobile education, but also to create a friendly feeling between the motorists and those in authority. Mr. Smith Lawson, the hon. secretary of the Burnley Club, which has three mayors among its vice-presidents, is to be congratulated on the good work done by the club.

◆ ◆ ◆

Ignorance no Excuse.

At the North London Police Court a young man was reported to have taken a new motor-bicycle to show to his friend. The latter got on to the machine to try it. On his return to his own door he was met by a constable, who summoned him for driving a motor-bicycle without a licence and without an identity plate. His friend was summoned for aiding and abetting in the commission of the offence. Both pleaded that they did not know the law, but the magistrate said that motors were luxuries, and people who indulged in them were supposed to know the law. He fined the abettor 3s. with 2s. costs, and the other defendant 3s. with 4s. costs.

◆ ◆ ◆

The Glasgow-London Run.

Among the cars that performed well in the Glasgow-London run was the Cadillac, and we believe we are right in stating that it was probably the first time that a car of 6½ h.p. has carried four passengers an equal distance, and kept up the speed maintained throughout the run. The four passengers were also carried up the test hill at Elstree, the time being 1 min. 3 1-5 sec. We have not yet the official figures on hand, but understand that the running weight of the car was something over one ton. These trials have demonstrated beyond doubt the reliability of the modern motor-car.

◆ ◆ ◆

A Motor-Car Mishap.

We illustrate herewith a motor-car after a mishap, which has, as usual, been exaggerated beyond recognition by the press of the North of England. Mr. T. M. De Bingham, of Manchester, was motoring at Bollington, near Altrincham, when his car (N. 447, a 20-h.p. Herald) was run into by N. 504—

Photo by] *F. J. Loblay.*

a Panhard owned by Mr. Newton, and driven by Mr. Scott. Mr. Bingham's car was stationary at the time, both brakes having been applied as soon as the collision was judged to be inevitable. All the connecting bolts of N. 447 were snapped, and considerable damage done to the car generally. Fortunately none of the occupants of either vehicle were hurt.

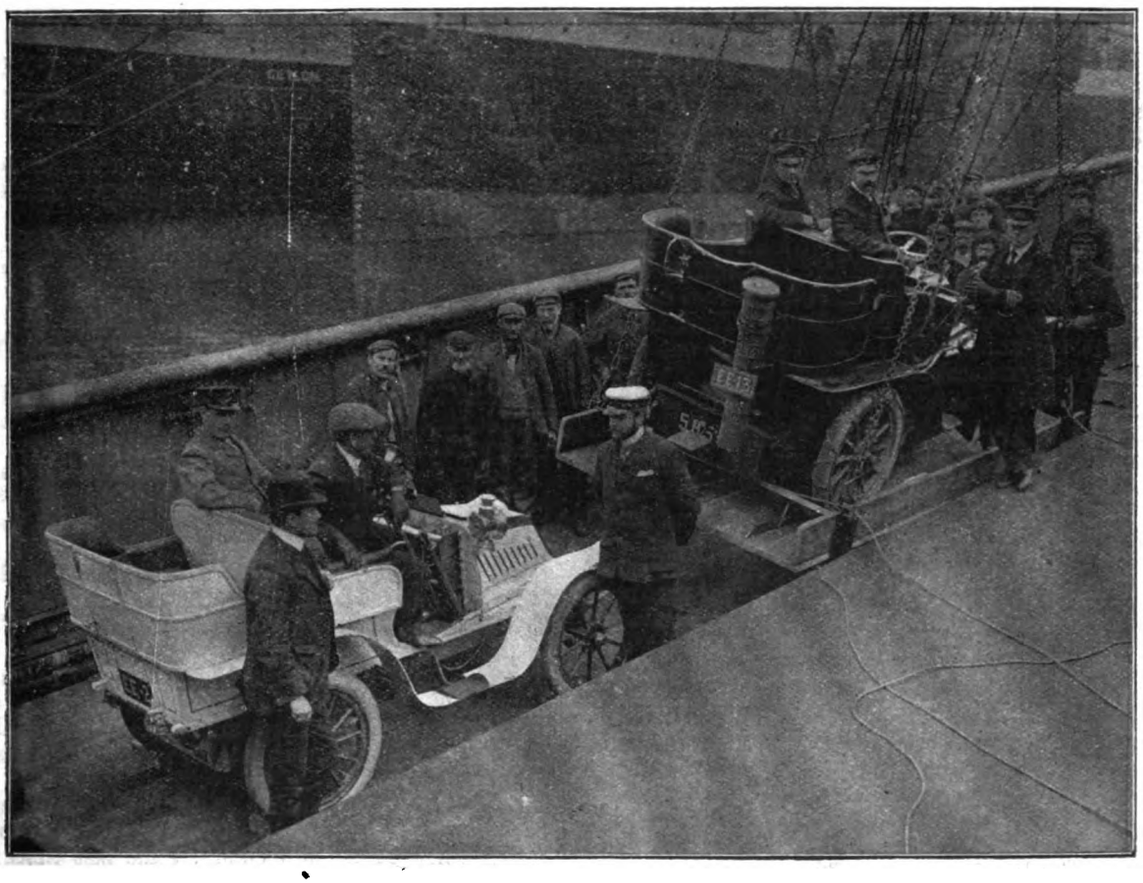
The Royal Agricultural Hall.

AGAIN has the Royal Agricultural Hall, London, demonstrated its "drawing" power, and the Military Tournament, visited by Royalty and patronised by the nobility, has been as popular as ever. The Smithfield Show, the Stanley Show, the Horse Shows, and the score of Trade Exhibitions which every year find a home at the Agricultural Hall, are so many proofs of the hold it has upon all who have had experience in attracting the people. Its great area, for it presents the largest letting space of any hall in the United Kingdom, is another factor contributory to its popularity. Then, too, the convenience of access by means of tube, train, or tram from every part of London has increased wonderfully of late, and the favour with which the Hall is regarded as the *locale* of exhibitions is further shown by the success of the Motor-Car Exhibitions that have been held there, and by the favour assured that announced for March of next year. Already more than 120 exhibitors have booked space—a number greatly in advance of the firms who have booked space at the corresponding periods of previous years.

◆ ◆ ◆



Commerce and Alcohol.

THE Lincolnshire Automobile Club have asked that a deputation might wait upon the Lincoln Chamber of Commerce with regard to the matter of alcohol being a duty free spirit for commercial purposes. They pointed out that many million gallons of petrol spirit were being used at the present time in this country for the propulsion of motor-vehicles. The demand was ever increasing, and as there was no increase in the amount of production, there was found to be a shortage. Alcohol had been found to be equally suitable, and this was largely made from potatoes. In Germany the area under production was four times as large, in proportion to its size, as it was in England. The German could obtain it at 10d. per gallon, while the Britisher had to pay 11s. for duty. The abolition of the duty would allow the supply to meet the demand. The Chairman of the Chamber said he was afraid it was rather a selfish application, but it was a matter for the Chancellor of the Exchequer and not for the Chamber of Commerce to consider. Mr. Bemrose did not believe any good result would be obtained by an interview, and the Chairman said he thought they must fight their own battle with the Chancellor of the Exchequer, an opinion which shows a narrowness of view that is regrettable.

◆ ◆ ◆

Motor Omnibus Success.

THE motor-omnibus which has been running from Brighton to Hove for some months has proved its value so conclusively that three other similar vehicles are shortly to be placed on the same road. Holiday-makers staying in either of the two resorts will be able to go to and fro with a considerable saving of time compared with that possible by the horse-drawn system of locomotion. The way in which the southern seaside towns are taking advantage of the motor-omnibus for public service is very notable, especially in view of the fact that it was away in the north that the early progress was made.

Loading Motor Cars at Grimsby Docks.

◆ ◆ ◆

Motor-Cabs.

THE other day on the Holborn cab rank we descried a motor-cab with the No. 15381, and, interviewing the driver, found he was ticketed "Licensed Driver No. 3, Mechanical Power." Evidently the authorities are placing the drivers of mechanically-propelled vehicles in a category apart from those who drive horses. Motor-cabs and 'buses plying for hire in the streets do not require being numbered after the manner of ordinary automobiles, but are identified by means of the ordinary figures given public-service vehicles. So many times has London

Digitized by Google

been promised an adequate supply of motor-cabs; that we almost begin to despair. "One swallow does not make a summer," but we hope the one motor-cab we have seen is a herald of many to follow; and these days of cab disputes seem an opportune time for the introduction of mechanical power to our cab ranks.

◆ ◆ ◆

The Development of Ireland.

THE scheme organised by Lord Iveagh and the Right Hon. W. J. Pirrie for improving the facilities for transport in Ireland was explained in detail at a meeting of the Antrim County Council in Belfast on Tuesday. Mr. Sanderson, of the Local Government Board, said it was proposed to start a motor-car service between Ballymena and Pontglenone. There would be one run daily each way between the places mentioned. The motor-vehicle would weigh about four tons, and would have trailers weighing between one and one and a half ton, able to carry live stock and agricultural produce. The speed would be about ten miles an hour. The Council decided to support the scheme.

◆ ◆ ◆

Southport and Southampton.

FROM Southport and Southampton we have this week received complaints of the way motorists are being treated by the police. A correspondent at the latter place asks us to warn motorists passing through the town, as the borough police have again taken to "trapping," and are doing this in a most vindictive way, stopping drivers on the least suspicion, and generally incurring the odium of those who motor. At Southport, too, some feeling has been aroused by the fine of £5 in each of three cases where motorists were summoned for their first offence. There is no doubt that the want of uniformity in fines throughout the country is providing many anomalies.

◆ ◆ ◆

The British Team.

THE possibility of Mr. Edge withdrawing from the team for the Gordon Bennett contest is an incident all the more regrettable because of the vacillating policy of the A.C.G.B.I., which is regarded as the foundation of the unpleasantness. In the Isle of Man it was at first said that no results would be known till the return of the officials to London, and then, an hour or two after the unfortunate accident at Douglas, the team was posted. Had a settled line of action been adhered to, there would have been no ground for much of the protestation that has been indulged in in the Press during the last few weeks. The latest development of the position is a letter from Mr. Orde to Mr. Edge on behalf of the Club committee asking to be informed "whether you are prepared to fulfil the obligation resulting from your entry and from your performances during the trials, or whether you refuse to drive as one of the selected team in the Gordon Bennett Race."

◆ ◆ ◆

The Transport of Cars.

SLOWLY but surely the railway companies are recognising that automobile traffic is likely to become a source of considerable revenue, and we are glad to learn that the Great Central Company have devised a plan whereby they can handle cars with care and secure their safe transfer from the quay at Grimsby to the deck of the steamer. A platform or tray has been constructed, on to which the car is driven as soon as it reaches the loading berth. The wheels are then checked by an ingenious device, the car not being tied or strained in any way. The tray with its contents is then carried into mid-air, gently swung into position and then lowered on to the steamer's deck, as shown in the illustration on page 299. The first car was driven to the quay by Major H. A. Errington Josse; the second contained Mr. F. Barwick, the postmaster and steamship superintendent, who had driven from the Royal Hotel at Grimsby prior to the taking of the photograph. The manager of the hotel is a practical motorist, so that owners who intend to go to the Gordon Bennett race *via* Grimsby will be well looked after. One little point which speaks for itself is, that soft cotton rope has been provided to lash the cars on the ship. This is rather a good idea, as it is calculated to save the bad language which is sometimes used on arrival at destination, when it is discovered that the car is scratched and tarred. Similar arrangements have been made for handling cars on the Continent at either Rotterdam, Antwerp, or Hamburg, and this selection of routes will give a splendid opportunity to motorists who wish to extend their Continental trip to North Germany.

THE Leicestershire Club will have a run to Stratford-on-Avon on the 11th inst.

A SPEED limit of ten miles per hour has been fixed for Richmond Park by the Office of Works.

THE Clement cars, as supplied by Mr. E. H. Lancaster, are fitted with "Aster" engines.

FROM the Bull Hotel, Redbourne, the first trial for the S. F. Edge motor-cycle trophy takes place to-day (Saturday).

TO-DAY the Wolverhampton Club is having a non-stop run to Llangollen, starting from the High Green at Tettenhall at 3 p.m.

MOTOR-CARS are about to be used in the public service from Windermere to Keswick, and also on the Ambleside and Coniston routes.

TO-DAY (Saturday), the Hertfordshire A.C. is holding a hill-climbing competition for motor-cycles at Maples Hill, near Chesham.

OWING to pressure on our space we have had to hold over a number of letters to the Editor, including one from the Rev. F. A. Venables.

ON Wednesday the Irish club-house in South Anne Street, Dublin, was opened to members. It includes a garage for thirty cars, with inspection-pit.

THE first meet of the Ladies' Automobile Club is announced for Thursday next. The cars will assemble at 3.30 p.m., near the Duke of York's statue in Waterloo Place, W., and will proceed to Ranelagh.

INQUIRIES by the Local Government Board into the applications for the restriction of the speed limit at Beverley and Todmorden will be held on Wednesday and Thursday next respectively.

MR. R. HILL, of the Victoria Mills, Leeds, has sent us samples of the motor-car cleaning and polishing cloths he has lately introduced. They are made of specially absorbent material, and, being moderate in price, should prove useful to motorists.

DURING a recent series of trial runs on Leon Bollée cars over nearly the whole of the ground constituting last year's "Reliability Trial" hill climbs, some fast times were accomplished. The Speedwell Motor Company inform us that over the test portion of Westerham Hill the speed exceeded 21 miles an hour. On Hogsback, Farnham side, one mile was covered in 1 min. 25 secs. On Hindhead top speed was maintained the whole of the way, over 30 miles an hour being reached.

IN view of the increasing use of motor-vehicles for commercial purposes, more and more attention is being devoted to the question of producing reliable solid rubber tyres for use on such cars. Among the firms who have devoted themselves to this class of work are the Shrewsbury and Challiner Tyre Company, Limited, whose "Giant" and "Twin" solid tyres have been adopted by several of the leading railway companies, corporations, public service companies and other users of heavy motor-vehicles. It is satisfactory to learn that these tyres have for a long time past given such satisfaction that many of their customers now prefer to purchase the tyres outright rather than to enter into any maintenance contracts, and that at the present time the company have orders in hand for no less than forty complete sets of solid tyres.

Digitized by Google

THE SIDE-SLIP COMPETITION.

JUDGES' REPORT.

THE side-slip trials organised by the Automobile Club produced thirteen entries, three being devices forming an integral part of the tyre, three being discs in contact with the road carried on arms attached to the back axle; two being steel blades kept in contact with the road by springs and attached to the wheels, three to each wheel; three being detachable leather covers fitted with steel studs or segments, and two being detachable chains or plates.

The trials began with an endurance test of 857 miles, to which all the devices were submitted, except those which could be put in or out of action from the driver's seat; these latter were only run over a distance of 104 miles. The roads chosen were, as far as possible, representative, but included a large proportion of tram lines and setts. Observers were carried on all the cars throughout the whole of the endurance test, who reported every repair and renewal made during the runs. At the conclusion of the endurance test, the cars were submitted to a trial of the absorption of power of the various devices. The cars were run down a hill at a speed of about twenty miles an hour, firstly with the device fitted, and secondly with the device removed. The distance between the stopping points under the two conditions was then measured and it was shown that there was an appreciable difference in the power absorbed.

The devices were then submitted to the actual side-slipping test. A space of 50 feet by 10 feet of smooth asphalt under cover was coated with a thin layer of Thames mud and fluid soft soap, forming a greasy substance closely resembling a London asphalt street on a damp, foggy day. All the cars were required to cross the greasy patch at speed, and to attempt to make a sharp turn while on the grease. None of the cars succeeded in turning in the least degree out of the straight, all making a front wheel side slip in the direction of the length of the car with the wheels locked hard over, clearly proving the necessity for having both front and back wheels fitted with a non-slipping device to ensure perfect control under extreme conditions; the Vivian device was fixed on all four wheels, but this did not enable the car to turn under the severe conditions imposed. The cars were then run over the greasy patch and the brakes applied suddenly; a considerable variation was apparent in the adhesion of the wheels fitted with the various devices. The cars were then made to start on the greasy patch and the results agreed with those of the brake test. Three of the devices under trial were then fitted to the front wheels, and this enabled the cars to make a fairly sharp turn on the grease. All the tyres, tubes, and devices were then examined for wear, and the results of the examination have been duly taken into consideration.

We recommend as follows:—

1.—That a prize of £150 and a gold medal should be given to M. L'Empereur for his device No. 12. This device gives good protection against side-slip, is quickly applied and removed, affords protection to the tyres, and in case of any fracture or disarrangement is easily, cheaply and quickly repaired.

2.—That a second prize of £100 and a silver medal be given to the Parsons Non-Skid Company for their device No. 14. This device gives good protection against side-slip, is easily applied and removed and is simple and cheap to repair.

3.—That a third prize of £50 and a silver medal be given to the Civil Service Motor and Cycle Agency for their Billet device, No. 15. This gives good protection against side-slip and to the tyres. The studs, however, require considerable attention and somewhat frequent renewal, and the device when detached is not so conveniently carried.

A silver medal and high commendation is given to the Wilkinson Tyre and Tread Company for their device, No. 8, but we find that considerable heat is developed, which is liable to cause trouble both with the covers and tubes.

That a silver medal with high commendation be given to Mr. Mark Vivian, for his device, No. 7. These tyres were in very good condition at the end of the trials, they absorb no more power than an ordinary tyre and are a fair protection against side-slip.

That a silver medal be given to Mr. H. S. H. Cavendish for his device, No. 2, as this proved to be the best of those designed to be operated from the driver's seat and to effectually prevent side slipping of the back wheels of the car to which it is fitted.

We are of opinion that all devices which depend for their application on the timely action of the driver, such as Nos. 2, 3, 5, and 6, are subject to the objection that they may not be brought into use quickly enough in emergency, and that they are not easily fitted to all types of cars without special design.

Although we have recommended the award of three money prizes with medals and three other medals, we do not consider that any of the devices as entered for the competition meet all the requirements. The problem is a difficult one, but more has been done towards its solution by some of the competitors than might have been expected. Much, however, yet remains to be done to remove the difficulties of application, inconvenience or even danger attending breakage of parts, first cost, cost of renewals, inconvenience caused by the necessity for frequent renewal of small component parts, and the absorption of power.

GORDON BENNETT RACE NOTES.

COUNT SIERSTORPFF, of the German Automobile Club, reports that the following towns and villages on the Taunus route will be neutralised :—Usingen, Weilburg, Limburg, Idstein, Konigstein, Obersursel, and Homburg. It will require forty-three minutes per circuit to pass through these seven localities, and as there will be four circuits, there will be a loss of 2 hours 52 minutes. The route will be guarded by 4,800 men, not including those at the start. Nearly eighteen miles of crossings will be barred with wire fences. Although the race will not start until 7 a.m., all the roads leading on to the course will be barricaded off at 4 a.m.

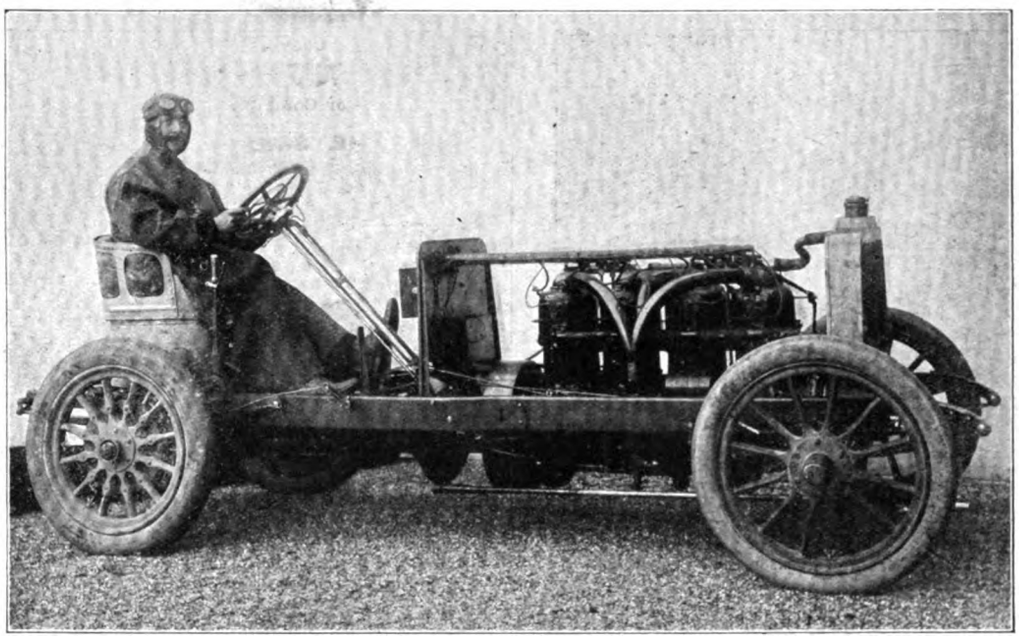
◆ ◆ ◆

THE Opel-Darracq car for the German Gordon Bennett team, with Herr Fritz Opel at the wheel, is shown in the accompanying illustration. Most of the details of this car have already been given in the *Journal*, but it may be repeated that the four-cylinder engine develops 85-h.p., and that the transmission is by cardan shaft and bevel gear on to a live axle. The car has been subjected to road trials and is stated to have attained a speed of over eighty miles an hour.

◆ ◆ ◆

Now that the United States has declared forfeit many are wondering what has become of the Swiss entry for the Cup race. Nothing has so far been heard or seen of the vehicle entered by the Swiss Club.

◆ ◆ ◆



THE Georges Richard Company last week gave a banquet in Paris in honour of the success of its car in the French Eliminating Trials, there being over 600 guests. Both the designer of the vehicle, M. Brasier, and the motorist who drove it to success, M. Thery, were enthusiastically congratulated on the results of their efforts in proving the merits of the Georges Richard-Brazier cars.

◆ ◆ ◆

THE Great Eastern Railway Company has sent us copies of a pamphlet they have issued regarding the Gordon Bennett race. It includes a time table and list of fares for the journey as far as the Hook of Holland, *via* Harwich. The charges for the carriage of motor-cars are also given, as also a sketch map of the route to Homburg, one of the Cup race course, and other information useful for those intending to visit Germany for the great event.

◆ ◆ ◆

WE are officially informed by the Austrian Daimler Motor Company that the drivers of their three cars which will represent Austria in the Cup race are Warden, Werner and Braun. The cars, which are of 90-h.p. and closely resemble those built at Cannstatt, have been on the road for some little time.

Herr Fritz Opel on his Opel Darracq Racer.—One of the three cars for the German Team.

"LA FRANCE AUTOMOBILE" publishes an interesting list of the causes which led to the withdrawal of the various cars in the French eliminating trials. We give a summary below :—

A. Fournier	Hotchkiss	Broken wheel.
Amblard	,,	Broken back axle.
Baron de Crawhez ...	,,	Magneto trouble.
Baras	Darracq	Rim of wheel ridden on so long that new tyre cover could not be fitted.
Beconnais	,,	Broken starting handle.
Wagner	,,	Leaking tank.
Rigolly	Gobron-Brillié	Radiator troubles.
Duray...	,,	Radiator troubles.
Burton	,,	Leak from water jacket into cylinder.
Baron de Forest ...	De Dietrich	Broken starting handle.
Jarrott	,,	Broken water tank.
Tart	Panhard	Overheating of engine.
Hanriot	Clement-Bayard	Clutch troubles.
Guders	,,	Clutch troubles.
Leger	Mors	Broken inlet pipe.
Lavergne	,,	Broken clutch spring.
De La Touloubre ...	Turcat-Mery	Leaky petrol tank.
Stead	Georges Richard	Pump troubles.
Chanliaud	Serpollet	Broken front axle.

AN outcry is being made against the speed of automobiles in Bulawayo.

THE Circuit Nationale of Belgium, which should have started on the 30th ult., has been postponed.

MOTORISTS will learn with interest of the engagement of Captain Skeffington Smyth to the Hon. Violet Monckton.

LORD WINDSOR, First Commissioner of Works, has laid before Parliament new rules for the regulation of the Royal parks and gardens. In accordance with Section nine of the Parks Regulation Act, 1872, they remain on the tables of both Houses for the space of one month, when, unless formally objected to, they acquire the force of law. Cycles, whether mechanically propelled or otherwise, and carriages and cars propelled or drawn by mechanical means, shall only be admitted subject to such regulations as may from time to time be framed by the Commissioners of his Majesty's Works and Public Buildings, and published by notice exhibited in the park.

THE TURNER-MIESSE STEAM CAR.

(*Concluded from page* 288.)

THE water is forced into one end of the generator either by a hand-pump, when starting, or by a mechanically-driven pump when the car is running; in the latter case the quantity of water delivered depends upon the speed of the car, but the actual amount which finds its way into the generator is regulated by hand, any surplus being allowed to find its way back to the supply tank. The hand regulator consists of a by-pass, and it primarily enables the driver to regulate the steam pressure. From the water tank, N, the water is led to the feed pumps, F, its passage to the pump cylinders being regulated by a shut-off cock. A small dome, N^2, is placed on the top of the tank on the right hand side, and an overflow pipe, which passes down through the water and out at the bottom of the tank, terminates at its upper end inside this dome. One of the delivery pipes, P^2, from the pumps is led to a by-pass valve, which is also connected back again to the suction side of the pump. The by-pass is controlled by a small lever working over a toothed quadrant attached to the steering column under the steering wheel, and the quantity of water delivered to the boiler can thus be regulated. The delivery pipe from the pumps to the boiler has an additional non-return valve between it and the pumps. It passes direct to the bottom coil of the generator, and has two branch pipes, one of which leads through a relief-valve, S, which forms part of the quadrant on the steering pillar, and the other to the safety-valve, Q, on the dashboard. The relief-valve, S, is normally kept closed; but, in the event of the pressure rising abnormally at any time, it can be opened by the driver, when the water or steam in the delivery pipe will be allowed to pass to the condenser. The overflow pipe of the safety-valve, Q, is also taken to the condenser. The feed-water pumps, F, are fixed on the right-hand side of the car and are formed in one casting. One of them is operated by the hand lever, F^2, and the other by the eccentric, F^1, on the countershaft, E. An air pump (Fig. 4) is fixed to the left of the engine, and is driven by a crank-pin on the crankshaft. The other end of the shaft carries a band-brake, X^1, controlled by a foot pedal, X^2; the latter also operates the steam throttle valve, its action being to first cut off the steam supply to the engine, and on further depression to apply the brake. The two water pumps have separate suction and delivery valves. The water passes from the pumps to the hand controlled by-pass R., and through an additional delivery valve and pipe fitting in order to go (1) to the generator, (2) to the relief valve, and (3) to the safety valve Q. The valve F^6, a non-return valve between the generator and pumps, is thus provided, which prevents the steam pressure forcing water or steam back through the by-pass and the condenser to the water tank.

The engine is carried in the centre of the frame. The cylinders, A, are cast in one piece, and are bolted to the crank chamber, B, which also encloses the differential gear on the countershaft, E. The cylinders of the 10-h.p. engine are 1 15-16 inch bore by 3 1-8 inch stroke, and those of the 16-h.p. 2 5-16 inch by 3½ inch. The engine, which is lubricated on the splash system, consists of three parallel, horizontal, single-acting cylinders, fitted with mushroom valves operated by cams. The cranks are arranged at angles of 120 degrees to one another, and the power is transmitted through a pair of spur-wheels to a differential shaft enclosed in the same casing, from the ends of which side chains convey the power to the rear wheels. The steam enters the cylinders through ports on the upper sides of the same, and is led out by the exhaust valves on the under side. Two spur wheels are mounted upon the crank shaft between the two bearings on the one side of the cranks. One wheel meshes with a corresponding pinion fixed to the shell of the differential gear; the latter is supported on each side by bearings formed in the casing. The differential countershaft is driven at about half the engine speed. The second spur-wheel on the crank shaft gears with a wide toothed wheel mounted on a lay-shaft in the box, and driving the two cam-shafts which operate the inlet and exhaust cams. The cam-shafts, which slide freely longitudinally in the crank-chamber casting, and are therefore easily removable, are simultaneously moved longitudinally by a fork piece which engages collars on both of them. The inlet cams are so shaped with varying profiles that they have a neutral longitudinal position in which they fail to open the valves at all. When slid in one direction they cause the engine to run forwards, and in the other direction to run backwards. For the forward direction they not only open the valves at the beginning of the outward stroke of the pistons, but they allow them to close later during these strokes according to the distance the shaft is moved, thus varying the cut off. The exhaust cams are so shaped that they hold the exhaust valves slightly open when in their neutral position, and allow for running backwards and forwards when slid longitudinally in one direction or the other,

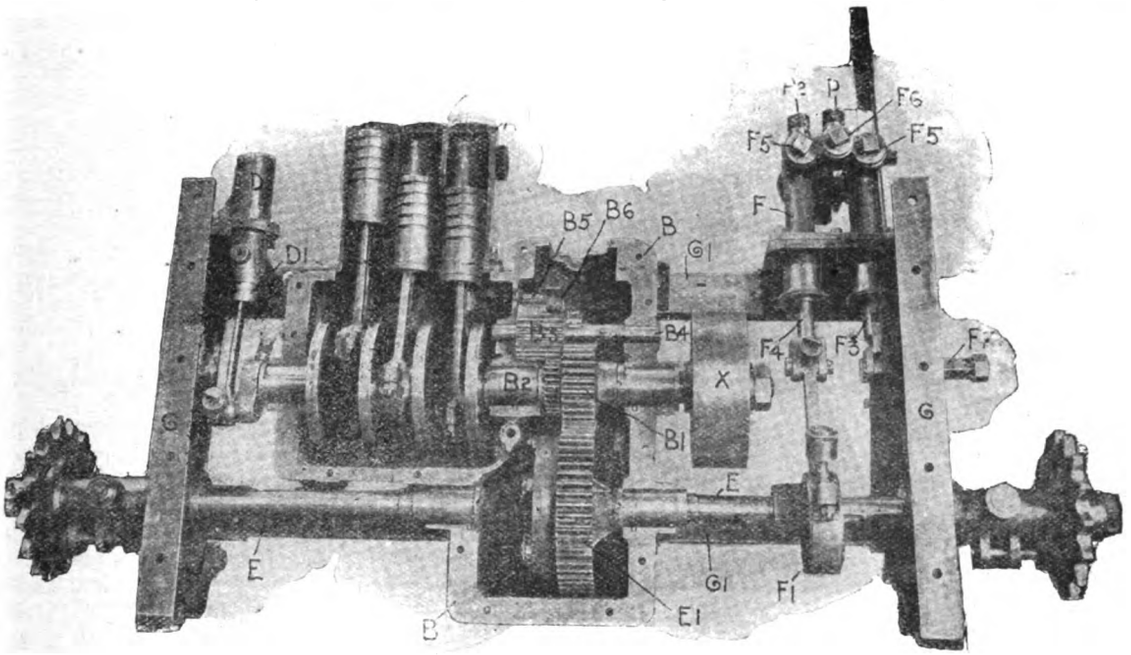

Fig. 4.—View of the Turner-Miesse Engine, Differential Shaft, and Water and Air Pumps.

Digitized by Google

and enabling the engine to run freely when the car is travelling downhill with the reversing lever in its neutral position. The sliding of the two cams is controlled by the lever C on the steering pillar (Fig. 5); on the extreme left, it gives the reverse; when moved to a central position no steam is admitted to the cylinders, and when shifted to the right various degrees of cut-off in a forward direction are obtained. The forks which slide the cam shafts are carried on a vertical spindle, C^3, by means of the lever, C^2, fixed to its upper end. The steam is taken direct from one end of the generator to the engine, the latter being controlled by varying the cut-off and reversing gear; in all cases a throttle-valve is also fitted, and it is so arranged as to be closed by depressing a foot pedal. The main steam pipe, A^6, from the generator to the engine, is of very small diameter; it leads to the admission-valve chamber on the top of the cylinder casting. The throttle-valve is fitted close up to the valve-chamber. A small pipe is taken from a junction on the steam throttle casting to the steam-pressure gauge, V, on the dashboard. The gauge is of special construction in order to prevent the needle from vibrating, in consequence of rapid variations in the pressure. For this purpose it is provided, beneath the dial, with an air and water cushion, which acts as a kind of dashpot. The exhaust steam is conducted by the pipe, W^1, to the condenser, W, in front. The steam enters the top tubes and passes down through each successive layer to the bottom, the condensed water being forced by the pressure of the exhaust steam through the pipe, W^2, and back to the water tank, N. This pipe passes up through the bottom of the tank and terminates above the normal level of the water in it. Any uncondensed steam which may find its way into the tank goes across the surface of the water into the dome, N^2, and down the overflow pipe. The crank chamber is lubricated from the oil-tank T on the dashboard by means of the hand pump, T^1, alongside it, the oil being conducted to the engine by the pipe, T^2.

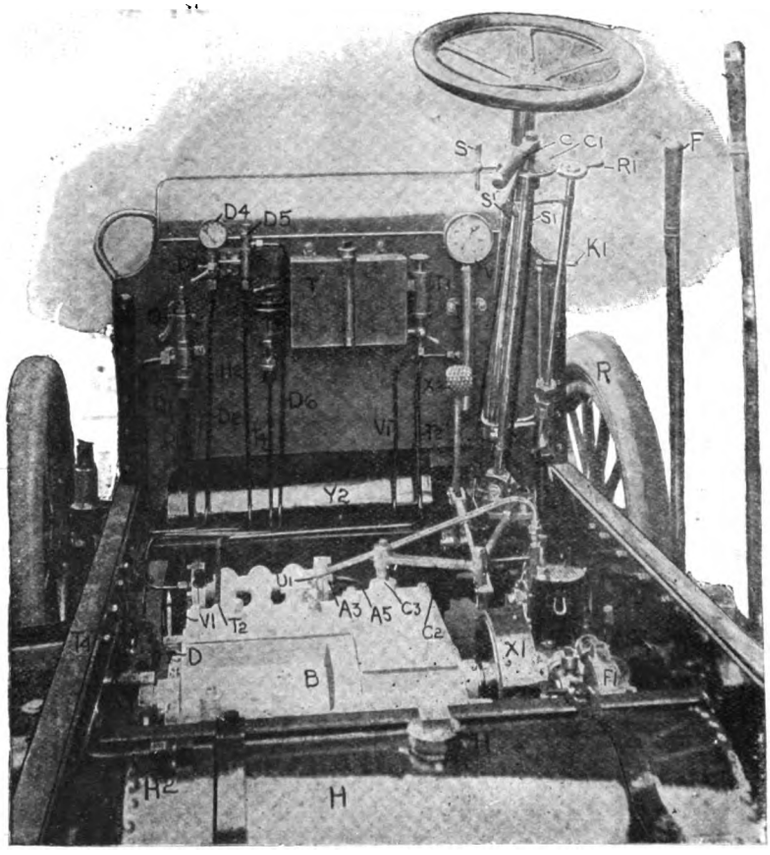

Fig. 5.—View of Chassis from Rear, showing Controlling Levers, Gauges, etc.

The paraffin tank is tested to a pressure of over 120 lbs. per square inch. On the 10-h.p. car it holds nine gallons, and on the 16-h.p. fourteen gallons—sufficient for running 100 miles. The water tank on the small car holds fifteen gallons, and on the large nineteen gallons. The pressure is not only kept constant in the fuel tank by the relief valve, D^5, on the dashboard, but, even in the event of this sticking, there is very little chance of an excessive pressure being attained, because the clearance space between the plunger and the delivery valve of the air pump is sufficiently large to prevent it from rising much above 45 to 50 lbs. per square inch. The steering gear is of the usual type, a worm and segment being used to render it irreversible. In addition to the brake on the countershaft double-acting hand brakes are fitted to each of the rear road wheels, and are operated by a hand lever. In practice the speed of the car is for the most part regulated by varying the steam pressure, and this is done almost entirely by varying the quantity of water which is admitted to the generator. The heat of the burner must, of course, be regulated to a certain extent in accordance with the amount of power which is required. When the car is standing for periods longer than a quarter of an hour the pilot light lamp cock is turned on and immediately lights itself from the main burner, which is then turned out, and *vice versa* when ready to start car again. When running, the driver can ascertain whether the genererator tubes are insufficiently hot, or are overheated, by noticing the rapidity with which the steam pressure rises in relation to the quantity of water delivered to the generator. If very hot, the pressure will rise very quickly, and if not hot enough, the reverse will be the case. When unexpectedly brought to a standstill by traffic, the steam pressure is apt to rise rapidly, and it is for such occasions as these that the hand relief valve on the steering pillar is provided, and that the safety valve is fitted. The steam pressure normally varies from about 150 pounds up to 400 pounds. The throttle valve is intended for use when wishing to slacken speed, or to stop momentarily, and is for the most part intended to obviate the necessity for removing the reversing lever to zero and back again; it thus saves trouble and avoids unnecessary wear and tear on the cams.

The only part of the system which is automatic is the air device for maintaining a constant pressure of fuel. The pressure is initially obtained by an ordinary tyre pump, which is connected to a nozzle provided for the purpose on the dashboard. The hand pump for forcing water into the boiler is only intended to be used when starting the car.

Although somewhat heavier than petrol vehicles of similar size, the Turner-Miesse steam car appears to have ample power for all ordinary purposes, and to be well and strongly built.

Sufficient water for a run of 80 miles can be carried, while the capacity of the fuel tank is, as already mentioned, equal to 100 miles' running.

In conclusion, we may mention that the cars are entirely built at the Turner Company's works at Wolverhampton, and that the consumption of fuel is only about one gallon per hour.

LORD AND LADY SAVILE have returned from an enjoyable motor-car trip through Northern Italy.

MESSRS. J. W. LOVEGROVE AND COMPANY, of Piccadilly, W., have issued an artistically designed catalogue to introduce their specialities in clothing to lady and gentleman motoriste. In addition to a full range of clothing, hats and caps, the list also includes goggles, motor-car lamps, sparking plugs, accumulators, jacks, horns, speedometers, and a whole host of accessories.

THE Executive Council of the County Councils Association, having considered the report of the Departmental Committee on Motor-Cars, has passed the following resolution:—"That this council regards the recommendations of the Departmental Committee on Motor-Cars with great satisfaction, and requests the Local Government Board to give effect to them at the earliest possible date."

CONTINENTAL NOTES.

A Touring Competition at St. Etienne.

The Automobile Club Forezien is organising a competition for touring vehicles, to be held on the 12th and 13th inst. The following categories are provided for:—(1) motor-cycles; (2) cars weighing less than 500 kilogs., with engines up to 8-h.p.; (3) cars up to 750 kilog. and 12-h.p.; (4) vehicles up to 800 kilog. and 16-h.p.; and (5) cars up to 1,000 kilog. and 18-h.p. With the exception of those in classes 1 and 2, all the competing cars must carry four persons. On the 12th inst. there will be a run of 235 kilometres, starting at 7 a.m. The route is St. Etienne, Bonson, Saint-Bonnet-le-Chateau, Craponne, Saint-Paulein, Le Puy, Paulhaguet, Brioude, Issoire, and Clermont-Ferrand. On the following day the run back to St. Etienne will be via Riom, Gannat, Vichy, Cusset, Lapalisse, Roanne, and Feurs, a total distance of 206 kilometres. The event is an international one, and entries will be received up to the 6th inst.

◆ ◆ ◆

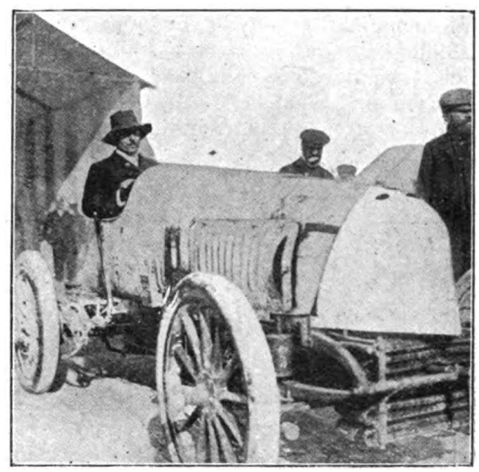
Driving Diplomas in France.

L'Association Générale Automobile has drawn up a series of rules with regard to the diploma it is arranging to issue to motor-car drivers. Candidates, who must not be less than eighteen years of age, will be subjected to an examination comprising the following points:—(1) driving motor-cars (starting, reversing, stopping, taking corners and driving up and down hill); (2) knowledge of the car (motor, transmission, ignition, dealing with breakdowns, detaching punctured tyres and fitting new ones); (3) acquaintance with the Motor Car Acts and Regulations; (4) physical and moral aptitude (sight, hearing, general conduct and behaviour, etc.) The diploma will only be available for a year, but can be renewed. Every driver to whom a diploma is granted will be required to acquaint the A.G.A. whenever he leaves or changes his place.

◆ ◆ ◆

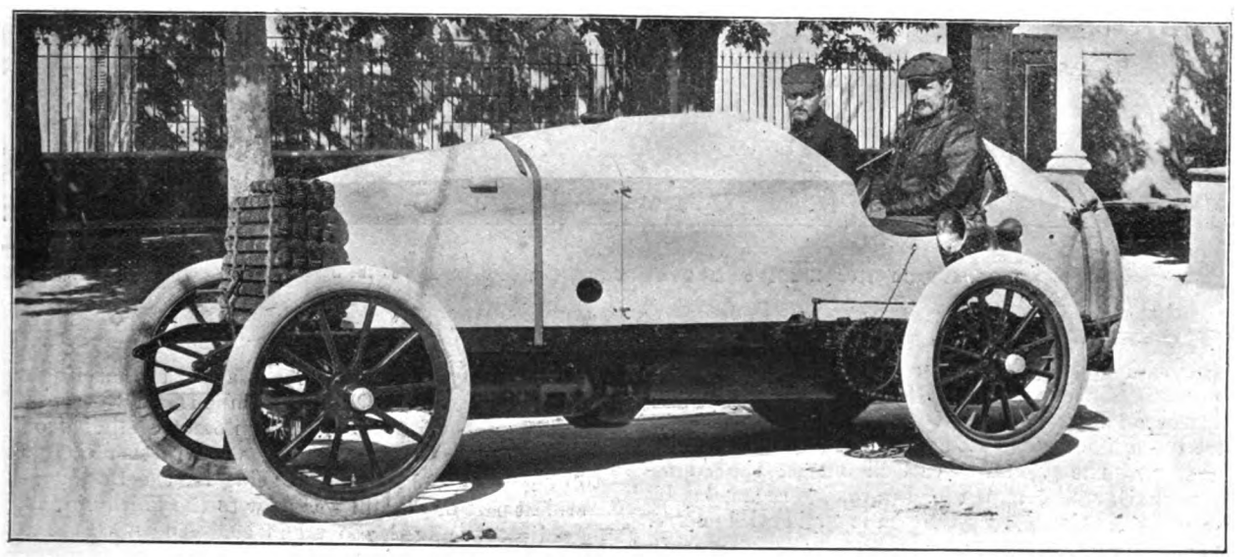
Motor Water Carts in Paris.

The streets of Paris are now being watered by a steam watering cart built by Messrs. De Dion, Bouton and Company. The wagon is provided with a 35-h.p. two-cylinder engine; the boiler, which is placed in front, has its smoke stack underneath the vehicle. The transmission is by means of a live axle and cardan joint. About a thousand gallons of water are carried on the vehicle, which can in twenty minutes sprinkle one mile of roadway fifteen yards wide.



◆ ◆ ◆

The late Marcel Renault.



A monument in memory of Marcel Renault, who lost his life in the Paris-Madrid race, was publicly inaugurated at Billancourt, near Paris, last week. The monument consists of a marble bust of the deceased motorist mounted on a large pedestal. On one side of the latter is a *bas relief* representing the arrival of Renault at Vienna in the Paris-Vienna race of 1902.

Thery on his Georges-Richard-Brasier.

Salleron on his Mors.

Rougier on his 80-h.p. Turcat-Mery.

THE FRENCH GORDON BENNETT TEAM.

Another Austrian Hill Climb.

The Austrian Automobile Club will hold its annual hill-climbing competition from Schottwein to Semmering, on the 21st August. Entries will be received until the 10th of that month.

◆ ◆ ◆

An Italian Motor-Cycle Reliability Trial.

The Italian Touring Club is organising an international reliability trial for the 19th June. The distance to be covered is about 200 kilometres, the route being Turin, Pignerol, Sesnieres, Suse, and Turin. A maximum of twelve hours will be allowed for the journey, this including a two hours' stop at Sesnieres for lunch.

◆ ◆ ◆

A Public Service between Honfleur and Trouville.

A public service of motor-vehicles has just been inaugurated between Honfleur and Trouville by a company known as La Société Honfleuraise de Transports Automobiles. At present three vehicles—single deck omnibuses constructed by Messrs. De Dion Bouton and Company—are being used, the time-table allowing an hour for the journey of 15 kilometres, including stoppages *en route*.

◆ ◆ ◆

The Five-Kilometre Speed Trials.

The programme on the second day of the meeting consisted of a series of five-kilometre speed trials on a straight road near Beaumetz-les-Loges, about ten miles from Arras. Griet on a Griffon was the best in the motor-bicycle class, his time for the five kilometres being 3 min. 30 2-5 sec., while Rigal, on a Buchet, secured first place in the heavy motor-cycle category (time, 3 min. 25 2-5 sec.). Villemain again led his Darracq to victory in the voiturette class (3 min. 15 sec.). The regular running of the Darracqs was again seen in the light car section, Beconnais and Baras both doing the distance in 2 min. 53 sec., as against 3 min. 15 sec. by Hanriot (Clement-Bayard). The best times of the day were made in the heavy car class, Gabriel on his Gordon Bennett De Dietrich doing the five kilometres in 2 min. 36 3-5 sec., or a speed over seventy miles per hour. Wagner (Darracq) was second in 2 min. 40 3-5 sec., and A. Clement (Clement-Bayard) third in 2 min. 54 3-5 sec. The day's proceedings were brought to an end by the trials of the touring cars, in which ten competed, Deville on a 20-h.p. Serpollet proving the winner; time, 3 min. 55 3-5 sec.

◆ ◆ ◆

The Arras Speed Trials—Hanriot on the Clement-Bayard Car, on which he won the De Caters Cup.

◆ ◆ ◆

Speed Trials at Arras.

The automobile meeting at Arras, organised by the Automobile Club du Nord in connection with the exhibition in that town, commenced on Thursday of last week by a series of mile and kilometre trials, the former with a standing and the latter with a flying start. The event was carried out on the Arras-Douai road, near Gavrelle, and the awards were made by adding together the times for the mile and kilometre. Some new times were set up; thus in the racing voiturette class Villemain on a Darracq did the mile in 1 min. 8 2-5 sec. and the kilometre in 34 4-5 sec. In the light racing car section Beconnais and Baras, both on Darracqs, each did the mile in 1 1-5 sec., claimed to be a new world's record for this class of vehicle. Although slower on the mile Hanriot on a Clement-Bayard covered the flying kilometre in 28 1-5 sec., likewise said to be a world's record. In the heavy racing car class Wagner on a Darracq took the first position, his time for the flying kilometre being 28 3-5 sec. A. Clement (Clement-Bayard), was the fastest over the mile (time, 1 min. 1 2-5 sec.). In the touring car section, Delmasure on a 12-h.p. De Dion did best in the two-cylinder category—2 min. for the mile and 1 min. 5 sec. for the kilometre. In the four cylinder 12 to 20-h.p. category Dreye on a 20-h.p. Serpollet headed the list, his combined time for the mile and kilometre being 2 min. 13 1-5 sec.

◆ ◆ ◆

The Doullens Hill-Climb.

The event for the third day of the meeting consisted of a hill-climb near the village of Doullens. Two trials were included in the proceedings, the first a kilometre climb from a standing start, the run being continued over a further 500 metres, with a flying start, the latter trial being for the De Caters Cup. The stiffest part of the hill was near to the finishing point, where the gradient averaged about 1 in 10. Appended are the best times for the kilometre from a standing start in each section:—

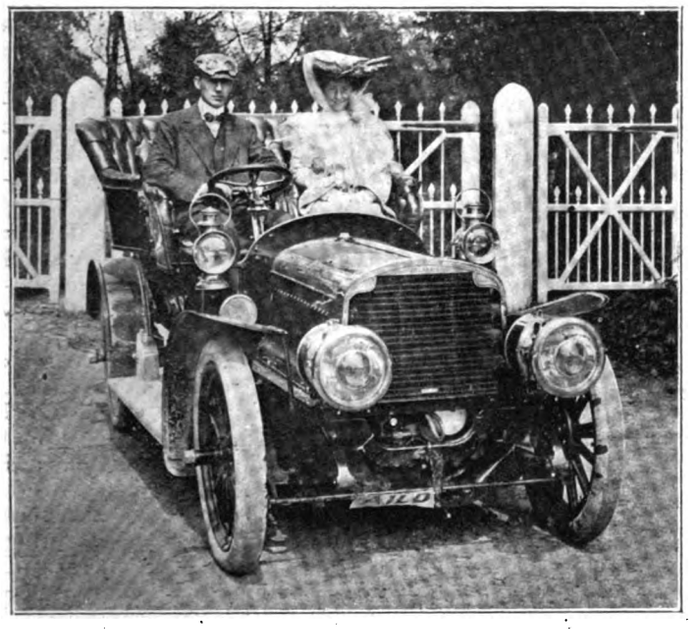
RACERS.

Class.	Driver.	Machine.	Time.
Motor-bicycles	Lamberjack	Griffon	50 sec.
Motor-cycles	Rigal	Buchet	55⅘ sec.
Voiturettes	Villemain	Darracq	53⅘ sec.
Light Cars	Beconais	,,	47⅕ sec.
Cars	Wagner	,,	53⅕ sec.

TOURISTS.

Motor-bicycles	Godard	Alcyon	1 m. 13⅘ sec.
Cars, 12 to 20-h.p.	Dreye	Serpollet	1 m. 14⅘ sec.
Cars over 20-h.p.	Wattine	Peugeot	1 m. 42 sec.

The result of the 500 metre speed trials for the De Caters Cup were:—



1. Hanriot ... ... Clement-Bayard ... ... 19 sec.
2. Wagner ... ... Darracq ... ... 19⅕ sec.
3. Anzani ... ... Alcyon motor-bicycle ... ... 19⅘ sec.

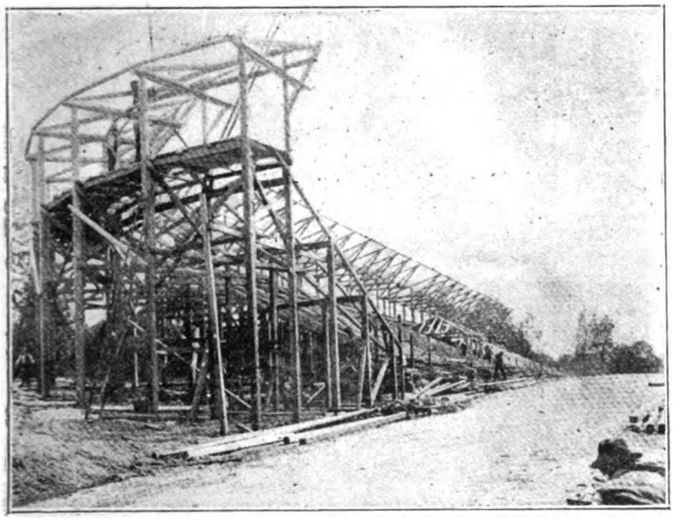
HERE AND THERE.

A NEW garage has been opened at King Street, Cork, by Mr. J. T. Mulligan.



THE Lagonda Motor Company, Limited, has been registered with a capital of £10,000.

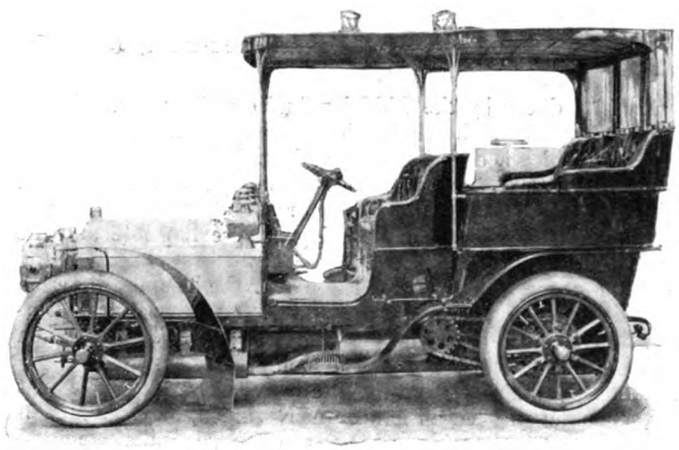
The 24-h.p. Delahaye Car, which took part in the Glasgow-London Non-stop Run and which made the second best time on Woodcock Hill.

MR. R. S. CURRIE, of St. Luke's Yard, Bravington Road, West Kilburn, has been appointed expert and engineer to the Ladies' Automobile Club.

MR. T. MASUI has opened a garage and repair at 8, Earl Street, Westminster, S.W., where he will have accommodation for 100 cars. The department will be under the supervision of Mr. H. Ramoisy.

The Gordon Bennett Race. The Grand Stand in course of erection, at the Starting Point at Saalburg. [*Automobil Welt.*

THE Government of India have sanctioned the purchase of a steam motor coach, for trial on short branches of the North Western Railway. The coach will be capable of attaining a maximum speed of 30 miles an hour and will carry 68 passengers, with luggage and sufficient coal and water to run thirty miles without replenishing.



A MILNES-DAIMLER van has just been put in service by the G.P.O. authorities between Mount Pleasant, W.C., and Paddington.

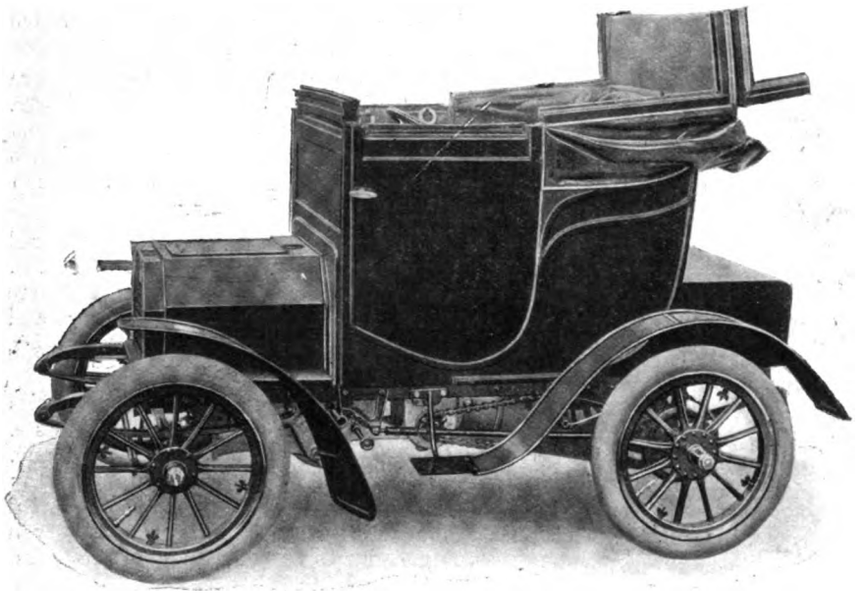
THE dangerous corner on the main road from Windsor to Maidenhead, known as the Cannon-hill death-trap, is to disappear, the local district council having received a free gift of land which will enable them to widen the road by 10 ft.

MESSRS. FULLER, MACLEOD AND COMPANY, LIMITED, have been appointed sole British agents for the dry batteries of Messrs. Hellesens, Enke and V. Ludvigsen. These cells have excellent keeping properties, as an instance of which it may be stated that several Governments, who use the cells for torpedo work, keep them in store for five or six years.

DIXI MOTORS, LIMITED, is the title of a company registered with a capital of £16,000 to adopt an agreement with Mr. R. S. Harger, and to carry on in the United Kingdom or elsewhere the business of proprietors of and dealers in motor-cars and carriages of all kinds. The first directors are Messrs. R. S. Harger, J. B. Stanford, and Captain W. H. Benett.

SICILY, by Mr. Jackson, is the latest addition to the series of "Little Guides" now in course of publication by Messrs. Methuen and Co. Illustrations add to the pleasure of the volume. The natural features as well as the historical associations of Sicily —the largest island in the Mediterranean— make it a delightful centre for tourists. The plan of these Little Guides is now well known; the newest volume adds to the reputation of the series.

The 35-h.p. Germain Car, which has just been supplied to Prince Albert of Belgium.



WITH reference to the excursion in the South of England which Messrs. De Dion-Bouton and Company, of Puteaux, are organising for users of their cars in July next, an outline of which was given in the *Journal* for the 21st ult., we are asked to mention that any owner of a De Dion-Bouton vehicle who would like to take part in the tour for the whole or a portion of the time will be supplied with further particulars in regard to hotel accommodation, etc., by applying to Messrs. De Dion-Bouton, Limited, 10, Great Marlborough Street, W.

KELLY'S Directory of Merchants, Manufacturers, and Shippers of the World for 1904 has just been issued. The book is intended to bring together, in one volume, not only the names of the manufacturers, merchants, exporters, &c., of the United Kingdom trading with the Colonies and abroad, but also those of all the more important foreign merchants (whether exporters to or importers from the United Kingdom), and further, those of the manufacturers of the principal goods imported into the United Kingdom. The Directory thus furnishes a guide to both the import and the export trades of the world, containing a large amount of information not to be found in any other book. The Directory contains (with the Customs' Tariffs published as a companion volume this year for the first time) no less than 4,300 pages, many of which will be found singly to give the names of as many as 400 merchants and manufacturers.

Digitized by Google

MR. W. G. MORRANT, the chief constable of Durham, is the last addition to the ranks of chief constables who are also motorists.

THE accompanying illustration shows a 6-h.p. landaulet

The Siddeley Doctor's Landaulet—Open.

recently introduced by the Siddeley Autocar Company. Except for the body work, the vehicle is identical with the Siddeley light car of which a description was given in the *Journal* for the 20th February last. In fine weather the car, which has been specially designed for the use of doctors, can be used as an open vehicle, the rear part of the top being made collapsible and the front glass to drop down.

THE commissioners of the bridge over the Thames between Goring and Streatley have agreed to reduce the toll for motor-cars from two shillings to one shilling, the speed of cars when crossing the bridge not to exceed four miles an hour.

THE London and Brighton Railway Company have just issued a booklet entitled "Picturesque Normandy." In addition to being a most interesting guide to the Dieppe and Rouen districts, the illustrations are veritable works of art, and we strongly recommend those interested in this part of France to procure a copy.

MR. G. GOLDSCHMIDT sends a new edition of his catalogue of motor accessories, in which we notice illustrations of some excellent types of headlights, tail lamps, side lamps, motor horns, pumps, oilers, goggles, and other necessary accessories for motorists. Among his specialities is a motor-cycle acetylene lamp fitted with sliding panels for the number plates.

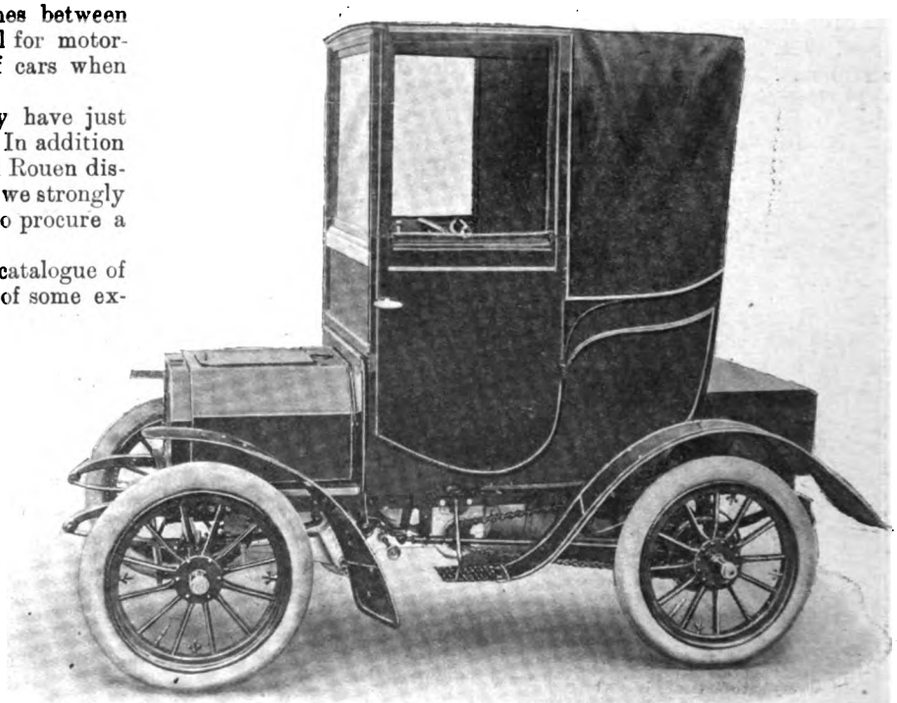
THE Comptroller-General of Patents, Designs, and Trade Marks, in his report for the year 1903, states that the subject of electric traction received much less attention at the hands of inventors than in the two or three preceding years. On the other hand, the development of motor-cars advanced very considerably, especially in the last quarter of the year. This development was shown not only in the construction of the cars themselves, but also in motors for driving them, particularly oil engines, and in tyres, speed gears, speed indicators, lamps, and other accessories. The new regulations for numbering motor-cars produced towards the end of the year many applications for number plates and means for illuminating them.

THE Rt. Hon. the Earl of Scarborough has just acquired a 12-h.p. Wolseley car.

WE hear that the Putney Motor Company are at present engaged on the construction of a twelve-cylinder petrol motor.

THE King of the Belgians motored from Brussels to Chantilly on his 90-h.p. Mercedes on the occasion of the French Derby.

MESSRS. R. A. WHYTE AND COMPANY, 144, Bath Street, Glasgow, have been appointed agents for the Continental Caoutchouc and Gutta-percha Company.



THE Patent Fluid Soap Company, of Coventry, are introducing Klenoyl for removing dirt and grease from the hands without hard rubbing. It leaves the skin in a soft, natural and emollient condition.

IN a case heard at North Shields on Monday fourteen Chinamen were summoned. They stood in and about the dock each bearing a number—"as if" says a facetious reporter, "they were so many motor-cars."

THE third edition of Mr. John Williamson's book on the Motor Car Acts of 1896 and 1903, together with the latest regulations of the Local Government Board, and a series of useful notes, has just been issued by Messrs. Iliffe and Sons, Limited.

ACCORDING to the Weather Chart sent out by Mr. B. G. Jenkins, the weather during June will be unsettled except for ten days in the middle of the month. So far during the present year the predictions of this chart have been generally accurate.

SOME time ago Messrs. John S. Morris and Son sent us a sample of their "Speedon" motor oil. We have now tested the lubricant and find it gives excellent results. "Speedon" is a pure, trebly-refined and filtered oil, quite free from acid, and has a high flash point. No lubrication troubles were encountered whilst it was in use, and there was no tendency for any parts to gum up.

The Siddeley Doctor's Landaulet—Closed.

MOTOR-CYCLING NEWS.

A MOTOR-CYCLE section of the Brighton Cyclist's Club has been formed.

◆ ◆ ◆

IN a recent issue we illustrated a device for suspending a motor-car from a strong roof to permit of repairs and adjustments being readily made where no inspection pit is available. We now give an illustration of a somewhat similar device

which has recently been introduced by Messrs. Jas. Roscoe (Bolton), Limited, for suspending motor-cycles to enable these to be cleaned and adjusted with facility. The suspender is also useful for storage purposes, as the pulley block is provided with a brake arrangement which permits the machine to be held at any desired height from the ground. The device consists of two pairs of pulley blocks, the upper pair of which is intended to be attached to a beam, while the lower pair is attached to a skeleton cradle which grips the frame just behind the seat pillar at the one end and the steering pillar at the other. The connections are made of the best raw hide belting, and are such that they can be easily adjusted to any motor-cycle with a minimum amount of trouble, and are designed to carry a weight of 224 pounds.

◆ ◆ ◆

THE second round of the eliminating motor-cycle trials organised by the Peterborough and District Motor Club took place on Friday, the 27th ult. The test is a 100 miles non-stop run from Peterborough to Lincoln and back. Originally there were thirteen competitors, and the first round reduced these to seven, as follows:—B. C. Holmes (Peterborough), 3½-h.p. Vinco-Minerva; T. Woodman (Peterborough), 2¾-h.p. Bat; H. Brown (Peterborough), 2¼-h.p. Bradbury; P. Mays (Bourne), 2¾-h.p. Vinco-Minerva; E. A. V. Sturton (Peterborough), 2½-h.p. Vinco-Minerva; P. R. Heighton (Peterborough) 2¾-h.p. Vinco-Minerva; and B. Gibson (Bourne), 2⅜-h.p. Vinco-Minerva. The rules were precisely the same as those in the first round, but rain fell during a greater part of the journey. Of the seven starters three again completed the non-stop as follows:—Holmes, Woodman, and Brown, and they consequently qualified for the third round. Two of the other competitors, Sturton and Mays, had the misfortune to break the belts of their machines, Gibson's ignition failed, and Heighton punctured. In the third round, should more than one competitor be left in the running after completing the 100 miles course as before, a further fifty miles will be run to Folkingham and back, and, if necessary, after an hour's interval, a further twenty-five miles, and so on until the winner is decided. The prizes offered are a handsome silver cup to the winner, gold medal to the second, and a silver medal with gold centre to the third. The seven competitors who originally competed in the non-stop will receive certificates recording their success.

◆ ◆ ◆

A MEETING of trade representatives interested in motor-cycles will be held at 119, Piccadilly, London, W., on the 9th, at 7.30 p.m., to consider the question of reliability trials for motor-cycles, to discuss the date of the same, and to elect ten representatives of the trade to form, with an equal number of representatives of the Auto-Cycle Club, the Trials Advisory Committee.

◆ ◆ ◆

THE Sheffield and District Automobile Club will hold a motor-cycle hill climb at Padley Wood to-day (Saturday), for which twelve entries have been received. Competitors must weigh machine and rider at Grindleford Station, under superintendence of the weighing clerk, Mr. L. C. Howlden. Mr. B. H. Gainsford will act as umpire, and Messrs. W. E. Cope, T. Lonsdale, C. Pearson, and J. R. Wade will officiate as timekeepers and starters. The first competitor will be started at 3 o'clock. Tea will be taken at the Maynard Arms after the event.

◆ ◆ ◆

AN interesting point has been decided by the Margate Borough Justices with reference to the affixing of identification number plates at the back of motor-bicycles, as well as on the front of the machine. Three defendants were summoned for a breach of what was submitted by the Chief Constable to be the regulations of the Local Government Board. The cases were dismissed on the payment of costs, but the Mayor, in reply to the Chief Constable, stated that the view the Bench took was that the back number on a motor-car was necessary to comply with the Act.

◆ ◆ ◆

IN our report of the opening run of the Eastern Counties Automobile Club, on another page, will be found a reference to the run of the Auto-Cycle Club from London to Yarmouth, which was thoroughly spoiled by the rain.

◆ ◆ ◆

THE annual meet of the Federation of American Motor-cyclists will be held in Cambridge, Md., on July 7th and 8th. The annual motor-bicycle endurance contest will be inaugurated

Mr. H. Williamson on the 2¼-h.p. Rex, on which he made a Non-stop Run in the London to Edinburgh Trial.

on July 2nd, and on that and the two following days runs radiating from New York will be made. On the 5th July the competitors will leave New York and finish in Cambridge on the evening of the 6th. It is proposed to devote one day to a series of tests designed to prove the hill climbing capacity of motor-bicycles, also how quickly they may be started and stopped, and also how slowly they may be run.

CORRESPONDENCE.

QUERIES *RE* MARSHALL CAR.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In reply to the letter of "Amateur," *re* Marshall car, in the *Journal* of the 21st ult., I would beg to suggest he is a little unreasonable in his complaints. In the first place, he seems to impute blame to the makers of the car for the condition in which he found the tyres of a third-hand car, and for which Marshall and Co., now the Belsize Co., can be held in no way responsible. As he was deceived respecting the mileage the tyres were said to have done, so he may be still under a misapprehension in saying they have now only done 3,000 miles. The makers of the car will fit any pattern of tyre that the purchaser may select, but no doubt an extra sum would be charged for fitting Collier tyres, as they are one of the most expensive in the market; but the make of the tyre in no way affects the good name of the Belsize Co. or their cars.

In the latter part of "Amateur's" letter he complains that the engine runs badly on top speed, that it cannot do anything on the roads in his district. As he does not say where his district is, I cannot draw comparisons between his neighbourhood and mine, but both he and your readers will admit that a car that gives satisfaction in Westmorland will, if properly treated, give satisfaction anywhere. I also am an amateur, and the possessor of a Marshall car, of which I received delivery from the makers last September. Previously to this my motoring experience had consisted of only one quarter of an hour on a car, and reading a large number of *Motor-Car Journals*. For the first two or three weeks I had one of their driver-mechanics to teach me how to drive and manage the engine, and since then I have driven it, cleaned it, and looked after it generally myself, employing no man.

For some little time the engine and I exchanged hard words, and then I went with my woes to Marshall and Co., and this is what I wish to emphasise, that the firm have always been most willing to spare neither trouble nor expense in helping me out of my difficulties, and in the end the engine and I became very good friends and understood each other very well.

No one can expect to get the best results out of a car which is two years old, and that for all "Amateur" knows has never been overhauled since it was turned out of the shop, and if he has not succeeded in selling his car, as he suggests, I should advise him to send it at once to the makers and have it thoroughly put in order, for he cannot expect an engine that may be badly wanting adjustment and repairs to be able to be driven with pleasure or satisfaction, and that with tyres valued at 2s. 6d. each. As for the hill-climbing power of the Belsize, I may mention that I have climbed hills with a gradient of 1 in 9 on the second speed with six adult passengers, although the car was only built to accommodate five.—Yours truly,

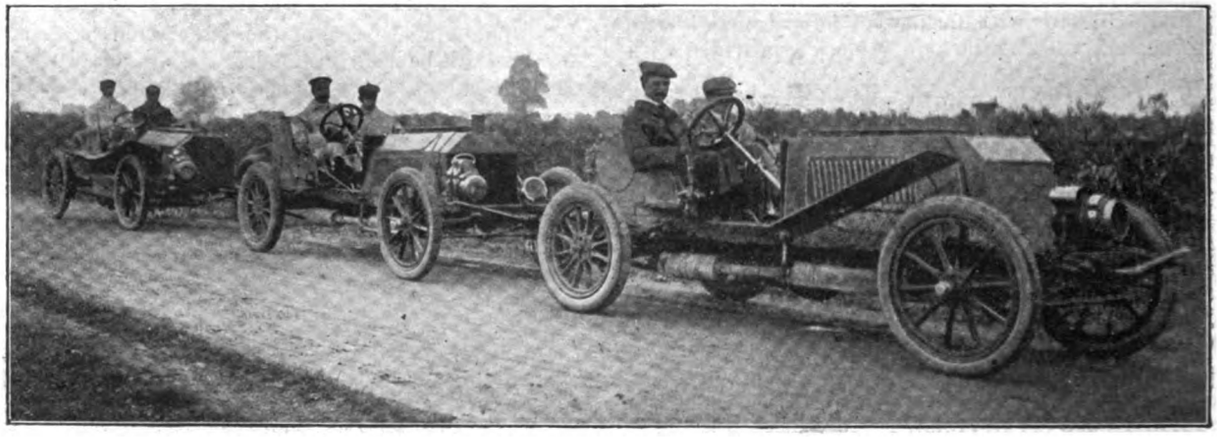
CHARLES E. MUMFORD.

SULPHATED ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I should be glad if you or any of the readers of the *Journal* can advise me what to do in the following difficulty. I have a high-class accumulator which has unfortunately, owing to neglect, become rather badly sulphated, and it is not possible to get it charged. I may add that I am able to charge the cells from a 100-volt circuit.—Yours truly,

J. LITTLETON.



[The remedy for sulphation in an accumulator is charging for a very long period at a low charging rate. If possible, the acid should be emptied out and weak acid of 1·050 specific gravity substituted, but if this is not easily done it is not an absolute necessity. The accumulator should then be charged at half its normal rate for a long period of time. The sulph will then be gradually reduced, or that part of it which is too hard to acted upon will be driven off by the gas bubbles when "gassing" begins take place. Some authorities recommend the addition of a little soda (sodium hydrate) to assist the action, but practical users have found that it makes very little difference. As the charging can be done from a 100-volt circuit, it will be no trouble to arrange for a low current, one 16-c.p. lamp being put in circuit for every ½ ampere required. Change to ordinary acid after the sulphate has been removed.]

Mr. S. F. Edge Rounding the last Bend.

The Finishing Point.

Messrs. Mayhew, Edge and Earp on the three Napier Racers.

THE NOTTINGHAM AUTOMOBILE CLUB'S HILL CLIMB. (*See page* 314).

CARS FOR DEVONSHIRE.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—As no one has ventured to advise "Would-be Motorist," perhaps my experience in S.W. Devon may be useful to him. I wish he had mentioned the price to which he was prepared to go, as all depends on this.

I have a 10-h.p. Argyll, top gear 20 m.p.h., other two lowered proportionately, supplied originally with small solids; after 3,000 miles altered to 3-inch Buffers on back wheels, and recently Martin pneumatics on front

Digitized by Google

I averaged 17 m.p.h. to London and back, actual running time spread ov four days; petrol consumption about 28 miles per gallon, three up a luggage, extra passenger some part of journey; I averaged 14 m.p.h. on Devonshire roads, including those across Dartmoor. One in seven is child's play with four up, one in five for a short distance I can manage; on the very few occasions when I have met anything steeper than this I have shed passengers just over the steepest part and started off again with full load on one in six (all taken on tested gradient meter).

I have just returned from Bude, and was informed when I got there that I had climbed the old hill out of Launceston and the old hill out of Stratton, neither of which are used for traffic, as new roads with less gradients have been built; of course, the road was strange. We were four up and luggage. Possibly your correspondent knows these, or he may know the road from Ashburton to Princetown or Moreton Hampstead to Princetown, both of which are a good test for any low-powered car. At the same time, a four-cylinder 16-h.p. would be better, of course, and give one a reserve in case of leaky valves or other troubles.

I daresay I could convince "Would-be Motorist" that a 10-h.p. car can go anywhere in any weather and over any road fit for a farmer's market cart (with solid tyres). I have no experience of other makes, so cannot say the Argyll is better, but in a country where one is constantly changing gear I consider the Govan gearing one of the best to manage, and less likely to wear or get broken. I had better state that I have no interest in this make and drive entirely for pleasure, or my enthusiasm may be misconstrued.—Yours truly,

T.2.

A WARNING.

To the Editor of *The Motor-Car Journal*.

Sir,—I think it is about time a word of advice was given to young men who are thinking of going in for motor-car driving. Several firms are advertising that competent drivers can command a good wage, and are much sought after. I, and several young men of my acquaintance, have paid fifteen guineas for what they term a thorough course of driving and mechanism, leaving good situations to do it, and now find the utmost difficulty in getting employment as chauffeurs.—Yours truly,

Disgusted Pupil.

LIGHT CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—Two hundred miles per day with a single cylinder hardly seems possible. Yet my single-cylinder 8-h.p. M.M.C. car has done it on several occasions between Exeter and London, and it has never landed me on the road. It has covered altogether over 6,000 miles, and with the exception of tyres has not cost a ten pound note for repairs and renewals, notwithstanding the fact that between twenty and thirty people have learned to drive on it. My driver had only six months' mechanical training, previous to which he was an indoor servant, but he is endowed with common-sense, and no doubt this, combined with the simplicity of the car, has much to do with the successful running I have experienced.—Yours truly,

Howard Beadle.

STEAM CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—In reply to "Saunterer" I bought a Locomobile when they first came over, six years ago, and the car runs as well now as on the day I had it. Of course, I have made one or two alterations and have had the usual tyre troubles, but it is practically the same car, and I question if any owner could show a better balance-sheet for cost of running, repairs, or petrol, and, above all, the silent and smooth running not to be found in any explosive car. Petrol per mile a fraction over 1d., water free; I can do forty-two miles on tank of petrol and twenty-two on water. I am glad makers are giving a little more attention to steam.—Yours truly,

Comfort.

To the Editor of *The Motor-Car Journal*.

Sir,—In answer to "Saunterer," *re* Locomobile steam car, I have driven several sizes for some time, and I may say in the hands of a careful person you can get more work out of them than any petrol car their own strength, and on a hill can keep up with, if not pass, a petrol car double its own power. If not for the trouble of picking up water often I should prefer it to any small petrol car on the market. What I wonder is that the police do not take action against the drivers for loitering. Again, it is argued that the time taken to get steam up is between ten and fifteen minutes. I prefer that to possibly the same amount of time in tuneless barrel-organ playing at the risk of one's arm being shattered. With the Locomobile you can start with the little finger on any hill, no changing gear. They are strongly built, suitable for a rough, hilly country, and may be called a toy, but are not to be played with. Regarding consumption of oil, I use Bowley's petrol B, 10d. gallon, and can run ten miles on a gallon. I have tried others, and find this the cheapest and best for steam cars. If "Saunterer" should purchase one and should want any information I should be pleased to answer any questions.—Yours truly,

A. Roper.

INGRATITUDE.

To the Editor of *The Motor-Car Journal*.

Sir,—Just an instance of how some motorists treat the trade, and a warning to others not to take the word of strangers. A car recently pulled up outside my place for petrol. They had four gallons and paid for it, but said they would take the cans, as it was for another car stranded for want of petrol. They took the two cans, promising to bring them back in about ten minutes, but did not. Consequently, I am minus 4s., which I have to pay for the empties.—Yours truly,

G. Turner.

COST OF OPERATION.

To the Editor of *The Motor-Car Journal*.

Sir,—On reading the letter which appeared in your valuable journal of 14th May, 1904, page 246, we felt it would be of still further interest to all concerned to obtain details of the item "Repairs to tyres (Collier's) £23 17s. 7d.—about 2d. per mile" from your correspondent, and we are pleased to say that he (Lord Edward S. Churchill) has very kindly furnished a detailed rendering of same, which, together with his letter, we have received permission to publish.

We therefore append same, and trust you will grant us space in your next issue for this correspondence, for, as will be seen from his lordship's figures, the actual total of "Repairs," pure and simple, amounts to £5 0s. 6d. only, which is equal to a little over one farthing (f. 1·606) per mile in 3,004 miles per set of four "Collier" tyres.

"Detailed Account of Cost of Tyre Up-keep."

	£.	s.	d.
1 new inner tube	2	9	0
1 new inner tube	2	9	0
Telegrams	0	2	10
Repair inner tube	0	10	6
Repair inner tube	0	10	0
Repair to cover	3	5	0
Garage while wheels were splayed	0	19	3
Repair to cover	0	15	6
1 new cover	12	7	6
	£23	8	7

"28, Grosvenor St., W.
"May 18th, 1904.

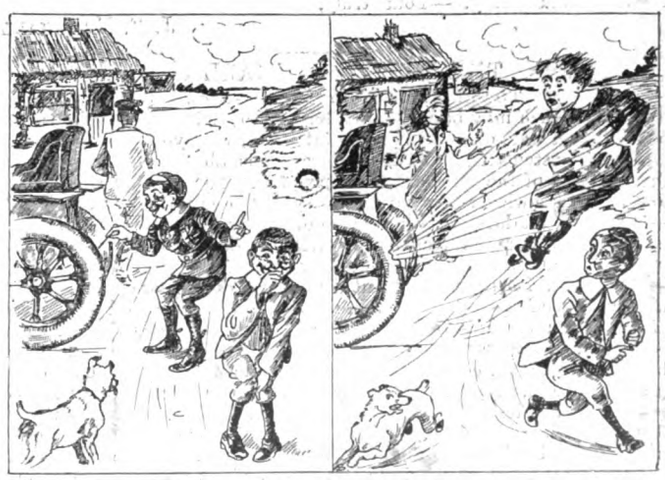
"Sir,—In reply to your letter of the 16th inst., I beg to enclose particulars of my tyre bill. There was a slight mistake in the addition, it should read £23 8s. 7d.

"I am at liberty to state that a friend of mine who has had a car of the same make for about the same period, but with another make of tyres, has had to pay £90 for repairs to them.

"Yours faithfully,
(Signed) E. S. Churchill."

The latter portion of this interesting letter makes the "Colliers," for reliability and durability, stand out in a most satisfactory and successful manner.

It will be noted further that the total tyre bill is shown now to be £23 8s. 7d.. and not £23 17s. 7d., as previously given.—Yours truly,



The Collier Tyre Co., Ltd.

BRAKES.

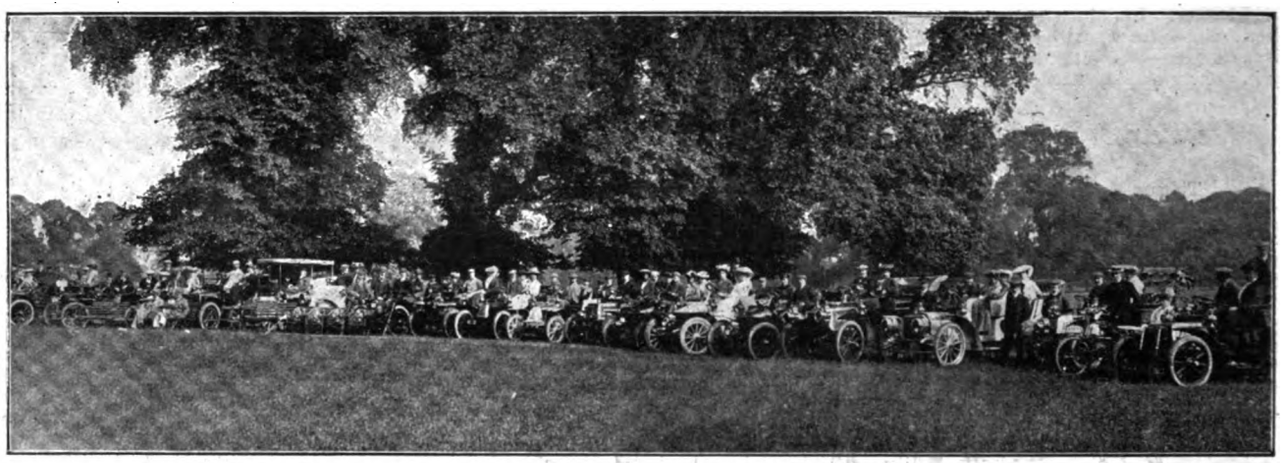
To the Editor of *The Motor-Car Journal*.

Sir,—I have a De Dion car with the usual leather-lined spring brakes. I find that the leathers slip with grease and swell with wet, requiring constant re-adjustment. I would be glad if any reader who has tried them would tell me if metal-lined brake springs are suitable for De Dion cars, 6-h.p. If so, what metal, size, and number of segments, and distance apart?—Yours truly,

J. C. Eddison.

Digitized by Google

PROPOSED INSTITUTION OF AUTOMOBILE ENGINEERS.



To the Editor of *The Motor-Car Journal*.

Sir,—I regret to find that my letter in your issue of May 14th has caused Mr. H. Austin such "great surprise," and trust that you will allow me, by way of apology, to draw his attention to the chronological side of the matter.

Early in November, 1903, I submitted to the criticism of about 600 automobile engineers and others connected with automobilism a circular containing certain proposals as to the formation of an institution of motor engineers—a circular in which, for the sake of promoting discussion, I had set out, in considerable detail, a suggested scheme. By a remarkable coincidence, a leading article in an automobile journal of November 28th dealt with the growing necessity for a Motor Engineers' Institute, and suggested that the Cycle Engineers' Institute "could possibly so enlarge its scope" . . . . "as to embrace the new industry." I thereupon wrote to the editor of your contemporary informing him of the steps which I had already taken, and received in reply a courteous letter, requesting me to forward my circular for his consideration. As a result of this, a leading article was published dealing very fully with my proposals. This article I specially commend to the notice of Mr. Austin. After this, I received a great many letters on the subject, and in February of this year issued, for further consideration, a circular summarising the results of my preliminary "canvass."

In another journal of March 17th, 1904, a letter from Mr. A. S. Hill (at that time President of the Cycle Engineers' Institute) stated that the title of the C.E.I. would, "at the general meeting, to be held in the near future," be amplified by the addition of the word "automobile." As far as I am aware this was one of the earliest (if not *the* earliest) announcements of such change of title; and it seems to me, therefore, that Mr. Austin's letter scarcely does justice either to myself or to those who are now assisting me in the matter. One of the principal aims of our "proposed" Institution to stimulate the investigation of the more advanced problems presented by automobile machinery—such problems as are (except in occasional papers by such authorities as Prof. Hele-Shaw, Mr. Dugald Clerk, and a few others), but rarely attacked. I have yet to learn that a knowledge of such subjects as (say) higher thermodynamics or, even, differential equations, has ever been regarded as a necessity to the cycle engineer; and I am equally at a loss to imagine how the mere alteration of a title at a general meeting can, *ipso facto*, render our "proposed" Institution "unwarranted, and therefore unnecessary."—Yours truly,

J. F. Marshall.

THE RATIONAL SMALL CAR.

To the Editor of *The Motor-Car Journal*.

Sir,—Much may be written under the above heading, as the subject is necessarily a wide one, but it is my intention, with your permission, to try and treat systematically of the two-seated small car as it is required by the majority of the public. Now, people have frequently written to the *Journal* asking when manufacturers are going to produce the "rational" car—not a car that does thirty miles per hour, and not to have pneumatic tyres, etc., *ad infinitum*. This is all very well, and doubtless such ideas are held by a large number of people, but they are *not* the ideas of the majority. When a manufacturer brings out a new and cheap car, his only hope of making a good profit lies in the number he must manufacture. He must also make an absolutely standard article, and hardly ever deviate from the specification, and when he does so, he must charge extra. The public, however, resent an extra, and a manufacturer can easily lose an order by refusing to add, say, an additional lever to control the air from the steering column, unless he makes some extra charge. If he once starts allowing a few extras there is no telling where it will end—hence the present question of the difficulty in obtaining a rational small car. People may not think o, but the question is infinitely more perplexing to the manufacturer than to the public. There are a large number of purchasers who really do not know what they want in the way of a small car; there are a still larger number who want too much, and if they had what they wanted their "small" car would be a large one; and the largest section of all want a reliable two-seated car—two-cylinder preferably—absolutely up-to-date, for less than £150. The manufacturer's difficulty can now be appreciated. He does not wish to put a car on the market which is obviously unsuitable, and he *cannot* supply one to suit the third section above-mentioned at £150. Consequently he can only adopt the course open to him. He finds out what *most* people require, makes a standard machine, and charges for all extras.

Now let me examine the question from the point of view of the public. If the requirements of those who demand solid tyres are carefully analysed, it will nearly always be found that they are not satisfied with a speed of fourteen to sixteen miles an hour; hence the unwillingness of the manufacturer to supply solid tyres to a very light vehicle which may be rushed about at over twenty miles an hour. If a manufacturer always knew into exactly what hands his car were going, he could act very differently; to put it plainly, he must make the car more for the "fool" than the "expert." In my opinion, a good, powerful, two-seated car should have a small two-cylinder engine, say about 7–8 h.p. A vertical engine also is necessary, it is only one out of ten who will clamour for a horizontal engine. "The rational car is not to be very speedy" is a statement frequently made, but is one which should be taken for exactly what it is worth. A man will buy a car that will travel about sixteen miles an hour, perhaps less; after he has had it a month he will want it to run faster—it will grow upon him, he will not be able to help it. But this can be supplied by the manufacturer. He will gear the car low, and if his customer requires more speed he can change the sprockets. By this last remark, it will be seen that I denominate the rational car as being "chain-driven." This, in my opinion, is undoubtedly what it will be. Several very large houses adhere to the side chain-drive, and there can be no doubt that if the chains are taken care of there is no fault to be found with the chain-driven car. As to the tyres, most people, especially those who have had experience of large cars, will go for pneumatics. If ample size tyres are fitted, they will not give much trouble on a car weighing about 7 cwt. If solids are demanded, the manufacturer will be wise to supply them only at customer's own responsibility. As regards transmission, as only about one in a hundred (if that) swear by belt transmission, I may safely predict a gear-drive for the rational car—probably three speeds and reverse—with a direct drive on the top speed, the whole being actuated by a single lever. With reference to the ignition, most people are quite satisfied with the ordinary high-tension, and this will probably be fitted. A high-tension magneto can always be fitted to any petrol motor, if required.

Let me now sum up the "rational two-seated car" in the form of a specification, and see how it looks:—

Engine.—Two-cylinder, 7–8-h.p. vertical.
Gears.—Sliding, three speeds and reverse, with direct drive.
Ignition.—High tension from accumulators. High tension magneto fitted if required. (Extra.)
Tyres.—Pneumatic, ample size; solids only at customer's own responsibility.

I have omitted several points from the specification, such as cooling, lubrication, type of frame, control and carburettor, etc., which may safely be left to the manufacturer. These are my views, Mr. Editor, on the subject of the rational small car. It would be interesting to know how far they agree with those of other readers of the *Journal*.—Yours truly,

C. A. R.

Charging Batteries.—Replying to R. P. Ross, primary batteries for charging ignition cells are made by the Boron Battery Company, 131, St. Domingo Road, Liverpool, and Messrs. J. C. Fuller and Co., Woodland Works, Wick Lane, Old Ford, London, E.

CLUBS AND ASSOCIATIONS.

BERKSHIRE.

On Saturday the members of the Berkshire Automobile Club held a gymkhana at Hall Place, near Maidenhead, the residence of Sir Gilbert A. Clayton East, Bart., the Chairman of the Club. In all some twenty-five or thirty cars were on the ground, and only the owners of the cars drove them, with the exception that Miss Thompson drove Mr. O. S. Thompson's Wolseley. Sir Gilbert Clayton East himself took part, and was cheered on scoring a success in one of the contests. The judges were Colonel H. C. L. Holden, R.A., F.R.S., and Sir Gilbert East, and the starter Mr. C. R. De la Salle, Chairman Sports Committee Berks A.C. During an interval Sir Gilbert and Lady Clayton East entertained their visitors at afternoon tea in the house.

The Berkshire Automobile Club's Gymkhana. Sir Gilbert Clayton East (on the extreme left) and the Officials.

Photo by] [Argent Archer.

The first event was a bending race between staves. This was run in heats, the "final" contest being between Lieut.-Colonel Waring (9-h.p. Renault) and Mr. L. Barwell (12-h.p. Clement), the latter ultimately winning by three lengths.

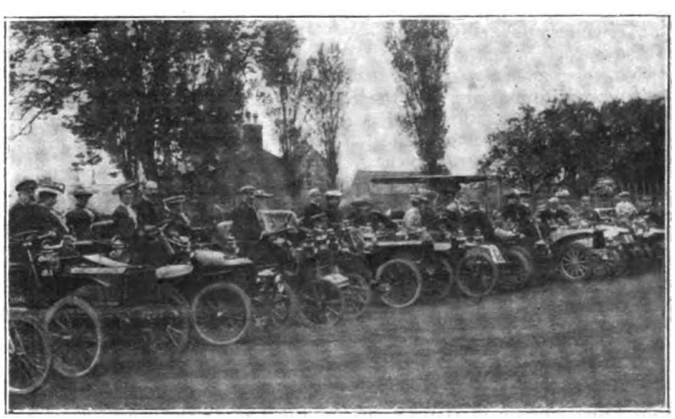
The motor-house competition was a contest in "pulling up," the cars first making roughly the figure of a letter S around two flags, then reversing and backing into a space between hurdles representing the "motor-house." The winners were Mr. W. Littleton (in 17 1-5 sec.), on a 7-h.p. Panhard, first, and Colonel Waring (19 sec.), on his Renault, second. Mr. Graham Loyd did the task in 18 sec. on a 8-h.p. Wolseley, but he and one or two other competitors did not back fully into the "house."

In the Ladies' Passenger race for four-seated cars, the idea was to drive 100 yards, alight, assist lady from a chair to the back seat of the car, re-take seat, drive another 100 yards, and pick up another lady as before, re-take seat and drive to finish. The cars were run in pairs, the final order of the winners being:—First, Mr. Powys Lybbe, on a 24-h.p. Bollée; second, Mr. Barwell, on a 12-h.p. Clement; third, Mr. Shrapnell Smith, on a 12-h.p. Lanchester. The object of the legal limit race was to test judgment of speed and ability to keep to the 20 mile an hour limit. The course being a mile long, the competitor who did the distance in a time nearest 3 minutes won. Dr. Norman Joy, on his 2¾-h.p. Morris motor-bicycle, completed it in 2 min. 26 sec., and Mr. H. Powys Lybbe, on his 24-h.p. Bollée car, in 2 min. 35 sec.—both too quickly. Ultimately the winners proved to be:—First, Mr. Littleton (3 min. 7 sec.); second, Mr. O. S. Thompson (car driven by Miss Thompson), 3 min. 16 sec.; third, Sir Gilbert East, 3 min. 16½ sec.). Other competitors were:—Mr. Shrapnell Smith (3 min. 19 sec.), Mr. Barwell (3 min. 44 sec.), Mr. Dodd (3 min. 50 sec.), Mr. Garcke (5 min. 8½ sec.), Dr. Paterson (4 min. 5 1-5 sec.), and Dr. Walters (driver Mr. Parrish), whose car had special trouble with the ground (5 min. 36 sec.).

SOUTH WALES.

The annual general meeting of the South Wales and Monmouthshire Automobile Club was held at the Royal Hotel, Cardiff. Mr. Godfrey Clark presided over a large attendance. The following officers were elected:—President, Lord Windsor; chairman of committee, Mr. Godfrey L. Clark; hon. secretary, Mr. J. T. Willows; hon. treasurer, the Rev. M. Whiteside; committee, Colonel Homfray, Captain Hughes Morgan, Dr. Prichard, Mr. J. L. Proger, Mr. W. Graham, Mr. A. G. Moffatt, Mr. J. J. Handcock, Mr. V. E. Brukewich, Mr. Griffith Jones, Mr. J. J. Neale, and D. W. Graham, J.P.; auditors, Messrs. Dryden Lewis and R. E. Jones.

BURNLEY.



Fourteen automobiles took part in the Burnley club's run to Settle. At the Town Hall, the Mayor (Alderman Carrington) and the Town Clerk (Mr. Sheldon) found seats in Mr. Jesse Altham's 12-h.p. Napier. Mr. Frank Clarke, of Nelson, on his 20-h.p. Vinot, was the first in the market-place at Settle, Mr. Ridehalgh following closely. There were a few mishaps on the road. Mr. Hargreaves had a puncture before he left the Cattle Market, Burnley, and was so unfortunate as to get another later. Mr Jesse Altham, too, was delayed for some time after the parade in Burnley, and was the last to arrive. The fourteen cars were marshalled in a half-moon before the old Shambles on the market-place, Mr. Jesse Altham's car forming the keystone to the arch composed of the following cars:—Councillor C. Atkinson's (Colne), chairman of the club, Locomobile steam car; Mr. W. S. Atkinson's 7-h.p. New Orleans; Mr. Jesse Altham's 12-h.p. Napier; Mr. Ridehalgh's 16-h.p. Belsize; Mr. A. Hartley's (Colne) 11-h.p. Clement; Mr. Riley's (Nelson) 6-h.p. Argyll; Mr. Parkinson's 7-h.p. Turrell; Mr. John Watts' 8-h.p. De Dion; Mr. John Hurtley's 8-h.p. Manchester car; Mr. Frank Clarke's (Nelson) 20-h.p. Vinot; Mr. Smith Lawson's 7-h.p. Panhard; Mr. Mosedale's (Burnley) 6-h.p. Midland car; Mr. Hargreaves' 10-h.p. Decauville; and Mr. R. Cox's 10-h.p. Decauville. The party took tea in the Golden Lion, an old stage-coach inn, built in 1671. The return journey by the same route, in the cool of the evening, was delightful, the first car arriving at Burnley about half-past seven. For the perfect smoothness of all the arrangements for the run, Mr. Smith Lawson, the secretary of the club, was mainly responsible.

MIDLAND.

Owing to the weather only a few members of the Midland Automobile Club met at Bettws-y-coed at their Whitsun tour. The journey to Bettws-y-coed was made *via* Shrewsbury and Llangollen. The principal trips enjoyed by the party were as follows:—Llandudno *via* Llanwrst, returning *via* Conway; Capel Curig, Beddgelert, visiting the Pass of Aberglaslyn, *via* Snowdon Ranger, through Carnarvon and Bangor to the Menai Bridge, passing over the bridge, the night being spent at Beaumaris. The return to Bettws-y-coed was made *via* Menai Bridge, Carnarvon, Llanberis Pass, and Capel Curig. The members returned home *via* Oswestry.

LINCOLNSHIRE.

The meet of the members of this club at Crowland, on Saturday, would probably have been a record one had not the weather been so threatening, for many would have gone over, if only to inspect the fine old Abbey and its ancient and historical surroundings. Notwithstanding the rainy morning, there was quite a nice muster of cars by four o'clock, and two of them were driven upwards of sixty miles. The meet took place at the residence of Dr. and Mrs. Husband, and amongst those who put in an appearance were:—Mr. and Mrs. W. B. Jevons (Market Rasen), on a 9-h.p. De Dion; Mr. and Mrs. A. A. Padley (Market Rasen), on a 6-h.p. De Dion; Mr. C. W. Pennell (Lincoln) with Mrs. Pennell, Mr. W. R. Pennell, and Mrs. Newsum, on a 12-h.p. Richardson; Mr. and Mrs. G. Linnell (Market Deeping), with Mrs. Linnell and Mrs. Stanton, on a 12-h.p. Wolseley; Mr. C. Holland (Boston), with Mr. W. Kitwood, on a 5-h.p. Baby Peugeot; Major F. H. Goddard (Lincoln), on a 12-h.p. Richardson; Mr. W. A. Tomlinson (Sleaford), with Mrs. Tomlinson and Miss Pearson, on a 5-h.p. Bardon; Dr. Reckitt (Boston), on a 5-h.p. Baby Peugeot; Dr. Gilpin (Bourne) with Mrs. Gilpin and Mrs. Wade, on an 8-h.p. Peugeot; Dr. Cragg (the Club Secretary, Billingboro'), on a 3½-h.p. Enfield Quad.; Mr. and Mrs. J. R. Richardson (Lincoln), on a 12-h.p. Richardson; Dr. and Mrs. F. Husband with their 8-h.p. Wolseley, and Mr. C. Brookes, with a motor-cycle, also joined in the group. Several personal friends of the host and hostess were

The Meet of the Lincolnshire Automobile Club at Crowland.

invited to meet the motorists, and close upon forty were entertained to tea. This over, Mrs. Husband, acting as guide, took the party on an exploration of the ancient town. The abbey, which was founded in 716, is still a beautiful building, and is highly interesting to the antiquary and architect. Part is in ruins, but one side is used as the parish church. The remarkable triangular bridge, if not the oldest in England, is certainly the most peculiar, and it is the object of much curiosity among the hundreds of motorists and other tourists who visit the place during the season. After viewing other points of interest the party returned to their homes. The evening kept fine, and, the roads being free from dust, the outing was immensely enjoyed.

WEST SURREY.

The annual hill-climbing competition of this club was held on Saturday last at Hind Head. The course was over the whole length of the hill, but the start was made somewhat further back than last year, giving a distance of 2 miles 1,500 yards with a rise of 520 feet. Messrs. Ponsford and R. W. Buttemer officiated at the start, and Messrs. Crothers and A. Buttemer took the times at the finish, the first car, Mr. Wilson Noble's 18-28-h.p. Mercedes being sent off at 4.20 p.m., and the remainder at two-minute intervals, with a short delay for some late arrivals. The following list shows the times and results:—

	Time. min. sec.	Handicap. min. sec.
Mr. W. Noble, 18-h.p. Mercedes	6 9	.. scratch
Mr. J. S. Fletcher, 20-h.p. Durkopp ..	9 42	.. 1 0
Mr. E. E. Pullman, 15-h.p. Durkopp ..	10 30	.. 1 30
Mr. O. Wrigley, 12-h.p. Clement	8 43	.. 2 0
Mr. A. C. Tessier, 10-h.p. Motobloc ..	10 32	.. 3 0
Mr. J. F. Ponsford, 9-h.p. Clement	9 38	.. 3 45
Miss Crothers, 9-h.p. Argyll	12 24	.. 4 30
Major Matson, 6-h.p. Benz	20 18	.. 7 30
Mr. G. C. Halahan, 20-h.p. Dennis ..	9 15	.. 1 0
Mr. R. W. Buttemer, 10-h.p. Decauville ..	13 46	.. 3 20

Mr. Ponsford was therefore the winner of the handicap, with Mr. Noble, who also won the badge offered by the club for the best time, second; and Mr. Wrigley third. Mr. Pullman was stopped on the hill through missing gear, and Mr. Buttemer by the breakage of his accelerator wire. The members subsequently adjourned to the Royal Huts Hotel for tea.

LEICESTERSHIRE.

On Saturday the Leicestershire Automobile Club had its fourth run of the present season, when among the members taking part in the trip to Rothwell, Northamptonshire, were Mr. E. G. Mawbey (the president) and Mrs. Mawbey, Mr. Maurice Mawbey, Mr. and Mrs. A. Mawbey, Mr. R. E. Parker, Mr. J. G. McAlpin, Mr. Harris, Mr. Pierpoint, Mr. Earp, Mr. and Mrs. Peberdy, Miss Peberdy, Miss G. Peberdy, Mr. and Mrs. Whitby. Mr. and Mrs. Waite, and Mr. A. McAlpin (hon. secretary). At the Red Lion Hotel the party took tea together, and subsequently returned home. Doubtless the fact that the Nottinghamshire Club were holding a hill-climbing competition on the same day prevented a larger attendance.

EASTERN COUNTIES.

The opening run of the second season of the Eastern Counties Automobile Club was originally intended to be to Felixstowe, but the fact that the Auto-Cycle Club had resolved upon a run from Barnet to Yarmouth on Saturday, passing, of course, through Suffolk, tempted the Committee of the E.C.A. Club to alter their plans in order to give their fellow motorists a welcome to Suffolk. It was arranged that the members of the Auto-Cycle Club should meet at Barnet, and start for Yarmouth at ten a.m., lunch at Newmarket, and from there proceed to Bury St. Edmunds, where the E.C.A. Club would meet them. Various circumstances militated against the realisation of this programme. The roads from London to Barnet were in such a shocking state that only ten members of the Auto-Cycle Club foregathered at Barnet, and so hindered were they by various happenings that they did not start on their journey north until 11.35. They were due to lunch at Newmarket shortly after one o'clock, but they did not reach there until three o'clock, and they had all had a good wetting en route. The condition of the roads between Newmarket and Bury, after the rain, was not such as to expedite matters, and the Eastern Counties Club members had given up all hope of meeting their southern friends, and had commenced the return journey when five of the ten who had set out from Newmarket were encountered on their way to the Angel, at Bury. The members of the E.C.A. Club who undertook the trip to Bury were fewer in number than they would have been had the weather been more propitious. They included Mr. H. J. Wood, on a 12-h.p. Peugeot; Messrs. O. T. and W. M. Cooke, of Polstead Hall, on a 8-h.p. Darracq; Mr. Forbes Gower, on a 12-h.p. Darracq; Mr. Botwood, on a 16-h.p. Argyll; Mr. and Mrs. Hossack, on an 8-h.p. M.M.C.; Mr. C. K. Moseley (the hon. secretary), on a 6-h.p. De Dion; Dr. Longworth, on a 3-h.p. Rex motor-bicycle; Mr. J. R. Egerton, on a 2¾-h.p. Bat; Mr. Leofric Hunter, and some others. The motor-cyclists journeyed from Bury through Diss and Scole to Yarmouth, which was to have been reached about seven o'clock. The headquarters at Yarmouth were the Queen's Hotel, where Mr. Nightingale had made every arrangement for the reception of the visitors, but it was some time after eight o'clock before the first cyclist arrived; and at a later hour a few more arrived, making nine in all. A nasty drizzling rain fell again on Sunday morning about 11.30, when the return journey was commenced, the route home being via Ipswich, Colchester, Chelmsford, Dunmow, Bishop Stortford and Ware.

NOTTINGHAM.

The hill-climbing competition held on Saturday, under the auspices of the Nottingham A.C., was in every way a notable event. The course was a mile in length, and was on the road from Melton Mowbray to Nottingham, about fourteen miles from Nottingham, and known as Ab Kettleby. It starts 1 in 21, then increases to 1 in 11, with a short stretch of 1 in 7. There are two slight bends, and on Saturday there were places that were rather greasy, owing to the rain in the early morning and the mist. The arrangements were excellent, both as regards the actual contest and for the convenience of the public. There were few spectators other than members and friends of the club, and no inconvenience was caused.

In the open section the fastest times alone counted, whereas in the other events the weight, power, and other things were taken into account. The times were:—S. F. Edge, 80-h.p. Napier, 1 min. 35 sec.; Lieut.-Colonel Mark Mayhew, 80-h.p. Napier, 1 min. 37 4-5 sec.; Clifford Earp, 55-h.p. Napier, 1 min. 40 1-5 sec.; W. D. Wells, 28-h.p. Daimler, 2 min. 5sec.; and F. Pearson, Nottingham, M.M.C., 2 min. 45 sec.

In the club event the results will not be known till the "most meritorious performance" is ascertained. The times, however, are as follows:—

W. D. Wells, 22-h.p. Daimler, 2 min. 15 4-5 sec.
A. R. Atkey, 12-h.p. Georges Richard, 5 min., 9 3-5 sec.
C. Hardy, 16-h.p. Georges Richard, 3 min. 4 sec.
J. Burton, 24-h.p. Darracq, 4 min. 17 3-5 sec.
R. R. Latham, 12-h.p Progress, 5 min. 3 4-5 sec.
S. Harvey, 4½-h.p. Renault, 9 min. 25 4-5 sec.
G. H. Kirk, 12-h.p. Georges Richard, 5 min. 0 3-5 sec.
Dr. Gass, 10-h.p. Georges Richard, 4 min. 40 sec.
H. Belcher, 25-h.p. Humber, 3 min. 36 4-5 sec.
H. H. Bowden, jun., 24-h.p. Darracq, 4 min. 24 2-5 sec.
F. Bowden, sen., 12-h.p. Darracq, 4 min. 59 sec.
J. T. Overton, London, 24-h.p. Georges Richard, 3 min. 24 3-5 sec.
J. T. Overton, 16-h.p. (two-seated) Georges Richard, 3 min. 35 2-5 secs.
A. M. Wright, Lincoln 8-h.p., De Dion, 4 min. 11 1-5 sec.
P. Huskinson, 6½-h.p. Wolseley, 5 min. 10 sec.
R. Harbidge, 12-h.p. Gladiator, 4 min. 54 sec.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Enfield.....	Beyond legal limit	25s., etc.
Kingston..... ..	Driving dangerously	£5.*
North London ...	Insufficient lighting of number plates.	5s., etc.
Westminster	Driving dangerously	£15.*
Exeter.....	Beyond legal limit	£5.*
St. Neots	Beyond legal limit	£5.
Hove	Allowing motor-car to remain in street.	10s., etc.
Brighton.....	Reckless driving	40s.

Dambridge	No number on motor-tricycle	2s. 6d.
Oxford.....	Dangerous driving	10s. etc.
Corwen	Furious driving	£5 etc.

* Licence endorsed in addition to fine.

MOTOR CAR v. TRAMCAR.

At the Liverpool Assizes, before Mr. Justice Jelf and a special jury, an action was brought by Mr. H. Jolliffe, of Rossett, against the Lancashire Light Railways Company, Limited, to recover damages for injuries done to a motor-car belonging to plaintiff, who said that the damage was due to the negligence of the defendants. Defendants denied negligence. Mr. Horridge said that the plaintiff and three friends, on the 9th of January, had been motoring to Warrington. Going back, when between Prescott and Liverpool the motor-car broke down and stuck in the road, so that a portion of it was across the tram lines belonging to the defendant company. Whilst in that position a tramcar was heard approaching from behind. The tram was well lighted, and threw a considerable light before it on to the road. Two of the members of the motor party ran for a distance along the road, shouting for the driver of the electric tramcar to stop, as there was a motor-car stuck in the road. The tram went on, however, and ran into the motor vehicle. The defence was that the motor was not lighted, but he, counsel, held that it was. There was a light behind and two lights at each side of the front of the car. After hearing evidence, and after counsel's speeches, the jury returned a verdict for plaintiff, and awarded him £145 damages. Judgment was given accordingly.

THE
Motor-Car Journal

VOL. VI.] LONDON, SATURDAY, JUNE 11, 1904. [No. 275.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE King and Queen have been frequently seen when motoring lately, and have used their automobile not only for purely pleasure trips, but also when fulfilling social engagements. The other evening their Majesties drove in their canopied motor-car from Buckingham Palace to Coombe Court, Coombe Warren, and dined with Earl and Countess De Grey. They ascended Kingston Hill just as a large number of motorists and cyclists were returning to London, but passed without being recognised. Both the King and Queen wore goggles, Her Majesty being attired in a fawn dust cloak and hat to match. The fact that Royal recognition is thus being given to the automobile is most gratifying to the industry, and the prospect of seeing the automobile in a State procession is really not very far off.

◆ ◆ ◆

The Gordon Bennett Race.

ON Friday next the great race will be decided and there will be a huge gathering of motorists in Germany from all parts of the world. During the few days preceding as well as those following the race a series of automobile events have been arranged which will prove of considerable interest, and of which fully descriptive and illustrated accounts will appear in the *Journal*. During the Eliminating Trials in the Isle of Man we were able to give the results of the hill-climbing competitions following the eight hours' trial in the same issue as the description of the race itself—outdistancing other automobile journals in the effort. A similar use of the telegraph will be made next week to enable us to chronicle the latest doings and give completeness to our special reports. As usual, photographic and other illustrations will add interest to the letterpress.

◆ ◆ ◆

The Glasgow-London Run.

ELSEWHERE we give the results of the Glasgow-London Reliability Trial for touring cars, a full report of which has previously appeared in the *Journal*. Gold medals have been gained by the 6-h.p. Light Wolseley, the 10-h.p. Argyll and the 20-h.p. Thornycroft cars, while the full marks—1,000—were also gained by the 12-h.p. Eagle light car, the 12-h.p. Arrol-Johnston, 12-h.p. Sunbeam and the 18-h.p. James and Browne. The loss of one mark for a driving stop by the 14-h.p. Renault robbed that vehicle of the credit of a non-stop run for a car that kept most uniform time throughout the trial. It will be seen from the table on another page that most of the vehicles secured more than 950 out of a possible 1,000, while punctures were responsible for losses on seven of the twenty-seven cars that completed the run.

◆ ◆ ◆

Sergeant Jarrett in a New Role.

SERGEANT JARRETT has so often been denounced and ridiculed in the automobile press, that when he appears in a new role it is right he should be publicly thanked. At Kingston a motorist was hauled before the Bench for driving his car at a speed which was declared by the police to be dangerous to the public. Among the witnesses for the defence was Sergeant Jarrett, the most famous of the motor-catchers in the south. He said he had been subpœnaed by the defendant, whom he knew from having seen him constantly on the road for two years. From his observation he had never seen anything to even justify a complaint. His attention had been more particularly drawn to the defendant, as he noticed he never wore goggles. Despite such evidence, the Bench considered the danger proved, and fined the defendant £3. We would congratulate Sergeant Jarrett on his courageous expression of opinion in the witness-box.

◆ ◆ ◆

In Ireland.

A FEW weeks ago we announced the formation of the Sligo Motor Service Company, Limited, to facilitate transit in a part of the country that has hitherto been neglected from the point of view of locomotion. The new concern has just put on the road a Stirling 'bus which is intended to run between Sligo and Rosses Point. This should go a long way towards making the picturesque and increasingly popular Point more popular still, not only with Sligo people generally, but with tourists and others visiting the locality. The committee of the company had a trial run in the early part of last week to Rosses Point and Collooney, and this proved very satisfactory. The service between Sligo and Rosses Point has already been started, and five or six runs will be made daily during the season.

◆ ◆ ◆

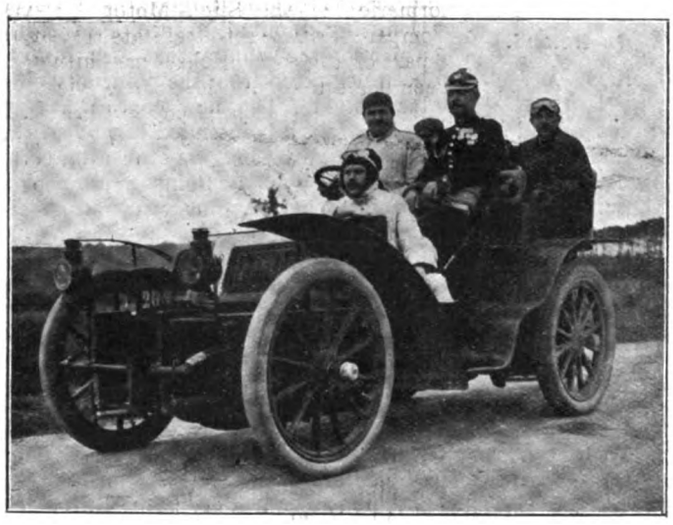
Motor-Cars in Parliament.

WHEN the House of Commons went into Committee of Supply the other evening, Sir Edward Strachy made a complaint against the Local Government Board for relying upon Section I. of the Motor Car Act, rather than sanctioning a series of restricted regulations for different localities. Mr. Cathcart Wason amused the House, and did harm to no one, by a graphic description of how he was very nearly run over by a motor-car within a quarter of a mile of the Houses of Parliament. He did not consider himself nervous, but, because of the speed with which automobiles can move about, he was in fear of his life whenever he went out for a ride. Replying to the discussion Mr. Long rightly justified the action of the Local Government Board in declining to accede to local applications to the ten-mile limit without very great care being exercised. He felt sure that the Act was working successfully, and had substantially reduced the number of reckless drivers. One gratifying feature of his speech was the confession that the police were abandoning the method of setting traps, and of this there can be no doubt, in view of the evidence in most of the cases lately heard at the police-courts.

◆ ◆ ◆

Ladies and Motoring.

MUCH interest has been evinced in Society circles in the first motor meet of the Ladies' Automobile Club, of which we shall give a full report in our next issue. This was announced for Thursday, the 9th, in the open space of Carlton House Terrace, opposite Waterloo Place, S.W. Some fifty petrol, steam and electric cars were expected to start from the Terrace



Digitized by Google

for Hyde Park, *via* Pall Mall, Birdcage Walk, and Constitution Hill. After making a circuit of the Park, the cars were to proceed to Ranelagh, where tea was to be partaken of. The President of the Club, the Duchess of Sutherland, was to head the procession on her 24-h.p. Mercedes, among the members entering for the meet being Mrs. Ainslie, 16-h.p. Pritchett; Lady Brassey, electric brougham; Mrs. Buttemer, 10-h.p. Decauville; Lady Colville, 6½-h.p. De Dion; Mrs. Edmunds, 10-h.p. Panhard; Mrs. E. M. Edmunds, 9-h.p. De Dion; Hon. Mrs. Tatton Egerton, 50-h.p. Panhard; Mrs. Grant, 12-h.p. Lanchester; Mrs. Hall, 30-h.p. Wolseley; Mrs. Hartung, 9-h.p. James and Browne; Mrs. Ashton Jonson, 5-h.p. Locomobile; Countess of Kinnoull, 14-h.p. Chenard and Walcker; Mrs. Gerard Leigh, 15-h.p. C.G.V.; Countess of Londesborough, 40-h.p. Panhard; Mrs. Arthur Paget, Electromobile; Hon. Mary Portman, 16-h.p. Clement; Lady Beatrice Rawson, 10-h.p. Peugeot; Mrs. Chas. E. Shaw, 24-h.p. Star; Lady Viola Talbot, 12-h.p. Clement-Talbot; Mrs. Wightwick, 10-h.p. Dennis; and Miss Woodhull, 20-h.p. Mercedes.

◆ ◆ ◆

At Oxford.

MANY undergraduates at both the great universities are becoming keen motorists, and the Vice-Chancellor's court at Oxford has been the scene of a motor-car case. Mr. Claude Gouldesbrough was summoned at the Vice-Chancellor's court on a charge of driving a motor-car on the Banbury

Thery on the Gordon Bennett Course, with a German Policeman as Pilot.

road at a speed and in a manner dangerous to the public. The proceedings were taken nominally by the police under Section 1, Sub-Section 1, of the Motor Car Act, the information having been laid by Mr. J. U. Powell, M.A., a member of St. John's College. The Vice-Chancellor (the Provost of Oriel) presided, supported by the Provost of Queen's, the Senior Proctor, and the Junior Proctor. Mr. Gouldesbrough, who pleaded not guilty, was represented by Mr. Andrew Walsh. The Chief Constable notified that the police were only the nominal prosecutors and intended to offer no evidence. After a long hearing the Vice-Chancellor said in the opinion of the Bench there had been some degree of negligence on the part of Mr. Gouldesbrough. They could not say he drove at an excessive speed, but they were bound to impose a fine of £2 and 9s. costs. His licence would also be endorsed.

◆ ◆ ◆

A Mishap—not to a Motor-car.

LEICESTER has now its electric tramways, and we would congratulate Mr. E. George Mawbey, the borough surveyor and engineer, upon their successful inauguration. He is president of the Leicestershire Automobile Club, and one of the most enthusiastic motorists in the county. At the time of writing he is staying within doors as the result of his indiscretion in trusting himself to a horse-drawn vehicle. On Monday, with the chairman and vice-chairman of the Tramways Committee, Mr. Mawbey was making an inspection of various new routes. Their horse shied—apparently at nothing—and, running away, knocked down a lamp-post, overturned the carriage, and generally proved the want of equine education. All the occupants of the vehicle were badly shaken, Mr. Mawbey being the most seriously damaged. Some may suggest this was a punishment for a seeming inconsistency in a motorist, but all will be glad to know that the president of the Leicestershire Automobile Club will soon be about again. Probably the Corporation will now recognise the value of the automobile in municipal service.

◆ ◆ ◆

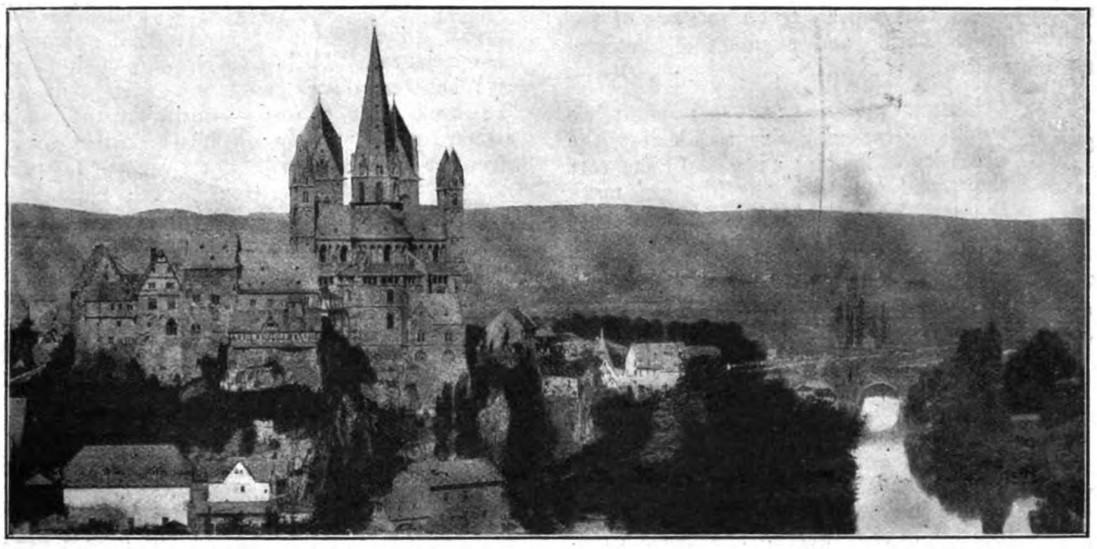
Mona's Thanks.

AT the last meeting of the Tynwald Court at Douglas, Lord Raglan, the Governor, congratulated the Court, the officials, and the inhabitants generally of the Isle of Man on the success of the recent motor-car trials. He apportioned praise as follows:—Firstly the Highway Board, and secondly the Chief Constable; and, in addition to him, those Captains of Parishes who gave assistance in selecting fit and proper men to act as "specials." He mentioned a member of the Court, Mr. Hutchinson, who, at some considerable trouble to himself, spent many days going round administering the oath to the special constables. Lord Raglan also congratulated the police and the special constables for the remarkably good manner in which they kept the course. They could congratulate themselves that it had been done entirely by Manxmen, and that no outside assistance had been required.

◆ ◆ ◆

The Motor-Car in India.

THE automobile is rapidly coming into favour for general adoption in India, and several leading firms in Bombay are already doing good business in motor-cars. Mr. Arthur Hoare, of Messrs. Turner, Hoare and Co., and one of the directors of the Bombay Motor-Car Co., is of opinion that the real introduction of the motor-car into India began with the Delhi Durbar. On the occasion of that ceremonial the Motor-Car Co. exhibited a large number of cars close to the Viceregal camp. For the most part the cars imported by them have been of French manufacture, and in their showrooms are to be found cars made by firms like Peugeot, Renault and De Dion. One of the first difficulties, says Mr. Hoare, which motor-cars in India encounter was the heating of the engines. This was noticed by such well-known motorists as Lord Wolverton and Mr. Henry James, who went out for the Durbar, and whose cars ran successfully through the Punjab during the cold weather of 1902–3. The Motor Car Co. now import all their cars with extra large water tanks, and the result has been shown to be very satisfactory indeed. For the cold weather of 1904 the company are making elaborate preparations. They have found that the demand in India is chiefly for small cars carrying from two to four people, and they are importing a large number of these types.



◆ ◆ ◆

Another Ascent of Snowdon.

THE recent achievement of Mr. Harvey du Cros, Jun., in ascending Snowdon on a motor-car, has just been emulated by Mr. W. M. Letts, on a 5-h.p. Oldsmobile. Mr. Letts did the journey in fifty-seven minutes, as compared with the three and three-quarter hours of the other trip. Mr. Letts, after having been lifted over two of the crossing points, ignored all the others and rode easily through or over the most intricate. His car weighed only 800 lbs., and working at 800 revolutions per minute on its low gear, equivalent to six miles an hour on level roads, consumed about half a gallon of water and about as much petrol over the whole course, and had enough spirit left in the three-gallon tank at the end to carry the car, *via* Capel-Curig and Bettws-y-Coed, to Llandudno—a trip of

Digitized by Google

about forty miles. Starting at 6.57 in the morning, Mr. Letts took the first one in eight gradient with evident ease. He stopped two minutes at Hebron station points, half a minute at a second set of points, and when the special train following stopped two minutes at Ilfway Station for water he raced clear out of sight, pulling up at Bwlch-on-llyn for fifteen minutes. There he awaited the arrival of the train and was photographed. At five minutes to eight he stopped to let out some tepid water in the tanks, and then, after another four minutes' stop, he preceeded without further pause to the top, arriving at 8.24. Once the car, owing to an obstruction on the line, swerved to within three inches of the verge of the precipice, Mr. Letts fortunately steering clear at the last moment. He informs us that if the culverts were covered over beforehand he could drive the car straight to the top of Snowdon without a single stop.

A View of Limburg, showing the Cathedral.

Entrance to the Castle at Saalburg.

The Main Street of Konigstein.

THE 1904 GORDON BENNETT RACE.

Some Typical Indian Agencies.

One of the cars which has made itself very popular in Bombay, and also in Calcutta and Rangoon, is the Oldsmobile. Mr. K. N. Wadia, of the Bombay Cycle Agency, who has secured the agency of this machine, has had a large experience of motoring in that city, and he generally selects an Oldsmobile to take him about town or for a run into the country. Messrs. J. A. Kirkbride and Company are introducing very shortly the Alldays Traveller Voiturette. Mr. Kirkbride also imports the Quadrant motor-cycles. Another importer who has done a good deal to popularise motoring in Bombay is Mr. T. Zuberbuhler. This gentleman will shortly have at his disposal the "Minerva" car. A variety of other cars are now being introduced into Bombay. At the show rooms of the American, London and Eastern Trading Company are automobiles by Dechamps, Peugeot, and Pick, and the company also import the De Dion and the Milwaukee steam car, as well as the Mills and Fulford forecars. Mr. Thanawalla, of Kalbadevi, has a speciality which has attracted much notice—the Orient Buckboard, a little car which is composed of a small petrol motor engine hung on to the rear axle of a lightly built vehicle. A motor-car which will probably have a considerable vogue in India as time goes on—the Humber—is imported by the Bombay Cycle Agency.

The Motor Car Act.

Another point in connection with the Motor Car Act has just been demonstrated by the Rev. Arundell Whatton, who was summoned at Marlborough Street Police Court for driving a motor-car at Hyde Park Corner, on May 7th, without a registered number or mark. Mr. Whatton said he would admit the fact but dispute the guilt, as a section of the

Digitized by Google

Motor Car Act gave a reasonable time in which to register and obtain numbers. That had actually been done, and the car was out solely for the purpose of being tested. The numbers were being made, but were not quite finished to put on the car. If there were any blame, he thought it ought to attach to the company who made the car, though he had no desire to blame anyone, as the offence, if offence at all, was quite technical and of an accidental nature. Mr. Kennedy imposed a fine of 10s., with 2s. costs, remarking that the company did seem to blame, and perhaps ought to have been summoned. Mr. Whatton asked the magistrate not to endorse the licence, but was informed that that must be done. This is one of the bad features of the Act, and although the discretionary powers of the magistrates have not always been wisely used, this appears to be just one of the cases where the infliction of the fine and payment of the costs seems adequate punishment.

◆ ◆ ◆

The Record Must be kept.

WHILE referring to this point we would again emphasize to dealers the necessity of keeping a record of the cars they send out with the dealers' mark thereon. Neglect of this easy matter has led to several firms making expensive appearances in the law courts, and no successful defence has yet been found. Those who use traders' identification letters for ordinary touring, too, will have to be careful in view of the interpretations of the provisions of the Act made by the average magistrate.

◆ ◆ ◆

Municipal Enterprise.

LIVERPOOL has an enviable position among English municipalities, and in the matter of quickened locomotion in the streets has shown an enterprise worthy of so important a city. At the last meeting of the Liverpool Finance Committee, it was resolved to purchase a motor-car at a cost of £700 for the use of the surveyor of the water supply. When this is procured, all the heads of departments in Liverpool will have motor-cars, thus showing an example of economy in time that should be followed throughout the country.

◆ ◆ ◆

Corporations and Cars.

WE hear that the committee of the Yorkshire Automobile Club is arranging for a gymkhana to be held during the present month in conjunction with the Harrogate Corporation. This is gratifying, because it indicates the growing friendliness towards motorists on the part of the municipal authorities, which will find development in the toleration of the police to those who drive through that town. Southport and Bexhill have already shown equal consideration, and now that automobile clubs are beginning to work in association with corporations for the development of the movement as well as the attraction of visitors to popular resorts, we may expect to hear less of the petty prosecutions that have done so much to arouse ill-feeling. In fact, organisers of anything likely to attract the public seem disposed to take advantage of the value of the automobile in such connection, and on the last two Saturdays in June the Wolverhampton Club is taking part in the charity sports in that town. We shall be glad to hear of similar engagements elsewhere.

◆ ◆ ◆

The Latest from Germany.

ALTHOUGH we admitted last week there was a "possibility" of the withdrawal of Mr. Edge from his allotted place in the British team, we did not imagine that such was probable. In response to the letter from the Club he wrote declaring his intention of competing in Germany, and the fact that he has been daily over the Taunus course has dispelled any illusions that may have been in the minds of readers of the uninformed press. He has just telegraphed to the A.C.G.B.I. from Nijmegen, which is situated near the frontier dividing Holland from Germany, stating that the route through Holland *via* Rotterdam and Dordrecht to the German frontier is a troublesome one to follow—although he finds the roads good—as it necessitates crossing the river by ferry several times. He therefore advises all who are driving their cars through Holland to proceed from Rotterdam *via* Gonda, Utrecht, and Arnheim to Nijmegen.

◆ ◆ ◆

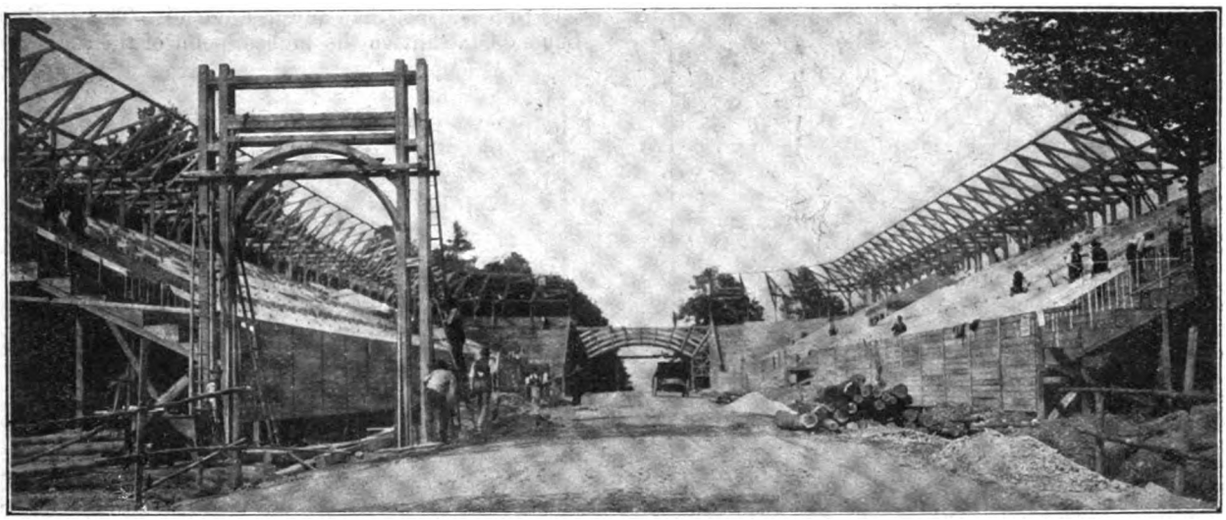
Customs Difficulties.

ALTHOUGH the Dutch authorities have distinctly stated that motor-cars introduced into the country for touring purposes may enter free of Customs duty, Mr. Edge had to make a deposit with the officials, and has experienced great difficulty in recovering the money. The part of his telegram dealing with this point reads as follows:—"Wherever duty paid, get wire sent to frontier station to have money ready; desirable to obtain transit passport when paying duty; officials will say unnecessary but frontier officials will not repay duty without it." Mr. J. W. Orde has written to the Dutch Customs authorities on the matter, and it is hoped that they will not demand a Customs deposit on any further cars which may be introduced into Holland *en route* for Germany; but it is advisable for motorists to be prepared to deposit a sum at the rate of 5 per cent. of the value of the car. They are also strongly advised to obtain a "transport permit" from the authorities, and to adopt Mr. Edge's suggestion as regards sending a telegram to the Customs officials on the frontier asking them to be prepared to refund the amount which has been deposited at the Customs House by which it is intended leaving Holland.

THE Hertfordshire Club will hold a hill-climbing competition on the 18th inst.

THE Frankfurter Reklame Gesellschaft, 58, Kaiserstrasse, Frankfort-am-Main, ask us to mention that they will be glad to afford any information to visitors from England, at the disposal of whom will also be a reading-room, where the *Motor-Car Journal* and other automobile papers can be seen.

FOR the convenience of British visitors going over to the Gordon Bennett Race, large depôts for Clipper Continental Tyres during the race week have been established at 76, Louisenstrasse, Homburg, and 4, Friedenstrasse, Frankfort-am-Main, where all sizes of these tyres, which are licensed in England, can be obtained at once from stock.



THE Begbie Manufacturing Company, Limited, inform us that their advertisement as to "Aster" engines being fitted to the Clement-Bayard cars was an error, those vehicles not being fitted with that particular engine. It is the Clement car, which, as we announced last week, is supplied by Mr. E. H. Lancaster, that is fitted with the Aster engine.

ON or about the 20th inst. one of the Seaham Harbour Engine Works' "Londonderry" steam wagons will leave Seaham Harbour for London carrying a five-ton load, only stopping to pick up water and relays of drivers *en route*. The course taken will be through Durham, Boroughbridge, Wetherby, Doncaster, Retford, Newark, Grantham, Stamford, Biggleswade, Hitchin, Hatfield, and Barnet to the Metropolitan Market. On arrival in London the vehicle will be garaged at one of the depots of the Provincial Carriers, Limited.

CALLING in at the extensive depot of Messrs. Friswell, Limited, the other day, we had an opportunity of inspecting what is claimed to be the most powerful motor-car ever constructed. The vehicle, which has just been purchased by Mr. Friswell, is of Italian construction, having been built by Messrs. Dobelli, of Rome. The car, which is of no less than 150-h.p., is fitted with a monster four-cylinder engine. One carburettor, of abnormal dimensions, supplies all four cylinders, the admission pipe being about 3 in. in diameter. Both magneto and high-tension ignition are provided. The transmission is on the usual lines of chain-driven vehicles, the gear-box giving five speeds forward in addition to the reverse.

The Gordon Bennett Race.

View of the Grand Stands at Saalburg.—the Starting Point.

NOW that we are within measurable distance of the great event of the year—the Gordon Bennett race, which is to take place on Friday next, the 17th inst.—interest in the international contest is becoming more and more intense. As all motorists are aware, the race is, this year, being held in Germany, the course decided upon being in what is known as the Taunus district. The largest and nearest town to the starting point, Saalburg, near Homburg, is Frankfort-am Main, which has a population of about 315,000 inhabitants, and is only about 20 minutes' rail from Homburg.

Itinerary of the Course.

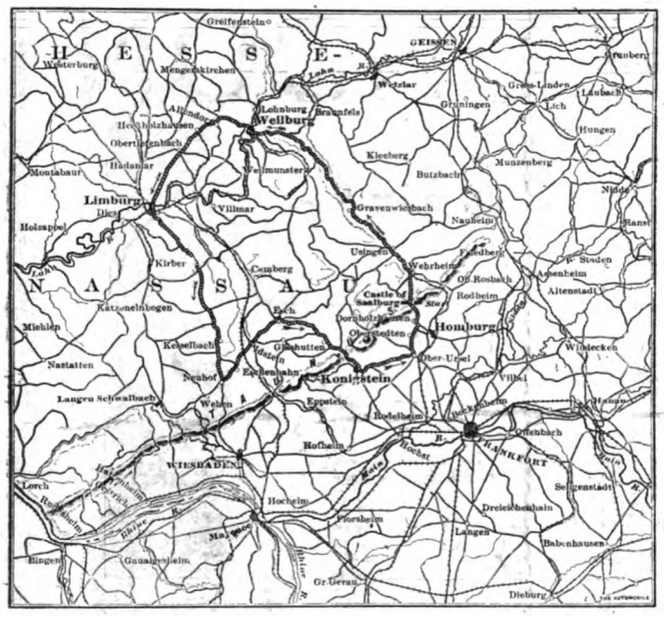
	Intermediate Distance.	Total Distance.	Altitude.
Saalburg	—	—	418 m.
Wehrheim	3 k. 700	3 k. 700	313 m.
Usingen (n)	4 k. 600	8 k. 300	288 m.
Gravenwiesbach...	8 k. 900	17 k. 200	288 m.
Einhaus	9 k. 200	26 k. 400	282 m.
Graneiten	4 k. 100	30 k. 500	330 m.
Weilburg (n)	7 k. 300	37 k. 800	150 m.
Allendorf	6 k. 800	44 k. 600	290 m.
Hechkolzhausen	3 k. 700	48 k. 300	210 m.
Obertiefenbach	4 k. 700	52 k. 300	223 m.
Limburg (n)	9 k. 700	61 k. 300	110 m.
Zollhaus	5 k. 800	67 k. 100	250 m.
Kirberg	5 k. 700	72 k. 800	200 m.
Hühnerkirche	8 k. 800	80 k. 800	380 m.
Zugmantel	6 k. 400	87 k. 200	465 m.
Neuhof	2 k. 600	89 k. 800	382 m.
Eschenhahn	3 k. 600	93 k. 400	410 m.
Idstein (n)...	4 k. 500	97 k. 900	265 m.
Esch (n)	7 k. 900	105 k. 800	370 m.
Glashütten	7 k. 500	113 k. 300	515 m.
Glashütten Hill	1 k. 300	114 k. 600	565 m.
Konigstein (n)	5 k. 200	119 k. 800	365 m.
Oberursel (n)	10 k. 200	130 k. 700	200 m.
Homburg (n)	4 k. 700	134 k. 700	183 m.
Dornholzhausen	2 k. 800	137 k. 600	220 m.
Saalburg	3 k. 500	141 k. 100	418 m.

n = neutralisation. 1 kilometre = ⅝ mile. 1 metre = 3·28 ft.

Neutralisations.

It has now been decided to neutralise Esch, so that there will be no less than eight "neutralisations," viz., Usingen, Weilburg, Limburg, Idstein, Esch, Konigstein, Oberursel, and Homburg. Between the starting point and the first control is a distance of only 8 kilometres, between Idstein and Esch 5 1-5 kilometres, between Konigstein and Oberursel 9 1-10 kilometres, and between Oberursel and Homburg 5 kilometres. The longest stretch is between Limburg and Idstein—37 3-10 kilometres, equal to about twenty-three miles.

The Course Described.



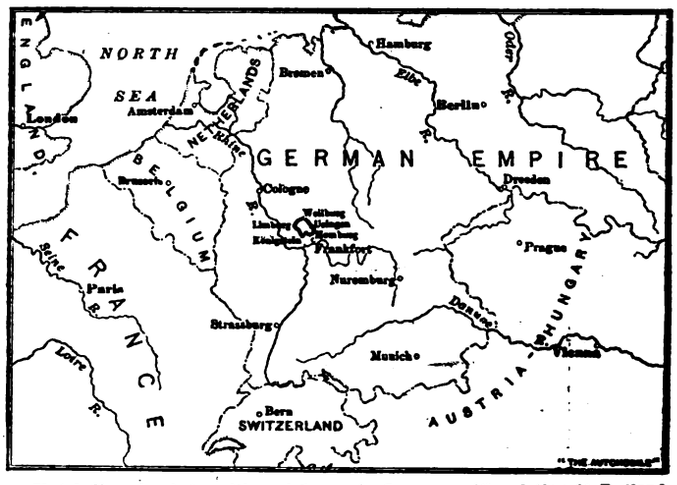
The course, which is roughly about eighty-eight miles in length, and has to be covered four times, extends over some of the most magnificent scenery in Germany, through well-wooded valleys, and across forests, and past quaint old-world villages, whose appearance is redolent of the middle ages.

The map on page 320 marks some of the principal points in the circular route. The Saalburg, from which the race starts, is an old Roman fort, formerly a ruin, but now in process of restoration. The fort was, it is said, erected in the first century, and was one of the frontier strongholds along the border line between the Roman and German Empires. It is situated at the summit of an ascent terminating on the one side at Dornolzhausen and on the other at Wehrheim. From the Saalburg the course runs to the north-west, through some woods. The first thing that attracts attention beyond is a magnificent straight road for two miles ahead down a fine hill. At the end is a railway crossing, just before entering Wehrheim. The road then continues through the forest to Usingen, the first capital of the principality of Nassau-Usingen, now forming part of the province of Nassau. The town is approached by a long descent from Wehrheim, and is situated picturesquely amid wooded hills. The town is connected with Homburg by a branch line of the railway, the station being at some distance from the main street.

After leaving Usingen the road rises sharply for several miles, passing through the forest till Gravenwiesbach is reached. This is a village standing in a clearing in the forest. About a mile or so from Gravenwiesbach a steep descent, in which there are some nasty corners, is encountered. The road is comparatively level for about six miles after this, leading through the beautiful beech woods for which the locality is renowned. After a short but steep descent Weilburg is reached, the town, which is the capital of the Duchy of Nassau-Weilburg, being entered by an avenue of ancient beeches, so planted that six cars could be driven abreast along the thoroughfare. After Weilburg

Digitized by Google

there is one of the dangerous descents of the race, in a steep hill, down which cyclists are forbidden to ride. The route winds southwards to Limburg, and the hill climb of the course is entered on by way of Allendorf, Heckholzhausen, and Obertiefenbach. From the latter place the road now falls sharply for some five miles, two of the hills being dangerous, especially that



Map of the Course.

descending into Limburg, an ancient episcopal town, situated on a rock overlooking the Lahn. About nine miles before the old and picturesque cathedral town is reached a sharp curve in the road has to be negotiated.

The Cathedral of Limburg is one of the oldest in Germany, dating from the beginning of the tenth century, and built in the reign of the Emperor Conrad I., 911-919, and rebuilt in the Gothic style about the beginning of the thirteenth century. The edifice shows traces of the transition from the Romanic to the Gothic style of architecture, and is of especial interest both from the historical and artistic point of view.

The bridge by which the Lahn in crossed dates back to the Middle Ages, and contains an effigy of Saint Nepomuk, the patron saint of all bridges.

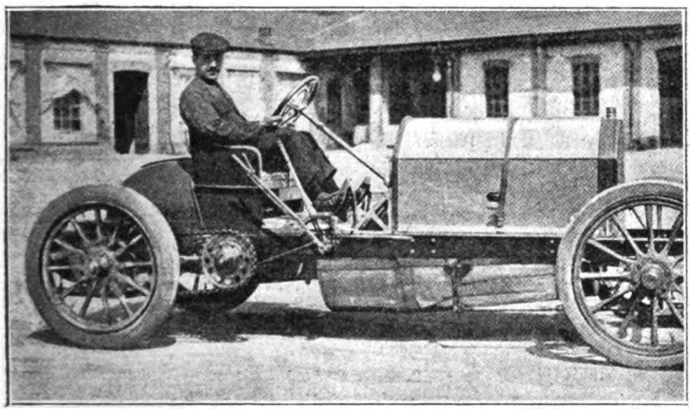
After passing out of Limburg over the old bridge there is a clear run on splendid roads to the village of Kirberg, leaving which there is a hill—the longest and most trying on the course—nearly eight miles in length, to be mounted. This hill is called "The Hühnerkirche." The road now goes to Neuhof, thence northward to Idstein. The town contains a well-preserved castle and an interesting old church with mural paintings. The main line from Frankfort to Limburg passes through here. Some distance from Idstein, after passing Esch, there is a hill said to be steeper than any in England. The gradient is 1 in 5. Beyond Glashütten the highest point of the course is reached—

Sketch Map showing position of Course in Germany with relation to England and Neighbouring Countries.

1,820 feet, and thence the road winds down to Königstein, the southernmost part of the run, which is famed for having the most beautiful ruins in the Taunus district. The old castle towers above the houses huddled together at the foot of the hill, and its name is associated with old stories of warfare and pillage. There is a finely wooded way right on to Oberursel, which is passed on the right. Thence to Saalburg the route is by way of Oberstedten, Homburg and Dornholzhausen.

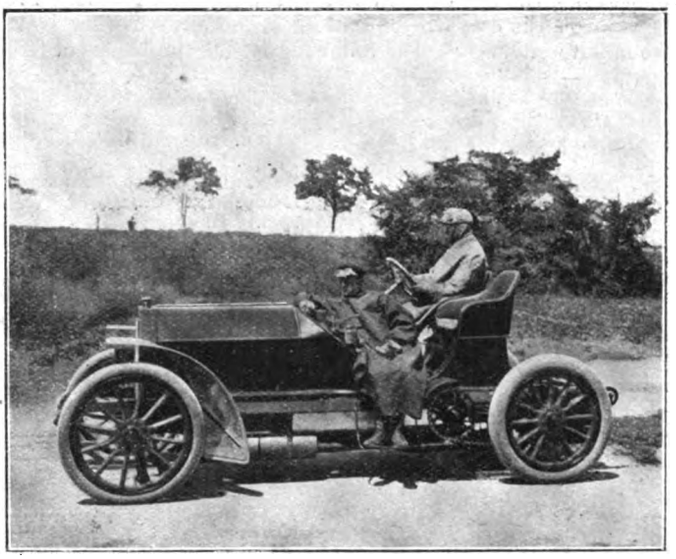
From Homburg a new track has been laid down for some distance, especially for the race, and just before the end of the course there is another steep hill—1 in 6—leading to the finishing point at Saalburg. Over 70 miles of the course are being sprinkled with Westrumite in order to lay the dust as much as

A view of the Course between Obertiefenbach and Limburg.



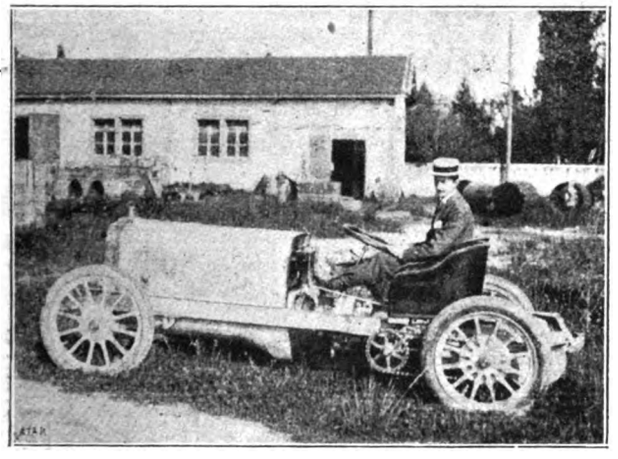
Digitized by Google

possible, while the most complete arrangements are being made to keep the course clear.

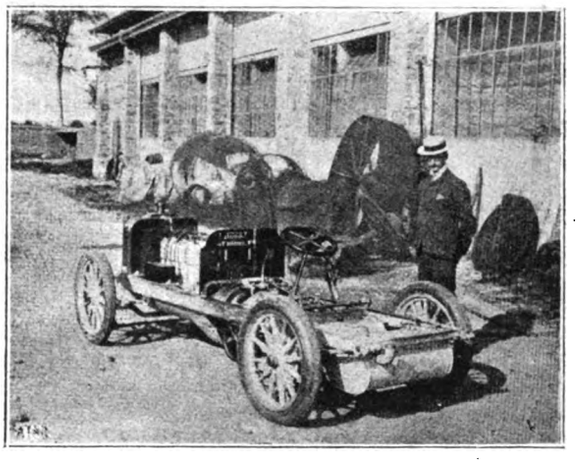


The Competitors.

Germany, as holder of the Cup, received challenges from no less than seven other countries, viz., England, Austria, Italy, France, Belgium, Switzerland, and the United States. Of these the last-named is the only one which has declared forfeit, and is unrepresented. Switzerland is only sending one car, as against three from each of the other nations, so that altogether there will be nineteen vehicles competing, the "field" for the 1904 race being thus much larger than in any of the preceding Cup contests. As for the cars themselves, the majority have already been illustrated and described in the *Journal*, so that it is only necessary now to deal with those of which information has only just been made public. Among the accompanying illustrations will be found reproductions of the Swiss, Austrian, Italian, and Belgian cars. The car which will represent Switzerland in the Cup race has been built by Messrs. Picard, Pictet and Company, of Charmilles, for and to the designs of Messrs. Dufaux Freres, of Geneva. It possesses an eight-cylinder motor, giving 90-h.p. on the brake at a speed of 1,200 revolutions per min. The cylinders are cast in pairs, the bore is 125 mm., and the stroke 130 mm. There are two systems of ignition, magneto and accumulators. M.O.V. valves are used, while, in addition to the usual differential and rear wheel brakes, the hubs of the front wheels are provided with brakes. Three speeds and a reverse are available. The tyres were made by the Michelin Company in a small factory established for the purpose in Switzerland. The car will be driven by M. F. Dufaux. The Fiat (Italian) vehicles have four-cylinder engines, rated at 75-h.p., with mechanically-operated inlet valves and magneto ignition. The vehicles, as also their drivers—Messrs. Lancia, Cagno and Storero—left Turin for Homburg by rail on Friday of last week. The Pipe (Belgian) cars have four vertical cylinders, developing about 75-h.p., with mechanical inlet valves and accumulator ignition. The clutch is of the Jenatzy magneto type, as used for some time past on the Pipe cars. Four speeds forward and a reverse are controlled by one lever. Continental tyres are fitted to the road wheels. There are two brakes on the differential shaft, while the rear brakes are of the expanding type. The vehicles will be driven respectively by Baron P. de Crawhez, one of the leading automobile sportsmen in Belgium, M. Augieres, who has hitherto driven Mors cars in such classic events as Paris-Vienna, Paris-Madrid, Gaillon, and who held the world's kilometre record for a period of eight months, and M. Lucien Hautvast, an old cycle racer, and who has also taken part in the Paris-Madrid, the Circuit des Ardennes, the Ostend week and other important mee ings. It may be added that, with the exception of the Napier and the Opel-Darracq, all the cars are of the chain-driven variety. The following are the colours of the cars representing the different countries, and their order of starting :—



Country.	Colour of Cars.	Order of Starting.			Drivers.
Germany	White	1	8	14	Jenatzy, Baron De Caters, Opel.
England	Green	2	9	15	Edge, Girling, Jarrott.



M. Cagno on the 75-h.p. F.I.A.T. (Italy).

Mr. W. Warden on the 90-h.p. Austrian Mercedes.

Two Views of the 90-h.p. Dufaux (Swiss Car) and its driver, M. F. Dufaux.

Digitized by Google

Country.	Colour of Cars.	Order of Starting.	Drivers.
Austria	Black and Yellow	3 10 16	Warden, Braun, Werner.
Italy	Black	4 11 17	Storero, Cagno, Lancia.
France	Blue	5 12 18	Thery, Salleron, Rougier.
Belgium	Yellow	6 13 19	Baron de Crawhez, Augieres, Haut-vast.
Switzerland	Red and Yellow	7 — —	Dufaux.

Of the nineteen drivers, only four—Jenatzy, Edge, Jarrott, and De Caters—have driven in the Cup contest before.

◆ ◆ ◆

The Order of Starting.

The course will be closed at 4 o'clock on the morning of the race. The cars will be started at five minutes' intervals, the first being despatched at 7 a.m., so that, as there are nineteen competitors, the last car will not get away until 8.30. From the controls the cars will be sent off in the order of arrival at two-minute intervals. The following is the probable order of starting :—

1.	Jenatzy	90-h.p. Mercedes
2.	Edge	80-h.p. Napier
3.	Warden	90-h.p. Austrian Mercedes
4.	Cagno	75-h.p. Fiat
5.	Thery	80-h.p. G. Richard-Brasier
6.	De Crawhez	75-h.p. Pipe
7.	Dufaux	90-h.p. Dufaux
8.	De Caters	90-h.p. Mercedes
9.	Girling	72-h.p. Wolseley

◆ ◆ ◆

The Programme of the Gordon Bennett Week.

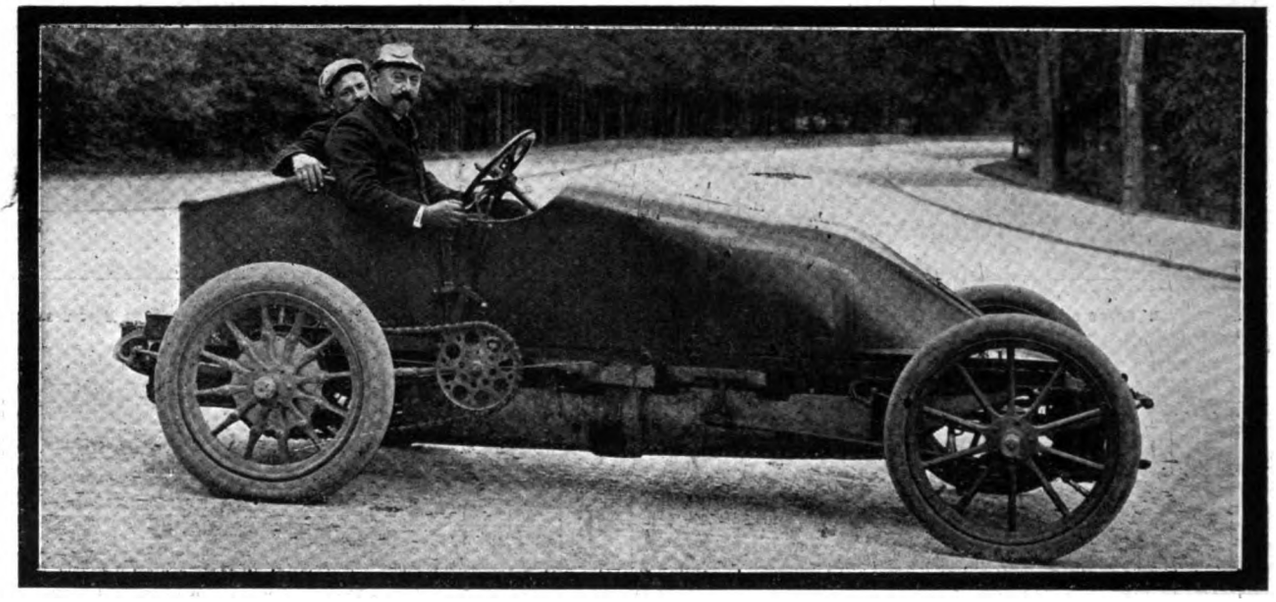
The following is the programme for the Gordon Bennett week :—

Thursday, June 16th.—Weighing of racing cars. Evening reception at Kurhaus in Homburg.
Friday, June 17th.—Gordon Bennett race.
Saturday, June 18th.—Touring excursion on the Gordon Bennett course. Evening dinner at the Kurhaus in Homburg.
Sunday, June 19th.—Races at Frankfort-on-Maine.
Monday, June 20th.—International Congress.
Tuesday, June 21st.—Competition for appearance in the Kurpark. Flower Corso.

There has also been issued a programme of festivities at the Kurhaus in Homburg, in connection with the Gordon Bennett meeting, from June 12th to 23rd. It includes concerts, theatrical performances, firework displays, and other fêtes.

◆ ◆ ◆

The Banquet in Homburg.



The German Automobile Club will give a banquet at the Kurhaus, Homburg, at 8 p.m. on June 18th. The club intends to invite the presidents and vice-presidents of the leading clubs as well as those members who have rendered conspicuous service to automobilism. Other members of automobile clubs are at liberty to attend at the dinner upon payment of thirty marks.

◆ ◆ ◆

Track Racing at Frankfort.

A large list of entries has been received for the track races at Frankfort-on-Main on the 19th inst. In addition to Germany, France, England and even Russia will be represented among the competitors.

◆ ◆ ◆

M. L. Hautvast on his 75-h.p. Pipe, one of the three Belgian Cars.

Keep Clear of Baden.

Those motorists who contemplate making the journey by road to the Cup course will be wise to steer clear of the Duchy of Baden, and especially the towns of Constance, Waldshut, Freiburg, Offenburg, Karlsruhe, and Mosbach, the police having received orders to keep an unusually vigilant eye on excessive speed.

◆ ◆ ◆

Free Garage in Frankfort.

The Mitteldeutsche Gummiwaarenfabrik (Louis Peter), the makers of the well-known Peter tyre, write us that they are placing at the disposal of visitors, without charge, a large garage capable of accommodating close upon 200 cars. The building, which will be open day and night, is situated close to their works in the Mainzerlandstrasse, Frankfort-am-Main. Arrangements have been made to supply petrol (known in Germany as "benzin"), lubricating oil, etc., and also to carry out any necessary repairs at moderate prices.

◆ ◆ ◆

THE Wolseley Company used Van Raden's coils and accumulators on their cars in the eliminating contest in the Isle of Man. They went through without a hitch and will be used in the great race of Friday next.

Digitized by Google

ARE MOTOR-BICYCLES DESIRABLE FOR CLERGYMEN?

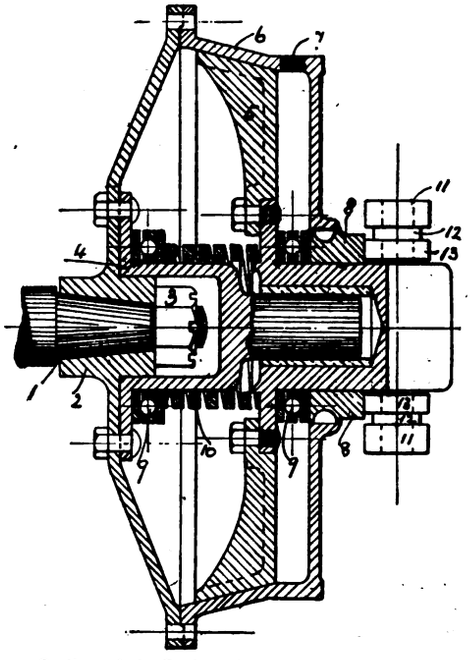
By the Rev. R. W. Taylor.

In considering the usefulness of the motor-bicycle from the viewpoint of a clergyman, the first and most important thing is its practicability as a means of conveyance. The writer is one who willingly, from a large experience, speaks commendatory words of the safety-bicycle as an aid to the pastor. With this he was able to do much more than would have been possible with the horse.

During the last two years a motor-bicycle has been doing service, and the writer is frank so say that with it he can cover a much larger district, reach more people, and do it quicker and easier than is possible with the bicycle. In a country with average good roads it is very useful. It is surprising how quickly one can ride out six or eight miles, make an average stop, and return. I find that about three calls can be made with the motor-cycle to one in the ordinary way. This means that with the motor-bicycle a much larger flock can be shepherded, and that more effectually, than would otherwise be possible.

Next to practicability are its possibilities as a means of recreation, which is necessary. The old saying, "All work and no play makes Jack a dull boy," is just as applicable to those in this profession as any other. In this respect the motor-bicycle serves admirably. A motor-cycle ride is a panacea for a "logy" mind or one overburdened with care. It will dissipate worry. A spin on a fine summer day over a good road will come as near rejuvenating a man as anything, and he will return to his study entirely relieved of that sluggishness which made study well nigh an impossibility, and with a mind clear and keen he will take up that dull theme with which he had been struggling to no purpose but an hour or so previous and find it as delightful and fresh as was the breeze which fanned his cheeks while the wheel, of its own power, bore him swiftly along. He can go as fast as he wishes and experience none of the ill effects so liable to follow scorching with the safety. In short, a spin on the motor-bicycle is just the thing for a hard-worked dominie.

Another use of the motor-cycle is that of touring. Vacations may be spent in this way with entire satisfaction. It will afford pleasure and rest; it will act as a tonic, increasing the appetite and building up the constitution. The increased speed afforded enables one to make journeys of considerable distance. You can visit friends, go to resorts, attend summer gatherings, even if you have to cross a county or two to do so. In case you are so unfortunate as to have no vacation, still, tours of considerable distance are possible—some hundred miles from your charge and return between Sabbaths. You will get inspiration from the ride for your next Sabbath's sermon. Some of your best pulpit efforts will be those prepared by the roadside, under the branches of a friendly tree, against which the faithful wheel leans.



In many ways the motor-bicycle is certainly useful for clergymen. It may occur to some that it is not, after all, desirable—that there are occasions when it would be entirely out of place to use one, as, for instance, the making of appointments on the Sabbath day. It sometimes happens that the pastor's right hand men are not over progressive, and so its use might be contrary to the sentiment of some very good people. Such sentiment against the motor-cycle, which certainly must be rare, can, however, be interpreted, and that justly, as against progress, and must eventually result to the advantage of the one against whom it is exercised.

Can gentlemen of the "cloth" use a motor-cycle and present a respectable toilet? The motor-cycle is pre-eminently an oil machine, it must be well supplied with oil for lubricating and motive power purposes; in fact, the rider is in proximity to a tank of petrol and lubricating oil, and this may seem an undesirable feature. However, the liability to soiling clothes lies with the rider, and may be reduced to a minimum, so that on this account it cannot be considered undesirable. Now the conclusion of the whole matter. Let those of this profession who are enthusiastic cyclists purchase a good make of motor-bicycle, become intimately acquainted with the machine, and use it for pastorate and pleasure. It will be found both desirable and useful.

THE DURHAM CHURCHILL FRICTION CLUTCH.

In a recent issue we mentioned that Messrs. Durham, Churchill and Company had brought out a metal to metal friction clutch specially designed for use with engines having no external flywheel. We are now able to give a sectional illustration of the new clutch, together with a brief description. Referring to the drawing, 1 represents the end of the crank shaft of the motor, on which is mounted the clutch drum, 2, which is fitted in the same manner as an ordinary flywheel and fixed by means of a castle nut, 3. The clutch centre piece, 4, which centres and supports the inner cone, 5, is made separate from the drum, 2, to facilitate the tightening of the nut, 3.

The outer cone, 6, forms the special feature of the clutch, in that instead of the outer cone ending about the face of the inner cone, it is continued forward and carried down, forming a box, into which oil can be poured by means of the filling hole, 7,

Section of the Durham Churchill Friction Clutch.

and so long as the level of the oil does not come above the lowest part of the sliding collar, 8, it will be oil tight. In addition to being oil tight the clutch is dust proof. The surfaces of the two cones are of metal. There is no end thrust upon either the clutch shaft or the motor when driving, two anti-friction bearings, 9, taking the thrust while the clutch is being operated. The clutch spring, 10, is of the ordinary type. It will be seen that the inner cone, 5, is bushed where it runs above the centre piece, 4, and it also forms at its outer end a dog or finger clutch to transmit power to the change-speed gear shaft.

The two arms of the fork are shown in plan at 11; pins, 12, are fixed in the arm of the fork, these carrying square blocks, 13. Should wear take place on the faces of these blocks adjustment can be made by giving them a quarter turn upon the pins, 12.

A sliding collar, 8, is provided to transmit the pressure from the blocks 13, in thrusting against the spring when operating the clutch. This collar further serves the purpose of filling the orifice in the outer cone.

Lady Blytheswood has ordered a C.G.V. car, with landau body, from the London Motor Garage Company.

CONTINENTAL NOTES.

The Ostend Automobile Week.

The programme of the Ostend automobile week, which is being organised by the Automobile Clubs of Antwerp and Flanders, has been issued. The meeting will commence on July 14th with a driving competition for decorated touring cars at the Wellington Hippodrome, followed by a flower fete on the Digue. On the 15th there will be a series of 5-kilometre speed trials for all classes of vehicles, from motor-cycles up to cars costing £1,200, on the road between Nieuport and Snaeskerke. On Saturday, the 16th July, on the same course, will be held the 10-kilometre speed tests for racers. Sunday will be an off-day, but on Monday, the 18th, there will be a run of touring cars from Ostend to Blankenberghe and back. Tuesday, the 19th, will be devoted entirely to motor-boat races, and Wednesday, the 20th, to a series of standing mile speed tests for racers and touring vehicles. The times for the standing mile will be added to those taken over the flying kilometre, in awarding the prizes. On Thursday, the 21st, kilometre speed tests on the Snaeskerke-Ostend road are to be held for all classes, while on Friday, July 22nd, the start will be made for a tour to Namur and Spa. Entries for the various events are to be sent to M. T. Ratinckx, 40, Grande Place, Antwerp, before the 25th inst.

◆ ◆ ◆

A Race Meeting at Padua.

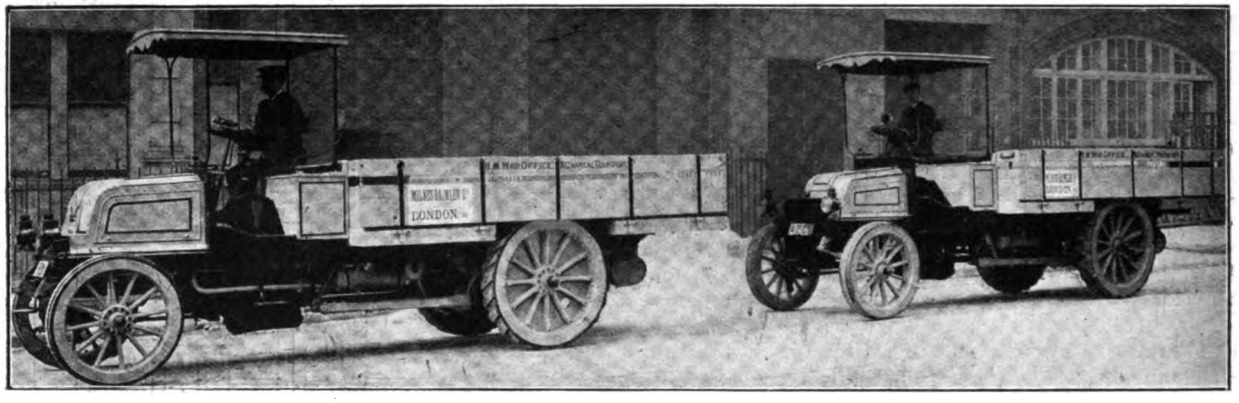
The Union Automobile Venitienne is organising an automobile race meeting to be held at Padua in the first fortnight of September. Among the events will be a ten kilometre race and a series of flying kilometre speed trials.

◆ ◆ ◆

A Motodrome at Versailles.

The Automobile Club de Seine et Oise is considering a scheme of establishing a large motor racing track at Versailles. The course would be 20 kilometres long, and from 20 to 25 metres wide. The road is a good macadam one, which it is proposed to treat with tar to lay the dust.

◆ ◆ ◆



A Swedish Reliability Trial.

The Swedish Automobile Club is organising a two-days' reliability trial of automobiles of all classes, including commercial vehicles. The start will take place in Stockholm on July 2.

◆ ◆ ◆

The Spa Week.

Still another programme which has just been issued is that of the Spa automobile week, to be held from July 26th to August 1. The first day will be devoted to the weighing in; and on the morning of July 27th there will be the Spa-Malchamps hill-climb, open to all classes of vehicles. The course is 5·137 kilometres long. The afternoon will be devoted to the mile hill-climb from a standing start for the Coupe de Spa, at present held by Barbaroux (Benz-Parsifal). On the 28th will be held a motor-cycle speed competition between Spa, La Sauvenière, Malchamps, Francorchamps, Sart, Niveze, Spa. This course has to be covered five times, giving a total of about 100 kilometres. The following day, July 29, there will be a competition for touring cars, six times round the same course. The 30th will be devoted to a balloon chase by motor-cars, and the 31st to an exhibition. The meeting will end with a driving competition on August 1st.

Two of the Four Vehicles recently supplied to the British War Office by the Milnes-Daimler Co. The Wagons are of 18-h.p., and are intended for loads up to 35 cwt. The engines are provided with magneto and high tension ignition, and are adapted to use either petrol, paraffin or alcohol as fuel.

◆ ◆ ◆

The Circuit des Ardennes.

The Arras meeting over, attention is now being centred on the Circuit des Ardennes, which is to be held on July 25, and entries for which will be received by the Belgian Automobile Club until the 2nd of that month. Already ten motor-cycles, nine light cars, and twenty-eight racers have been entered, the latter including Mr. S. F. Edge (Napier), and two Wolseleys. The names of Mr. C. Jarrott and the Hon. C. S. Rolls also appear in the list, but no information is so far available as to the vehicles they will drive. As usual, the A.C.B. is arranging for a special train from Brussels to Bastogne.

◆ ◆ ◆

Le Circuit du Pas de Calais.

The Arras meeting was brought to an end by a run of touring vehicles from Arras to Paris Plage, near Boulogne, via St. Pol, Hesdin, Fruges, St. Omer, Colembert, St. Leonard, Montreuil, and Etaples, the total distance being 212 kilometres. There were twenty-eight starters, of whom twenty finished within the specified time. *En route*, the speed of the vehicles was tested over a kilometre on the level and over a similar distance on a hill, in both of which tests the best times were made by M. Leon Serpollet on one of his steam cars; his time for the level kilometre was 40 2-5 sec., and on the hill, 1 min. 1 2-5 sec. In the evening a banquet was held at Le Touquet, when the gold medal presented by the King of the Belgians for the touring car making the best average in the different events was awarded to M. Deville, who drove a 15-h.p. Serpollet.

◆ ◆ ◆

A Touring Competition at Lyons.

A touring competition for the Rochet-Schneider Cup was held on Saturday last by the Automobile Club du Rhone. The route was from Lyons to St. Claude, Faucille, Amberieu, and back to Lyons a total distance of 346 kilometres. There were twenty-five starters, of whom no less than twenty-three finished. The award of the jury has not yet been issued, but in the hill climb which formed part of the trial the best times were made by M. Dumond on a 24-h.p. De Dietrich, M. Chalencon on a 24-h.p. Berliet, and M. Gobalcool on a new 14-h.p. car made by Les Chantiers de la Buire.

CAPTAIN NEWSUM, who has toured many thousands of miles on his 12-h.p. Richardson car, which is identical with the one which took part in the Glasgow to London non-stop run, has now placed an order with Messrs. J. R. Richardson and Company, Limited, for a 20-h.p. 4-cylinder car.

THE "G.A." SPEED REGULATOR.

AMONG the many interesting devices displayed at the last *Salon* in Paris was the new speed regulator for petrol motors introduced by Messrs. Grouvelle and Arquembourg, of Paris. This is an apparatus arranged between the float feed and spraying chambers of the carburettor, in which advantage is taken of the suction of the engine to automatically regulate the feed of petrol to the spraying chamber, means being also provided whereby the action of the same can be gradually varied between the normal maximum speeds, or instantly set at the minimum or maximum rate from the steering wheel. Referring to the illustrations, Fig. 2 is a view of the regulator, which, as already mentioned, is located between the float-feed and spraying chambers of the carburettor; Fig. 3 shows the control mechanism on the steering wheel, while Fig. 1 shows the regulator in position and in section, as well as the connections to the steering wheel and the suction pipe of the motor. The reference letters under Fig. 1 refer equally to those on Figs. 2 and 3. The suction of a petrol motor varies, of course, with the speed at which the latter is running, being, however, always the same for any certain number of revolutions per minute. Coming now to the action of the device, when the engine is in operation the different phases of the cycle of operations cause a rise and fall in the suction pressure in the admission pipe F,

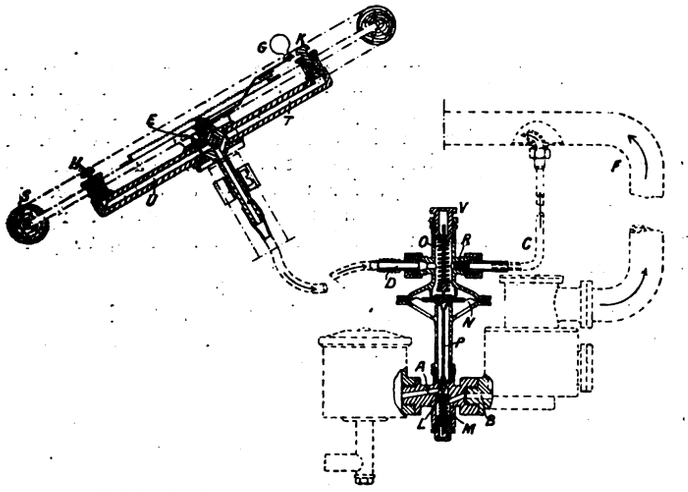

Fig. 1.—Sectional View of Regulator and Control Mechanism.

A.—Petrol supply from Float Chamber.
B.—Petrol supply to Spraying Chamber.
C.—Branch from suction or admission Pipe.
D.—Union connecting regulator with Valve E.
E.—Needle Regulating Valve.
F.—Suction or Admission Pipe to Engine.
G.—Lever controlling Valve E.
H.—Minimum Speed Button.
K.—Maximum Speed Button.
L.—Petrol Valve.
N —Diaphragm.
O.—Diaphragm Spring.
P.—Petrol Valve Control Rod.
R.—Diaphragm suction inlet.
S.—Steering Wheel.
T. U.—Return Air Pipe.
V.—Screw to adjust tension of Spring O

which is transmitted to the upper side of a diaphragm N, by the pipe C, in which is a small diaphragm R. The pressure on N is resisted by a spring O, the tension of which can be regulated by the screw V. The pipe D is connected by flexible tubing to a return air valve E on the steering wheel, by means of which the degree of action of the suction pressure on the diaphragm N can be controlled at will; the more N is lifted the smaller the opening of the petrol valve L, and, *vice versa*, as the suction pressure on N is reduced the rod P falls and opens the petrol valve. Two buttons H and K on the steering wheel complete the system, and permit, without interfering with the adjustment of the valve E, controlled by the lever G, the return air pipe to be entirely closed or fully opened instantly.

With the motor at a standstill, the valve E half open and the spring O at a suitable tension, the petrol valve L is open and allows spirit to pass to the spraying chamber. On starting the engine, as its speed increases, the suction pressure on the diaphragm N becomes greater and eventually will be equal to that of the tension of the spring O. In this position the petrol valve will be opened and closed and the degree of opening varied automatically by the speed of the engine—that is to say, any slight increase of suction pressure will overcome the spring O and allow the petrol valve to close to a corresponding degree, while any fall in pressure will allow the spring O to act and open the petrol valve. To modify the speed slightly from the steering wheel it is only

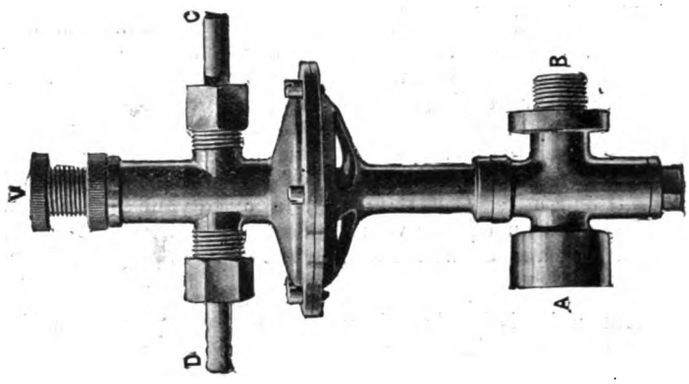

Fig. 2.—General View of Regulator.

necessary to move the lever G a notch or two, while by pressing down either the button H or K the minimum or maximum engine speeds can be instantly obtained; one button controls a valve which opens another air inlet. The lever G actuates the valve E which regulates the degree of opening of the air pipe at that point, so permitting the air pressure to enter and assist the spring in overcoming the suction pressure, while the other closes the air supply, so that only the tension of the spring has to be overcome by the suction pressure. In fixing the apparatus, the engine is set in motion and the lever G put at the end of the sector, the valve E then being closed. The compression of the spring O is next reduced by turning the adjusting screw V until the engine

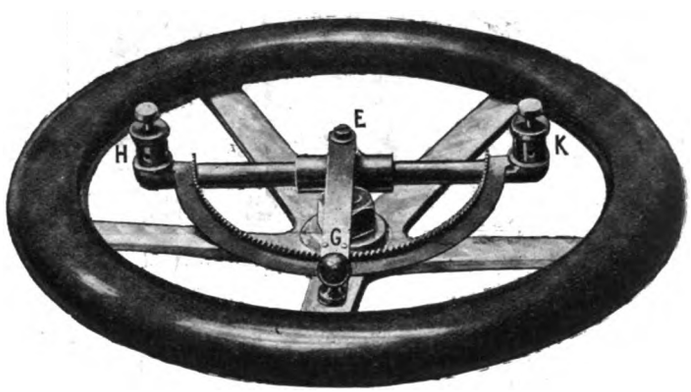

Fig. 3.—View of Control Mechanism on Steering Wheel.

is running at the slowest speed permitted by the carburettor. The lever G is then moved round two-thirds of the sector, opening the value E to such an extent that the engine should run at its normal speed. If it exceeds this a larger opening is given to the piece R, while if it is below the normal the opening in R is reduced. The normal speed being obtained, the adjustment screw V is securely fixed and need not be further touched. By moving the lever G notch by notch along the remaining third of the sector the valve E is gradually opened and the speed of the motor accelerated step by step up to its maximum. The apparatus, which can be fitted to any float-feed carburettor, is claimed to obviate the use of a governor and its consequent mechanical parts, while among other advantages it is stated to possess are the economy in fuel, the consumption of spirit being proportional to the power developed, the instantaneous control of engine speed rendered possible, and, finally, the cooling of the cylinders, owing to the suction of cold air only, when the supply of petrol is shut off.

SOME USEFUL NOTES.

THE Swift Motor Company have issued some hints which should prove useful to owners of the new 7-h.p. Swift cars, from which we take the following.

◆ ◆ ◆

WE would preface the following instructions on driving the "Swift" car by remarking that undoubtedly the chief charm of motoring is the driver's, and that the more interest he takes in his charge, the more is that charm enhanced. The peculiarly keen pleasure of piloting a modern motor-car, with all its gradations of speed from minimum to maximum, and its wonderful ease of control, must be experienced to be understood; and it is equally difficult to describe the sense of mastery of the car which is developed after a little study of the principal parts and their careful practice. Give the consideration to your car that you would give to an equally valuable horse; don't treat it like a wheelbarrow, and blame the makers if it refuses to go satisfactorily.

◆ ◆ ◆

THE engine is lubricated by means of a pump fitted on the dashboard, and special motor oil should always be used for this purpose. The amount of oil which this engine requires is about one charge, *i.e.*, a pump-full, every twenty miles. It is preferable, however, to give a ¼ charge every five miles. While this may be a little more inconvenient, it is much more satisfactory, as an excess of oil may cause trouble with the ignition. The gear-box should be kept about one-third full of gear-box oil, and this quantity may be maintained by adding a little each week according to the amount of running that the car is given. The bearings of the gear-box are kept lubricated by means of a screw-down Stauffer grease-box, which is fitted in a position easily accessible from the driver's seat, and the cap of this should be screwed down before starting, and once in about every fifty miles. The back gear-box should be lubricated with the same sort of oil as is used for the change-speed gear-box. A small trap door is fitted in the back of the body to give easy access to this part. The driving shaft bearing in the back gear-box is lubricated by means of an automatic Stauffer grease box, readily reached through the same trap door. The back axle is fitted with four lubricators, and should be well oiled before taking the car out, using ordinary machine oil. This also applies to all other running parts of the mechanism, such as wheels, working parts of brakes, etc. It should be borne in mind that efficient running of the car can only be ensured by thorough cleaning and lubrication of the working parts. If an owner intends to use his car every day it would be advisable to take special precautions and have suitable mud shields fitted. Care should always be taken to lubricate the car immediately after washing, and not leave this overnight.

One way of Getting a Timid Horse past a Motor-Car.
[*Allgemeine Automobil Zeitung*

◆ ◆ ◆

AS regards starting and driving no actual force is required to actuate any of the levers. We consider this a most important point for amateurs to bear in mind, as it is invariably their greatest mistake and frequently the cause of trouble and expense. Of course, one has to learn to drive, especially on a gear-driven car; but there is not the slightest difficulty in learning, providing the tyro first obtains even an elementary knowledge of what he has to do. He should first, then, make it a point to gain this information. The fact that the engine will work is no proof that the car is running well. It is necessary to periodically examine the various bearings to see what amount of wear is taking place, and as soon as wear is detected steps should be taken to have the part properly adjusted. Most of the bearings are made adjustable, and upon the degree of attention that is given to this item depends the life of the car.

◆ ◆ ◆

IF the best results are to be obtained, it is absolutely necessary that the motorist should be in sympathy with and have a liking for his car, for if this is the case he will take the trouble to both thoroughly understand and care for it. Not only is care necessary if the best results are to be obtained, but thorough knowledge of what each part is and what it is intended to do is necessary in order to properly locate troubles and remedy the same. The automobilist who has this knowledge of his vehicle drives with a feeling of security not possible if the fear of mysterious happenings haunts him, and thus derives pleasure not known to the motorist less well informed. As rapidly as practicable, therefore, the novice should get acquainted with each part of the car and thoroughly understand its operation and construction. In doing this care should be taken not to disarrange any portion of the mechanism needlessly, for unless care is exercised the educative process may result in putting something out of order and being unable, because of lack of information, to put it back correctly.

◆ ◆ ◆

IT should not be overlooked, in the constantly growing practice of mounting a chain-driven commutator upon the dashboard, that a great deal of difficulty will be experienced in getting the chain correctly replaced if for any purpose it is taken off. Of course, where a spur gear is employed to drive the commutator, it is very easy to mark one tooth and the bottom of the two opposite teeth, into which it engages, thus insuring correct timing, but with a chain drive it is impossible to simply mark two teeth alone. The difficulty may, however, remarks a writer in the "Automobile Magazine," be overcome to a certain extent by marking the rim of the wheel on the centre line; it then becomes a matter of the eye in replacing the chain, and also one of memory to insure the marks being in correct positions, *i.e.*, both marks should be at the bottom or top of the wheel, as originally placed when they were indicated. It is a good idea, too, to have pointers attached to convenient parts, the marks on the chain wheel being brought opposite to these. In any case, it will, of course, be necessary to ascertain, roughly, the relative position of the crankshaft to the camshaft. Unless this is done, it is quite possible to get the setting incorrect, since, while one wheel may be in correct position, the other may be a revolution ahead or behind it.

FROM our contemporary the "Queen" comes a "Book of Travel," being a *resume* of the practical travel information that has appeared in our contemporary during the last ten years. This has been brought thoroughly up to date, and the list of hotels at all the tourists' resorts throughout Europe will be of considerable utility to those who travel. One section of the book is devoted to the routes and fares from London to resorts throughout the world, and this, so far as we have been able to gauge, has been done with accuracy. A few excellent illustrations add interest to the volume, which is published in a size convenient for the pocket.

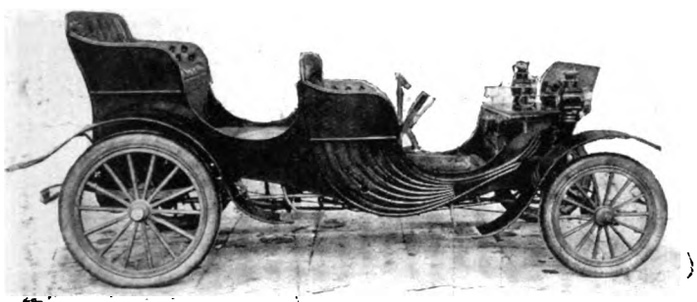
HERE AND THERE.

WITH a capital of £5,000 Motor Agencies, Limited, have been registered in Scotland.

MOTOR-CARS were let on hire in London by a well-known tourists' agency for the conveyance of parties going to Epsom for the Derby.



NOT only will the three German cars which are entered for the forthcoming Gordon Bennett Race be fitted with Continental tyres but also the three Belgian and the three Austrian cars, the tyres in each case being manufactured in the respective countries.

MR. A. GOVAN, of the Hozier Company, has an article on the progress of the motor-car industry in Scotland in Scotland's Industrial Souvenir, recently published by Messrs. Bemrose and Sons, Limited.

WE learn that Messrs. J. E. Hutton, Limited, are now in a position to undertake all classes of motor-car repairs at their extensive works at Thames Ditton. The plant there has been designed entirely for motor-car work, and a staff of trained workmen is available.

MR. J. RICHARDSON, of Unity Buildings, Market Street, Altrincham, has just erected a commodious garage, situated on the main road between Manchester and Chester, which has accommodation for twenty cars. A large stock of petrol, grease, oils, spare parts, etc., is kept, and accumulators are charged on the premises.

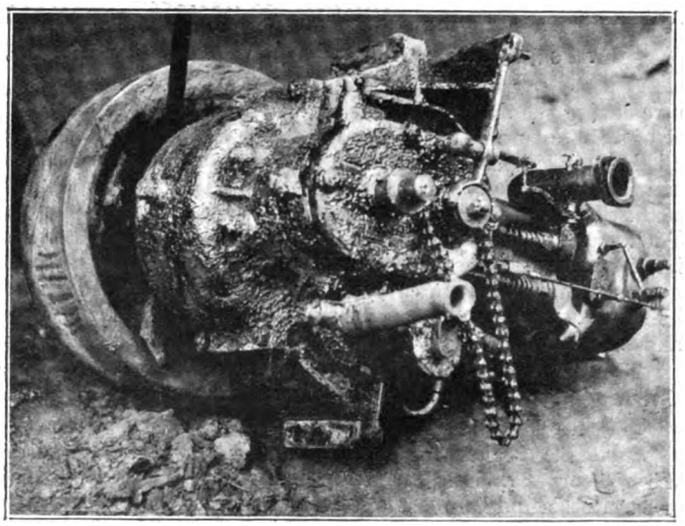
THE Duryea Company have just delivered a 15-h.p. British built Duryea Surrey to Mr. Allen McMullen, of Dublin. The car was driven from Coventry by road to Holyhead, and did

The First British-built 15-h.p. Duryea Surrey.

not meet with a single hill on the whole journey which necessitated the use of the low gear. The last twenty-six miles were covered in fifty minutes.

MRS. MANVILLE, Mr. Frank Butler, Mr. Spencer and his son, aged seven, ascended in the Aero Club's balloon No. 1 from the Crystal Palace on Saturday. After attaining a height of 10,000 feet and passing over Box Hill and Leith Hill it descended at Chichester. Aero Club No. 2, with Mr. C. F. Pollock, Mr. Martin Dale, and Mr. Moore Brabazon, descended at Petworth.

AN automobile club has recently been formed in Winnipeg, Manitoba. The opening run was held a few days ago, more than thirty cars taking part. A parade of all the principal thoroughfares in the city was made, the line of cars being headed by Dr. Webster. The Winnipeg Automobile Club has for its honorary president Sir Daniel McMillan, Lieutenant-Governor of Manitoba, who is taking a great interest in the movement and will shortly possess a car of his own.



LAST week end the Locomobile Company of Great Britain, Limited, subjected one of the latest 20-h.p. Spyker cars, for which they have recently secured the agency, to an interesting test. Leaving the depot in Kensington at noon on Friday last week, Mr. A. E. Perman started off on a tour of the south coast in order to ascertain how far he could comfortably travel in a couple of days. The first part of the journey was to Margate (eighty-five miles), *via* Maidstone and Canterbury. From the batch of postcards we have received the day's run appears to have ended at Folkestone (116 miles). On Saturday morning the journey was continued, keeping close to the sea coast, *via* Hastings, Eastbourne, Brighton (200 miles), Chichester, Southampton (262 miles), Poole, Bridport, Exeter, Teignmouth, Torquay, and on to Plymouth (432 miles.) Mr. Perman had intended to return by the north of Devonshire through Torrington, Bristol, etc., which would have made the tour a very interesting one; but, unfortunately, he suffered from sunstroke just before reaching

The 20-h.p. Spyker Car.

Plymouth, and had to place himself in the doctor's hands which naturally made it impossible to continue the run Not only was the journey a severe test of the hill-climbing capabilities of the car, but it was an even more severe trial of the brake power, especially in Dorsetshire and South Devon. Although no attempt was made to perform a non-stop run, the only delays encountered were to refix the fan belt, which slipped off the pulley near Hastings, and to replace the contact blade in the electrical ignition distributor. Otherwise the car was not touched, with the exception, of course, of filling up the tanks. Just after leaving Eastbourne the off-side back tyre punctured, this being caused by a rusty nail about 3 in. long and nearly a ¼ in. thick which had penetrated the cover and tube. On Sunday the car was driven from Plymouth to London, a distance of a little over 250 miles, by Holland, the mechanician.

THE Stern-Sonneborn Oil Company are making arrangements whereby their lubricating and cylinder oils may be obtained from any motor dealer in Great Britain.

An Object Lesson—How Not to Treat an Engine.

THE accompanying illustration is reproduced from a photograph sent us by the Beaufort Motor Company. It depicts the engine of one of their 9–10-h.p. Beaufort phaetons which has lately been sent in for an overhaul. It will be agreed that it requires one! On the ground to the left will be seen a heap of dry mud which has been chipped off the engine.

AN automobile gymkhana will be held at the Ranelagh Club, Barnes, this (Saturday) afternoon.

MR. F. WILKINSON, of Prince's Chambers, John Dalton Street, Manchester, has successfully negotiated Bland's Cliff, at Scarborough, on a Stanley steam car.

THE Electric Welding Company, Limited, have sent us an illustrated circular giving particulars of a variety of articles welded by their electrical apparatus. Included in them are an electrically-welded tyre rim and a motor hub, etc.

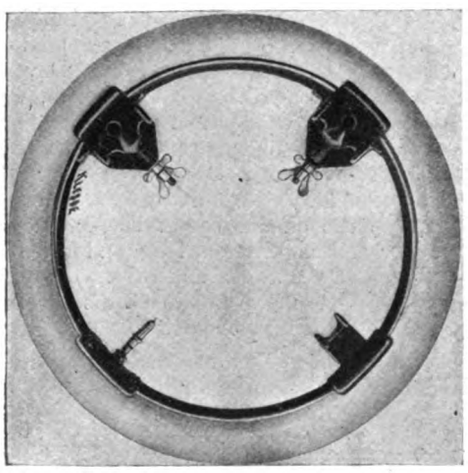
ALTHOUGH no accidents have been reported in Montreal, Canada, in spite of the rapid increase of motor-cars, an old ordinance limiting vehicle speed to six miles an hour has been dug up, which ridiculous rate it is proposed to apply to all automobiles.

MESSRS. DAVIES, BROS., of Llanelly, have recently introduced the Stepney Spare Motor-wheel illustrated herewith. The idea is that, instead of carrying a spare inner tube and cover a complete rim and tyre shall be kept in reserve on the car ready to be affixed to the side of the disabled wheel at any time, and so enable the motorist to drive home without delay, and without injuring the deflated tyre. The additional rim is attached to the side of the road wheel by means of clips and two thumb screws; the makers claim that it can be fitted within a minute without the use of any tools. thereby saving the unpleasant labour and loss of time entailed

A 22-28-H.P. Benz-Parsifal car has just been delivered to Prince Henry of Prussia.

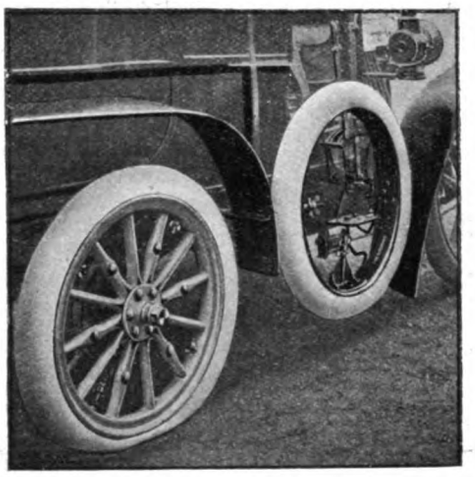
AN automobile parade, in which no less than 228 motor-cars took part, was held in Chicago on the 21st ult.

MESSRS. J. WATERS AND COMPANY are opening a depot and small motor garage at 79, Hyde Road, Ardwick, Manchester.



MAJOR DRINKWATER, J.P., of the Isle of Man, has become a motorist since the Eliminating Test there, having purchased a White steam car.

IT is stated that no less than 2,500 motor-cars passed through Rheims on the way to the French Eliminating course, the night before the great race.



AMONG recent purchasers of the popular little Oldsmobile are the Right Hon. James Lowther, M.P., Sir Charles Hamilton and Lord Algernon Percy.

MR. DOUGLAS S. COX has taken over the premises at Thomas Place, West Norwood, London, S.E., lately occupied by Messrs. Weller Bros., Limited, and has opened the same as a Garage and Motor Works.

DRASTIC measures are being taken by the Automobile Club of Buffalo, U.S.A., to stop "scorching" on club runs. A police representative will be asked to accompany future runs, for the purpose of keeping the participants in line.

The Stepney Spare Motor Wheel.

View Showing Punctured Tyre, and one way of carrying Spare Wheel.

The Spare Wheel in Position.

n removing the damaged, dirty tyre, and the substitution therefor of a spare tyre. There is no pumping required on the road, as it is intended that the spare wheel should be always carried pumped hard, ready for use. The second illustration shows one of the many ways of carrying the wheel when not in use. When carried at the side or tail of car, a ring is made the same size as the rim of the road wheel, and the spare wheel clipped thereon. Many modern cars are made with a box underneath the tonneau for carrying a spare tyre, in which the spare wheel can also be carried.

THE Rochet-Schneider Company have lately completed a 50-h.p. eight-cylinder racing car. It weighs complete only 700 kilogs., and is fitted with wire road wheels.

MR. J. R. BROOKS, of Trinity Hall, Cambridge, entered his 28-h.p. Georges Richard car at the University Club Hill Climb for the Rothschild Cup last week, and obtained second place in 1 min. 9 secs. The first car was a 40-h.p. Mercedes, which made the ascent in 59 secs.

IN our last issue we stated that the Shrewsbury-Challiner Tyre Company, Limited, had orders in hand for forty complete sets of solid tyres. We are asked to mention that this is of the "Giant" and "Twin" type alone, for heavy motor vehicles, and does not include tyres of the Company's Cup section for lighter classes of cars, for which orders for about fifty complete sets of wheels and tyres are at present in course of execution.

WITH a view to encouraging motor-car traffic, the Southampton Dock Company have provided a tray similar to that of the Great Central Railway Company, illustrated in last week's *Journal*, for the more efficient handling of automobiles leaving their docks.

MESSRS. SIMPSON AND BAILEY, LIMITED, has been registered with a capital of £1,000, to acquire the business now carried on by Mr. A. L. Abraham at 14, Pembridge Road, Notting Hill, as Simpson and Bailey, and to carry on the business of manufacturers and factors of and dealers in motor-cars, etc.

THE Streets Committee of the Corporation of the City of London, in consequence of the great success of the motor dust-carts, have just been empowered to purchase two more at a cost of £750 each. It was stated that these carts were not only cheaper in working and repairing than horse vehicles, but they were a great advance in the matter of cleanliness.

THE largest single order so far secured by the Milnes-Daimler Company for public service vehicles is that which has just been placed with them by the Birmingham Motor Express Company, Limited. The contract in question is one for no less than forty double-deck omnibuses, which are to be delivered by the end of September next. It may also be interesting to mention that the Great Western Railway have now close upon thirty Milnes-Daimler vehicles in service.

MOTOR CYCLING NEWS.

MESSRS. MECREDY, PERCY, AND COMPANY, LIMITED, have presented a valuable cup to the Committee of the Motor Cycle Union of Ireland. The offer has been accepted by the Committee of the Union and it has been decided to offer it in a competition confined to members of the Union to be ridden by teams of three riders, each rider to be mounted on the same make of machine, and the team doing the best performance to be declared the winners of the cup. A Sub-Committee have been appointed to consider the further details of the competition and to consider the possibility of running the event on the track at Ashtown, Dublin, or on the Velvet Strand at Portmarnock, where the recent competitions of the Union were held.

THE New York Motor-cycle Club has finally and officially set its seal of disapproval on leather clothing for motor-cyclists' wear. After six months of endeavour to agree on a suitable uniform, the club has adopted a suit of Scotch tweed of "pepper and salt" colour—a grey that is not too light to readily show oil stains, and not too dark to quickly show dust. The coat will be of the half Norfolk pattern, capable of being buttoned closely at the neck when occasion requires, and with more pocket room than usual. The trousers will be of the ordinary knicker-bocker pattern, or long trousers to be worn with leather leggings, as the individual member desires. The cap will be of the same grey material as the clothing.

THE Hertfordshire Automobile Club held a successful hill-climbing competition for motor-cycles on Saturday last, the hill chosen for the contest being Maples Hill, on the road between Boxmoor and Chesham. The gradient at the worst part is one in seven, and is never at any part of the hill better than one in nine. The competitors were weighed in at Boxmoor station, and then proceeded to the hill, which lies about three miles beyond Boxmoor, and where some thirty members and friends had assembled to watch the contest. There were six starters, these being Messrs. N. B. Kenealy (2¾-h.p. Bat), Dr. Ker (2¾-h.p. Bradbury) A. Hunt (2½-h.p. Kerry), B. Crump (3½-h.p. Trimo), W. S. Cole (2¾-h.p. F.N.), and C. Wood (2¼-h.p. Kerry). Only three succeeded in reaching the top of the hill. The following were the times made by those who succeeded in surmounting the hill:—Dr. Ker 21⅖ secs., Mr. A. Hunt 25⅗ secs., Mr. B. Crump 42⅕ secs. After deducting handicap allowance, Mr. Hunt was adjudged the winner. The handicapping was based upon the formula of multiplying the list horse-power with number of seconds taken in ascending the hill, and dividing by the weight in pounds of machine and rider.

ON Saturday the annual hill-climbing competition of the Sheffield and District Automobile Club took place so far as motor-cycles were concerned, on a course from Grindleford Bridge to Longshawe Lodge, with the following result:—

		M.	sec.	Marks.
1.	F. W. Oates, De Dion tricycle, 2¾-h.p, 4 cwt. ...	7	32	.. 21·6
2.	W. L. Gilder, Royal Enfield tricycle, 2¾-h.p., 3 cwt. 2 qr....	6	19	... 20·9
3.	W. James, Fairfield Griffin bicycle, 3-h.p., 2 cwt. 2 qr.	4	52	.. 19·1
4.	J. Walker, Devonshire tricycle, 3½-h.p., 4 cwt. 2 qr.	8	25	... 17·1
5.	C. Harlow, Majestic bicycle, 3-h.p., 2 cwt. 3 qr. ...	6	57	... 14·7
6.	F. B. Cawood, M.M.C. tricycle, 2½-h.p., 3 cwt. 1 qr.	11	42	... 13·7

THE Irish Motor Cycle Union challenge cup, presented by the Hon. Leopold Canning, D.L., which was won last year by the Belfast centre in competition with Dublin, was competed for on Saturday in a race from Dublin to Belfast. Mr. R. G. McTaggert marshalled the competitors at Drumcondra, whence the start was made, the route being through Swords, Balbriggan, Dunleer, Castlebellingham, Dundalk, Newry, Loughbrickland, Banbridge, Dromore, Hillsborough, Lisburn, and Balmoral, a run of 96 miles. The speed limit was twenty miles an hour, and those who did not exceed it, and went at a rate of not less than fifteen miles an hour, were to be entitled to the maximum marks (100). Every minute gained on the minimum time involved a deduction of five marks, and each minute or portion of a minute lost a like deduction, as also for every stoppage from any cause other than the exigencies of traffic. Besides the challenge cup, the donor gave three presentation silver champagne goblets to the three best of the winning team, the Dublin centre presenting a consolation guinea to the best performer of the defeated team. The teams were as follows:—

Dublin Team—T. W. Murphy (Singer), H. A. Evans (Singer), C. B. Franklin (F.N.), A. Somers (Triumph), R. Morrow (Quadrant), F. A. Wallin (Triumph), B. Gannon (Riley), L. R. Oswald Sealy (Brown), C. G. Grey (Bowden), H. S. Heiet (James), and W. B. Martin (F.N.)

Belfast Team—J. Holden (Rover), A. W. Hamilton (Ormonde), T. Denby (Riley), R. W. Ireton (Riley), P. S. Brady (Centaur), J. Brady (Centaur), T. Ireland (Humber), and J. M'Kee (Werner). The result was that Messrs. Evans, Murphy, Franklin and Gannon, of the Dublin team, each secured 100 marks, while two of the Belfast contingent, Messrs. Holden and Hamilton, obtained the maximum number of marks. Mr. T. Denby was credited with 95, and Mr. T. Ireland with 90. Dublin thus won by 15 marks.

Mrs. E. Rogers, a well-known American Lady Motor-Cyclist.

THE first of the 200-mile non-stop trials for the Edge trophy was held by the Motor Cycling Club on Saturday last. In order to better control the riders, the course selected differed from that of last year; it extended from Redbourne for a distance of 25 miles on the Coventry road, the competitors turning near Stony Stratford. The conditions under which the run is held provide that no competitor may cover less than 15 miles nor exceed 20 miles in one hour. No adjustments of any description are allowed. For the first trial there were thirty-three entries. The start was made at 6 a.m., the riders being despatched at intervals of a few seconds. The following successfully completed the run of 200 miles:—T. Silver, 2-h.p. Quadrant; H. P. Mays, 2¾-h.p. Vinco-Minerva; W. H. Wells, 2¾-h.p. Special Vindec; S. Bramley-Moore, 3½-h.p. Hulbert-Bramley; F. Hulbert, 2¾-h.p. Hulbert Bramley; T. Hooydonk, 3½-h.p. Ariel; W. A. Sale, 3-h.p. Quadrant; A. Hoffmann, 3½-h.p. Ariel; J. F. Crundall, 2¾-h.p. Humber; W. J. Milligan, 2¾-h.p. Bradbury; Chester Fox, 2¾-h.p. Special Vindec; E. F. Johnson, 2¾-h.p. Humber. The foregoing list is not official, as it is not unlikely that one or two may be disqualified for exceeding the speed limit.

ON another page will be found a short but interesting article by the Rev. R. W. Taylor on "Are Motor-Cycles Desirable for Clergymen?" taken from the columns of the "Motor Cycle Magazine," a monthly publication which has recently been started in New York.

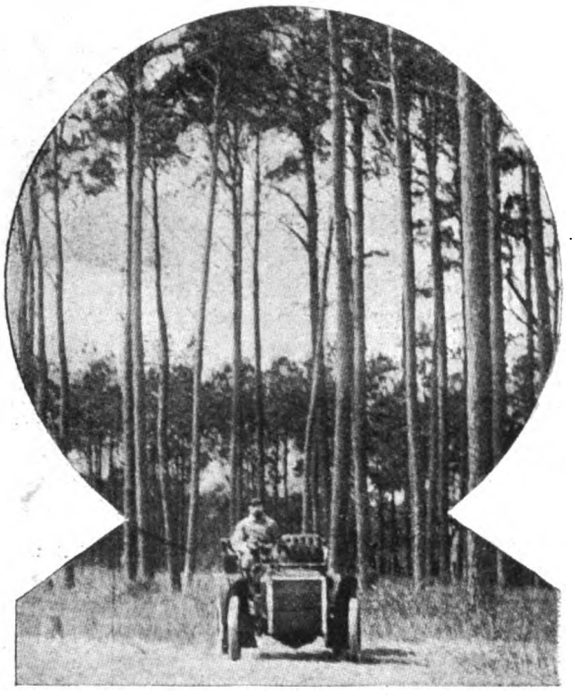
CORRESPONDENCE.

ACCUMULATOR TROUBLES.



To the Editor of *The Motor-Car Journal.*

Sir,—I have been having some trouble recently owing to my accumulator constantly running down. I have taken all the wiring completely down, and can find no flaw in the same. Similarly I have tested the contact maker and other parts, but without locating any cause for the trouble. I recently went for a run, and having gone about forty or fifty miles found the accumulator had run down. The voltmeter at starting had registerd 4½ volts, and the car had run quite well up to the time of stopping, when the accumulator only showed about three volts.

I should also feel obliged if you or any of your readers could inform me how to stop the acid leaking out of accumulators.—Yours truly.

J. W. C.

[Provided that the voltmeter is accurate, and that no fault of an intermittent character exists in the wiring, the most probable cause of the trouble is that the accumulator requires fresh acid and rinsing out with water to clear all loose particles of material in the cell. The capacity of an accumulator rapidly declines when the density of the acid falls below a certain point, and if the acid is old, the voltage may fall as soon as the density has dropped below the amount that charging has brought it up to. J. W. C. should test a little of the acid with a hydrometer; to be correct it should be at 1·200 approximately. If it should be as low as 1·0 the accumulator cannot be properly charged.

A White Steam Car among the Pine Trees.

To prevent the acid leaking out of accumulators, many devices can be used, but they all depend upon whether the containing cells are ebonite or celluloid. Also, by leaking out, does J. W. C. mean actual leakage of the containing cells, or splashing out of the vents? The first can only be remedied by efficiently repairing the cells, the second can be effected by various forms of valve vents and by care in properly fixing the accumulator in the car. The acid can also be made unspillable by making it into a jelly with silicate of soda, but this reduces the capacity in time.]

STEAM CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—The *Journal* of May 28th contained a letter by "Saunterer" on steam cars, asking for readers' experiences of the Locomobile. I have done a good deal of driving and repairing of Locomobile cars, and feel qualified to give an opinion to your enquirer. The vehicle is not a toy; some really remarkable work can be got out of one. I have not met a car to equal them in hill climbing. For an about-town car or for short distances of thirty miles or so they will take a lot of beating. I do not think they are so satisfactory for touring as a petrol car, the filling of water and petrol tanks takes up too much time on a journey; and, again, the wheel base is rather short, which makes the car, if driven fast over rough roads, rather shaky. They are not very fast, although a good average can be made. Your correspondent says "he is told the Locomobile is too flimsy for real use." They might look so, but they are not; the metal is put exactly where it is wanted, and where it is not wanted it is not put. This is not after the pattern of many English builders of motor-cars, who have a habit of putting great lumps of metal exactly where they are not wanted, and in places where metal is wanted it is omitted. The only things I have found to need attention in the Locomobile, with ordinary use, are—the air valve for pumping pressure in petrol tank sometimes leaks; the back band brake is rather inefficient, and in some of the older types the back wheel spokes used to break and chains stretch, but latterly this has been remedied. Your correspondent also asks "what is the cost of running," and also "can paraffin be used?" Twelve to fourteen miles per gallon of petrol is a fair average, but if a superheater is fitted (the Strickland is the best for this car) fifteen to eighteen miles per gallon can be made. I myself have found that all petroleum does not work satisfactorily, although an addition of 10 to 15 per cent. of petroleum to the petrol works very satisfactorily, without any alteration to the burners. The driving of this car is a pleasure. Care must be exercised to always keep the water level correct; the boiler soon runs short of water and scorches if this is not seen to. A good deal of time requires to be spent to keep them in good order. If "Saunterer" wishes to run these cars efficiently and economically, he must always keep a good steam pressure, say 180 to 220 lbs. per square inch, and always, as soon any leaks start, have them seen to at once. Have a car fitted with a Klinger gauge and not more than 2½ years old.—Yours truly,

A. I. Toby.

HIGH COMPRESSION.

To the Editor of *The Motor-Car Journal.*

Sir,—I have a 1¾-h.p. engine which would take hills in very good form with trailer when I first had it, but now I am unable to get up those hills alone without pedalling. The compression, when new, was very good for a new engine. I have come to the conclusion, now that the rings are well worn in, the compression is too high. I weigh eleven stone ten, and it takes a good training effort to get it over. Do you think my surmise is correct? If so, what remedy would you suggest, please?—Yours truly,

Supplant.

[High compression is undoubtedly the cause of "Supplant's" engine failing on hills—this because the engine is unable to keep up a good speed and the flywheels too light to carry over the compression. We would suggest hollowing the piston, if possible; or, if there is not sufficient metal to admit this, a new piston would be necessary, somewhat shorter than the one now fitted.]

IRREGULAR IGNITION.

To the Editor of *The Motor-Car Journal.*

Sir,—The other Sunday Mr. J. K. Heard went for a drive on his 8-h.p. M.M.C. to a place called Burnham, 18½ miles from Taunton, when a most peculiar instance occurred. The engine kept misfiring, then picking up again. He examined his wiring and took out the plug, all to no effect. On reaching home, the voltmeter was tried on the accumulator and found to be showing only 1·5 volts. Can you or any of your readers give me any idea of this strange thing? For a 8-h.p. car to carry two people a distance of at least twenty miles on an accumulator showing only 1·5 volts seems incredible, but I can vouch for the truth.—Yours truly,

H. Douglas.

[It is, of course, possible that under certain conditions, such as a very short spark gap, a very efficient coil, etc., an E.M.F. of 1·5 volts may effect more or less regular ignition; in fact, in the Benz cars of 1896–97 it was usual to run on one accumulator cell, two volts, and the coil was kept constantly at work, the secondary being "shorted" except at the moment of ignition. But then the compression was low. On the other hand, self-ignition where the compression is high and the engine runs rather hot may go far to help out a feeble spark. Another and not unlikely theory is that of mendacity on the part of the voltmeter. The number of incorrect instruments sold is scandalous, while to these must be added the further number which, trustworthy enough in their youth, become depraved by too close and violent association with the contents of the tool-box. A voltmeter is a delicate instrument, and deserves treatment as such if its needful accuracy is to be maintained.]

SECOND-HAND CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—Each season witnesses a greater number of second-hand cars thrown on the market, to be disposed of to the best possible advantage. The owners get rid of them for one reason or another, the chief cause being a desire to purchase a more powerful car. There are fewer antiques disposed of each season, and it will be only a few years before they have been relegated to the scrap-heap.

The net result is that the second-hand car business is rapidly assuming a condition where it is no more necessary to "get stuck" in a deal of this kind than it is in buying a new car. Bad bargains can always be made, of course. The purchaser who wants something for nothing—or close to it—is likely to get pretty nearly what he deserves, as is his fellow who brushes aside advice and in a cocksure way rushes in where even experienced motorists fear to tread, and makes

Digitized by Google

a bargain without having much idea of what he is getting. But these deserve, as they get, little sympathy. The one who is to be considered is the man who wants a good, serviceable car at from one-half to three-quarters the value of a new car of similar type. He can get just what he desires if he will but go about it in the right way. He needs to look carefully into the standing and reputation of the car. Pedigree counts for a great deal, and the car turned out by a concern which for years has built practical, reliable cars, and has a long list of satisfied customers to cite as evidence, is a good one to go in for.—Yours truly,

PLANTAGENET.

A WARNING.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—With regard to the warning given by "Disgusted Pupil" in your issue of the 4th inst., we think it fair to inform your readers that the utmost charged by the School of Motoring in Liverpool—the first school of the kind in the country—for the instruction of intending chauffeurs is five guineas. Your correspondent has doubtless had bad luck in not having secured a position, but plenty of pupils who have passed through our school have secured positions; we, however, always refuse to secure situations for pupils, preferring to leave this matter to their own enterprise and initiative.—Yours truly,

ARCHIBALD FORD.

THE POLICE AT SOUTHAMPTON.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I notice in your last issue a paragraph reflecting on the police of Southampton, as you say they "are trapping motorists in a vindictive way, stopping drivers on the least suspicion and generally incurring the odium of those who motor." I do not know who your informant is, but I am sorry you should have based such a sweeping assertion upon his complaint. I cannot think that these attacks by the Press are likely to improve the condition of motorists. I have spoken to the hon. sec. of our Motor Union, and he, like myself, knows nothing of any of the difficulties you mention. We have both used our cars of late, and neither of us have been spoken to by any motoring friends on the subject. For my part I have never been interfered with by the police ever since I drove a car, in any possible way.—Yours truly,

SIDNEY TEBBUTT.

[The note was based upon information supplied by a correspondent whose reports have been found most reliable.]

WHEEL v. TILLER STEERING.

TO THE EDITOR OF *The Motor-Car Journal.*

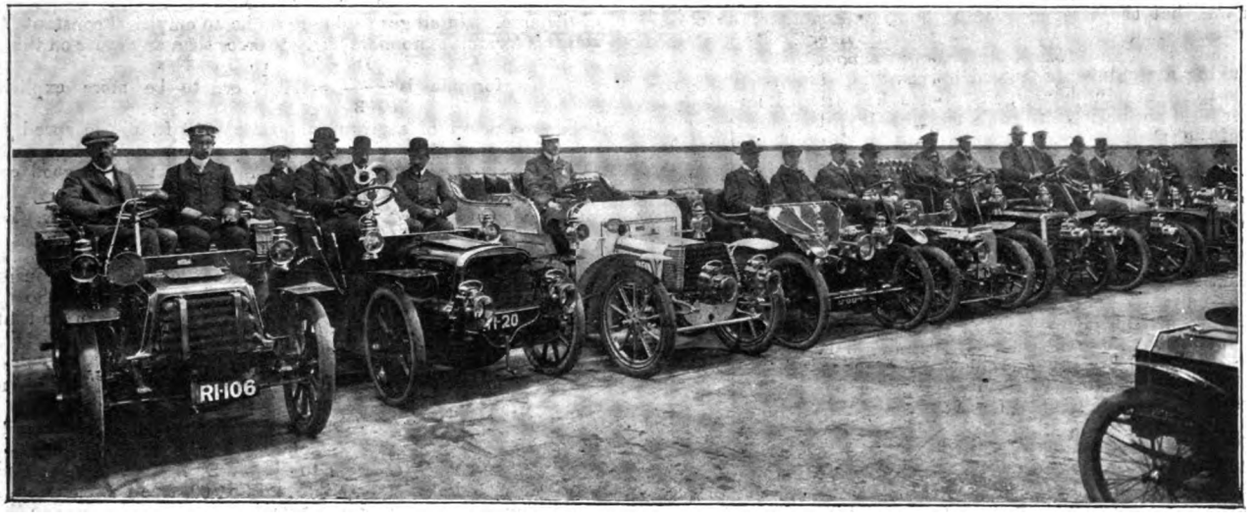
SIR,—It was with great pleasure we read the letter of "A.B. 50" in a recent issue. But for the fact that wheel steering is fashionable and is used on racing cars, and that the whole question of steering gear is not understood by the public, we feel certain that for the touring car we should have seen the claims of properly-constructed lever steering much more widely recognised than they are at present, to the greater comfort of the car-driving public. No one who has once tried and got used to a good lever steering car would go back to the wheel except for sixty miles an hour work, where the wheel serves not only for steering but for "hanging on" to. The wheel is, after all, but a creature of circumstances, the result rather than the cause of a safe steering gear. It is bulky, expensive to construct, cumbersome and dangerous in case of accident, and it renders mounting and dismounting very awkward. It is the result of using worm gearing to counteract the reversing tendency of the ordinary vertical-socket steering gear, and with such a construction is more or less needed; but if the steering wheels are centred this reversing tendency is destroyed, and there is no need for either worm gearing or wheel, and the greater comfort and ease, rapidity and certainty of control obtained by the lever, as well as the freedom of access to the seats provided by its use, can be obtained without any disadvantage.—Yours truly,

THE DURYEA COMPANY.

A USEFUL HINT REGARDING TYRES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I noticed in your paper recently a suggestion as to covering tyres with old covers. No doubt this would be a protection against puncture. But what about wet, say in washing the car; would not water penetrate between the covers, thus causing rot to set in?



With regard to the query of "Would-be Motorist" *re* cars for Devonshire—I fancy an 8-h.p. M.M.C. would meet his requirements. I am the owner of one of these vehicles and speak from experience in this hilly district, *i.e.*, North Wales.—Yours truly,

E.Y. 29.

TYRES FOR THE GORDON BENNETT RACE.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—Is it not more than a coincidence that the Club, in having voted against Earp, should have vetoed the only car not fitted with Dunlop tyres? I understand that Earp's tyres gave no trouble whatever, whereas this is far from the case with the rest. It certainly appears that the Dunlop Company are even unable to make a reliable touring tyre (*vide* Cecil Edge's 2,000 miles run), therefore it follows (and this is borne out by facts) that they cannot make a racing tyre.

A Group of Members and their Cars at the opening of the New Motor House and Club Rooms of the Irish Automobile Club.

Now I have come to the conclusion there is something wrong somewhere. Can it be that there is a want of competition between tyre manufacturers as to which is to have the honour of fitting tyres to the Gordon Bennett racers, and probably of having the proud boast that theirs was the winning tyre? It is the duty of the Club to choose the best tyre quite as much as the best car, and however good a car may be bad tyres will handicap it. Before it is too late, let the Club have a trial of other tyres, and choose that make which in all human probability can be more relied upon than the Dunlop.

As a subscriber to your valued paper since the first number, I ask you to insert this letter. If it is the means of opening a discussion which may help the Club to come to a right decision, it will not have been written in vain.—Yours truly,

(Rev.) F. A. VENABLES.

THE ENDORSEMENT OF LICENCES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In your issue of May 21st, under the heading "The Endorsement of Licences," your criticism on the judgment of the magistrate for West Ham is surely in error.

A motor-cyclist who had left his licence at home was fined and his licence endorsed. As I believe the motor-cyclist pleaded guilty he cannot complain about the fine! Now what does the Act say about endorsing the licence in such a case? "And if the person convicted holds any licence under this Act *shall* (not *may*) cause particulars of this conviction and of any order of the court made under this section to be endorsed upon any licence held by him, etc."

It seems, therefore, quite plain to anyone of average intelligence that

Digitized by Google

the magistrate has no option in the matter, and *must* order the endorsement of the licence.

I feel sure that Mr. R. A. Cillespie, the stipendiary for West Ham, has no bias against us motorists, so it is hardly fair to place him in the same category as certain county justices. The law may be a "hass," but a magistrate can only administer it as it is written, and this our genial stipendiary does, with such an admixture of sound common sense as makes me anxious that he should not be unfairly criticised for so doing.—Yours truly,

PH. D. (WEST HAM).

[What we feel is that forgetfulness or carelessness—or call it what you will—is not surely so great a crime as recklessness or driving furiously, and that even if there is no escape from endorsement the payment of costs might suffice as a warning in such a case.]

STEAM OR PETROL.

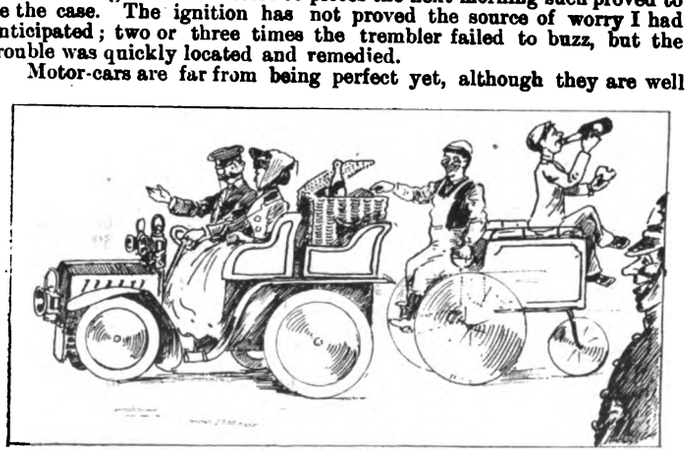
TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could any of your readers advise me which is the better car for work on really bad, rough roads—steam or petrol? Further, which of them gives the less trouble for winter work? In my case speed would not be a factor to be considered, as an average of ten to twelve miles an hour would be ample. Are the light two-seated cars now on the market strong enough for work on rough and steep gradients?—Yours truly,

MOUNTAINEER.

SOME EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.



SIR,—Long before ever seeing a "horseless carriage" I wanted to own one; later two great fears developed and almost reconciled me to being without a motor-car—one fear was that the new vehicle would frighten so many horses that there would be but little pleasure in using it, the other was that the steering would require altogether too close attention and leave but little opportunity for enjoyment. By degrees these fears diminished, and eventually I bought a popular type of two-seated car having a single water-cooled horizontal cylinder.

In regard to frightening horses, experience has taught me that a careful driver need not hesitate to run a car from fear of it, for by a due observance of the speed limit and decent regard for the rights of others he will not be likely to experience trouble. The time has come when a motor-car is liable to be met on any public road, and it is pretty generally understood that the driver of a horse must be equal to the emergency, if such it should be called. It is pleasing to find that the majority of motorists are considerate enough not only to slow down but to stop both car and engine when a horse shows much fright, and it is to be wished, for the good name of automobilists in general, that all would do so. It must be admitted that it is exasperating to have a horse persist in being afraid when he meets his best friend, and it is anything but pleasing to be obliged to lose the headway that would have carried you up the next hill so nicely; but it is certain that these inconveniences are to endure but for a season, and the existing horses will be succeeded by an equine race both fewer in point of numbers and less troublesome to encounter.

It seems to be expected that whoever relates automobile experiences will tell of troubles, both those caused by faulty design or construction in the car and those occasioned by the inexperience of the driver. Perhaps my worst trouble came while on a trip in the Highlands one hot day last summer. When part way up a long zig-zag road, the engine began to behave strangely, and would run slower and with less power if the throttle was opened, instead of having the opposite effect. I did not think the trouble was in the ignition, but, still, changed the plug for a new one; of course no improvement followed. At length the engine would not only run slower, but would come to a full stop if the throttle was opened. At last we reached a village where the car was stabled for the night, while the tired and puzzled driver retired to rest and to wonder a good deal what was wrong. The conclusion arrived at was that some petrol passage had become clogged, and on taking the carburettor to pieces the next morning such proved to be the case. The ignition has not proved the source of worry I had anticipated; two or three times the trembler failed to buzz, but the trouble was quickly located and remedied.

Motor-cars are far from being perfect yet, although they are well advanced on the road to perfection, and I do not hesitate to advise any intending motorist to get a car without delay and enjoy life as he goes along. The man who waits for a perfect automobile will still be waiting when some of us have worn out at least one car, and got our money's worth, too.—Yours truly,

P. T. L.

EASY FORMULA FOR DETERMINING HORSE-POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The usual formula for computing horse power is more complicated than average men can or will use. If they, on the other hand, could get at these facts instantly by a simple mental process, more of them would inform themselves as to the probable power of the motor in their vehicle. Working towards this end the writer has prepared a table covering seventy-three American vehicles, and twenty-two foreign ones, and from this table has learned that the average rated piston speed of American vehicles is 778 ft. per minute; of foreign ones, 790. Since rated speeds are usually higher than the speeds commonly used, it is likely that 750 ft. piston speed per minute is a most satisfactory one, and since this has already been used as a standard maximum limiting speed, it seems advisable to base computations of automobile motors upon this speed. The table also shows that American motors develop a rated horse power for each 15½ cubic in. piston displacement, whereas European motors are rated at a horse power for each 12½ cubic in. displacement; also that 6,350 cubic in. per minute mixture burning capacity corresponds with a rated horse power in the American list and 5,625 cubic in. mixture burning capacity per horse power in the foreign list. From these figures a simple formula has been found by dropping the revolutions and stroke, since these vary inversely to produce the constant piston speed of 750 ft. per minute. Since the area of the piston varies as the square of diameter, the readily ascertained diameter may become the basis of computation instead of the area. In all gas engine formulæ an empirical constant is necessary, and this formula is no more likely to error than any other on this account.

This formula is $\frac{D^2}{3}$ = H.P., or, to be more explicit, to find the horse power of a given cylinder at 750 ft. piston speed per minute square the diameter and divide by 3. The result will be as high power as may be reasonably expected from a good motor in good condition.—Yours truly,

CHAS. E. DURYEA.

OWNER WANTED.—Mr. W. A. Wigram, of Hersham House, Hersham, near Walton, has an accumulator belonging to a motorist whom he recently assisted at Walton, and will be pleased to hear from him, so that it may be returned.

AHOY POLISH.—We have received several inquiries for the address of the Hansa Chemical Works, the makers of the "Ahoy" liquid metal polish. Can any reader supply it?

HULL.—Alderman Holder suggests that Hull would be a good manufacturing centre for the automobile industry.

MILDE CARS.—Replying to Mr. J. D. Adams, the Mildé electric carriages are made by Messrs. Mildé and Co., 60, Rue Desrenaudes, Paris.

KOSMOS TREADS FOR PNEUMATIC TYRES.—In answer to the inquiry in a recent issue, Mr. J. Foster, of 422, Birkbeck Bank Chambers, E.C., writes to say that he is the English agent for the Kosmos detachable non-skid device.

MOTOR-CAR CHAINS.—Replying to W. O., the J.C. chains for motor-cars are made by M. J. Conte, 38, Rue des Panoyaux, Paris.

PETROL IN READING.—Replying to A.391's letter in *The Journal* for the 14th ult., Messrs. Watts and Co., of 28, Caversham Road, Reading, write that their premises are open day and night, and that petrol can be supplied any day of the week, Sundays included.

PATRICK METAL.—Replying to several inquirers, the "Patrick" metal referred to in a recent issue is being introduced by Messrs. J. C. Lyell and Co., Ltd., 55, Victoria Street, Westminster.

A TOOL-BAG belonging to a motor-cycle and an axle-cap for a large car, have been found and taken to Mr. C. W. Burnell's garage, Rugeley, Staffs.

PETROL SUPPLIES IN SETTLE.—A reader of the *Motor-Car Journal* writes:—"Requiring motor spirit in Settle (Yorks) one Sunday, I enquired at two shops carrying Pratt's advertisement plates, but learnt that the people did not sell on Sundays. It may be useful to motorists to know that they can obtain spirit in Settle on any day of the week from Mr. Slinger (well known there as "Electrical Bill"), who is repairer to the C.T.C. and Automobile Club."

PARAFFIN BURNERS FOR STEAM CARS.—Replying to a number of enquirers, we believe the National Burner Company referred to by a recent correspondent is the National Crude Oil Burner Company, of Des Moines, Iowa, U.S.A.

A USEFUL TIP.—A correspondent writes:—"Thirty miles an hour is forty-four feet per second. In a police-court case, a witness (the usual bucolic gentleman) will swear to thirty an hour, but, if asked whether he thinks the car was travelling forty-four feet per second, he will probably say 'no.' This is a useful method of upsetting the evidence of the usual police-court witness."

GLASGOW TO LONDON RELIABILITY TRIAL.

THE Scottish Club Committee have carefully considered the Observers' Records on the various vehicles entered, and have approved and adopted the following tabulated report. Certificates will be issuod in respect of the vehicles which completed the entire distance, in accordance with the results shown, in due course. The Committee desire to record their indebtedness to the officials and members of the Yorkshire, Lincolnshire, and Hertfordshire Automobile Clubs, who afforded them valuable assistance in connection with the Trial; to Messrs. T. Swindley and F. Straight, who acted as timekeepers at Woodcock Hill-Climbing Trial; to Mr. Basil H. Joy, the technical secretary of the Automobile Club of Great Britain and Ireland; to the gentlemen who acted as honorary observers on the cars; and to many others who assisted them in various ways at different portions of the route. The highest number of marks possible for reliability was 1,000. One mark was deducted for every minute, or part of a minute, during which the vehicle was at rest from start to conclusion of the Trial, with the exception of compulsory stops at Penrith, Leeds, and Stamford, and stops for traffic or by order of a club steward. One mark has also been deducted for every minute in excess of the maximum time allowed for each stage. At Penrith, Leeds, and Stamford, 30 minutes were allowed for replenishing and lubricating, and time was taken one minute after the order to start the engine was given. Only two gallons each of petrol and water, other than that contained in the usual tanks might be carried.

The marks for the Hill-Climbing Test on Woodcock Hill, Elstree, were arrived at on the basis of the following formula:—

$$\frac{(w \times 60 \times L) + (W \times h) + \frac{(W \times v^2)}{2}}{a \times n \times s \times \left(\frac{G}{D\pi}\right)}.$$

EXPLANATION OF SYMBOLS.

w = Laden weight of car in tons.
L = Length of hill in feet.
W = Laden weight of car in lbs.
h = Height of hill in feet.
v = Velocity in feet per second.
a = Area of piston in square inches.
n = Number of cylinders.
s = Stroke in inches.
G = Gear ratio or number of revolutions of engine for one revolution of road wheel on lowest gear.
D = Diameter of road wheel in feet.

Woodcock Hill is 710 feet in length, 62·62 feet in height, and has an average gradient of 11·3 and a gradient of 7·3 at one portion.

A Gold Medal is awarded in each class to the vehicle having full-marks for reliability making the best results in the Hill Test, as determined by the formula. The Gold Medals have been gained by the vehicles whose entry below is followed by the letter G.

By authority of the Club Committee,

GLASGOW, *7th June*, 1904. ROBERT J. SMITH, C.A., *Hon. Secretary.*

HOW TO GET TO HOMBURG.

Homburg, which is the headquarters of the German, English, and French Automobile Clubs on the occasion of the Gordon Bennett Race, to be held on Friday next week, is in the province of Hesse Nassau, Germany, about 10 miles north-west of Frankfort-on-the-Main. It is essentially a town of pleasure, and every preparation is made for the comfort of visitors. There are several large thermal bathing establishments, and also a magnificent kursaal, where meals are served in the open air, and at reasonable rates. The public park is supposed to be one of the finest in Europe, and contains among other things twenty-six tennis courts, a golf course, and many croquet grounds. With its dainty dinner parties, its fashionable dances, it society functions, Homburg in some respects suggests the haunt rather of vigorous health than the invalid. It stands on the slopes of the Upper Taunus. Fine roads climb the green heights up to Langenschwalbach, whence there is a delightful run down to Wiesbaden or the Rhine, or down the Aar Valley to Limburg and Ems on the Lahn, a route little known, and thence by the Lahn back to Coblence. There is a fine mountain excursion to Frankfort, by way of Königstein and Cronberg, the beautiful Taunus home of the late Empress Frederick, returning to Wiesbaden or Mayence. Or from Königstein or Cronberg the excursion can be continued to Homburg, taking the Great Feldberg, the highest point in the Taunus, on the way.

The following information concerning rates, etc., has been supplied by the various railway and steamship companies concerned:—

SOUTH EASTERN AND CHATHAM RAILWAY.

The South Eastern and Chatham Railway offers three separate routes to Homburg, viz.:—

		A. *Via* Dover-Calais.	B. *Via* Dover-Ostend.	C. *Via* Queenboro'-Flushing.
Charing Cross ..	..dep.	9 a.m.	—	—
Victoria ..	..dep.	—	1.30 p.m.	8.25 p.m.
Calais ..	..dep.	12.52 p.m.	—	—
Ostend ..	..dep.	—	8.40 p.m.	—
Flushing ..	..dep.	—	—	5.15 a.m.
Brussels ..	..dep.	5.10 p.m.	11.24 p.m.	—
Cologne ..	..arr.	11.12 p.m.	5.40 a.m.	12.12 p.m.
Cologne ..	..dep.	9.17 a.m. (next day.)	8.10 a.m.	12.27 p.m.
Frankfort ..	.. arr.	1.20 p.m.	12.17 p.m.	4.18 p.m.
Homburg ..	.. arr.	2.16 p.m.	1. 7 p.m.	5.16 p.m.

The German times are liable to slight alterations.

By Route A, *via* Dover-Calais, a through carriage is run from Calais to Cologne, and also a restaurant car between Brussels and Verviers. By Service B, *via* Dover-Ostend, a through carriage and also a sleeping car are run between Ostend and Cologne. The supplement for the sleeping car is 10s. 2d. per place, and accommodation therein should be ordered beforehand at the Sleeping Car Company's London office, 20, Cockspur Street, S.W. By Service C, *via* Queenboro'-Flushing, single berths and deck cabins (containing two berths) can be reserved beforehand. The charge for each single berth is 2s., and for each cabin £1, and these charges are payable on board the steamer. A restaurant car is attached to the train from Flushing to Cologne. A charge of 2s., payable on the train, is levied by the German railways for the corridor train.

The return journeys can be made as follows:—

	A. *Via* Calais-Dover.	B. *Via* Ostend-Dover.	C. *Via* Flushing-Queenboro'.
Homburg	10.15 p.m.	11.10 p.m.	10.15 p.m.
Cologne	5.28 a.m.	4.10 a.m. Ostend.	5.28 a.m. Flushing.
Calais	3.15 p.m.	9.25 a.m. Charing Cross.	10.20 a.m.
Victoria	6.45 p.m.	4.55 p.m.	7.15 p.m.

B. First Class only with extra fare.

The time taken by the various routes is approximately as follows:—*Via* Dover-Calais, 23 hours. *Via* Dover-Ostend, 23¼ hours. *Via* Queenboro'-Flushing, 22 hours.

Return fares between London and Homburg:—

	Via Dover-Calais.	*Via* Dover-Ostend.	*Via* Queenboro'-Flushing.
	£ s. d.	£ s. d.	£ s. d.
First Class	6 19 7	6 1 10	5 1 4
Second Class	5 2 8	4 9 6	3 10 1

Tickets are available for 45 days.

Rates for Motor-Cars.

Cars are not carried on the steamers between Dover and Ostend.

Between Dover and Calais cars are conveyed by mail boat only by special arrangement with the South-Eastern and Chatham Railway Company's Marine Superintendent at Dover Harbour, but they are carried by the cargo boat any night, Sundays excepted. Cars must be embarked before dusk. For the return journey, from Calais to Dover, cars must be on the quay by 6 p.m. The company's agent in Calais is Captain E. H. Blomefield, Quai Paul Devot. The cost of transport for four-wheeled cars, uncrated and at owner's risk, is £4, or £5 5s. at company's risk. An additional charge of 6 fr. is made at Calais for landing or shipping cars. A through rate from London may be obtained from the company.

By the Flushing route only a limited number of cars can be carried, and the Superintendent (Mr. Flood-Page) must be advised beforehand. At Queenborough Pier cars are shipped by platform crane. No car exceeding three tons in weight can be dealt with by this route, and vehicles cannot be shipped on Sundays. On the reverse journey, from Flushing to Queenborough Pier, cars are wheeled on board by means of a chute, and are carried by the ordinary mail boat, which leaves Flushing daily at 10.25 a.m. Vehicles must be on the quay not later than 9 a.m. The company quote for four-wheeled cars uncrated a rate of £4 at owner's risk (for accompanied vehicles only).

GREAT EASTERN RAILWAY.

London to Homburg *via* the Hook of Holland or Antwerp.

Passenger service to and from Homburg *via* Harwich and the Hook of Holland, daily (Sundays included):—

London (Liverpool Street)	.. dep.	8.30 p.m.
Harwich (Parkeston Quay)	.. „	10.0 „
Hook of Holland	.. „	5.33 a.m.
Cologne	.. „	12.27 p.m.
Frankfort-on-Main	.. „	4.18 „
Homburg	.. arr.	5.16 „
Homburg	.. dep.	12.54 p.m.
Frankfort-on-Main	.. „	1.42 „
Cologne	.. „	6.10 „
Hook of Holland	.. „	11.20 „
Harwich (Parkeston Quay)	.. „	6.30 a.m.
London (Liverpool Street)	.. arr.	8.0 „

Fares from London and all Great Eastern Railway Company's Stations (except Peterborough):—

	Single. 1st Class.	Single. 2nd Class.	Return. 1st Class.	Return. 2nd Class.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
To Hook of Holland ..	1 9 0	0 18 0	2 5 0	1 9 0
„ Antwerp	1 6 0	0 15 0	2 0 0	1 4 0
„ Homburg, *via* Hook of Holland	3 8 10	2 7 2	4 18 3	3 7 8
„ Homburg, *via* Antwerp	3 7 5	2 6 0	4 18 3	3 7 10

Rates for Motor-Cars.

London (Liverpool Street) to	Hook of Holland Quay	84s. each, not exceeding 1½ tons in weight.
„ „ „	Rotterdam Quay	
„ „ „	Antwerp Quay	
London (Bishopsgate Goods Station) to	Hook of Holland Quay	45s. per ton, not exceeding 2 tons in weight.
„ „ „	Rotterdam Quay	
„ „ „	Antwerp Quay	
Harwich to	Hook of Holland Quay	60s. each, not exceeding 2 tons in weight.
„ „	Rotterdam Quay	
„ „	Antwerp Quay	

The space on the Great Eastern Railway's steamers is limited, and it is necessary to give at least 24 hours' notice of intention to ship cars to Captain Howard, Marine Superintendent, Parkeston Quay, Harwich. If the tide serves cars are run on board the steamer at Harwich, otherwise they are slung by their axles.

The distance by road from the Hook of Holland to Homburg, *via* Rotterdam, Gorinchem, S'Hertogenbosch, Boxtel, Roermond, Haardt, Rheindahlen, Odenkirchen, Stommeln, Bocklemund, Cologne, Bonn, Coblence, Mayence, Frankfort, is 530 kilometres (about 330 miles), and from Rotterdam to Homburg 500 kilometres (about 310 miles). The distance from Antwerp to Homburg, *via* Herenthals, Moll, Lille, Hamont, Roermond, and thence as above is about 470 kilometres (about 292 miles). The roads, generally speaking, are good.

CLAIM FOR DAMAGES.

At Newcastle County Court, Percival John Purdy, of Manchester, was sued for £50 damages for injury done by his motor-car to a butcher's cart, driven by George Smith. The defendant admitted that he drove past the plaintiff at ten miles an hour, although the plaintiff was holding the horse with both hands. His Honour, Judge Greenwell, said that whether a man was driving a motor-car, coach and four, or any other vehicle, if he saw a man struggling as Smith was, he should not drive at ten miles, four miles, or two miles an hour, it being his duty to stop until it was safe for him to go past. That seemed to him (the speaker) to be the law of the country, and he intended to act upon it. Judgment would be given for the plaintiff for £40 and costs.

CLUBS AND ASSOCIATIONS.

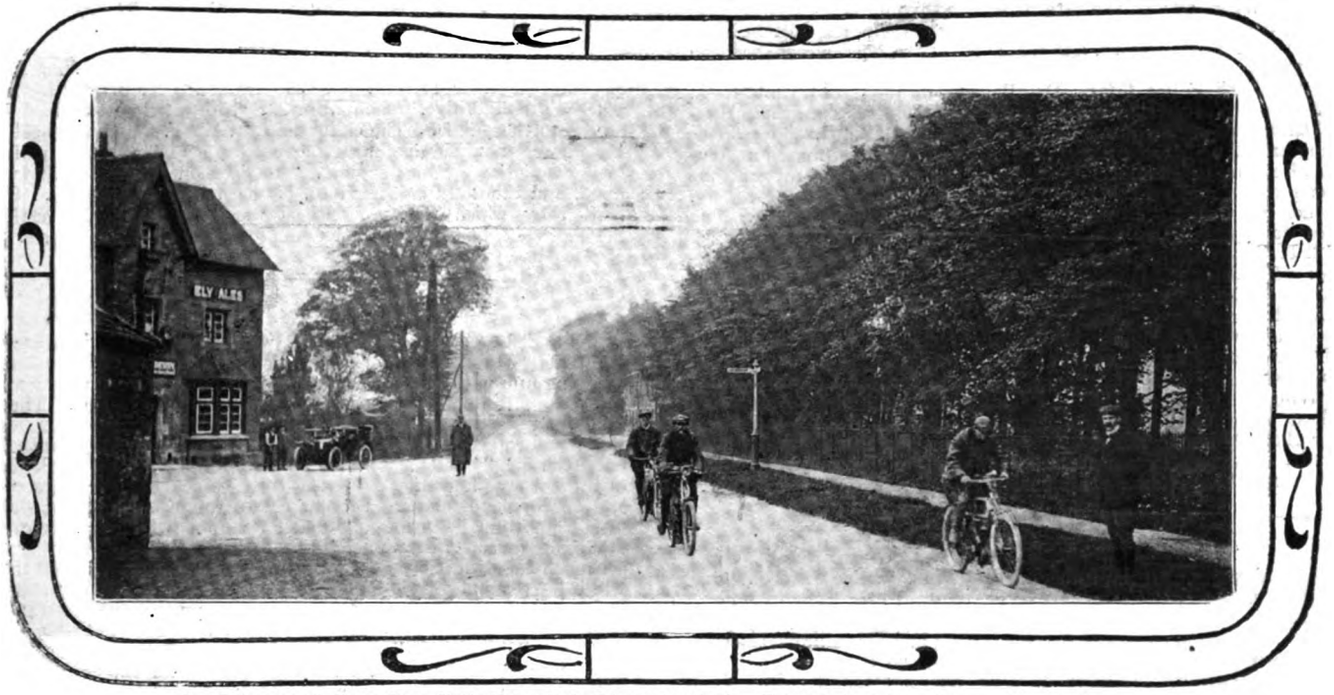
NORFOLK.

THE second meet of the Yarmouth, Lowestoft, and Beccles section of the above club was held at the Bridge Hotel, Potter Heigham, on Thursday of last week. Among those present were Mr. and Mrs. A. E. Lark, Yarmouth, 12-h.p. Brooke; Mr. and Mrs. H. W. Williams, Norwich, 4½-h.p. De Dion; Mr. and Mrs. Maudsley Brooke, Lowestoft, 14-h.p. Brooke; Mr. J. Griffin, Norwich, 12-h.p. Gladiator; Mr. and Mrs. Estcourt, Wroxham, 14-h.p. Brooke; Mr. E. King and Mrs. Bradley, Yarmouth, 8-h.p. Daimler; Mr. and Mrs. W. W. Williams, Norwich, 4½-h.p. De Dion; Mr. and Mrs. Mayer, Gorleston, 10-h.p. Swift; Mr. and Mrs. Addison-Williamson, Yarmouth, 5-h.p. Locomobile; Mr. H. L. Clarke, Norwich, 6-h.p. De Dion. There were also present Mr. J. Brooke, with his new 14-h.p. racing motor-launch Baby, and Mr. Bruce Leach, with his motor-boat, Stormy Petrel (Brooke 14-h.p. engine). Mr. Brooke ran trips with the Baby, several members of the club, with their friends, embarking, and all were much impressed with the performance of the boat. A bountiful tea having been enjoyed, the members left for home at 6 p.m. after a most successful meet.

YORKSHIRE.

A COMMITTEE meeting of the Yorkshire Club has just been held, Mr. Penrose Green in the chair, to consider the question of having a motor gymkhana, and during the evening a telegram was received from the Town Clerk of Harrogate asking for a deputation of the Y.A.C. to meet the committee at the municipal offices, and try and make the preliminary arrangements. On Thursday of last week Mr. Penrose Green drove the hon. secretary, Mr. A. W. Dougill, on his car. Mr. Walter Jackson went with Mr. King and met at the municipal offices. A full committee was present, with Councillor Holgate in the chair, and after hearing the views of the club, the Corporation Committee gave an unqualified welcome to the deputation, stating they would be pleased to assist in any way possible. They then elected three of their number, Alderman Milner and Councillors Holgate and Binns, as representatives on a special committee to be formed for carrying out the gymkhana arrangements. The committee paid a visit (per motor-cars) to the various grounds in Harrogate, and, after inspecting the Strat Football Ground and Cricket Ground, decided that the latter was most suitable, and are at present arranging for use of same. This ground is a magnificent one for the purpose, and the probable date is July 25th. The gymkhana will be open to all private owners of cars or cycles. It was suggested that the gymkhana should be preceded by a motor parade and prizes given for the smartest car and also for the best decorated car. Further particulars will be given in later issues of the *Journal*.

—The hill climbing trial of the year was proposed for Pool Bank, but Mr. King named a hill which was considered more suitable. It was duly inspected and tried, and found much steeper and on a quieter road (being situate between Beckwithshaw and Killinghall, and locally called Po Bank). The gradient appears about 1 in 6, and has two bends, but almost the whole length of course can be seen from the bottom. Mr. Jackson has promised to survey the hill, and the Superintendent of the West Riding Police (in whose division it is) has promised to meet some members of the Y.A.C. on the spot next week.



The hon. treasurer and hon. secretary have been busily engaged in getting assistance for Mr. Rees Jeffreys in the Beverley and Todmorden speed limit enquiries.

WOLVERHAMPTON.

ON Saturday last the members of the Wolverhampton and District Club had their first non-stop run of the season to Llangollen. Twelve cars were entered, all of which completed the journey without any mechanical or tyre troubles. Altogether thirty-four members and friends met at the Royal Hotel, Llangollen, and returned on Sunday afternoon, a most enjoyable week end having been spent. The following members drove:—Messrs. J. O. Evans, 10-h.p. Wolseley; H. W. Evans, 10-h.p. Wolseley; George H. Evans, 10-h.p. Wolseley; S. R. Rhodes (secretary), 16-h.p. Ariel; T. F. Young, 15-h.p. Star; W. G. Owen, 10-h.p. Wolseley; E. Lisle, 12-h.p. Star; J. Lisle, 12-h.p. Star; F. C. Bishop, 7-h.p. Star; T. T. Mills, 8-h.p. Sunbeam; F. B. Corker, 6-h.p. Sunbeam; Dr. Pratt, 6-h.p. Mobile.

PETERBOROUGH.

THE reliability trial organised by the Peterborough and District Motor Cycle Club has created very great interest in the district. Starting from Peterborough, the fifty miles was reached at the "John Bull," on the hill to the south of Lincoln, and here the riders were checked, Mr. R. M. Wright, Lincoln, a well-known cyclist and motorist, doing duty each time. The three who finished were Mr. C. Holmes 3½-h.p. Vinco; Mr. T. Woodman, 3-h.p. Lightfoot; and Mr. H. Brown, 2¼-h.p. Bradbury, and they arrived together at 11.30 a.m. on Thursday morning of last week, taking two hours and a half for the fifty miles, or twenty miles per hour. After checking and filling up their tanks with petrol they got away together and all three finished without a failure of any sort. Another run of fifty miles was taken, and in this Brown fell out. After a short rest, a further run of twenty-five miles was taken, but both Holmes and Woodman kept in so that another run becomes necessary.

The Peterborough Motor Cycle Club's Motor Cycle Eliminating Trials. The last three competitors making for home.

STOCKTON.

THE opening meet of the Stockton Automobile Club was held on Thursday of last week, the rendezvous being the Hardwicke Arms Hotel, Sedgefield. About a dozen cars assembled, and their occupants, having partaken of tea, held a business meeting, under the presidency of Mr. T. E. Atterby, J.P. Mr. J. Nattrass (hon. sec.) reported that Mr. F. B. Watson had consented to act as hon. solicitor to the club. The election of president and vice-president, the adoption of rules, and the question of affiliation with the Motor Union, were deferred, as also was the admission of motor-cyclists as members of the club.

SCOTTISH.

A MEET of the western section of the Scottish Automobile Club took place at Tarbet Hotel, Loch Lomond, on Saturday afternoon last. There was a large turnout of cars, carrying well over a hundred members and their friends, who took tea in the hotel during the afternoon. It was a perfect day for motoring, and a number of members varied the route *viâ* Luss by going or returning by Whistlefield and Arrochar or Ardlui and Callander.

CASES DISMISSED.

At the Wigston Police Court, on Saturday, Colonel Cyril Martyr, of Stoughton, was summoned for recklessly driving a motor-car at South Wigston on the 23rd ult. After a lengthy hearing the case was dismissed.

Herbert Burbridge was summoned at East Grinstead for driving a motor-bicycle without a licence at Forest Row on April 9th. Mr. F. S. White defended, and entered a plea of not guilty. P.C. Edwards said he stopped defendant because his light did not show up the number-plate. He then asked him for his licence, and defendant said he had not got it with him. At that Court on April 25th defendant said he had no licence when he was stopped, but that he applied for one a day or so afterwards. Mr. White explained that defendant had taken the machine to Forest Row for a trial. At the time he saw the constable he was not driving it, and was not actually on the highway. The summons was dismissed.

At Stony Stratford Petty Sessions, Percy Martin, of Coventry, was summoned for driving his car to the danger of the public at Potterspury, on April 26th. Mr. W. R. D. Adkins defended, and pleaded not guilty. Sergeant Robinson said a measured quarter-mile was covered in twenty-five seconds. Mr. Adkins having addressed the Bench, called the defendant, who said when the police-sergeant signalled he was travelling at the rate of fifteen or sixteen miles an hour. The Bench considered that there was a doubt as to whether the pace travelled was dangerous to the public, and dismissed the case. Superintendent Norman gave notice of appeal.

The engineer to the Birmingham Waterworks, Mr. T. Nash, was charged at Kidderminster with recklessly driving a motor-car, and the case was dismissed. According to the police evicence, Mr. Nash drove down a hill in the town at the rate of twenty-five miles an hour. This Mr. Nash disputed, saying that for the greater part of the hill he only drove at fifteen miles an hour, and when he approached a cross road he reduced the speed to about seven miles.

At the Bath Police Court, Dr. Benson, of 1, Oxford Row, Bath, was summoned for driving a motor-car in Milsom Street at a furious rate. Defendant pleaded not guilty. P.C. Miles stated that he saw the car being driven up Milsom Street at a speed which he estimated at fourteen or fifteen miles an hour. Defendant denied that he drove at the speed suggested, and said that he disapproved strongly of motor-racing. The Bench found that the evidence did not suffice for a conviction, and the case was dismissed.

Mr. F. Barbour, of Stratford-on-Avon, was summoned at Stony-Stratford for driving his motor-car to the danger of the public near Loughton, Bucks. Three policemen gave evidence for the prosecution, and alleged that defendant was travelling at thirty miles an hour. The case was, however, dismissed. Mr. Staplee Firth was for the defence.

Mr. Paternoster, chauffeur to Mr. Ean Cecil, of Stevenage, Herts, was summoned at Ottery St. Mary, Devon, on Tuesday, the 7th June, for driving a motor-car to the danger of the public, and the defendant was alleged to have driven the motor-car in such a reckless manner that a horse bolted and smashed up a trap, injuring the occupants. The magistrates ultimately found that the motorist was not to blame and the summons was dismissed.

AN M.P.'s MOTOR-CAR.

On Monday the hearing was begun, before Mr. Justice Grantham and a special jury, of an action brought by the Hon. C. S. Rolls to recover from Dr. Rutherfoord Harris, M.P., £1,500, the price of a 20-h.p. Panhard motor-car. The defence was that the plaintiff had not fulfilled the contract; the car was to be a practically new one, and it was not, and also that certain alterations agreed to be done were not completed within a certain time. Mr. Lush, K.C., and Mr. Wills appeared for the plaintiff; and Mr. Rufus Isaacs, K.C., and Mr. Muir Mackenzie for the defendant. Plaintiff said he bought the 20-h.p. Panhard in August, 1901, it having been on order nearly twelve months. It had a French body, holding two, and when it came over witness put a small seat on behind. It was sent up to Glasgow by train to take part in the reliability trials. On the first day it scored full marks, but on the second day it broke down with a cracked piston. A new one was put in, and it returned to London by road. At Christmas witness and his father, Lord Llangattock, were at Llangibby Castle, where they met Dr. Rutherfoord Harris. Defendant mentioned that he had a small 7-h.p. Panhard, and was thinking about getting a bigger one. Witness said he had one which he was willing to sell, and an arrangement was made for a trial. The car was tried in Richmond Park and round London, and defendant suggested that he would want further accommodation at the back. It was arranged that plaintiff should take the small Panhard and allow £400 for it, but a fire occurred at Dr. Harris' stable and the small car was completely burnt. The 20-h.p. Panhard ran in the Welbeck Trials, and proved very fast. From time to time witness did his best to see Mr. George Pauling's car, as the new tonneau on the 20-h.p. Panhard was to be similar to the one on that gentleman's car. Each party was to bear half of the price of the new tonneau. In answer to Mr. Justice Grantham, Mr. Muir Mackenzie said that the contract was for an aluminium tonneau, costing 200 guineas, whereas the one put in hand was mainly of wood, costing only fifty guineas. Mr. Lush said that from May, 1902, to April, 1903, the correspondence continued, and still Dr. Harris did not take the car, but made complaints. Finally, Dr. Harris wrote that unless the car was completed by June 13th he would not take it. The car was complete, but a new tonneau which had been put in hand was not, and defendant repudiated the contract. Mr. Rolls stated that he did not represent the car as new. It had run to Aldershot with M. Santos Dumont as passenger, and it had been let to the Hon. Lionel Rothschild, who paid £9 for the hire for a day. Witness had Dr. Harris' permission to run it to Welbeck for the speed trials. Mr. Mark Mayhew took it to Bexhill in May, 1902.

On Tuesday, Mr. A. Wilkinson and Colonel Crompton gave evidence for the plaintiff. Dr. Harris, M.P., having given evidence, the case was adjourned to Wednesday, when the judge announced that the parties had agreed to leave the matter in his hands; and the arrangement come to was that Mr. Rolls should keep the car and that Dr. Harris should pay £600, each party to pay their own costs.

THE MOTOR-CAR ACT.

Charles Woolley, late chauffeur to Mr. Henry Wyndham Jefferson, of 12, Berkeley Square, W., was summoned before Mr. Sheil, at the Westminster Police Court, for driving a motor-car in a manner dangerous to the public, and for failing to stop when called upon to do so by the police. At one o'clock on the morning of the 6th of May the defendant was driving his employer's motor along the Westminster Bridge Road, at from sixteen to twenty miles an hour. As there was a good deal of traffic about, Constable Cox called on him to stop. The defendant took no notice whatever, but rushed on, and 100 yards further along the road he collided with and wrecked a hansom cab, jerking the driver off, and causing him such injury that he had since been unable to follow his employment. Mr. Sheil said he saw by the defendant's licence that he had already been convicted at Woking for driving in a dangerous manner. On the two summonses he fined him £15 and costs, or three months' imprisonment.

Before the Kingston-on-Thames county justices, Wm. Mosenthal, of 38A, Porchester Terrace, W., was summoned for driving his motor-car at Pain's Hill Bridge, Cobham, on May 15th, at a speed which was dangerous to the public. The chairman (Mr. W. Y. Cockburn) said that the Bench were not unanimous on the present occasion, seven justices being for a conviction and one against. The decision of the majority was acted upon, and the defendant fined £5, his licence being endorsed. Under the section by which the proceedings were instituted the justices, said the chairman, had no alternative but to adopt the latter course. Notice of appeal was given.

MOTORIST v. POLICEMAN.

Dr. E. Lehwess, of Holland Park Avenue, N.W., appeared at the West London Police Court on Saturday to answer an adjourned summons charging him with wickedly and corruptly offering Police-Sergeant Fellen a sovereign, intending to pervert the due course of justice. There was a further summons against him for fraudulently allowing a false identification mark to be used on a motor-car. Mr. Blanchard Wontner prosecuted on behalf of the Commissioner of Police. Last week the driver of the car was fined for using the car, which bore the mark "U 421," and the evidence showed the car came from the garage of the Motor-Car Emporium (Limited), Addison Road, of which Dr. Lehwess was managing director. It appeared that the mark in question was really a French identification mark. Police-Sergeant Fellen stated that it was while he was making inquiries at the defendant's office respecting the false mark on the car that the defendant pulled out a sovereign and offered it to him, saying: "Take this and say nothing about the matter." Witness replied: "No, thank you," but the defendant followed him about the room, persisting in tendering the coin, and witness still refused it with the remark: "I don't do business in that way." Subsequently he reported the matter to Inspector Evans. Dr. Lehwess who reserved his defence, was committed for trial, the magistrate requiring him to find one surety in £100 for his appearance at the sessions.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Chester	Dangerous driving	20s.
North London ...	(1) No licence	20s. etc.
,, ,, ...	(2) No lamp	4s., etc.
,, ,, ...	(3) Not illuminating registered mark	10s., etc.
Marlborough St. W.	Reckless driving	To pay 2s.—cost of the summons.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JUNE 18, 1904. [No. 276.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AS this issue reaches our readers the great race will be in progress and the fate of the Gordon Bennett Cup for the coming year will be in course of decision. Elsewhere will be found reproduced the photographs of eighteen out of the nineteen drivers who are competing in the Cup race, the one too late for inclusion this week being that of Augieres, who is driving one of the Pipe cars. The youngest competitor in the race is M. F. Dufaux, who is representing Switzerland in the international event. He is only twenty-two years of age, and has not hitherto competed in any big automobile race. Next week's *Journal* will deal fully with the events following the race as well as with the great contest itself.

◆ ◆ ◆

Progress in Ireland.

AUTOMOBILISM is making considerable advance in Ireland, and in addition to the Irish Automobile Club, which has headquarters in Dublin, a Co. Louth Motor Club has now been formed. The inaugural meeting was held at Dundalk, and the following officers have already been elected :—President, Lord Louth ; vice-presidents, Mr. E. O'Conor, D.L. ; Mr. F. St. George Smith ; hon. treasurer, Mr. P. L. M'Ardle ; hon. secretary, Mr. Chas. J. Thornhill ; committee, Dr. Sellars, Dundalk ; Mr. D. O'Connell, Dundalk ; Mr. F. W. Brittain, Drogheda ; Mr. G. L. Wells, Drogheda ; Dr. H. Moore, Ardee ; and Mr. Bernard Gannon, Dunleer. The club headquarters are at Castlebellingham.

◆ ◆ ◆

The Ladies' Day.

ELSEWHERE we make reference to the first meet of the Ladies' Automobile Club on Thursday of last week. Half of the fashionables in town turned out to see ladies driving automobiles with as much elegance and grace as they handle horses. A few years ago such a spectacle would have been impossible ; the man who dared to suggest such an assemblage would have been sweetly smiled upon as a simpleton. Yet it seemed quite the order of the day. The sedate footmen who, with folded arms, sat on the box seats of electromobiles, appeared quite in keeping with the fitness of things, and the only incongruity in the display was an oil-begrimed mechanician leaning over the back of his fair driver's seat watching with evident interest her ladyship's conduct at the wheel. The contrast with her fair face and delightful summer costume and the dirty, grinning countenance at her shoulder caused even the police inspector to relax his stern visage and attempt to smile—in an unofficial way.

◆ ◆ ◆

The Small Car Trials.

IN another column we publish some of the salient points in the rules of the trials for small cars which are being organised by the A.C.G.B.I. for this year. The trials are this year confined to cars costing not more than £200, and will probably take place from some centre in the Midlands and not from London. A radical alteration has been introduced in the method of making the awards, in that prizes will be given for the maximum number of non-stop runs of fifty miles each, in addition to prizes given entirely at the discretion of the judges. The same system of observation of the cars will be adopted as before, every car being accompanied throughout the runs by an official who will note everything that is done to the cars, which will be under observation throughout the whole period of the trials. Washing and a reasonable amount of adjustment is to be allowed after every run, so that the conditions will approximate to those of ordinary touring, the great object being to produce a car which will run on the roads without breakdown if it receives reasonable attention.

◆ ◆ ◆

An Invitation from Hereford.

EVIDENTLY inland towns as well as seaside resorts are recognising the importance of the automobile movement, and the decision of the Hereford Town Council to officially invite the A.C.G.B.I. to make that place the centre of the reliability trials is proof of the wisdom of such authorities. For the presence in any important country town of such a representative number of motorists as is attracted by such an event would be a really profitable as well as a pleasant incident in local history. Should Hereford be selected, it is to be hoped that the hotelkeepers there will prove as hospitable and as free from extortion as were those of Manxland.

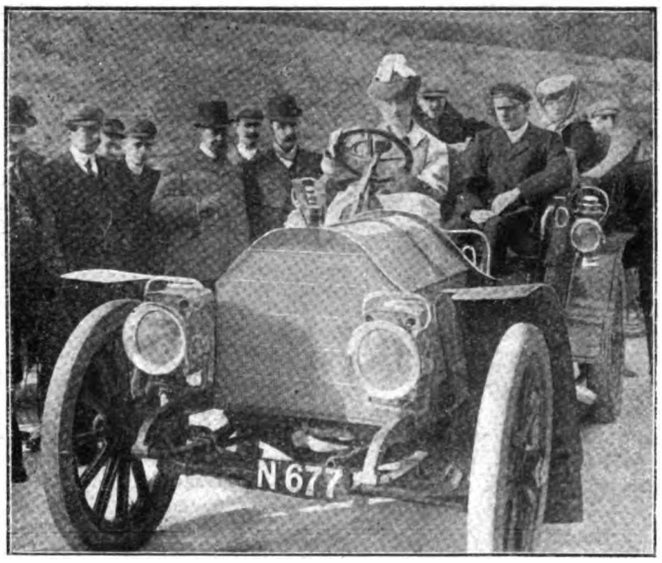
◆ ◆ ◆

Bexhill on Bank Holiday.

THE tradesfolk of Bexhill are apparently elated at the prospect of an automobile meeting taking place at their pleasant place on August Bank Holiday. Since the unfortunate injunction of two or three years ago, the town has undoubtedly lost a great deal. The event that was held then proved a source of immediate profit, and it also advertised Bexhill far and wide. There is no doubt that the great advantage of motor races at pleasure towns is the publicity they bring among a class of people whose presence is a substantial asset to whatever town they visit. Hence the delight with which the Bexhillians are anticipating the buzz of the motors again on the forthcoming Bank Holiday.

◆ ◆ ◆

An Artist's Perversity.



PROFESSOR HERKOMER must really have a chat with his friend Mr. Holman Hunt, who seems to have allowed his keen artistic perceptions to have outrun his utilitarian sense when speaking at the meeting of the Society for the Preservation of Ancient Buildings the other day. In the course of an interesting paper he described the modern motor-car as a rectangular box on wheels—a not very beautiful supersession of the delightful horse. It may have been true in the early days of the motor-car that it was not a thing of beauty, and even that it was positively ugly, but that day has gone, and the automobile is now a very presentable object. Many of the mechanical vehicles are certainly delightful from an art point of view, and Mr. Hunt cannot have allowed his eyes to have full play when in the streets of the town, or he would not have spoken as he did for the benefit of those who would preserve our ancient buildings.

Gymkhana at Ranelagh.

An automobile gymkhana was held by the Ranelagh Club on Saturday. The Hon. J. Scott Montagu officiated as judge, Dr. G. Hastings and Mr. Claude Johnson were the stewards, and Mr. G. A. Williams, the secretary of the club, starter. In the Coach House Handicap Mr. J. D. Restler (7-h.p. Panhard) won the final heat, Mr. H. Langrishe (10-h.p. Panhard) being second. The Bending Race for Motor Carriages resulted in Mr. A. Rawlinson (30-h.p. Darracq) being the winner; Mr. H. Langrishe being again second. In the final heat of the Race for Motor Carriages, Mr. C. Johnson (12-h.p. Orleans) was first, and Mr. A. Rawlinson (30-h.p. Darracq), second. Mr. A. Rawlinson, on a 15-h.p. Darracq, won the Ladies' Passenger Race, Mr. C. F. Torrey (10-h.p. Wilson and Pilcher), taking second place. The Competition for General Appearance of Car and Occupants resulted in Mr. C. F. Torrey (18-h.p. Brouhot) proving the winner, Mr. Walter Foster (24-h.p. Georges Richard) gaining second honours.

◆ ◆ ◆

The Buxton Meet.—Miss Hampson, of Southport, at the Wheel of her 60-h.p. Mercedes.

◆ ◆ ◆

The Climb up Snowdon.

Last week we recorded the successful climb up Snowdon by Mr. W. M. Letts, of Messrs. Jarrott and Letts, on a 5-h.p. Oldsmobile. We have since learned that the task before Mr. Letts was complicated by the unusually large wheel gauge of his car, and by the position of the "differential" on the centre of the under side of the car. The position of the differential necessitated the striding of the 2 ft. 7 in. gauge line of the Snowdon Mountain Tram Road unevenly, as, had the motor-car been placed evenly across the line the differential box would have come into constant contact with the rack rail lying from beginning to end of the line in the centre of the track, and thus have thrown the motor-car off. The result of this uneven striding of the line was that, whilst the wheels on one side of the car had ample room on the ballast on their side of the track, the two wheels on the other side of the car were perforce dangerously near the edge of the ballasting, a position of considerable risk, and one which almost led, at one stage of the ascent, to an accident, the results of which can only be imagined.

◆ ◆ ◆

A Run Northward.

Mr. Duncan E. Campbell, the managing director of the Northern Counties' Motor Garages, Limited, of Newcastle-on-Tyne, recently took a run from London to Newcastle on a 15–19-h.p. Beaufort Princess car. A 20-h.p. Beaufort tonneau car also accompanied the party. They ran *via* Hitchin and Biggleswade to Buckden, where they stopped at the George and Dragon for tea. Then on to the George, at Grantham, where a halt was called. On Sunday morning they went to Mr. James Smith's garage on the North Road, and filled up with petrol. The only other thing they required was a nut to replace one which had come off one of the bolts supporting the metal shield under the engine. They ran on silently and troublessly to Retford, and thence to Doncaster. Running *via* Wetherby and Boroughbridge to Darlington, they arrived in Newcastle about 7.45 a.m., and found that the 20-h.p. car had arrived about half an hour before them, having come by a longer route *via* York, but had not stayed so long for lunch. The only incident of note on the road was seen between Stamford and Newark, where the new signposts of the County Council were up, with an X for cross roads and a red diamond for dangerous corners. The milestones in that neighbourhood, instead of being of the old fashioned type, namely, a small stone stuck in the grass and barely legible, consisted of two boards shaped V on a post at least six feet high. The boards faced the road, so that vehicles from either direction could read them distinctly without slowing up.

◆ ◆ ◆

A Hint to Private Residents.

The travellers also noticed, between Grantham and Retford, a big country house close by the roadside. Opposite the house the road had been sprinkled with some dust-laying material, but what it was they did not have time to discern. There was an old gentleman looking over the wall who was very pleased with the results, as the cars coming along the road created a tremendous dust until they reached this portion, when for fifty yards there was absolutely no vestige of dust of any kind. If people who live close to the roadside find that the dust created by motor-cars is a nuisance, they might take hint from that little incident and thus protect themselves; they would be serving a useful purpose in saving much unpleasantness. For motoring is now inevitable, and all sections of the community should endeavour to make it as comfortable to everyone as possible. If there is to be consideration on the part of users of the road, there must also be something of the same spirit evidenced by those who dwell by the side of popular thoroughfares.

◆ ◆ ◆

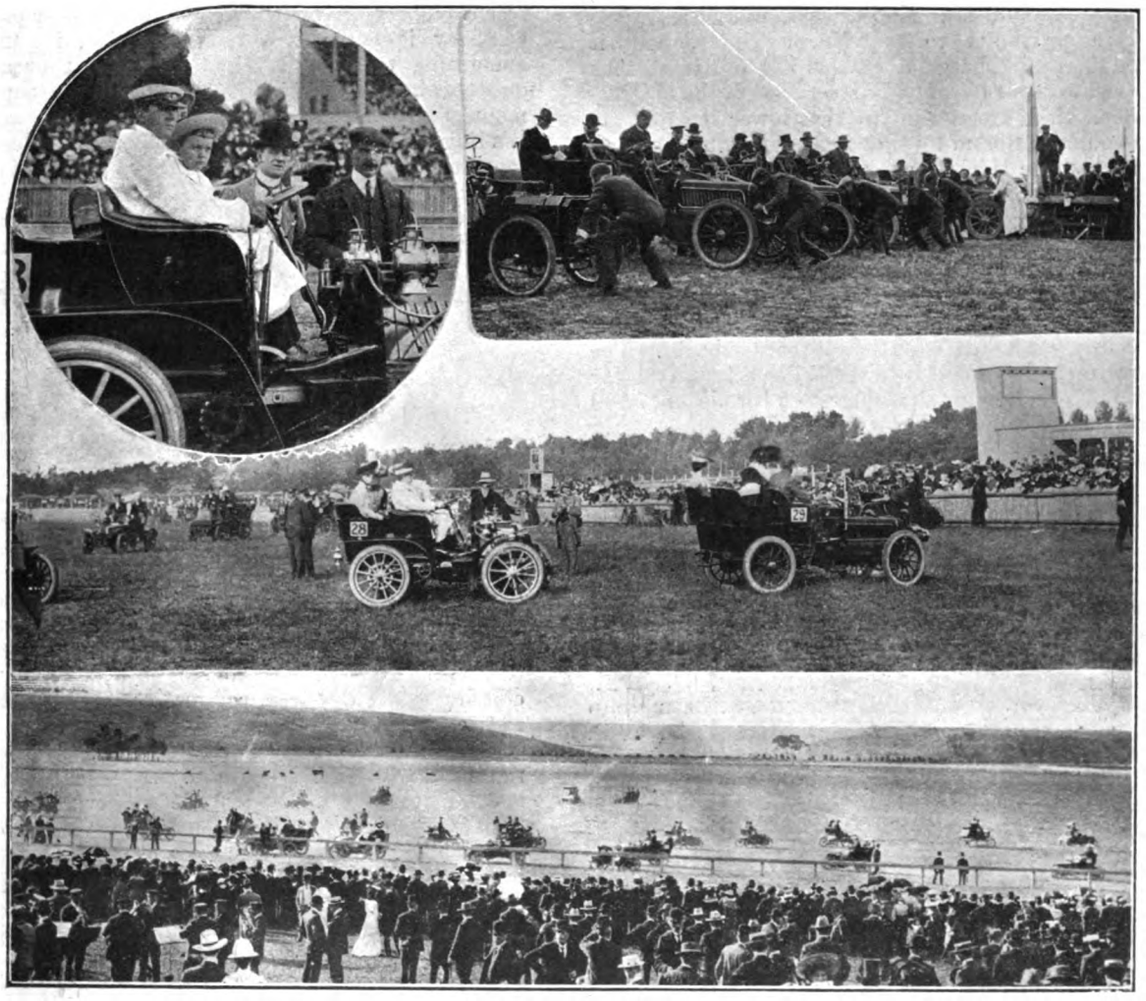
The Alake a Convert.

The Alake of Abeokuta, whose tour of investigation in this country has been thoroughly comprehensive, took occasion of his visit to Liverpool to have his first motor-car ride. Upon leaving the Liverpool School of Tropical Medicine he and his party entered automobiles and departed for the Corporation Sewage Farm at West Derby. The visitors were accompanied by Alderman Thomas Menlove, chairman of the Health Committee, and Mr. J. A. Brodie, city engineer, himself a practical motorist. The disdainful way in which the Alake declinod to wear the motor-goggles offered to him occasioned much amusement. At first he pushed the proffered goggles from him, and then, having been made acquainted with their special virtue, with a merry twinkle in his eye and a smile playing round the corners of his mouth, he told his interpreter that he could "do without them" (meaning the goggles). He thoroughly enjoyed his ride and will certainly return home with a very superior opinion of motor-cars.

◆ ◆ ◆

The Ten Mile Limit in the North.

Two further inquiries under the Motor Car Act have been held during the last few days at Beverley and Todmorden. The Beverley Town Council had applied for a five-mile limit for three places within the borough and a ten-mile limit on all other roads. Earl Russell and Mr. Rees Jeffreys appeared in opposition to the application on behalf of the Automobile Club and the Motor Union of Great Britain and Ireland. The Town Clerk called, in support of the application, the Borough Surveyor and the Chief Constable. Earl Russell, Mr. E. Starkey Wade, of Kirk Ella Hall, Hull, and Mr. F. Lambert, of Beverley, gave evidence in opposition to the application. The



Digitized by Google

second inquiry was held at Todmorden, where the Town Council had applied for a ten-mile limit for all roads within the borough. The Town Clerk called, in support of the application, the Borough Surveyor and several members of the Highways Committee. Mr. Jeffreys pointed out that no police witnesses had been called, nor was any evidence forthcoming that the ordinary law and the provisions of Clause 1 of the Motor Car Act had been proved insufficient to deal with the motor traffic passing through the Borough. In opposition to the application were Earl Russell, Dr. Crossley Wright on behalf of the Yorkshire A.C.; Dr. McRoberts, and Mr. Petrie on behalf of the local automobilists; Mr. Herbert Bright (Hon. Local Correspondent of the Motor Union at Rochdale), and Mr. O'Neill on behalf of the Manchester Automobile Club. Mr. Smith Lawson appeared on behalf of the Burnley Automobile Club, and the Halifax A.C. was also represented.

◆ ◆ ◆

Necessity for Urgency.

In the early days of motoring—say when Hancock's 'bus was making its daily trips from Stratford to Paddington—the neglect of the authorities to keep the roads in order was one cause of the withdrawal of the vehicles from public service. The great roads used by the stage coaches were, of course, well kept, but the subsidiary arteries of travel were neglected. Subsequent development of railroad enterprise has destroyed the necessity for a general attention to the roads of the country. But the revival of the automobile movement has brought the road question into the domain of local politics, and county and district councils will have to realise that "the state of the roads" is a matter of primary importance when settling their estimates. Surely such lessons can be learned without having to be taught by coroners' juries.

Capt. P. Chirnside on his Panhard. The Starting Competition.

The Cars arriving at the Maribyrong Racecourse.

A GYMKHANA IN AUSTRALIA.

◆ ◆ ◆

The "State of the Road."

While driving a motor-car in the New Forest, G. H. Hart was thrown out, owing to the car being overthrown, and killed. At the inquest a verdict of "Accidental death" was returned, the jury adding a rider drawing the attention of the authorities "to the state of the road." We have no local knowledge on the point, but doubtless the jury were familiar with the condition of the road before passing a rider which reflects upon the way in which the local authorities do their duty. The verdict should bring into prominence the necessity for roads being kept in thorough repair, their surface being regularly inspected and a proper recognition made of their growing importance to the industries and pleasures of the country.

◆ ◆ ◆

Motor-Car Imports and Exports.

Large numbers of foreign motor-cars continue to be imported into this country, the number last month being returned at 530, of a value of £224,129. Parts were responsible for £28,216, bringing up the total for May to £252,345, as against £202,499 in the preceding month and £184,045 in May, 1903. So far this year, that is to say, for the first five months, the imports

Digitized by Google

stand at £972,518, or approximately £166,000 more than in the same period of last year. It is noticeable from the returns that the cars now being imported are of larger power, and consequently more costly individually than in 1903, for while the aggregate value of the cars imported has increased, the number has declined from 2,569 to 2,454. Passing now to the exports of British automobile productions, the returns are somewhat disappointing, only 30 vehicles being shipped last month, these with the "parts" being valued at £17,123. For the five months ending with May the exports are, however, returned at £123,630, or roundly £13,000 more than in the corresponding five months of 1903.

◆ ◆ ◆

Balloon Ascents.

UNDER the auspices of the Aero Club, two interesting ascents were made on Thursday of last week from the Crystal Palace. The first balloon, containing Professor Huntington, Mr. Spencer, and Dr. Knott, was carried by the easterly wind in proximity to the North Tower, and it was only by the speedy discharge of a whole bag of ballast that sufficient lifting power was obtained to steer clear of the obstruction. The balloon then proceeded in the lower current to Sutton and passed over Epsom town and racecourse to Leatherhead, Guildford, and the Hog's Back, but at the height of 6,000 feet a different current of air changed the balloon's direction towards Pirbright. Descending again into the lower current, Aldershot was shortly reached, and a descent effected in the Long Valley. The second balloon, whose occupants were Mr. C. F. Pollock and Messrs. Mecklethwaite and Aitkens, passed vertically over the Tower at the start, and at once rose to a great height, and a course was taken over the southern suburbs. The Thames was crossed at Kew, and then the balloon floated as far as Staines and Ashford. After attaining an altitude of 7,500 feet it descended a little, and encountering a north-easterly breeze, recrossed the river, and proceeded via Chobham and Bisley Ranges until at length it reached Aldershot twenty minutes after its predecessor, and descended on Laffan's Plain.

◆ ◆ ◆

An Australian Gymkhana.

THE first automobile sports meeting in Victoria took place on the Maribyrnong racecourse on April 30th, and was a great success, more than 5,000 spectators being present, including many of the leading people in the colony. Dr. D. M'M. Officer acted as judge, Mr. H. J. Maddox and Mr. E. Beauchamp as starters, Mr. F. W. Heath as timekeeper, and Mr. G. R. Broadbent as a lap scorer. Mr. H. B. James was hon. secretary to the meeting. Thirty-five cars took part in the parade with which the gymkhana opened. The voiturette race for cars up to 6½-h.p. was won by Mr. J. R. Crooke on a Locomobile, Mr. S. Day being second on a Humberette. Captain Chirnside's 7-h.p. Panhard was first in the starting competition, Mr. J. Wallace's Benz being second. A similar result was recorded in the heavy car race. The tourist car race brought out seven De Dions, four Humberettes, three Decauvilles, and one each of the following:—Argyll, Panhard, Knowles, Centaur, Benz, Toledo, and Rochet-Schneider. Mr. J. W. Moffatt's 8-h.p. De Dion was first, being followed by Mr. S. Day's Humberette. Mr. T. Rand on his Decauville made a series of evolutions that testified to his ability as a driver, and also won the mixed car handicap and the reversing contest.

◆ ◆ ◆

Latest News from Germany.

AS we go to press the news comes to hand that it has been decided, after all, to start the cars in the Cup race at seven minutes intervals, instead of five. The sprinkling of the course with Westrumite, combined with the rain, has rendered the roads somewhat sticky, Edge experiencing a bad side-slip on Wednesday. Salleron, too, is reported to have met with an accident on his Mors car, a road wheel being broken.

The M.M.C.

ON Tuesday, Mr. Justice Joyce heard an application, on behalf of the plaintiff in the debenture-holders' action of Beadle v. the Motor Manufacturing Company, Limited, for the appointment of a receiver and manager of the company. Mr. Byrne, for the plaintiff, stated there was a fear that executions would be levied in London and Coventry. The company made motor-cars, and they had orders in hand amounting to £10,000. It was proposed to appoint Mr. Frank Edward Beadle (a large shareholder and director) to be the receiver and manager, he being a fully qualified man who understood the business. The issue of debentures was not a large one. His Lordship appointed Mr. F. E. Beadle, as asked, and gave the common form judgment in a debenture-holders' action. With reference to this matter the Motor Manufacturing Company, Limited, write:—"We desire to say that the reason for this course is that many of the company's creditors, frightened no doubt by some of the recent failures, have unreasonably pressed for payment. As the company is really in a sound position, its trade debts only amounting to between eight and nine thousand pounds, the directors have considered it advisable to consent to the appointment of a receiver and manager in order to save its goodwill pending a re-arrangement of its finances. Meanwhile work is continuing, cars and motors are being built and sold, and orders booked. It will be remembered that the company did very well last year, and there is not the slightest doubt that it will continue to do so when the present difficulties are settled. Negotiations for an amalgamation are proceeding, which will, if they materialise, make the Motor Manufacturing Company one of the strongest concerns in the country."

THE Manchester Motor Supply Company have removed to more extensive premises at 18, Oxford Street, Manchester.

THE Howick Motor 'Bus Company is a New Zealand concern which has just put a motor-'bus upon the road in Auckland.

THE Kingston Motor Cycling Club has been formed with headquarters at the Anglers' Hotel, Kingston. Mr. P. H. Vickery is hon. secretary.

THE South Western Motor Club is a new organisation intended primarily for motor-cyclists in the south western suburbs of the Metropolis.

THE Maidenhead Bridge Bill to free vehicular traffic crossing the bridge from toll passed its second reading in the House of Commons on Tuesday.

THE Anglo-American Oil Company has decided to make the substantial reduction of 2d. per gallon for their Pratt's "A" grade motor spirit. No change whatever will be made in the high standard of purity that has been reached by Pratt's.

WITH reference to the case Rolls v. Harris reported in our last issue, we would mention that the car in question was not sold as a new one, but as one that had been run a thousand miles, and that each party should have the use of his car pending the exchange.

THE exhibition of the Royal Agricultural Society at Park Royal, Willesden, N.W., will open on Tuesday next and continue throughout the week. The Great Western Railway Company will run a rail motor service every hour between Westbourne Park and Park Royal.

AN accident befell some motorists from London last week whilst driving through the New Forest. The party, consisting of Mr. Westrop, the owner of the car, two friends, and the driver, left Southampton for Bournemouth, and were making the descent of Trons Hill, at Brockenhurst, which has a somewhat steep and curving gradient, when the car skidded. The driver instantly applied the brakes, with the result that the automobile shot into the side of the road and the front part of it was smashed. The occupants were all thrown out and the vehicle overturned. The driver, who hung to the steering-gear, was literally buried in the wreckage, and when recovered he was found to be dead. The others had miraculous escapes.

GORDON BENNETT RACE.

HOMBURG, WEDNESDAY.

Just as in Dublin a year ago, powerful motor-cars are now to be met at every turn here in Homburg. Visitors have been arriving daily for over a week past, and, although the hotels are far from full, yet there is ample evidence that there will be a huge crowd at the starting point of the great race which will be

M. F. Dufaux, who is representing Switzerland in the Race.

in full swing by the time these lines are read. The competitors and their retinue are all on the spot, and have been cantering over the course daily to make themselves familiar with the sharp turns and its other intricacies. They have, however, not been permitted to indulge in travelling at full speed—this being reserved entirely for the day of the race. The Wolseley headquarters are at Usingen, while Edge is at the Savoy Hotel here in Homburg. The German and Austrian Mercedes cars are quartered at the works of the Oberursel Motor Company at Oberursel.

Extensive precautions have been taken along the entire course to prevent accidents. At all points appearing in any way dangerous military guards are stationed, their to al number being 3,200. About 120 cyclists will lead the competitors

Baron P. De Crawaez—one of the Belgian Team.

hrough the places where the cars are under control. The Park of the Saalburg has been transformed into a "fair-ground," with restaurants and refreshment buffets galore. It is said that provision is being made for the feeding of from 25,000 to 30,000 persons. The grand stands on each side of the road at the starting point are connected by a bridge, and will provide accommodation for about 2,500 persons. Three bands will be in attendance, and will play alternately during the day. The grand stands, the admission to which is £2 10s., are being provided with ten telephone call offices, situated close to them, and spectators will be kept informed of the progress of the race by wireless telegraphy. For those who do not take tickets for the stands, an enclosure, 10 kilometres in extent, has been made round the Saalburg, to which admission can be obtained for £1, while from the stand a path runs through the woods to a point on the course at which it is expected high speeds will be attained. The railway authorities are doing their utmost to rise to the occasion, and a frequent service will be run from Frankfort and Homburg to Saalburg. There will also be a train every ten minutes on the electric railway from Homburg to the starting point and one every quarter of an hour to Dornholzhausen. Most complete instructions have been issued by the police authorities as to the routes to be taken from Frankfort, Homburg, Cassel and other places to Saalburg. Separate routes are indicated (1), for those proceeding by motor-cars and cycles, (2) those going by horse-drawn vehicles or cycles, and (3) for foot passengers. Huge garages have been established near the starting point for both motor-cars and horse vehicles. At the last moment it has been decided to sprinkle the whole of the course with Westrumite.

To-morrow (Thursday) a tour of the course will be made by the officials to see that everything is in readiness. The final order of starting of the nineteen competitors is not likely to be known officially until the weighing in to-morrow. It is, however, certain that Jenatzy, the winner of the race last year, will start first, and that Edge will be second. The only two competing drivers who have previously won the Cup will the lead off in the 1904 contest. On Saturday, the day after the race, a tour of the course will be held by the motorists present. The Saalburg will be left at 10 a.m., and at 1 p.m. a stop will be

M. L. Hautvast—another of the Belgian Drivers.

made for "breakfast" at Limburg No less that sixty-three entries have been received for the track races which are to be held at Frankfort-am-Main on Sunday. The municipal authorities of Frankfort have just presented a cup for one of the touring car competitions.

THE awards in the service test of motor-wagons held in New York from the 1st to the 9th April last have just been announced by the Automobile Club of America. The medal winners are as follows :—First class (to carry 1,000 pounds or under).—Olds Motor Works (petrol), gold medal for the first Oldsmobile van and a silver medal for the second ; Knox Automobile Company, bronze medal. Second class A (to carry 1,000 to 2,000 pounds). —Pope Motor Company (petrol), silver medal, and a bronze medal for the same company's electric vehicle. Second class B (to carry 1,000 to 2,000 pounds).—Cantono Electric Tractor Company (electric), gold medal; Electric Vehicle Company (electric), silver medal, and Rockliff (petrol), bronze medal. Third class (to carry 2,000 to 3,000 pounds).—Consolidated Motor Company (petrol), gold medal, and Knox Automobile Company (petrol), silver medal. Fourth class (to carry 3,000 to 4,000 pounds). Union Motor Truck Company (petrol), gold medal, Fifth class (to carry 4,000 to 5,000 pounds).—Electric Vehicle Company (electric), gold medal. Sixth class (to carry 8,000 to 10,000 pounds) —Fischer Motor Vehicle Company (combination petrol electric), gold medal.

THE "VULCAN" SPEED INDICATOR.

CONSIDERABLE attention has been devoted during the past few years to the production of a reliable device which will indicate the speed at which a motor-car is travelling, and many indicators have been introduced which have met with more or less success and adoption. One of the latest instruments of the kind is that which is being introduced into this country by Messrs. Geipel and Lange, whose name is already well known in connection with the ignition accessories of petrol motor-cars. It consists of a magneto driven off one of the wheels of the car, and a hot wire voltmeter, connected to the magneto by means of a flexible wire, which

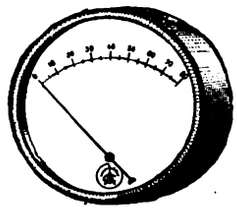

Fig. 1.

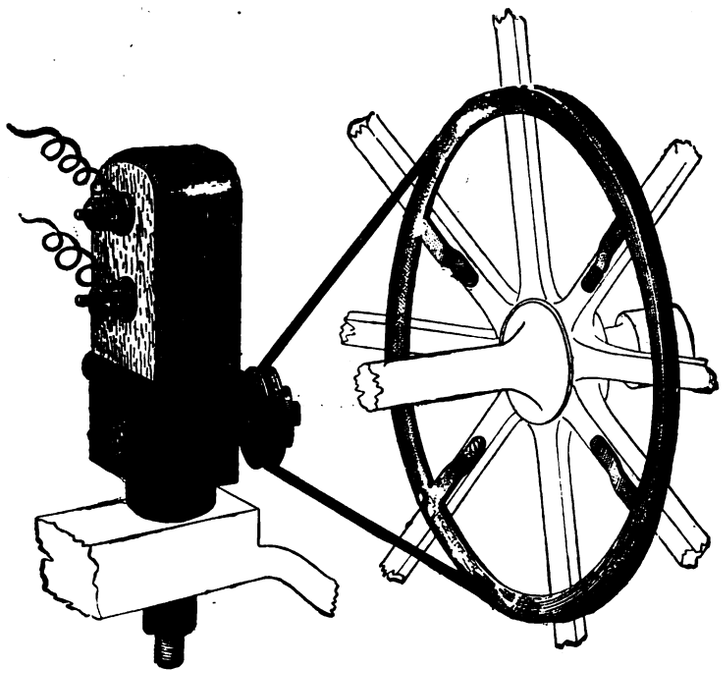
forms the speed indicator. The indicator is of the watch pattern of instrument, two inches in diameter and three ounces in weight, and is preferably fitted on the steering wheel, so that it is always immediately under the eye of the driver. One, four inches in diameter, is also made to fit on the dashboard. The dial (Fig. 1) is calibrated to indicate from five to forty-five miles an hour, and as the needle is perfectly dead beat, the speed indications can be read under the worst conditions of vibration. It may be added that the readings are



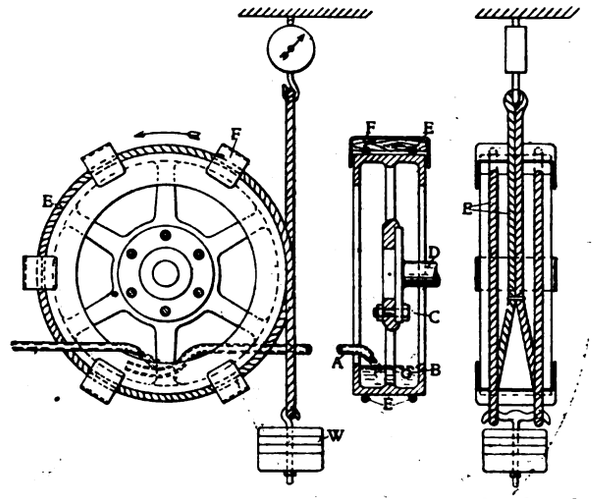


Fig. 2.

equally accurate whether the vehicle is running backwards or forwards. The magneto (Fig. 2), which is also small, measuring 6 in. by 2 in. and weighing 1½ lbs. only, is arranged preferably for fixing on the steering horn of the front wheel, from which it is driven by means of a rubber band passed round a little aluminium pulley fixed on the inside of the wheel. The armature consists of iron only, while there are no moving wires or electrical contacts, as the coils in which the current is generated are placed inside the magneto and are sealed therein by paraffin wax. The magneto is entirely waterproof and can be played upon with a hose without being injured or causing any inaccuracy in the readings The bearings are self-oiling and the whole design of the apparatus is such as to obviate any necessity for attention. The indicator may, of course, be placed in any other position than on the steering pillar, if desired, while the magneto may be driven off one of the hind wheels.

TESTING THE BRAKE HORSE POWER OF PETROL MOTORS.

A SIMPLE and accurate dynamometer for making a continuous brake horse power test of high-speed petrol motors, as employed at the works of the Geo. N. Pierce Company, of Buffalo, U.S.A., makers of the Pierce cars, is shown in the accompanying diagram. The brake pulley C can be made of the same weight as the engine fly-wheel, in which case the flywheel is left off or the pulley can be made lighter and used in conjunction with the flywheel; in either case it is cast hollow, in channel section as shown, with the hub plate drilled to bolt to the crank shaft D. This plate can be cast to suit the requirements of the different engines. A hemp rope E is then wound around the pulley C and held in place by wood blocks F, which in turn are kept on the pulley by steel guide straps. The weight W is suspended from the two ends of the rope, and the folded part of the rope is suspended by a spring balance from a beam or floor overhead.

A pipe A is then provided to furnish the cold water supply into the channel section of the pulley, while a pipe B, with a

feathered edge, is allowed to dip into the water in the channel so that the water as it travels around with the pulley is forced into the pipe B, which carries off the heated water as fast as the cold water is supplied, keeping the brake pulley perfectly cool for any length of time.

To find the horse power developed by the engine:—

W = Total weight on rope.

w = Average pull on the spring balance, which must be deducted from W to get the net load.

r = Radius of brake pulley and rope to point of suspension.

The effective circumference $= 2r \times 3.1416$.

N = Revolutions per minute.

Then:

$$\frac{\text{Net weight} \times \text{circumference of rope in feet} \times \text{revolutions.}}{33{,}000} = \text{H P.}$$

MESSRS. A SIMPSON AND SON, coachbuilders, Clerk Street, Brechin, have added an up-to-date garage to their premises.

IN connection with the comment in our last issue, on the subject of the motor-car in India, Turner's Motor Manufacturing Company, Limited, write to us pointing out that at the present time they have several orders in hand for Turner-Miesse steam cars for India.

CONTINENTAL NOTES.

The Mont Ventoux Hill-Climb.

The annual hill-climb up Mont Ventoux will be held by the Automobile Club Vauclusien on August 28th next. The test will be divided into two classes—racers and tourists. The racing section will comprise categories for vehicles weighing under 1,000 kilogrammes, and for motor-cycles of not more than 50 kilogrammes. In the touring class the divisions will be single cylinder two-seated cars, two-cylinder three-seated vehicles, and four-cylinder four-seated cars.

◆ ◆ ◆

Motor-'Buses for New Caledonia.

Messrs. Turgan, Foy and Company, whose heavy steam vehicles are well known, have lately taken up the construction of petrol public-service vehicles, and have just completed three cars for a service in New Caledonia. They are of the single-deck type, having accommodation for twelve passengers. The motive power is supplied by an Abeille four-cylinder motor of 24-h.p. Four speeds forward—the maximum being fifteen miles per hour

Signor Lancia. Signor Storero. Signor Cagno.

Herr Braun. Mr. Warden. Herr Werner.

THE ITALIAN AND AUSTRIAN GORDON BENNETT TEAMS.

—and a reverse are available, the power being transmitted from the gear box by means of side chains.

◆ ◆ ◆

The Touring Competition at Lyons.

The awards have now been made known in the recent touring competition at Lyons organised by the Automobile Club du Rhone for the Rochet-Schneider Cup. The winner is M. Martini, who, with his 16-h.p. Martini car, gained 1,086 points. M. Weitz (20-h.p. Pilain) was second with 1,077 points, and M. Chalencon (24-h.p. Berliet) third with 1,073 points. The next competition for the cup will be held in Switzerland.

◆ ◆ ◆

Public Services in Germany.

Quite a number of new public motor vehicle services have lately been inaugurated in Germany, while several projects are under consideration. One has just been started between Triberg and Furtwangen, the cars making two journeys in each direction daily, the time occupied in making the trip, including stops at intermediate stations, being 1 hour 18 min. A service was also inaugurated on the 4th inst. between Brunswick and Wendeburg. At Peine a company has been formed to organise a service between that town and a number of outlying villages not provided with railway communication.

◆ ◆ ◆

More Racing in Belgium.

The Automobile Club of Namur and Luxembourg is organising a series of races for July 12th. The events include a series of kilometre speed trials on the road between Gisnes and Ben, and a kilometre hill-climb. They are both open to all classes of vehicles, including motor-cycles, and a special prize will be awarded should the world's record be lowered.

◆ ◆ ◆

Another Motor-Bicycle Competition.

The "Auto" is organising another competition for motor-bicycles, to be known as Criterium du 1-3 de Litre. It is to be held from October 3rd to 9th, on similar lines to last year's event. The capacity of the motor is, however, being increased from ¼ litre to 1-3 litre. On the other hand, silencers must this year be fitted to the engines.

◆ ◆ ◆

No more Trailers in Vienna.

The police authorities of Vienna have issued an order forbidding the use of trailers in conjunction with motor-bicycles. The regulation is the result of one or two recent accidents.

◆ ◆ ◆

The De Dion-Bouton Excursion in the South of England.

The Channel steamer Nord has been chartered specially to bring across from Calais to Dover a number of French motorists and their vehicles for the forthcoming tour in the South of England. So far about fifty motorists have notified their intention of participating in the tour.

◆ ◆ ◆

The Mont Cenis Hill-climb.

The Automobile Club of Turin, having secured the necessary official permission for the event, has fixed July 10th as the date of the hill-climbing competition from Suze up Mont Cenis. The available course includes nearly fifteen miles of splendid road, with a gradient of from 1 in 10 to 1 in 7½. Several handsome prizes will be given, and three challenge cups are offered in connection with the trials.

THE MEET AT BUXTON.

THE popular meet of north-country motorists, so long anticipated, duly came off at Buxton in glorious weather on Saturday last, and was attended with the greatest success. Cars began arriving at the Empire Hotel in the morning, and continued until the evening, when more than eighty were assembled, varying in size and power from the mighty "sixty" to the humble Horbick. By the letters on the cars we were able to perceive that they came from London, Bradford, Nottingham, Lancashire, Salford, Lincoln, Bolton, Yorkshire, Stockport, Chester, Cheshire, Manchester, Derbyshire, Sheffield, and other places. Among the ladies who drove cars Miss Hampson was distinguished on a new 60-h.p. Mercedes with a lovely body made by Messrs. Cockshoot, of Manchester. She was met on the road driving steadily and showing well up to the legal limit. The meet as a matter of fact was remarkable for the number of ladies present, and these all appeared happy and smiling and evidently enjoying the surroundings and their proximity to the numerous cars. Several new cars were present, including the four-cylindered Richardson, a handsome and well-designed vehicle; four "sixty" Mercedes, including those belonging to Mr. Higginbotham, Mr. Cordingley, Miss Hampson, and one driven by Mr. Dobson, who, by the way, has designed a simple method of starting these monsters. In the evening about 250 sat down to dinner at which Mr. Fred Smith presided. The speeches were commendably brief.

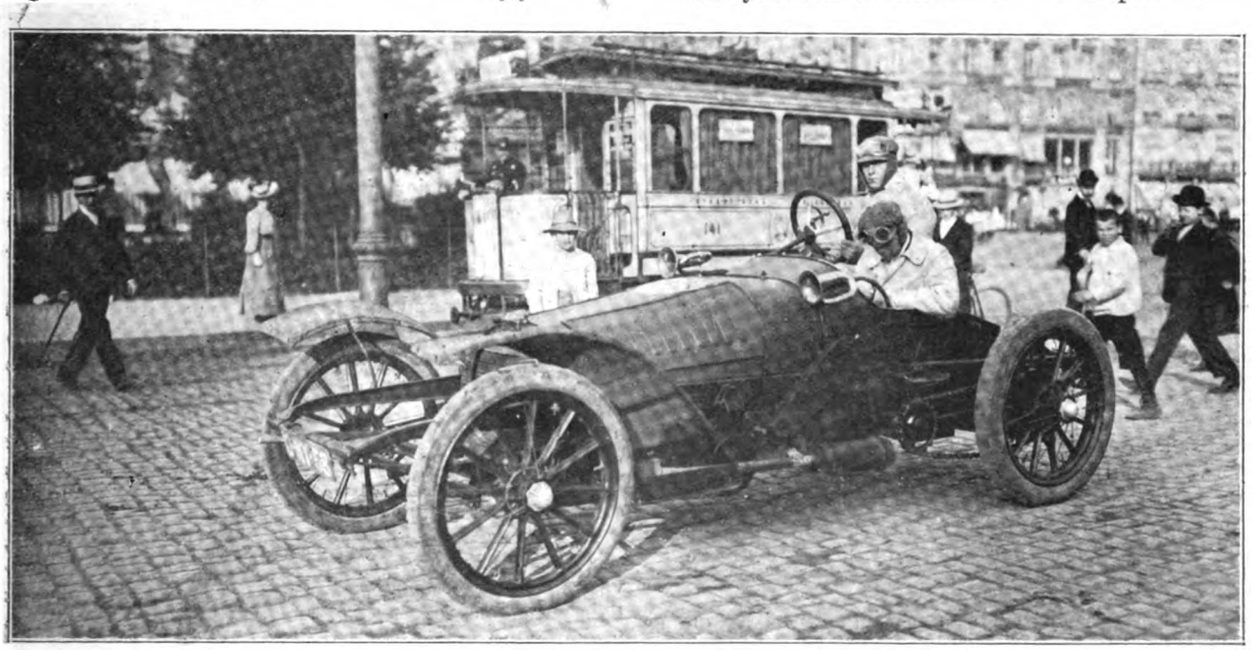
THE LADIES' AUTOMOBILE CLUB.

THE inaugural meeting of the Ladies' Automobile Club was a great success, over sixty cars being assembled in the open space of Carlton House Terrace, opposite Waterloo Place, W. The vehicles were drawn up in front of the Duke of York's column, and punctually at the appointed hour the procession moved off by way of Pall Mall, past the Horse Guards Parade, round Hyde Park, by the Powder Magazine to Hammersmith Bridge and to Barnes, where tea was enjoyed at the Ranelagh Club. The Duchess of Sutherland headed the procession with her 18-h.p. Mercedes, closely followed by Lady Scott Montagu, Lady Beatrice Rawson, and Mrs. Gerald Leigh, vice-presidents; and Miss d' Esterre Hughes, the secretary, on Lady Violet Talbot's car. Mrs. Manville's car was gaily bedecked with flowers, and the gay dresses presented quite a novel spectacle. There was quite a large contingent of gentlemen, headed by the Right Hon. Henry Chaplin and Mr. C. E. Shaw M.P., the latter on a 24-h.p. Star car.



Jenatzy on his 90-h.p. Mercedes.
It will be noticed that the wheels of the car are provided with a novel form of folding mud-guard.

Signor Lancia on his Fiat Car.

THE "Adelaide Advertiser" has been using a squad of motor-cyclists in connection with the despatch of "copy" from local race meetings. The machines were supplied by the Lewis Cycle Works, of Adelaide.

THE Tyre Syndicate, Limited, has been formed with a capital of £1,000.

Mr. C. Jarrott on his Wolseley at Homburg.

SOME USEFUL NOTES.

MANY cars have a coupling-box in which the clutch-shaft slides, the drive being on a square. It is most important that this box should be well lubricated, as otherwise the shaft is apt to stick, and the result is that either the clutch will not go in properly, or it will go in and refuse to come out when required.

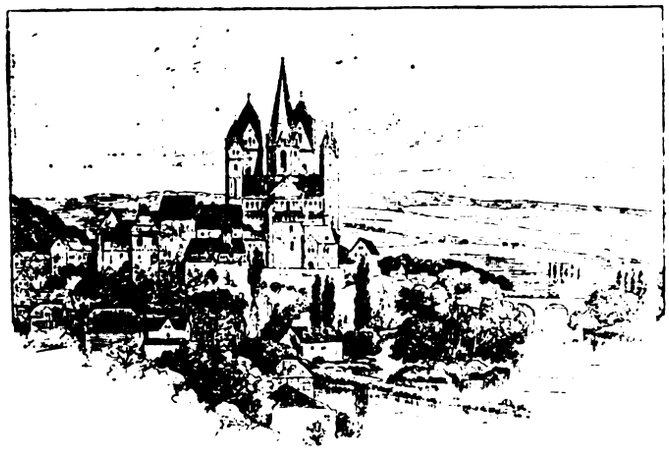
CARS have been made, and some are made now, with the steering arms set straight, so that when the front wheels move they turn parallel. This, of course, is incorrect, as in describing a curve the outer wheel should describe an arc of larger radius than the inner wheel, so that there shall be no slip, and consequent wearing of the tyres. To effect this, the two steering arms are set inwards, and the steering is then correct.

PNEUMATIC tyres are often put down as an expense and worry, but they are not really so bad. If one looks after them and fills in cuts on the outer cover as they appear, and does not use the brakes recklessly, there will not be one half the trouble some people say.

IN choosing a car with a honeycomb cooler, in which the fan is driven by a belt, two points should be noticed. First, the belt should be as thick as possible, as otherwise it is very liable to break; (2), the half-time wheels, if exposed, should be protected with some sort of cover, to prevent the belt dropping between the wheels in the event of it breaking.

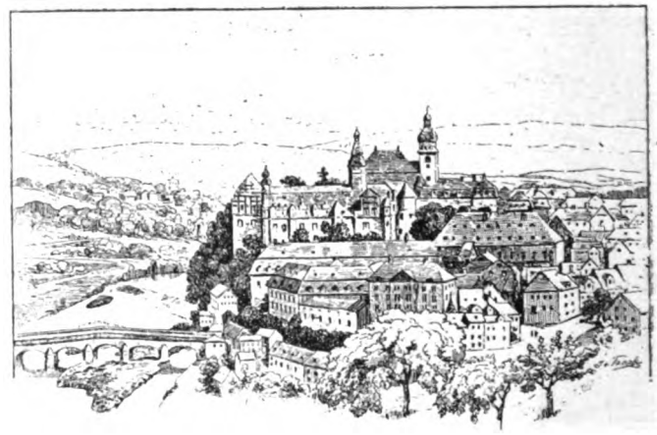
CARS are now usually made with a metal shield underneath the engine (sometimes all the way underneath) to protect it from mud, wet, etc., but provision is rarely made for draining off the oil in the crank-chamber. An aperture should be made for this, or a pipe should come from the crank-chamber through the shield.

IF one desires to remove the clutch-spring box on a Panhard, or a car of similar type, do not start by unscrewing the small nuts which secure it at three corners, or trouble will follow. Run the nut on the draw-bolt right up, so that the box is held, then remove the small nuts and slacken back the nut on the draw bolt, and the box will then come off by pressure of the spring.



MUCH of the ease and comfort of motoring, especially on tour, depends on the care and forethought which has been bestowed on that too often neglected portion of the car's anatomy, the tool-box, and a glance at the interior thereof will often give the observant critic much insight into the character of the owner. The too familiar cupboard, in which spanners, oil-cans, wire, loose nuts, and—too often—inner tubes as well, wallow in a marsh of spilt oil and grease, sometimes has a variant in a clean and neatly-kept receptacle, in which the orthodox set of tools repose in assorted places, but from which all else that could be useful in an emergency has been carefully omitted.

IT may be well to consider what a well-regulated tool-box ought to contain. Lubricants will, of course, occupy an important place, and an oil-can and grease injector, with reserve stock of oil, grease, graphite, and French chalk, also a small can of paraffin for valve grinding and lamps, and flour emery, will include most things necessary of this kind, a collection which is, if possible, best kept apart from the tools and replacements, in the interests of cleanliness. Screw-top tins, such as used for vaseline, form the best receptacles, on the whole, for such of these as are solid.



SUFFICIENT spanners are generally supposed to accompany a car, a belief that it is not always superfluous to verify, and a large adjustable spanner, and hammer (unless the same tool serves for both) is always wanted, while a smaller one of the "Clyburn" type, most convenient for awkward corners, should accompany it. It is generally necessary also to have another one thin enough to be used on the lower of two lock-nuts, or such, if small, cannot be properly tightened, while some car-builders have a prefect genius for devising nuts in positions where a specially-shaped instrument is needful to tighten them. Screw-drivers, cutting pliers, a large file, and a watchmaker's file for the coil will also have their places, and a steel "tommy" and 6 in. or 9 in. "Footprint" pipe-wrench should be included. If touring in remote regions is intended, it is useful to have a small vice that can be clamped to the step of the car, which need not take up much room, and it is better to have a knife and scissors in the tool-box than not to have them in one's pocket.

SPARE parts and sundries will vary with the type of car, but plenty of nuts, bolts, and split pins should be carried, and replaced as they are used up, which precaution, though obvious, it seems almost necessary to mention, if experience of its neglect is a guide. Spare sparking-plugs, valves, and valve-springs suggest themselves, as also, in some cases, a spare circulating pump, while the necessary plates and bolts for patching up a broken spring are things very inadvisable to omit in the present state of road management. Asbestos sheet and string, and ready-cut packings, along with copper wire—plain and insulated—and cloths and waste, should all be there, and though it is very improbable that any one of all these multifarious items will be wanted on any particular run, like the Yankee's revolver, "when you want it you want it badly."

FINALLY, tyre-repairing necessaries are a thing apart, and should be kept so, not being improved by rude contact either with tools or oil; and the harmless, necessary voltmeter is safer in the owner's pocket than elsewhere; it is doubtful even whether, in the small sizes useful for ignition accumulators, it can be safely screwed to the dashboard if it is to retain its accuracy, convenient as that arrangement is.

VIEWS ON THE GORDON BENNETT COURSE.

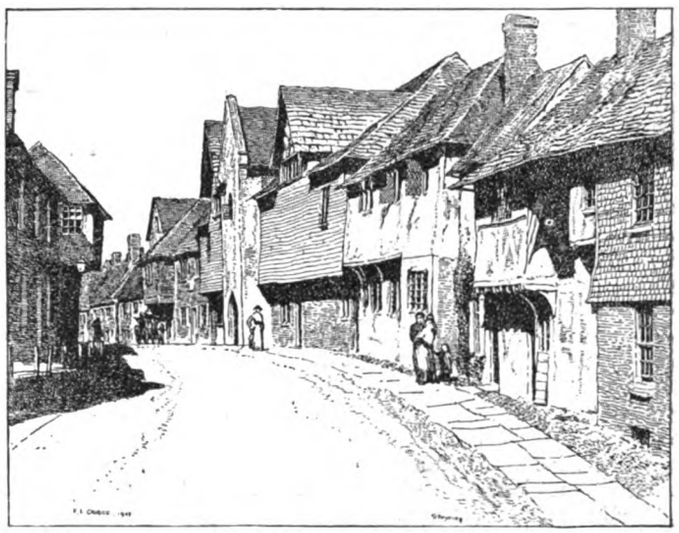
Digitized by Google

IN SUNNY SUSSEX.*

THE motorist goes beyond the ordinary plans of guide book writers. Their daily rambles he compasses before lunch, and ere nightfall he has traversed their itinerary of a week. Hence the route sketches of a few years ago have become of almost antiquarian interest, their practical value being as mythical as the famous Mrs. Harris. The need has arisen for a new order of Knights of the Pen—men of rapid characterisations, of full knowledge, and of native love of the places

Westham, near Pevensey.

of which they write. And, as Thackeray told, in his "Book of Snobs," the Occasion always produces the Man. So far as the county of Sussex is concerned he comes in the person of Mr. E. V. Lucas, accompanied with Mr. F. L. Griggs, whose pencil gives definition to the writing of his collaborator. Two characteristic sketches are reproduced herewith by favour of the publishers.



Mr. Lucas enters Sussex from the west at Midhurst, where memories of leaders of the nineteenth century as dissimilar as were Richard Cobden and Cardinal Manning linger in the minds of the older residents. It is the most contented town in the county. From thence the way taken by the author is through Chichester, which some Goodwood devotees would probably be alarmed to know is a cathedral city with a wonderful sense of silence during fifty-one weeks out of the fifty-two; ancient Arundel, as mediæval as in the days of the Plantagenets; breezy Brighton, with its delightful background of the Downs; Lewes, with its pleasant gardens; Eastbourne, the select; Hastings, the popular; and finally emerging from the county at Withyham, on the borders of Ashdown Forest.

Mr. Lucas does not sing needless rhymes as to the glory and the smoke of railways, the throbbing of the automobile, and the weary walking of the pedestrian, or the score of other useless rhapsodies which might have induced him to wander from his subject. He writes only of Sussex, its pleasant pastures, its literary lore, and the men and women who have found a resting-place in its old houses and castles. Of the Sussex Downs he is enthusiastic. They are the "crown" and the "symbol" of the county, and will "probably be the last stronghold of the horse when petrol has ousted him from every other region"—the only reference to the automobile of which Mr. Lucas is guilty.

Brighton is known to everybody. Salubrious, gay, uninteresting, fashionable in the season, and breezy at all times, the "Queen of Watering Places"—as it was first called by Horace Smith in 1813—has a favoured situation. In the days of William Hazlitt and the Lambs travellers embarked from its beach for France, and it was really an adjunct of the Court. But the coming of the train destroyed its distinction—it became *caviare* to the crowd, and the crowd drove away the few. But in modern days its healthy situation has proved a source of profit to its hotels. Herbert Spencer lived there in his later years, and towards the close of his life Mr. Gladstone confessed that a few days at the Lion House on the Front renewed his health as did no other place. In fact, Robert Browning is said by Mr. Lucas to have been the only Englishman of note who never visited the place; and, as we have tested the accuracy of what he writes on many other points, we accept his statement as to the poet. But Brighton is not alone—lying clustering about it are little villages accessible by road, and leading to secluded hamlets away from the clatter of the half-crown tripper. By a hilly road, with the sea in view the whole way, we reach Rottingdean, where Sir Edward Burne-Jones was inspired to paint his "Legend of the Briar Rose," and where William Black's remains sleep in their flower-covered grave. A few years ago we met Mr. Rudyard Kipling motoring to his home between the artist's house and the little churchyard, with a dirty green duck pond before the high wall that hid his house from the gaze of the "absent-minded beggars" and others, who have at length driven the vigorous writer to the seclusion of Burwash. A few explosions more and the motorist will be at Ovingdean, which supplied Harrison Ainsworth with a subject for a novel, and gave him the opportunity to mix his history into a strange medley. All of which is known to Mr. Lucas, as well as many other things not in the nature of a review to disclose.

In the other direction is Shoreham, with its town of bricks and mortar nestling around the old church and the newer colony of railway carriages taken off wheels and set upon the shingle for human habitation—a summer clan of people making sojourn there and finding no mention in this otherwise all observing volume. And at Worthing the author enters into the spirit of the place without mentioning such modern conveniences as the local hotel proprietors, who cater for motorists with an enthusiasm rare even in this rapid age. There is a delightful picture of Rye, the "city set upon a hill," looking wistfully to the sea that will come no more near its walls, but is steadily leaving the little town, which looks as though it were in Flanders.

Sussex is essentially a county of delight to the modern traveller, who can dart along its bye-ways and highways finding contrasts in such places as Bognor, a speck of a town wholly lacking in resource, and Brighton, that almost overwhelms itself with its pushfulness. Pulborough was a Gibraltar of the

Church Street, Steyning

Romans; at Bignor the man of the Twentieth Century is transported to a Roman villa of the days of the Cæsars; at Hastings, old ruins and the day tripper almost jostle each other; at East Grinstead is Sackville College, made famous by Fred Walker's picture, "The Harbour of Refuge"; and, in fact, Sussex, though lacking the majestic grandeur of the Welsh hills or the pathetic splendour of Killarney, is a pleasant county, full of delightful associations and made all the more attractive to the motoring tourist by its quaint inns and friendly hospitality to man and motor.

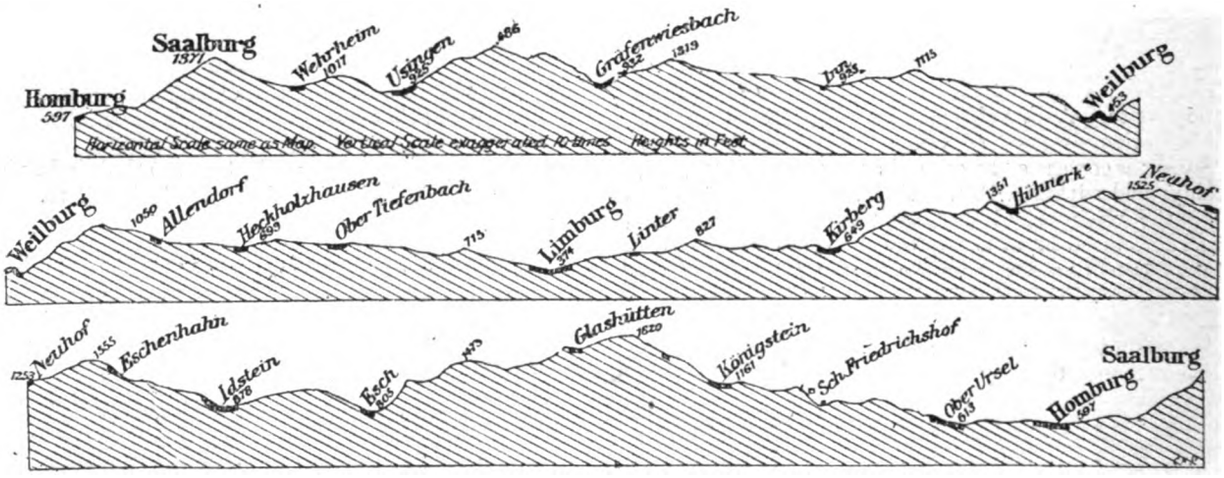
NOTES ON RE-CHARGING ACCUMULATORS.



FROM letters which have reached us during the past months, we notice that more attention is being paid to the practical points of re-charging ignition accumulators, but most of our correspondents appear to think that it does not materially signify if a 4-volt accumulator is charged with 5 or 6 volts at the terminals. This, however, is a great mistake, and one which has been the cause of large numbers of accumulators being ruined.

The instances in which this error arises are those in which accumulators are charged from a 6-volt plating dynamo, from three large electric lighting type cells, or from a low resistance primary battery giving 6 volts or more. Now it may be taken as a practical fact that a 4-volt two cell accumulator, which is in good working order, does not require more than 5 volts at its terminals to pass a current through it of sufficient strength to recharge it properly. It should be noticed that the 5 volts must be available at the terminals of the accumulator, as this eliminates any loss of voltage from internal resistance in the charging battery, if a primary battery is being used. But if the charging is being carried out by a 6-volt dynamo there is no internal resistance to speak of, therefore the dynamo voltage must be reduced so that it is only 5 at the accumulator terminals, by inserting a resistance in series. When this has been properly done, and the charging current is flowing through the circuit, it will be found that a voltmeter applied to the two terminals of the accumulator will register 5 volts, whilst the voltmeter reading across the two ends of the resistance will read 1 volt. Each part of the circuit is absorbing the required proportion of the total 6 volts pressure.

Having, therefore, firmly fixed in the mind that 5 volts is all that is required at the accumulator terminals to charge it, we must now explain why this is so, and why any increase of voltage over the prescribed amount should make such a great difference in the current. When a 4-volt accumulator is first put on to recharge, the voltage immediately rises to between 4¼ and 4½ volts whilst the charging current is flowing through it, though it may fall to 4 again directly the current is cut off. As this pressure of 4½ volts is opposed to the charging pressure of 5 volts, there is a difference of only ½ a volt between them, and it is, in fact, only this ½ volt which is necessary to send the current through the accumulator after the opposing voltage has been overcome. This being the case, it is obvious that if the charging voltage is increased to 6 volts the effective available voltage is being increased to three times its previous value, and as the current is directly proportionate to the voltage, the current is increased to three times its value and the accumulator is charged at an excessive and injurious rate.

If the voltage of the accumulator to be charged happens to be very low, perhaps 3·8 volts, and the charging voltage even higher than 6 volts, the excess of current will be very much greater. When charging at 5 volts, if the accumulator to be charged is low in voltage it will receive more current for the first few moments, but the effect of this will be to quickly raise the opposing voltage, whilst the charging battery will fall slightly, and a suitable balance soon arrived at. With 6 volts as the charging voltage it is not possible to get a balance, as the accumulator being charged cannot under any circumstances rise above 4·7 volts.

In order to obtain some practical figures showing the excessive currents than can be obtained by using 6 volts to charge a 4-volt accumulator, we made the following experiments. A 6-volt set of accumulator cells of 10 ampere-hours capacity was connected up to a 4-volt set of the same capacity, to charge them. Immediately the circuit was completed the current was 15 amperes. We then replaced the 4-volt 10 ampere-hour accumulator by a 4-volt 30 ampere-hour size, the current in this case being 6 amperes. Lastly we took three large accumulators of the type used for electric lighting in a house circuit, and connected these up to charge two similar cells in the same set, so that, as before, we had 6 volts to charge 4 volts. In this case, owing to the large area of the plates and the internal resistance of the acid, the current was only 2½ amperes, though a current of 40 amperes would not have harmed the cells. It will therefore be seen that though no harm may be done in the case of cells having a large area, in small cells such as are used in motor-cycles or cars, with very small internal resistance, the current strength will be increased to an enormous degree if too much pressure in volts is available at their terminals.

Profile of the Gordon Bennett Course.

A golden rule to be remembered as a guide is as follows. When charging accumulators allow 2½ volts in the charging circuit for every 2-volt single cell to be charged, and on no account exceed this. When charging is carried out from an electric light circuit with lamps in circuit, no care of this sort need be taken, as the lamps act as an effectual resistance to prevent any possibility of excess of current, more care being needed to see that enough current is obtained than too much.

MESSRS. READ, HOLLIDAY AND SONS, LIMITED, Huddersfield, have sent us a pamphlet descriptive of the new motor spirit, "Motol," they have recently introduced. They claim it to be the result of many experiments made with a view to the production of the best possible spirit for use as a motive power. "Motol," is a carefully fractionated hydro-carbon of practically uniform boiling point, free from all objectionable odour, and which may be vapourised in the motor, under ordinary working conditions, to dryness. The new spirit is manufactured in two qualities, viz., S.G. ·680 "Motol" L, and S.G. ·700 "Motol" H.

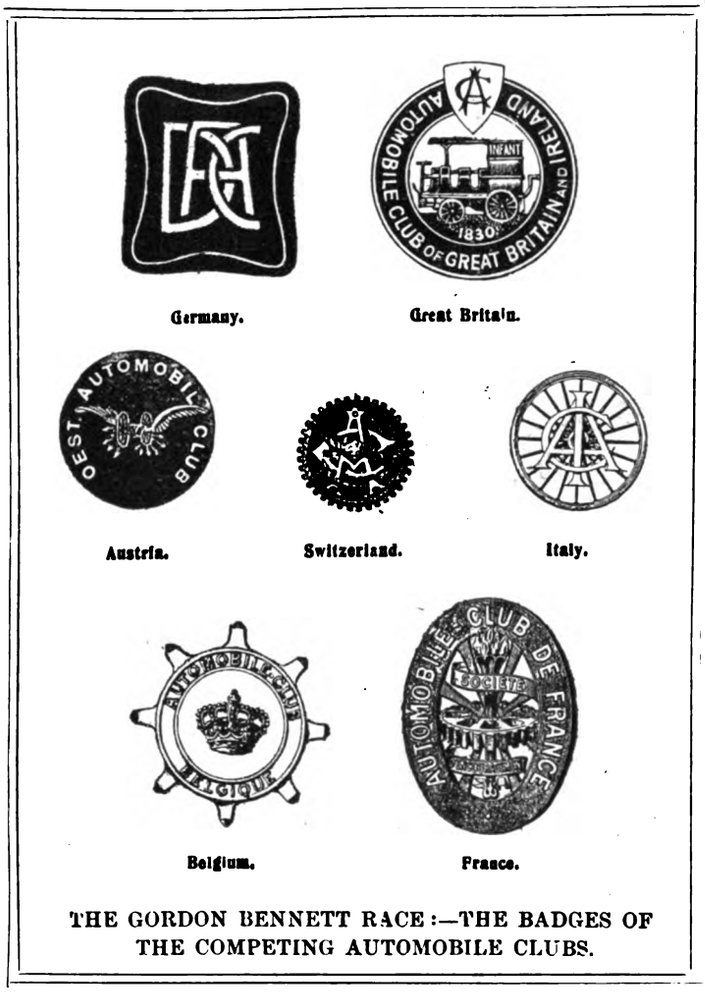
THE HILL-CLIMBING POWER OF MOTOR-CARS.

HILL-CLIMBING power is a characteristic of the motor car about which much interest rightly centres. It is a far more important consideration than the attainment of high speed, and to a certain extent is incompatible with it. The hill-climbing power of many cars has been sacrificed to the speed ideal, and oftentimes to considerations of simplicity and cheapness of construction of the change-speed gear. The capacity of any petrol car to ascend hills is dependent upon (1) the total piston displacement per stroke of the motor; (2) the efficiency of the transmission elements between the motor and the vehicle tyres; (3) the diameter of the driving wheels; (4) the gear, *i.e.*, the ratio of engine revolutions to driving wheel revolutions on the lowest gear, and (5) the total weight of the vehicle loaded.

The relation may be expressed thus:

Hill-climbing capacity $a \frac{D\,e\,g}{W d}$,

where D is the total piston displacement per stroke (account being taken of the number of cylinders); *e*, the total efficiency of transmission as previously defined; *g*, the gear, as specified above; W, the weight, and *d*, the diameter of the driving wheels. This formula may occasionally prove of assistance in comparing the performance to be expected of different vehicles, if like quantities are always expressed in the same units, but, like almost all mathematical expressions obtainable in the present state of the automobile art, it is really of very little value, owing to the following considerations: Piston displacement is a very poor criterion of the energy delivered per cycle by an explosion engine, because different motors of the same bore and stroke vary in regard to their compression spaces; the tightness of their valves and pistons; the degree of expansion of the charge; internal friction; the pressure and temperature at which the charge enters the cylinder; the quality of the mixture; the correctness of the spark position; the adequacy of the exhaust valves and their timing; the silencer back pressure, etc. As it is practically impossible to obtain all this data in suitable units, to determine what effect the different variables would produce and to incorporate them into any usable mathematical expression, we are without any means of comparing what different petrol engines are actually developing per stroke, except by a brake test.



Furthermore, the efficiency of transmission depends upon so many obscure conditions that it can never be determined with any exactness short of an actual test. The losses in clutches, in the tooth friction of spur and bevel gears, in the bearings of transmission shafts and axles, and in the sprocket and chain gear and universal joints are values which vary with the speed and torque existing in the parts concerned, with the alignment of shafts, the correctness of tooth outlines and with the lubrication. Very few, if any, tests of transmission gear efficiencies have been made and given to the public. The transmission efficiency obtained by test for a certain machine when running at a certain speed, of a certain gear, with a known absorption of power, is not necessarily exactly that of the same vehicle when a greater or less amount on power or speed is involved, and is certainly not the same when running on a different gear, owing to there being more or less gears concerned, running at greater or less speeds, and for other reasons. The transmission efficiencies of different individual machines of the same make and model may be widely different, owing to deformation of the tooth outlines of gears or through incorrect pitch, the looseness and consequent misalignment of shafts, or any undue tightness in their bearings, the dragging of idle clutch bands, the stretching of chains, so that their pitch is no longer correct, and differences in lubrication.

Different types of machines, employing widely diverse transmission systems, would naturally be found to possess efficiencies differing very markedly. The American type of light two-seated car, when running on the high gear, must possess a very high efficiency of transmission, as the driving sprocket forms virtually a part of the engine shaft, and there should be hardly any loss between the engine and the tyres, except the chain and sprocket friction, as the rear axle generally runs on ball or roller bearings. Probably no type of automobile which has ever been built wastes less power than such a machine on the high gear. When, however, it is running on the low gear, not much can be said in commendation of its transmission efficiency, as the planetary gear is too often made in the very cheapest manner, and the small internal pinions are believed to constitute an arrangement excessively wasteful of power, although this belief may not be true of all planetary combinations, and in the absence of published tests cannot be definitely asserted. It is at least true that in no type of automobile is the good efficiency of the high gear so strongly in contrast with the inferior low gear efficiency as in the typical American runabout.

However, petrol cars in general have unfortunately a lower efficiency of transmission on the lower gears than on the high speeds. This, while apparently inevitable, is unfortunate for the reason that it is just when a car is operating upon its lowest gear, negotiating a steep hill or a very bad piece of road, that one needs the highest net horse power that the engine can furnish to the wheels, and at that very time we have to be satisfied with the lowest, owing to the gears that are in action and the very powerful torque which is acting upon the transmission shafts tending to increase friction, and to force them out of alignment.

There is no such difference between the high gear and low gear efficiencies in the case of the sliding gear and individual clutch systems as exists among the planetary systems, for in the two systems mentioned there are always the same number of gears in mesh (not considering the reverse), and the change of gear merely produces a change in the relative speed of the driving and driven spur wheels. Furthermore, the sliding gear and individual clutch transmissions are generally more substantially built and less shaky and springy than some of the planetaries.

(To be continued.)

THE GORDON BENNETT RACE:—THE BADGES OF THE COMPETING AUTOMOBILE CLUBS.

MOTOR CYCLING NEWS.

To the end of May 578 foreign motor-cycles had this year been imported into this country; their value, together with those of parts, amounted to a total of £28,646.

◆ ◆ ◆

On Monday last Signor Horace Toscano left Messrs. Werner and Company's depot in Regent Street, W., *en route* for Newhaven, where he intended to catch the night boat for Dieppe. His object is to establish a motor-bicycle record between London and Rome, and to beat the record between Paris and the latter city. He hopes to accomplish the journey of 2,000 kilometres in six days.

◆ ◆ ◆

The second annual hill-climbing contest of the New York Motor-cycle Club was held on the 30th ult., on Fort George Hill, New York, and brought out nineteen competitors, all of whom rode American-made machines except one, a French 2-h.p. Griffon. The hill is 2,812 feet long, the maximum grade being a little more than eleven per cent. The best time up the hill was made by a boy named Fox. He did it in 59 4-5 seconds, but was disqualified for violating the rules by using the Indian machine of another contestant, that of F. W. Rogers, who won the first prize, his time being 1 min.; G. H. Curtiss on a Hercules was second in 1 min. 2 4-5 secs.

◆ ◆ ◆

A Rexette carrying Five Passengers up Stoneleigh Hill, near Coventry.

◆ ◆ ◆

The following is the official list of the riders completing the distance from London to Edinburgh within twenty-four hours, and thus qualifying for the gold medals and special badges offered by the Motor Cycling Club. This list is compiled after the committee have investigated each claim. Messrs. T. H. Arnott, C. E. Bell, C. W. Brown, D. E. Brown, A. Candler, H. E. Cowles, J. F. Crundall, H. J. Densham, Chester Fox, C. W. Hacking, J. Van Hooydonk, T. Hooydonk, H. P. Maffert, W. J. Milligan, J. H. Reeves, W. A. Sale, F. Silver, L. N. Young, W. H. Wells, H. Williamson, and A. C. Wright. It will thus be seen that twenty-one riders have qualified. Twenty-two were reported at Edinburgh, but one has been disqualified.

◆ ◆ ◆

The 1,000 miles trial of the Auto-Cycle Club has been fixed for Monday, August 15th, and the following days. Last week a meeting was held at the Auto-Cycle Club, with Mr. Robert Todd in the chair, to discuss the plans, and after a variety of opinions had been expressed a majority voted for the 1,000 miles being covered in runs of seventy-five miles out and home. Last year the wet weather and the twelve miles an hour regulation did much to make the event a particularly arduous one, but with a twenty miles an hour rate of speed and fine weather there should be a really satisfactory test possible on the proposed lines. The Trials Advisory Committee is fully representative of the trade and the Auto-Cycle Club and the forthcoming event will be something of importance in the motor-cycle world.

◆ ◆ ◆

The final test for the Edge trophy was held on Saturday last by the Motor Cycling Club between Redbourne and Stony Stratford. Of the twelve competitors left in the contest eleved faced the starter at the early hour of 3 a.m. As compare with the first round a concession was made in allowing the riders to dismount at the turning points. Eight of the riders finished the first hundred miles and six completed two hundred miles. Some had, however, exceeded the maximum speed limit set out in the rules, and were thus liable to be disqualified. Amongst these were Wells, T. Hooydonk and Silver, who decided not to continue. This left in only Johnson, Hulbert and Mays. Unfortunately the latter was not able to start on the third 100 miles owing to the simple matter of a temporarily flooded carburettor. On starting for the last fifty miles it was observed that the back tyre of Johnson's 2¾-h.p. Humber was leaking. Nevertheless he achieved second place in the contest, the winner being F. Hulbert on a 2¾-h.p. Hulbert-Bramley.

◆ ◆ ◆

The Catford Cycle Club held their 18th annual hill-climb at Westerham on Saturday last. The course was from below the cross-roads up to the danger-board, the total distance being 1,200 yards. The motor-cycle events, which were run off first, were divided into two classes—machines having a cylinder capacity of 70 by 70 mm., and those over this measurement but under 80 by 80 mm. Competitors were allowed a running start or a push-off, and pedalling was permitted. In the light class only three riders started, while but two, H. Tyler (Humber) and A. A. Chase (Chase), reached the top, in the respective times of 2 min. 32 3-5 secs. and 2 min. 33 secs. In the heavy class twenty-six competed, including a Cosi car, a two-seated vehicle intended for attachment to a motor-bicycle. The winner was A. A. Chase (Chase), 1 min. 43 secs.; W. W. Genn (Eland) being second in 1 min. 43 3-5 secs.; F. W. Chase (Chase), third in 1 min. 50 secs.; and J. J. Leonard (Lurquin-Coudert), fourth in 1 min. 52 2-5 secs.

◆ ◆ ◆

A meeting of motor-cyclists connected with the Lincolnshire Automobile Club will be held on the 22nd inst., to consider the formation of a motor-cycle section.

◆ ◆ ◆

The final round of the Peterborough Motor-cycle Club's reliability trial was to be brought to a conclusion on Tuesday. Three hundred and seventy-five miles had been covered by both the men left in, B. C. Holmes (3½-h.p. Vinco Minerva), and T. Woodman (3½-h.p. Lightstrung). On Tuesday morning they rode to Lincoln and back to Peterborough, a hundred miles, but, both being left in, went another hundred miles to Hitchin and back. As both were left in after 575 miles, it was decided to divide the prize. Later this was altered, and a run to Folkingham and back arranged

◆ ◆ ◆

On Saturday last the Motor-Cycle Union of Ireland held the second of their series of speed trials on the Velvet Strand at Portmarnock. The programme was made up of three events. Two of these were confined to members of the Union and were run over a distance of one mile from a standing start. The third event was open to non-members as well, and was run over a distance of one kilometre (1,096 yards) with a flying start. Speeds equivalent to thirty-seven miles an hour were accomplished for the standing start classes, and in the flying kilometre the time of the winner was equal to about 42½ miles per hour. Details of the events are appended:—In Class A, F. A. Wallen (Triumph) was first, F. G. Drury (Triumph) being second. In Class B the final resulted in C. B. Franklin (F. N.) being first, H. S. Huet (Minerva) second, and F. A. Wallen (Triumph) third.

Class C, the open event over a kilometre with a flying start, attracted fourteen entrants, the first six being:

L. R. Oswald Sealy, 84 by 84, Excelsior, 54 1-5 secs., 1;
C. B. Franklin, 70 by 80, F. N., 54 4-5 secs., 2;
H. S. Huet, 82 by 82, James, 55 3-5 secs., 3;
F. A. Wallen, 70 by 76, Triumph, 56 4-5 secs., 4;
B. Gannon, 3½-h.p. Riley, 57 2-5 secs., 5;
R. W. Stevens, 76 by 76, Phœnix, 59 2-5 secs., 6.

HERE AND THERE.

THE Duke of Leeds has just acquired a 16-h.p. Wolseley.

THE County Garage Company, of Carlisle has every facility for the repair and overhaul of cars.

A RACE meeting is being organised by the Irish Automobile Club for September on the Portmarnock strand.

THE De Dion-Bouton excursionists will pay a visit to Sir David Salomons at his seat at Tunbridge Wells in July.

MR. A. DUNCAN, secretary of the South Australian Automobile Club, has completed a motor-car journey of over 600 miles, between Adelaide and Melbourne, in the excellent time of thirty-eight hours.

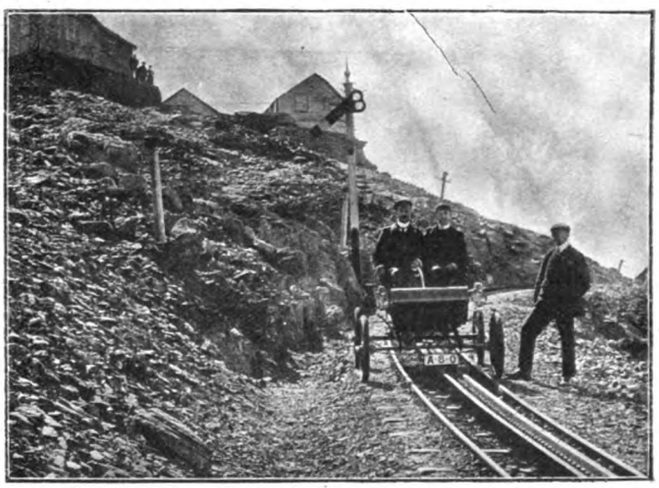
THE Glamorgan Roads and Bridges Committee on Thursday decided to purchase 500 warning posts, to be erected at dangerous spots on the county roads for the benefit of motorists. The cost, it is estimated, will be about £2 each.

AT the meeting of Wilmslow Council Mr. Wood said the way motor-cars flashed round corners was most dangerous, and action should be taken to limit the speed. The Council unanimously decided at once to approach the County Council on the speed limit.

A PASSENGER and goods service by motor-car has lately been started between Camuy and Aguadilla, Porto Rico.

THE Laffrey hill-climbing trial, which has been held for three years by the Automobile Club Dauphinois, will not take place this year.

A LIGHT racing car fitted with an eight-cylinder air-cooled engine has just been completed by the Marion Motor Car Company, Indianapolis, U.S.A.



THE exports of automobiles and parts from the United States during April last amounted to £47,351, as compared with only £26,936 in the corresponding month of 1903.

A COMPANY has been formed in New York with the title of the Niagara Falls Automobile Transit Co., to take tourists and excursion parties by motor-car to all points of interest near Niagara Falls.

MESSRS. J. W. BROOKE AND COMPANY, LIMITED, of Lowestoft, have sent us a photo of a racing motor-boat, the "Baby," which they have built for racing purposes on the Norfolk Broads. The vessel, which has proved remarkably fast, doing twelve knots, for such a short low-powered boat, is only 25 ft. long and is fitted with a three-cylinder Brooke 14-h.p. petrol engine.

Photo by] Half Way Up.

At the Top. [Rowlands, Llandudno.

CLIMBING SNOWDON (*See page* 338).

A 250-H.P. racing car is reported to be in course of construction at Detroit, U.S.A., "with a view of setting the world's record on the straight-away and on the tracks so far below the present figures that they will last indefinitely."

MESSRS. FRISWELL, LIMITED, have opened an upholstering and trimming department at their establishment in Albany Street, N.W., and are now in a position not only to carry out repairs to cars, but also to repaint and varnish, and re-upholster the bodies.

A BILL was recently introduced in the Legislature now in session in Quebec providing that every person driving an automobile along any public thoroughfare shall at the request of or upon signal by putting up the hand from a person driving or riding a restive horse or horses or driving domestic animals, whether in the same or in an opposite direction, stop the automobile immediately and remain stationary, and upon request shall stop the engine so long as may be necessary to allow the horses or domestic animals to pass. A penalty not exceeding £4, or in default of payment imprisonment not exceeding one month, was provided. The bill was amended in committee by striking out the clause to compel drivers of automobiles to immediately stop their motor-car, etc., and by fixing the rate of speed on country roads at eight miles an hour. It was then read the third time and passed.

MESSRS. WALSH, NICHOLLS AND COMPANY have opened the Britannia Works, Sedgely Street, Wolverhampton, for the manufacture of bonnets, radiators, tanks, lubricators, etc. The works will be under the supervision of Mr. James Walsh, late of Coventry.

AMONG the American motorists who will tour Europe this summer is Mr. Windsor T. White, president of the National Association of Automobile Manufacturers, and vice-president of the White Sewing Machine Company, the makers of the White steam car.

THE Birmingham Motor Express Company intend to run a ten minutes' service of motor omnibuses between Bearwood and the City. The company will then possess licences enabling them to maintain a five minutes' service between New Street and the top of Hagley Road, six vehicles going to the Bear, and six to the King's Head.

A MEETING of the committee appointed at a recent public meeting in connection with a proposed Aberchirder, Huntly and Cornhill motor-car service was held in the Aberchirder Town Hall last week. Provost Auchinachie presided. Petitions, containing about 1,100 signatures, in favour of the service, were submitted, and the clerk was instructed to forward them to Mr. Moffatt, general manager of the Great North of Scotland Railway.

Digitized by Google

leather brake band on my "Ariel" tricycle owing to grease, and on Messrs. Allen's advice have had it replaced with "Mynerine," and it is now perfectly reliable.

I have no interest in "Mynerine," but it is the best material that I have come across for its purpose, and therefore the foregoing may be of service to your correspondent and others who have had trouble in the same direction.—Yours truly,

T. GOLDSWORTHY-CRUMP.

A NEW METAL FOR TANKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may interest readers of the *Journal* to know that a new metal for petrol and water tanks has just been introduced. It consists of a steel plate covered on both sides with copper, and possesses all the stiffness of the steel with the non-rusting properties of the copper. For extreme lightness, aluminium covered with copper may be had, and may be soldered with ease. These metals or tanks to any design in them may be had from Messrs. Berrie and Company, 13½, East Howard Street, Glasgow. I may say that I have no interest whatever in this firm, but have found the manager most attentive and intelligent in carrying out designs for my experimental work.—Yours truly,

WALTER JAMIESON A.M.I.E.E.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have been much interested in the correspondence that has recently taken place in the columns of the *Journal* re the above. We have driven steam cars for about two years and certainly think they are preferable to petrol cars for many reasons. They are certainly far better hill climbers and more reliable on the road. We consider that next to the White steam car, which is a very expensive car, the Toledo is by far the best; it has a semi-flash boiler and there is therefore no trouble with the tubes, as there is with an ordinary tubular boiler, and steam is generated much more rapidly. This car is built much more strongly than most other steam cars, and is therefore a more reliable touring car. We have run 25 miles on one supply of water and 75 miles on one supply of petrol. We think a petroleum burner would be an advantage, but we have up to the present time failed to hear of one.—Yours truly,

THE WATFORD ENGINEERING WORKS.

IRREGULAR IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to H. Douglas' letter in the last issue of the *Journal* I think that he is somewhat mistaken in surmising that the car in question ran the whole of the distance mentioned, viz., twenty miles, on 1·5 volts, as the accumulator evidently stood at a much higher voltage when starting the run. I have known instances when an accumulator showing 4 volts. has been reduced to 2·5 within a distance of five miles, and this without a short circuit. Generally the discharge is very rapid when the voltage becomes reduced, and in all probability the greater part of the run was done on at least 3 volts. But even this would need a coil that would take a very small amount of current. I can remember an instance of trying a coil, made to run on 2 volts only, but never with any great success, owing to the engine misfiring greatly.—Yours truly,

T. J. H.

TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may be of interest to some readers of the *Journal* possessing De Dion pattern engines designed to work with non-trembler coils to know that a trembler coil can be used without the trouble and expense of fitting a new contact make. This may be done by bending the existing contact blade so that it presses deeper into the cam notch and screwing down a spare blade on the top of the one in actual use, so as to get double the contact pressure. This ensures a firm contact, and does away with all possibility of misfiring. I recently made this alteration to a 4½-h.p. De Dion engine as a temporary arrangement, but found it so satisfactory that I shall make no further alteration.—Yours truly,

F. J. SIMPSON.

INCONSIDERATE DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to make, through the columns of your *Journal*, an appeal to motor-car drivers who use the Bath road to drive with greater consideration and care when passing through villages, particularly those between Reading and Newbury. There have been several well-grounded complaints of excessive speed when passing through these villages, and quite recently several accidents have occurred.

I also notice a growing tendency to an insufficient use of the horn, the neglect of which is a source of great danger when approaching the many cross-roads and blind turnings in this section of the road.

The practice of obscuring the back identification plate by hanging a spare tyre cover to the back of a car should be put a stop to by owners, being clearly employed with the object of avoiding identification when committing offences against the Act.—Yours truly,

W. WARING.

AHOY POLISH.—In reply to the query in last week's issue for the address of the makers of the Ahoy polish, several correspondents have sent us the address of the Hansa Chemical Works as 46–48, Sun Street, E.C.

THE DE DION VOITURETTE.—One of the readers of the *Journal* in Freiburg (Breisgau) writes:—"As great interest is shown in England in light two-seated cars, maybe, through your kindness, I might learn by means of the *Journal* what the experience is in your country with the 6-h.p. Dion-Bouton voiturettes with only two speeds, in hilly districts." We should be glad to have the experiences of users of this popular vehicle.

BUCHET MOTORS.—Replying to J. F. Gardner, the address of the makers of the Buchet petrol motors is Les Usines Buchet, 15, Rue Greffulhe, Levallois-Perret, France.

THE "G.A." SPEED REGULATOR.—In answer to T. W. L., the agents in this country for the apparatus described in the last issue of the *Journal* are Messrs. Lawrence and Company, 132–138, Latimer Road, London, W.

CUTS IN TYRES.—A correspondent asks if there is any compound on the market for readily filling up small cuts in the outer covers of motor-car tyres.

CHARGES AT HINDHEAD.—"Tourist" writes:—"I have no doubt that many of your readers will be glad to know that the proprietor of the Beacon Hotel, Hindhead, charges 1s. 6d. for a whisky and soda, and 1s. 8d. per gallon for petrol, which they admit is of higher specific gravity than ·720."

ANONYMOUS LETTER TO CHIEF COMMISSIONER OF POLICE.—The proprietors of *The Motor-Car Journal* present their compliments to the writer, and beg to inform him that they consider he is an unmitigated blackguard, whose action is likely to do injury to a valued and honourable member of the Metropolitan Police Force.

CLUBS AND ASSOCIATIONS.

BERKSHIRE.

THE second of the series of summer "meets" arranged by the Berkshire Automobile Club was held on Wednesday of last week, at Beenham Grange, near Aldermaston, the residence of Lieut.-Colonel W. Waring, hon. sec. of the club. Among those who accepted invitations were Major Thoyts, the Rev. J. D. and Mrs. Ouvry, Capt. E. F. Rhodes, Mr. and Mrs. E. R. Portal, Mr. H. Hill, Dr. and Mrs. Norman Joy, Mr. J. G. Carew-Gibson, Dr. A. Gordon Paterson, Dr. and Mrs. Roalfe-Cox, Miss Wyld, Messrs. C. H. Nash, J. M. Napier, J. S. Scott Smith, E. A. Potter, E. Shrapnell Smith, E. A. Barry, L. Barwell, Dr. Bruce Porter, C. H. Dodd, Gladwin-Errington, E. S. Garcke, J. F. Ochs, R. W. Powys-Lybbe, and Russell Miller. The afternoon was pleasantly spent in the pretty gardens and grounds of Beenham Grange, and in a run up to Beenham House, the residence of Mr. Henry Waring, who conducted the visitors over his famous stables. Returning to the Grange, the visitors were entertained at afternoon tea by Colonel and Mrs. Waring, and soon after the gathering dispersed.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

AN extraordinary general meeting of members of this association was held at the offices, 24, Cecil Chambers, Strand, W.C., on Friday, the 10th inst. In the absence of the president, Lord Shrewsbury, Mr. E. Lisle was voted to the chair. The fresh articles of association were submitted and approved, the resolution being moved by Mr. J. D. Siddeley, seconded by Mr. D. M. Weigel, and supported by Messrs. Charles Friswell and Charles Holmes. It was carried unanimously.

The new regulations, *inter alia*, widen the power of the association as regards protecting the trade against alleged master patents, and increase the number of the committee, which will now be styled the council. Power is also taken to appoint a Finance and General Purposes Committee.

The date for the confirmatory special meeting of members was discussed and provisionally fixed for June 27th.

A vote of thanks to the chairman was accorded on the motion of Mr. Geo. Monro, jnn., seconded by Mr. J. T. Overton.

EAST SURREY.

THE opening run of the season of the above club was held on Saturday, June 4th. The members were invited to lunch at Blackstone, Red Hill, the residence of Mr. J. B. Purchase, and about fifty members availed themselves of his hospitality. After submitting to the ordeal of the camera, the members proceeded by various routes to Timberham, Charlwood, the residence of Mr. F. E. Charles, who entertained the party to tea. After spending a very pleasant afternoon the members began to leave for their respective destinations, with many remarks of appreciation at the amount of trouble so cheerfully undertaken to make the outing a success. Among those who took part in the run were:—Major Kingsley O. Foster (President), Mr. and Mrs. J. B. Purchase, Mr. and Mrs. E. K. Purchase, Mr. and Mrs. F. E. Charles, Mr. C. H. Whittington, Mr. and Mrs. A. Gunning Keen, Mr. J. Underhill, Mr. and Mrs. G. H. Bowden, Mr. H. Hughes, Mr. and Mrs. C. F. Wakefield, Mr. F. W. Ellwood, Dr. J. Hewetson and Mr. Frank Watney, Mr. H. Rosling, Mr. A. W. Makovski, Mr. J. Humphrey, Mr. and Mrs. W. Cleaver, Mr. W. F. Garside, Mr. D. J. Barry (Hon. Sec.) and Mrs. Barry.

LEICESTER.

THE Leicester Automobile Club had a run on Saturday to Stratford-on-Avon. The route was through Coventry, Kenilworth, and Warwick. Stratford was reached in good time, and lunch was had at the Red Lion Hotel. In the afternoon a thorough inspection of the town took place. An adjournment was made to the hotel at five o'clock for tea. Mr. King acted as president in the absence of Mr. E. G. Mawbey, whose recent accident and illness were much deplored by the members. A telegram was sent to him at Hunstanton conveying the good wishe of all present at Stratford. A start on the return journey was made at about 6.30, and halts were made at Kenilworth and Warwick to enable the castles at both places to be visited. The run both out and home was entirely devoid of any untoward incident, and the members were well satisfied with their pleasant experience.

LINCOLNSHIRE.

CAPTAIN J. A. COLE, J.P., presided over a meeting of the committee of the Lincolnshire Automobile Club at headquarters on Wednesday week. Dr. Gilpin, Mr. Cyril Nelson, Dr. Lowe, Mr. W. R. Pennell, and Dr. Cragg (hon. secretary) were also present. The following new members were elected:—Mr. W. Haddon Owen (Louth), Mr. R. H. Fowler (Louth), Mr. R. A. Pelham (Gainsborough), and Mr. R. Connell (Gainsborough). Others proposed for election were:—Mr. Hugh Peacock (Gretford Hall), Mr. T. Ives (Lincoln), Captain E. Tatchell (Grantham), and Mr. F. H. Atkinson, M.D. (Grimsby). The question of alcohol being a duty free spirit for commercial purposes was brought up by Dr. Lowe, and it was stated that the various Chambers of Commerce and Agriculture were showing an interest in the matter.

A letter was before the meeting from the Motor Union concerning the question of universal lighting of vehicles, and the model bye-laws were considered. The secretary was instructed to reply stating that the club was in sympathy with the movement.

For the convenience of members attending the County Agricultural Show at Grimsby, it was decided to communicate with the secretary asking for the provision of a suitable enclosure for the cars on the show ground, where they could be left for inspection by the public.

A run to Wisbech, on the invitation of Mr. Goddard Jackson, was under consideration, and was deferred for a time, as were other fixtures at the end of the season.

Photo by] The First Meet of the Stockton and District Automobile Club. *[E. Thirlwell and Co.*

EASTERN COUNTIES.

THE second run for the season of the Eastern Counties' Automobile Club took place on Saturday afternoon, and was from Ipswich to Felixstowe. At three o'clock a fine array of automobiles was drawn up in Northgate Street, almost opposite the residence of the hon. secretary of the Club (Mr. C. K. Moseley), who had made efficient arrangements for the occasion. The motorists present included Messrs. Godolphin Milbank (10-h.p. Argyll), John Bennett (12-h.p. Ryknield) O. T. Cooke (8-h.p. Darracq), G. C. Ching (7-h.p. Primus), E. C. Sayer (Royal Enfield quad), C. D. Castell (8-h.p. Rex), B. B. Booth (9-h.p. De Dion), Dr. H. L. Heath (3½-h.p. Bat), J. R. Egerton (8-h.p. De Dion), Dr. Longworth (2¾-h.p. Rex), C. J. Edwards and H. Kettle, both with 10-h.p. Georges Richard. The road was good as far as Walton, where it became bumpy and stony, and the party had a most enjoyable run to Felixstowe, which was performed to the fraction of a second within the legal limit in regard to speed. Proceeding at once to the Felix Hotel, the motorists and their friends partook of tea. A run followed as far as Mr. Felix Cobbold's house, back by the front at the top of the cliffs, and thence round the Ordnance Hotel and along the Undercliff Road to the foot of Bent Hill, where a hill-climbing test was essayed. It was a stiff and difficult test, moreover, for no "run" could be got at the steep and winding ascent, so that a start had to be made from "stop." Mr. Moseley "reversed up"; Mr. Egerton did likewise, carrying four passengers; and most of the others succeeded in making the climb, though two had to be pushed from behind. Only one failed altogether.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Clerkenwell	Driving to common danger	£5.
Shoreham	Insufficient lighting of plate	11s.
Brighton	Dangerous speed	40s.*

*Notice of appeal given.

RULES FOR SMALL CAR TRIALS, 1904.

1. The trials are to be under the Competition Rules of the A.C.G.B.I., and will consist of twelve non-stop runs of approximately fifty miles each, starting from and finishing at the same point. A fifty mile non-stop run shall be made in the afternoon, for six days, a total distance of about 600 miles, and every car in order to be eligible for any award must complete the whole of the 600 miles.

The trials shall be confined to cars costing not more than £200.

There shall be four classes :—

Class A.—Not exceeding £125.
Class B.—Exceeding £125, but not exceeding £150.
Class C.—Exceeding £150, but not exceeding £175.
Class D.—Exceeding £175, but not exceeding £200.

No fore-carriage, tricycle, or quadricycle shall be allowed to compete in the trials, and the decision as to what is a fore-carriage, tricycle, or quadricycle shall rest entirely with the committee.

Entries will only be accepted from manufacturers or their nominees. No manufacturer shall enter directly or indirectly more than two cars, which, unless there is more than 20 per cent. difference in volume swept by the piston, shall then be run as a team; that is to say, each car shall be awarded marks equal to the average marks gained by the two cars.

The entrance fees for the various classes shall be as follows :—

Class	A	£10
„	B	£12
„	C	£14
„	D	£16

The entrance fees shall be paid not later than 12 noon on Saturday, July 23rd, 1904. After that hour the entrance fees shall be increased 25 per cent. per week or portion of a week. No entry can be received after 12 o'clock on Saturday, August 13th, on any consideration.

Owners shall state on the entry forms the bore and stroke and number of cylinders, and after the trials these measurements may be checked by the judges; the cylinders shall be opened up for this purpose by the owners.

If possible, there will be a timed hill climb on every day of the trials. A car carrying more than two passengers throughout the whole of the trials shall be credited with an increase in speed over that actually shown on the hills amounting to 12½ per cent. for each such additional passenger carried.

The Committee will give awards on the recommendation received from the judges appointed by the Club, as follows :—

(*a*) The first award in respect of non-stop runs in each class shall be given to the car which makes the greatest number of non-stop runs. If there be more than one car or team in a class making the same number of non-stop runs, the award shall be given to the car or team which is credited with the highest average speed on the hills in the trials.

(*b*) A car which occupies more than twenty minutes before any run in repairs, replacements, or adjustments is precluded from receiving any award in the non-stop competition.

(*c*) A car which is stopped for more than twenty minutes for repairs, replacements, or adjustments on the road during any one run is precluded from receiving any award in the non-stop competition, except in case of repairs wholly connected with tyre trouble, which shall cause that car to forfeit its non-stop for that run, but shall not disqualify it for the non-stop award.

(*d*) Cars not ready to start by 11 o'clock in the morning for the first run of the day or by 3 o'clock in the afternoon for the second run of the day and cars not completing the 100 miles by ten minutes past 7 o'clock in the evening of every day for Classes B, C, and D, or by 8 o'clock for Class A, will be disqualified from all awards, and must take no further part in the trials.

The awards for the non-stop trials shall consist of certificates in the form of a report of the performance in respect of every competing car which completes the whole of the distance of the trials. The certificate shall state the order of merit of the car in its class.

There shall be further awards, to be given at the discretion of the judges, which shall consist of gold, silver, or bronze medals, accompanied by a certificate stating the ground upon which the award is made and the class in which the car is entered.

OBSERVERS.

Every vehicle will carry an official observer, for whom a front seat must be provided, and the cars shall be under observation continuously throughout the whole period of the trials.

The club will, as far as possible, obtain independent hon. observers, but the manufacturers must be prepared to furnish one observer in respect of each car entered by them.

All competing vehicles shall be within the gates of a place to be hereafter named by 12 o'clock noon on Saturday, 27th August, 1904. Any car arriving at the gates after that hour shall only be allowed to take part in the trials on payment of a fine of £10 up to 5 o'clock on the evening of that day, and no car arriving at the gates after that hour will be allowed to take part in the trials under any consideration whatever.

The first run shall start at 8 o'clock on the morning of Monday, August 29th, 1904, and the last run shall be on Saturday, September 3rd, 1904.

CLAIM AND COUNTERCLAIM.

AN action was heard before the Lord Chief Justice in the King's Bench Division, on the 7th instant, brought by Mr. W. Mourilyan, of Richmond, against Mr. Joseph Wass (trading as Wass and Company), motor-car repairers and dealers, of Eton Street, Richmond, for wrongfully using the plaintiff's car while the same was in the defendant's care at garage.

Mr. T. Hollis Walker appeared for the plaintiff and Mr. Harper for the defendant.

After witnesses had been called on both sides the Lord Chief Justice, in delivering judgment, said he had a very strong suspicion that the car had been used more for Mr. Wass's purposes than the case made out by Mr. Harper would admit. His Lordship was, however, not satisfied that the car was in a substantially worse condition after it had left the defendant's control. His Lordship entered judgment for the defendant for the amount of his counterclaim for goods supplied and repairs done.

POLICE TRAPS.

THE Kingston police have set up different traps for motorists on the Kingston side of the Reservoirs on the Portsmouth road. There are at present two, one from Cleveland Road to Uxbridge Road, and another one from Palace Road to St. Leonards Road, and *vice versa* in each case.

IT was very interesting the other day to watch the making of a police trap on the Saint Albans road, about three-quarters of a mile beyond Barnet, and this side of the sign post pointing "5½ miles to Elstree." The inspector and policeman in uniform, and the individual in civilian dress helping with the tape measure, were somewhat disconcerted when we watched their operations. Due care in passing the point should be observed by motorists.

CASES DISMISSED.

BEFORE the Lowestoft County Bench, Mr. Harold Chamberlin, solicitor, Great Yarmouth, was summoned "for that he being the driver of a motor-car unlawfully did drive at a speed exceeding twenty miles an hour at Pakefield on May 23rd." A similar summons was preferred against Mr. Hy. Melville Simons, 41, Cadogan Gardens, London, S.W., in respect to the same date. P.C. Clarke said on the day in question, about 2.53, he was at his station at Pakefield for the purpose of timing a motor-car. A green car passed his station at 2.53. That morning witness timed his watch by the Pakefield Post Office clock, and later on he met P.C. Bloomfield, and they compared watches, and found they were the same. At 7.30 the same evening witness met P.C. Bloomfield again, and on again comparing watches they were found to be alike. Witness had measured the distance from Kessingland police-station to Pakefield and found it to be 2 miles 303 yards. P.C. Bloomfield assisted in the measurements, which were taken by a 20-yards line. After hearing evidence and Mr. Chamberlin's defence, the Bench retired, and on their return Col. Leathes said they felt that there was not sufficient evidence on the question of timing. It was not for the Bench to suggest stop watches, but it was for the police to suppress the fast driving that continually took place. The case against Mr. Simons was then withdrawn.

MR. CLAUDE WATNEY was summoned by the Guildford police for failing to give warning of his approach in accordance with the regulations of the Local Government Board. The prosecution stated that he passed in between two cars going at double the speed of either of them and dashed past four cross-roads outside Guildford without giving any warning. Mr. Staplee Firth defended and the case was dismissed.

MOTOR-CAR OR MOTOR-CYCLE.

A CASE of considerable interest to motorists has been heard at Highgate Police Court, when Mr. Thomas Belvoir, of Melrose House, New Southgate, N., appeared in answer to three adjourned summonses, charging him, as the driver of a motor-car, with carrying an identification mark which did not conform in lettering and numbering with the provisions set out in Schedule 4 of the Motor-Car Order of 1903; with driving a car which was not registered; and with fraudulently using a mark for identification. It was alleged that defendant held a licence to drive a motor-bicycle or tricycle, and that he converted the motor-tricycle (still bearing the plates intended for a motor-tricycle) into a motor-car by removing the front or steering wheel of the tricycle and affixing a fore-carriage to it. The defendant contended that the machine was not a motor-car, and the summonses were adjourned in order that the Bench might see it. He now produced the machine. Sir Francis Cory-Wright said he understood the defendant's contention to be that, if the machine in its present condition was a motor-car, he was guilty of the three charges. The defendant replied that that was so, with the exception that he had no fraudulent intention.

Sir Francis Cory-Wright said the Bench found defendant guilty on the first summons. Without going into the question of whether the machine was a motor car or not, it was a carriage with four wheels, and as such should have had a plate with letters 3 in. high, which it had not. They found him guilty on the second summons because, though it was true that he had registered a bicycle, the machine he was riding was not in substance and in fact the machine which was registered. They also found him guilty on the third summons. On each summons he would be fined 20s. and costs, making a total of £4 7s.

THE

Motor-Car Journal

VOL. VI.] LONDON, SATURDAY, JUNE 25, 1904. [No. 277.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AGAIN the Gordon Bennett cup is within French territory, and motorists will rejoice at the way the coveted trophy is travelling through Europe. France was the first holder; next Great Britain; then Germany; now it goes again to France, and in following the sequence it should be a British victory next year. Those who believe in omens may take comfort in that reflection. We would congratulate both M. Thery and his country upon his victory—a victory all the more conspicuous by the way in which the holder of the cup struggled to retain his position. Later the rules of the contest may be reconsidered, but the immediate duty of all sporting Englishmen is to raise the cap with "Vive Théry" in honour of a driver whose skill came as well through the test as did the character of his car.

◆ ◆ ◆

Panic Headlines.

IT is really time that newspapers like the "Express," that have rendered service to motoring in the past, should be a little reasonable in the headlines with which their columns are embellished. On the morning of the great race in Germany our contemporary came out with the headlines

"MOTOR RACE OMENS."
"TRIAL SMASHES AT HOMBURG."
"FIRST DEATH."

Such a sensational introduction to the event of the motoring year is hardly likely to do the sport any good, and, fortunately, the actual incidents of the day proved how false was the impression apparently sought to be conveyed. Among the few motorists who seemed to have seen the lines some indignation was felt, and had such absurd innuendoes appeared in any recognised journal of opinion official notice might have been taken of the incident.

◆ ◆ ◆

No Royal Road.

HIS MAJESTY THE KING and party arrived at Wellington College half-an-hour late on Saturday last, owing to two breakdowns. The more serious delay occurred in Church Lane, East-hampstead, and was due to ignition failure. Three royal mechanics wound the starting handle without result, while the entire Royal party looked on, smilingly assisted by a group of children who had gatherad to cheer their progress. Some yards down the road a master was with difficulty restraining thirty odd boys, whose loyalty had to remain dormant that extra twenty minutes, though their curiosity was unassuaged. The King and Queen, with the Archduke John, had just entered the car of the Prince and Princess of Wales, who stood disconsolate on the road, when the engine of the Royal car suddenly responded and a re-transfer of passengers was effected. The Queen did not change back again, but completed the outward trip, and made the whole of the run back to Windsor in the Prince's car. Notwithstanding these mishaps, at least three hours were saved over any other method of travel which might have been adopted.

Encouraging Amateurs.

A HILL-CLIMBING trial will be held by the Yorkshire Automobile Club at Pot Bank, near Harrogate, on the 2nd prox. Every member who enters will be required to drive his own car, and the results must not be used for advertisement. This regulation as to members driving their own cars is designed to prevent the entry of vehicles driven by those who are really professionals, and should add to the interest and pleasure of the Meet so far as the amateur drivers are concerned. There is thought to be a tendency among some drivers to tour the country seeking what racing trophies they can devour—a course of action likely to discourage the amateur side of the sport, hence the rules drawn up by the Yorkshire Club for their forthcoming contest.

◆ ◆ ◆

Trouble on the Continent.

THE Marquis of Northampton, who presided over the jubilee dinner of the Royal Hospital for Incurables on Tuesday night, explained that he had feared he would have to telegraph from a German prison his inability to attend. On the frontiers of France and Germany he was arrested by a German soldier, with drawn sword, for committing the very grave offence—of which, needless to say, he did not imagine he was guilty—of going too fast through a populous village on his motor-car. Having paid a large fine, he escaped from Germany and got into France, but there he had a worse experience. A bicyclist took it into his head to see whether his machine or the speaker's 40-horse-power car was the stronger, and came off second best. For a time his lordship thought he would be incarcerated in a French prison for manslaughter, but fortunately he escaped that danger, and got home just in time to attend the banquet.

◆ ◆ ◆

Wire for Motorists.

AT one time the police of Bucks placed a tree trunk across the road to obstruct the passage of motorists; now some miserable person at Slough has improved upon the device. On Sunday night Mr. F. Partridge, of the Holland Park Motor Co., was returning to London from Maidenhead, when near the town of Slough he saw a stout wire stretched across the road at a height which would have caught his face, but for the fact that he raised his arm, striking the wire. Alighting from his car he discovered that the wire had been attached to telegraph poles on either side of the road, and that he had indeed had a very providential escape. The matter is being taken up by the Motor Union as well as by the local authorities, and we trust the offender will be caught and deservedly punished.

◆ ◆ ◆

Speed in Devon.

RELATIVE to the Motor Car Act, 1903, the Bridge, Main Roads, and County Buildings Committee reported to the Devon County Council at their last meeting that they had had before them the replies of various District Councils to the circular issued by direction of the Council at the meeting in December. Many of the replies contained suggestions for pro-

Digitized by Google

hibiting and restricting the use of cars on specified highways or parts of highways, and specified places in which the speed of motor-cars should be limited to ten miles an hour. In view of the variety and extent of the proposals, the committee had thought it desirable, before making any definite recommendation to the Council, to refer the replies to a sub-committee for detailed consideration. Mr. Hurrell said it was thought it might be better to rely on the Act rather than to impose a speed limit. The number of motor-cars licensed in the county was 153, and motor-cycles 183. The Rev. W. D. Pitman said it was better to rely on the Act. Motor-car drivers would soon find out what roads they could go over in the country parishes. As to loss of life, that was not likely to occur in the rural districts. In the urban districts it might be different. He thought they would be perfectly safe under the Act. The report was adopted.

◆ ◆ ◆

Municipal or Private Enterprise.

SEVERAL municipalities are now considering the question of organising motor omnibus services and of inserting in their Parliamentary bills a clause giving them powers to initiate such public conveniences. At the last meeting of the Worthing Town Council, the Finance and Parliamentary Committee was instructed to prepare a report on the subject for the information of members of the Council, and the way in which the proposal was received showed how sympathetic were the local rulers to the idea. Granted that automobile public services are possible and payable, the question of municipal trading is opened up and controversy begins. That is a question of policy with which the *Journal* has nothing to do; suffice it that the initial capital is enough to give experiments a fair chance of success, and that the management is unhampered by the squabbles of party which have wrecked even more promising schemes.

◆ ◆ ◆

Considerate Driving.

IN our correspondence columns last week, Lt.-Col. W. Waring, the hon. sec. of the Berkshire Automobile Club, made an appeal to drivers of motor-cars to pay regard to the ordinary courtesies of the road. We trust the appeal will not be in vain, not only as it affects the Bath road but also other great arteries for the circulation of traffic. It is the duty of motorists to go slowly through villages and to give audible warning of their approach. To drive as quietly and as rapidly through hamlets is an offence of which no self-respecting driver is guilty, and it is monstrous that the automobile movement should be discredited because of a few mad-headed persons.

The Van Trials of the A.C.G.B.I.

WE understand that another alteration in the date of the motor van trials to be held by the A.G.G.B.I. next year has been made, and that they are now definitely fixed for April 1st, 1905. The Expert and Technical Committee of the Club are to be congratulated on thus postponing an event which would have clashed with the official exhibition of the Automobile Mutual Protection Association, which will be held from March 18th to 25th. Many firms who contemplate entering for the trials will be showing duplicates of their vehicles at the Exhibition, so that the two events will have a useful continuity interesting to the public and valuable to the trade.

◆ ◆ ◆

Proposed Revision of Racing Rules.

THE Automobile Club of France is being urged to convene a conference of the national clubs of each country with a view to suggest to Mr. Gordon Bennett (not Gordon-Bennett) some alterations in the rules affecting the contest which bears his name. It is suggested that the race should be not only a trial of speed and trustworthiness but also a test of the motor and the car. Hence the further proposal that the cars engaged should be of a type required by the public for ordinary carriage purposes. If this idea is carried out, the race could be run at moderately fast speeds, and by eliminating the dangers much expensive organisation would be avoided. Something of a combination between the reliability trials of the A.C.G.B.I. and the Continental races extending over, say a week, would prove acceptable to those suggesting the change, and there is much to be said in favour of a revision of the conditions at present controlling the great event.

Thery, the Winner of the Gordon Bennett Race, on his Georges Richard-Brasier Car.

◆ ◆ ◆

Tours v. Races.

IT must be confessed that people generally are not anxious, having seen one Gordon Bennett race, to see another. Those who witnessed the struggle in Ireland did not swarm across the Irish Sea to witness an equally keen struggle in Manxland, nor did they show any enthusiasm for seeing the race in Germany—apart from the pleasure of a Continental trip. Therefore high-speed racing cannot be defended on the ground of public interest. The development of the monsters which now participate in such trials has served its purpose, while the cost of organisation for such a race is absolutely prohibitive to any but wealthy firms. On the other hand, there is a growing demand for touring cars, and in a competition in which such had fair play

Digitized by Google

steadily increasing number of entries might be expected. That a great impetus would thus be given to the automobile industry is indisputable.

◆ ◆ ◆

Another International Cup Race.

THE conditions governing the race for the Vanderbilt Cup were decided upon at a meeting of the Racing Board of the American Automobile Association held on the 7th inst. They are substantially as follows:—The cup is to be known as the William K. Vanderbilt, jun., Cup. It is to be raced for annually, beginning in 1904, the first race to be held on October 8th. The entry list will close on September 8th. The distance is to be not less than 250, and not more than 300 miles. In 1905 and thereafter the race is to be held on some date between August 15th and October 15th. After the first race challenges must be forwarded before March 15th. No postponements on account of the weather will be permitted after a date has been selected by mutual agreement between the holder of the cup and the challengers. Members of all clubs recognised by or affiliated with the American Automobile Association or the Automobile Club of France will be eligible for the race, but not more than ten cars from one country will be permitted to compete. The races in 1904 and 1905 must be held in the United States, and after 1905 in the country in which the cup is held. A fee of £60 for each car must accompany challenges. To each starter one-half the fee will be refunded. The road racing rules of the American Automobile Association will govern races held in the United States, and the road racing rules of the Automobile Club of France will govern races held in other countries.

◆ ◆ ◆

Some of the Conditions.

THE race each year will be in immediate charge of a commission. This year the commission will consist of the Racing Board of the A.A.A.; in 1905 it will be the same, with the addition of the donor, who this year is a member of the Racing Board, and one member of the A.C.F. In succeeding years, when the race is held in the United States, the Commission will be the same as in 1905, and when held abroad it will consist of the donor, one member of the A.A.A. Racing Board and the Sports Committee of the A.C.F. Competing cars must weigh not less than 881 nor more than 2,204 pounds, and must carry two persons seated side by side, each weighing at least 130 pounds. The start, in the order of drawing, will be at sixty second intervals, and time will be taken from departure to finish. The vehicle making the least elapsed time will be the winner, and need not necessarily be first to finish. The time for each vehicle will be taken from the moment it is scheduled to start, whether it is then ready or not. In the first race the start will be made as soon after daybreak as possible. No postponements are to be made for any cause. Competitors will assume all expenses incidental to their individual participation and will be held liable for civil suits or damages caused by themselves. The race must take place on highways that are in general use, and under no consideration may any part of it be held on a track.

Helping Visitors.

IN response to several letters lately received from the Colonies and the United States, we are glad to say that the A.C.G.B.I. is now assisting motorists from the great English-speaking peoples visiting the Old Country in the way of number plates, etc. Provided sufficient notice is given Mr. Orde, the secretary of the club, he will have the necessary licence plate and number obtained ready for the motoring visitor on arrival on English shores. The make of the machine, its horse-power, colour, and similar details should accompany the intimation to Mr. Orde, at 119, Piccadilly, London, W., that his services in that direction will be welcome.

The Kaiser receiving M. Brasier and the Officials of the French Club after the Race.

Reckless Driving.

THANKS to one or two members of Parliament having nothing better to do, the question of motor-cars has been before the House of Commons in several ways during the last few days. Dr. Farquharson has been asking the President of the Local Board to do something to relieve the London suburbs from the annoyance of vehicles that "poison the air with the fumes of petroleum, and destroy the vegetation of trees and hedges by clouds of dust." Mr. Long does not see his way to any effective action in the direction suggested by the learned doctor, although he hinted a reply that a stricter observance of the existing law on the part of drivers of motor-cars would probably be useful in this connection. This point is brought home to motorists very closely by the conviction on Monday of a French driver at the Hay-

Digitized by Google

wards Heath Petty Sessions for driving to the public danger. This driver was fined £20 and £10 costs, with the alternative of two months' imprisonment. It was alleged that he travelled at a rate of thirty-five miles an hour, and had caused two accidents on the journey. Although the statement that he was travelling thirty-five miles may have been an exaggeration, the fact that the accidents had been caused cannot be gainsaid. We believe this gentleman, or one of a similar name, has already suffered for his motoring enthusiasm, and that he should continue such a foolish course is one of those scandals which bring discredit on the whole movement. Owners of cars have a duty to the general body of motorists as well as to themselves, and should prohibit their men from driving in such a way as to become a nuisance, if not actually a danger.

◆ ◆ ◆

A Census of Accidents.

CAPT. DONELAN is another Parliamentary enthusiast who keeps his eye upon motor cars, and who wants to have a record of accidents caused by such vehicles. Mr. Long has no information on the subject, and we believe there is little probability of any adequate return being issued; but Mr. Scott Montagu is also exercising his vigilance in the matter, and has asked that if a return of the number of motor-cars accidents be given another showing the number of accidents caused by horses and horse-drawn vehicles should also be compiled. We endorse his view that one return should not be given without the other, for without such a basis of comparison no trustworthy deductions can be drawn from the figures. The fact, however, that M.P.s are so anxiously watchful with regard to automobiles should be another reason why motorists generally should conduct themselves with something like decorum on the public highways.

◆ ◆ ◆

Cars in Ceylon.

WRITING at the end of May, a reader in Ceylon sends the result of a census of automobiles that has been made in the island, from which it appears that seven cars had been imported up to then, and that double that number was on order. Of motor-cycles no fewer than seventy-two were already in use in the island, and eleven were on order, so that by the time these lines appear in print more than a hundred automobiles of one kind and another will be doing service in Ceylon. A Motor-car Committee has been formed in the island, and holds its meetings at the Auditor-General's Office, under the presidency of the Hon. F. R. Ellis.

Queer Notions of the Layman.

EARL RUSSELL gives an instance of entire failure to judge the speed or control of motor-cars by persons who are not accustomed to them. He was motoring down the descent from Hindhead to Tilford the other day, and passed two men talking together by the side of a wall. One of them called out something, and, wishing to see what he really wanted, the motorist pulled the car up within twenty yards of him, and backed up to him to ask what it was. He already looked somewhat ashamed when he realised the complete control the car had been under, and said that he was only warning the driver against the corner fifty yards ahead, which he thought Earl Russell was approaching at a reckless speed. His Lordship asked whether the fact that he had stopped dead thirty yards short of the corner did not induce him to think that he must have been mistaken in thinking the car was not under control. He somewhat grudgingly admitted this, and Earl Russell proceeded. Had he, however, not stopped and spoken to the man, no doubt he would have told everyone, and believed, that he had seen a large motor-car dashing recklessly down hill in a narrow lane in a manner which must have caused a serious accident if there had been any obstruction.

Motors at the Harbours.

ACCORDING to the bye-laws of Dundee Harbour, motor vehicles are prohibited from entering the sheds at the docks for any purpose. But as several of these are now in use in the city for trade purposes, this question has been brought under the consideration of the Trustees. Regulations regarding the matter have been prepared, and will be submitted to the Works Committee for consideration. There are many places in the country where new regulations will have to be framed in view of the advance of the comparatively new method of locomotion. We trust the business men on the various harbour and similar boards will recognise the necessity of doing all they can to facilitate the adoption and extension of motor vehicles in the transport of goods.

Reporting the Race.

THE way in which the newspaper correspondents were able to despatch the times taken on the various circuits in the Gordon Bennett was very different to the difficulty of obtaining imformation in the Manxland trials. The London Press reported the race very fully, the correspondent of the "Morning Post" specially distinguishing himself by the conscientious care with which he interspersed some valuable statistical deductions in a vivid account of the great race. Generally speaking, the daily Pressmen seem to have controlled the desire for sensation in their anxiety to be accurate—a tendency that is becoming the rule.

THE directors of the Begbie Manufacturing Company, Ltd., are paying an interim dividend at the rate of 10 per cent. for this year.

ON Wednesday Dr. E. Lehwess was fined £50 at the Old Bailey, after pleading guilty to an attempt to bribe a sergeant of the Metropolitan Police.

ON Wednesday afternoon Mr. D. M. Weigel started from London for a 2,000 miles non-stop motor run on a 20 h.p. Talbot car. The intention is to run to Perth and back twice, and then journey to Portsmouth, returning again to London for the finish.

MR. AND MRS. GRANVILLE KENYON, of the Oaklands, Bromley, held an "At Home" on Saturday last to the members of the West Kent Club. There was a numerous attendance, there being about twenty cars present, and a most enjoyable afternoon was spent.

AT 3 p.m. on Monday last one of the Londonderry steam wagons left Seaham Harbour, Durham, for London. The vehicle, which was carrying a five-ton load, reached the Metropolis on Wednesday evening, the only stops *en route* having been those to pick up water and relays of drivers.

THE outfit of an automobile is not complete without a set of box spanners. They are most convenient in awkward places, and in any case a more steady pressure can be exerted. The studs holding valve-covers have frequently been broken through their nuts being strained at unevenly with an ordinary open spanner.

A GREAT deal of interest is being evidenced by American motorists in a series of tests being made with a new fuel for petrol motors, which is being manufactured by the Energine Co., a concern recently formed in Cleveland. The company has completed a refinery, and is said to be now producing about 200 barrels of the product per day. The new fuel is a laboratory product, petroleum, of course, being the base. It is described as being more highly refined than petroleum spirit, and as leaving no odour or carbon after being exploded. The manufacturers claim that the explosive mixture produced is much more powerful than that derived from petrol, and, although the new product costs more than the familiar spirit, it is claimed to be more economical in the long run.

The Gordon Bennett Race.

HOMBURG, Thursday, June 16th.

EXCITEMENT over to-morrow's race is at a high point. The town is full of visitors, and the main thoroughfares present continuous streams of privately-owned motor-vehicles, while every now and then a racing car comes snorting along. The day began early with the arrival of the Kaiser and Kaiserin, and shortly afterwards the Kaiser went over a part of the course on his Mercedes car, and inspected the arrangements at the starting-point. In the afternoon His Majesty received the members of the International Automobile Commission at the Saalburg, and subsequently drove into Homburg and dined with the German Club at the Kurhaus. There was a great concourse of visitors at Saalburg the whole of the day. The tram-cars were crowded and the beer garden adjoining the stand was filled with hundreds of people of all nations, making the place a miniature Babel. The grand stand which has been built on either side of the roadway at the starting point is now practically complete. The structure, which will accommodate between four and five thousand people, is of a most substantial and ornate nature; it is ornamented with beautiful statuary, and is draped and trimmed and decorated with evergreens and gold medallions. Unfortunately, however, though it is situated on the crest of an incline, it does not command an extended view of the course. Indeed, the cars will be lost to sight almost before anything approaching speed can be achieved. On being started they will dash down a slight gradient and disappear on negotiating the first bend on the road to Wehrheim, scarcely a mile from the starting point. There is some compensation, however, in the fact that the Saalburg is not a control, so that those who take up a position there will not only witness the start and finish of the race, but will see the competing cars come coursing up the hill from round a wide curve as they complete each circuit.

Thery, the Winner of the Race.

Edge has been very unfortunate in his preliminary canters over the course. A week ago to-day the crank shaft of his engine broke just inside the central bearing. A new one was at once wired for and arrived post haste on Sunday night. The six-cylinder Napier racer was also brought over as a reserve, the car being driven by road from Rotterdam by Clifford Earp. The new shaft was fitted as quickly as possible, and Edge was again on the road on Tuesday. Jenatzy has been absolutely living on the course, which he is stated to have covered no less than fifty times. Some friction is said to exist between him and the German Daimler Company as to the terms on which he will drive their car. The authorities have just arrived at a decision which motorists here consider will considerably increase the risks in the race. It had been intended, in cases where more than one car arrived at a control simultaneously, to only permit them to resume racing within two minutes of each other. It has, however, been resolved to do away with the interval, and the cars which arrive together will be re-started simultaneously.

The exact length of the circuit is 137 kilometres, 400 metres (85⅞ miles), of which 7½ miles are taken up by controls. As the course has to be covered four times, the total distance run will be 549 kilometres, 600 metres (343½ miles). The time of the stoppages at the different controls has now been fixed. At each start the time will be entered on printed forms which will be placed by the officials in a tin box fixed to each car. At the close of the race these papers will be taken out and examined. The following are the times of stoppages at the various controls:—

Control.	Stoppages.
Usingen	5 minutes.
Weilburg	7 „
Limburg	10 „
Idstein	8 „
Esch	5 „
Königstein	7 „
Oberursel	6 „
Homburg	8 „

The operation of weighing in the different cars was taken in hand this morning. For some reason great reticence was shown to the Press as to the locality of the weigh-bridge; but the place eventually turned out to be in a small side street known as the Elizabethenstrasse, close to the volunteer fire brigade station, where apparently no arrangements had been made to restrain the crowd. The operation was not without its incident—one which promised to be rather exciting and serious, but fortunately was quickly ended. The cars had to be weighed with empty tanks, and several of the competitors allowed the petrol to run down the gutter. No attempt had been made to prevent smoking, and it was not surprising that a match carelessly thrown down should ignite the petrol. Immediately there was a flare up in dangerous proximity to the Napier and Opel-Darracq cars. A general stampede ensued among the spectators, but those in charge of the cars stood their ground and put their shoulders to the wheels. In a few seconds the cars were out of danger, and the flames soon burned themselves out. Mr. Edge's car was slightly scorched, but in no way damaged. Curiously enough, while before the fire there was a sad want of organisation, after the blaze the police authorities went to the other extreme, and it was with difficulty that we, as well as other members of the Press and also many of those connected with the cars, were allowed to get anywhere near the cars. A feature of the weighing in was that five of the competitors brought two cars each to the scales, viz., Jenatzy, Jarrott, Thery, Salleron and Rougier, one vehicle having plain tyres and the other anti-skid bands, in case the course should be in a greasy state.

The Gordon Bennett Cup.

A protest was lodged against the Austrian Mercedes cars as not being in accordance with the rules and regulations of the race, one point being that there was no seat for the mechanician and the other that the manometer was identical with those on the German Mercedes. The seats were added and the manometers complained of removed and peace and contentment reigned once more. M. Dufaux was not weighed in, his car having met with an accident to the steering gear. There was not time to get a new part from Geneva, so, to the great regret of everybody, Switzerland will not be represented in the race.

Appended is a table showing the order in which the competitors will start to-morrow, and the weight and other particulars of their cars :—

THE RACE.

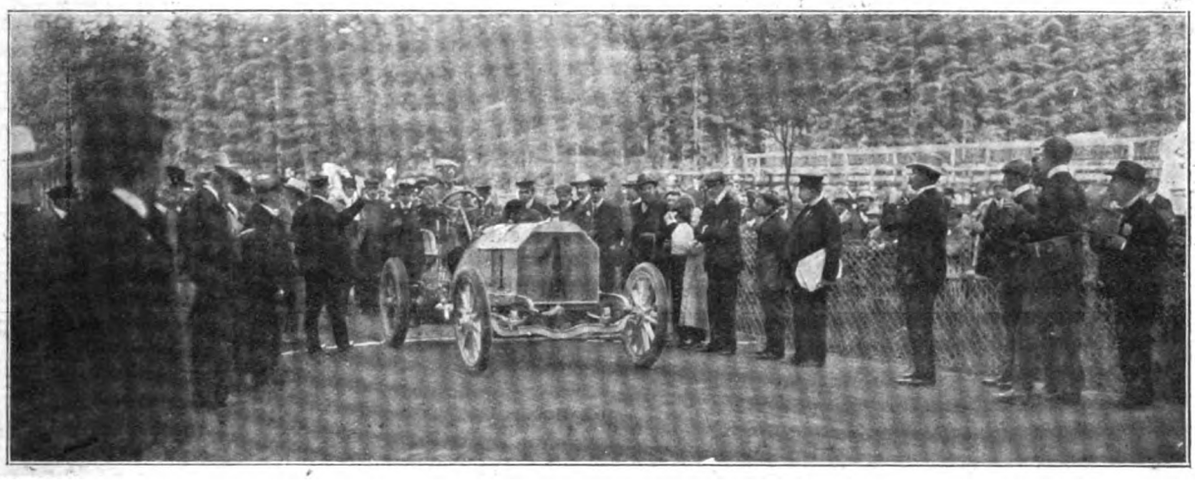
HOMBURG, June 17th.

Like thousands of others, we anxiously peered through the window at daybreak this morning in quest of the state of

The Scene at the Weighing In at Homburg.

the weather, which proved, if anything, too warm for both the drivers and spectators. At 4 a.m. Homburg was all astir, and from thence onwards vast numbers of people flocked to the Grand Stand at Saalburg from all points of the compass. Jenatzy was the first to put in an appearance, being on the course an hour and a quarter before the time for the start. The Emperor, wearing the uniform of a Hussar, accompanied by the Empress, arrived at eighteen minutes past six o'clock, at which early hour the Grand Stand was practically empty. A few minutes after he had entered the Royal box Prince Henry of Prussia, who had driven over in his car, joined the party. The Duke of Ratibor, President of the German Automobile Club, received their Majesties, who were accompanied by Prince and Princess Frederick Charles of Hesse, while among the other distinguished spectators were the Princess Henry of Prussia, the Grand Duchess Anastasie of Mecklenburg-Schwerin, the Duchess of Mecklenburg-Schwerin, the United States Ambassador to Germany, Prince and Princess Salms, Colonel Holden (Chairman of the Automobile

The Fire at the Weighing In.



Club of Great Britain), and the Baron de Zuylen (the President of the French Club). Altogether it may safely be said that never has there been such a brilliant assembly at an automobile meeting as at the 1904 Gordon Bennett Cup race.

Although the time-keepers' box was exactly opposite that of the Kaiser, the cars were started two hundred metres before that point, so that they might attain some speed in passing the Grand Stand. This, however, was scarcely possible, as the start was on a gradient sufficiently steep to prevent the drivers getting on to top speed until after passing the stand. The first to start at the sound of a ceremonial fanfare was Jenatzy, the front wheels of whose powerful Mercedes car rested just behind the white starting line, some few hundred yards below the apex of the Saalburg Hill. At one minute to seven Jenatzy adjusted his goggles and seated himself in his car with his mechanician, and shook hands with his numerous friends. As the red flag was lowered the car leaped forward and careered up the hill past the grand stand, its driver saluting the Emperor with his right hand, and vanished down the hill. Jenatzy started off two seconds in front of time, the error being due to Baron von Molitor, who held the red flag, having mistaken the instructions of M. Tampier, the official timekeeper of the French Automobile Club, to whom the German Club had entrusted the timing. As soon as he had gone Mr. Edge, looking composed and neat in a white jacket with a blue cap, brought his car up to the line. At seven minutes past seven the flag fell a second time, and the Napier car flew up the hill, amid cheers from the English present. Werner, on an Austrian Mercedes, was third, and Lancia, on a Fiat, fourth off, while Théry and de Crawhez followed, both failing to get their fourth speeds in before cresting the hill. The seventh place was Dufaux's, who, as already recorded, was unable to start, owing to an accident to the steering gear of his car. De Caters, who was due to start eighth, met with some delay owing to a sparking plug having got fouled, which necessitated his getting down and wiping it. It was not till after Girling, the ninth man, had started that he got off, having lost 14 m. 30 secs. Braun, Storero, Salleron, Augieres, and Opel followed in order, those at the starting point

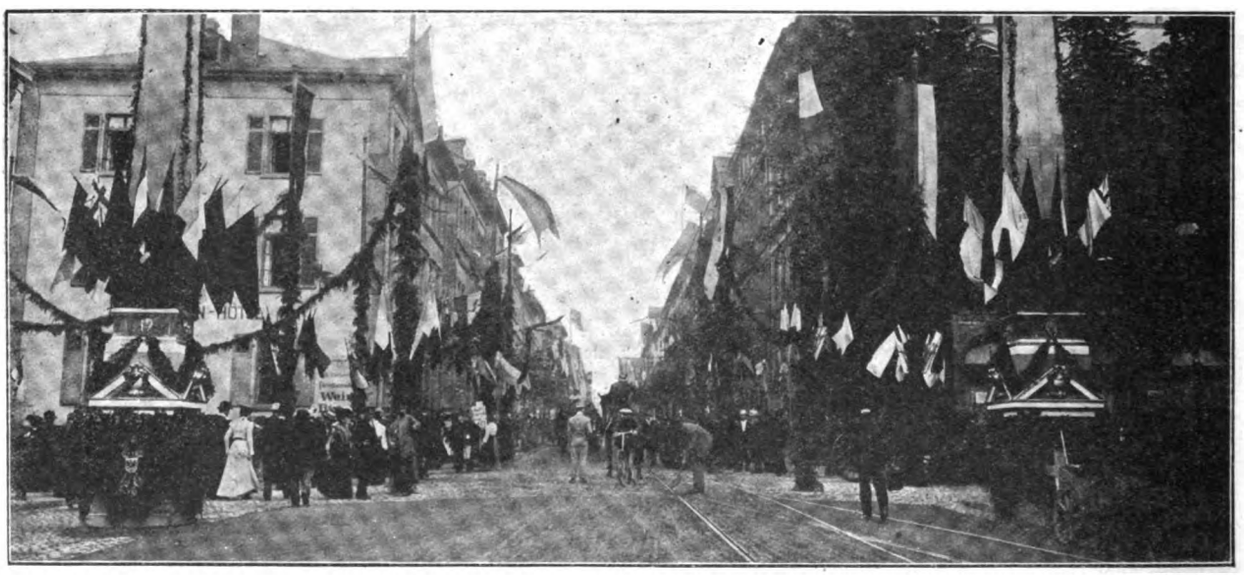
being enveloped in their exhaust. Opel made a false start, and nearly knocked over the timekeeper. Jarrott was next away, receiving the heartiest reception so far accorded. Warden and Cagno followed, and Rougier was the recipient of many good wishes and handshakes up to the very moment of setting off. Hautvast, the last man, was despatched at one minute before nine o'clock. The start was a somewhat dull affair, the usual preliminary incidents alone relieving the monotony, but the Kaiser watched it with great interest, making comments to the Minister of the Interior and the president and members of the Race Committee.

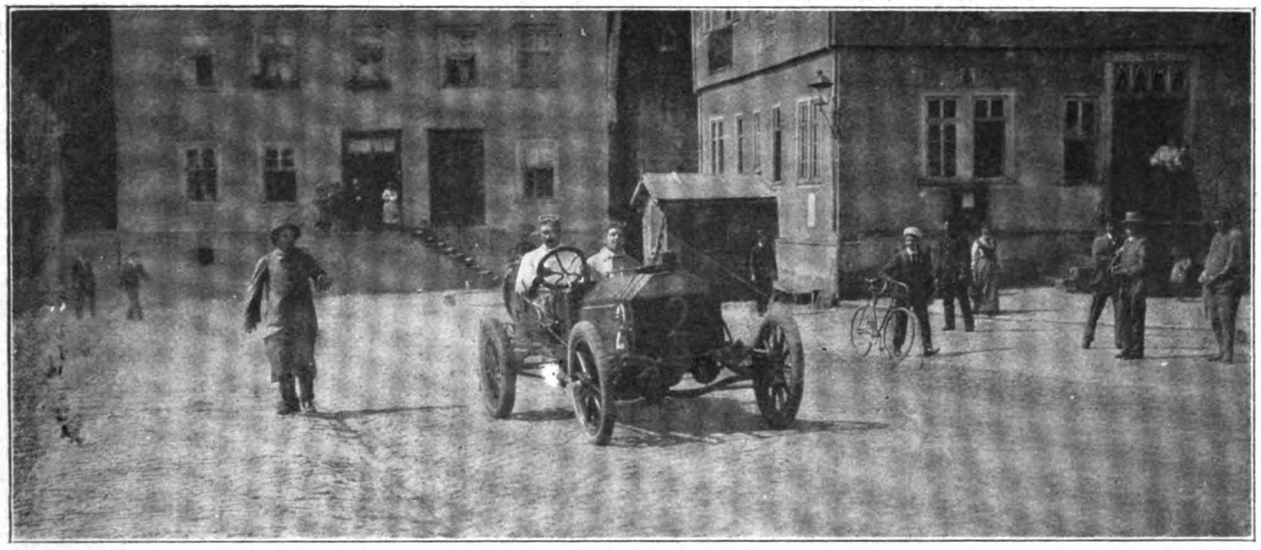


a hundred yards further on. It was reported by telephone that the roads were in excellent condition, and, thanks to Westrumite, free from dust. It had been arranged that the approach of the cars should be heralded by a bugle, other bugles higher up passing on the news to the successive stands. The last man had only been gone twenty-four minutes when the bugler heralded an approaching car. It was Jenatzy, who had completed his first round in 1 h. 26 min. 56 sec., after deducting 56 minutes for controls. He swept by the Grand Stand at a speed of about fifty miles per hour amid lusty cheers. He had an exciting incident at Wehrheim owing to a locomotive obstructing his

Girling on his Wolseley.

Rougier on his Turcat-Mery.

The Gordon Bennett Decorations at Homburg.



Once the drivers were despatched there was a somewhat tedious wait of about twenty minutes, during which scarcely any news was received. The interval, however, gave us time to discover that the best point for seeing the race at Saalburg was the small uncovered and unreserved stand just on the turn of the hill two hundred yards north of the Grand Stand. From this point, facing east, there was a capital view of the start and of the cars gathering speed as they rushed forward and rounded the turn that begins the steep descent towards Wehrheim. Down this slope the eye could follow each car till it disappeared behind the overhanging trees half a mile away to emerge into view

passage at the level crossing. He had to slow up, and claims to have thereby lost a minute. Edge followed twelve minutes later, but the next arrival was Théry, who had thus overtaken Werner and Lancia—the latter having had to stop at Idstein owing to a puncture—and was travelling splendidly. Girling came next, followed quickly by De Caters. Salleron had improved his position, while among those who had fallen behind were De Crawhez, Warden, and Augieres. As each car passed the net time was officially hoisted on a white board erected on the bridge spanning the course. At 10 o'clock the Empress

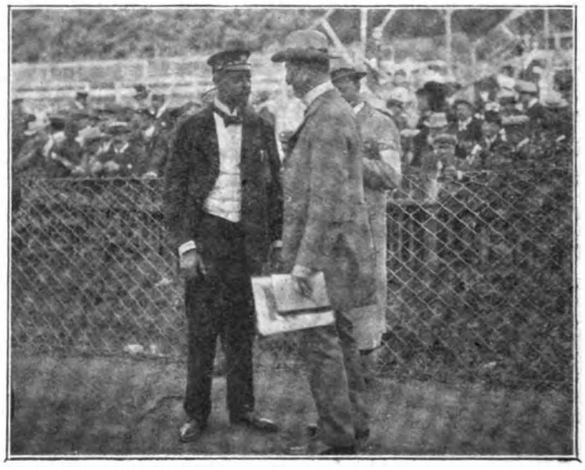
returned to Homburg, but the Kaiser remained an interested spectator, and in the course of the morning, accompanied by Prince Henry and Baron de Zuylen, he walked as far as the bend, whence the cars could be seen coursing on their way to Wehrheim. At the end of the first circuit the order of the leaders was Jenatzy, Théry, Edge, Girling, and Jarrott, the English team thus running well together. The first round was completed by all the competitors except Opel, who broke his cardan shaft at Usingen, a few miles from the start. Fortunately he escaped with nothing worse than a severe shaking.

FIRST ROUND.

The hour at which the various competitors completed the first round, and the times occupied, are shown below :—

Order of Starting.	Driver.	Hour. a.m. h. m.	Net Time occupied. h. m. s.
1.	Jenatzy	9 23	1 26 56
2.	Edge	9 35	1 31 44
5.	Théry	9 51	1 26 57
3.	Werner	10 8	1 58 41
4.	Lancia	10 11	1 54 53
9.	Girling	10 18	1 32 55
8.	De Caters ...	10 21	1 43 15
12.	Salleron	10 43	1 36 53
10.	Braun	10 48	1 56 24
11.	Storero	10 53	1 42 24
6.	De Crawhez ...	10 59	2 28 32
15.	Jarrott	11 2	1 35 18
17.	Cagno	11 23	1 42 22
19.	Hautvast... ...	11 41	1 46 47
16.	Warden	11 41	2 7 14
13.	Augieres	11 36	2 23 7
18.	Rougier	11 54	2 6 0



Ere Rougier had completed his first lap Jenatzy was back from his second circuit, and was going strongly. An anxious wait followed, for it was close upon half-an-hour ere another of the early starters appeared. It proved to be Théry, who had thus passed Edge. Girling was the next to arrive, followed within two minutes by Lancia. About noon the Kaiser left for Homburg for lunch, and at a quarter to one there was a sort of luncheon interval, the people on the grand stand apparently having got tired of waiting in the broiling sun, the seats on the stand becoming empty. Werner, who had had to stop to change a tyre, was next in; Edge followed thirty minutes later, he having been delayed by tyre troubles. He completed the second circuit in 4 h. 1 min. 54 sec., and went by the Grand Stand at six minutes past one about two hundred yards behind De Caters, who completed the second circuit in 3 h. 32 min. 52 sec. Edge was evidently doing his utmost to regain lost time, and one of the most exciting and dangerous incidents occurred when he and De Caters raced abreast along a stretch of road for eight miles. It was at the end of the second round that the board showed that Théry had run into first place with a lead of nearly two minutes. When the news became known, the French spectators became wildly excited, and prepared to give their hero a rousing reception on his next round. De Crawhez had fallen further back, and Warden suffered from tyre troubles, and Salleron met with a serious delay on this round owing to a similar cause; Jarrott, too, was unfortunate, for he had to stop to adjust his chain, after which the governor of his engine broke. The news also came in that Augieres, who had experienced ignition troubles which kept him back all the time, had retired.

SECOND ROUND.

Order of Starting.	Driver.	Hour. h. m. a.m.	Net time occupied. h. m. s.
1.	Jenatzy	11 47	1 28 29
		p.m.	
5.	Théry	12 13	1 26 45
9.	Girling	12 48	1 34 25
4.	Lancia	12 50	1 42 13
3.	Werner	12 57	1 52 47
2.	Edge	1 6	2 36 8
8.	De Caters ...	1 6	1 49 26
10.	Braun	1 26	1 41 38
11.	Storero	1 33	1 43 5
12.	Salleron	1 42	2 3 46
15.	Jarrott	1 55	1 57 32
17.	Cagno	2 3	1 44 19
6.	De Crawhez ...	2 12	2 16 37
19.	Hautvast.	2 22	1 44 23
18.	Rougier	2 27	1 37 0
16.	Warden	2 34	1 57 17

The Kaiser with Baron de Zuylen and suite en route from the Grand Start for a better view of the Race.

Prince Henry of Prussia.

ROYALTY AT THE RACE.

It was exactly 2.21 that Jenatzy made his next appearance at the Saalburg. Having regard to his times in the previous laps it was evident that he had experienced trouble, but it transpired that his delay was but a brief one—to fill up with petrol. When Théry came in 18 minutes later, thus improving his lead over Jenatzy to 10 minutes, the Frenchmen set up a deafening cheer. It became more and more evident that the race had resolved itself into a keen duel between Théry and Jenatzy, and the spectators, who had become very weary, now watched the contest with renewed interest. Warden, whose car got into a ditch near Eschenhahn, but without serious injury, decided to retire owing to a leak developing in his radiator. Storero also abandoned owing to a broken sprocket wheel. Girling experienced a serious delay in this round at Homburg, due, as was eventually discovered, to a block in the petrol pipe. Up to that point he had retained the third position, and was going well. The stop brought him down, however, to the seventh place in the third round, at the end of which the order (net times) of the first four was Théry, Jenatzy, De Caters, and Cagno.

19.	Hautvast	5 9 ...	1 51 26
6.	De Crawhez ...	5 30 ...	2 21 52

The Kaiser was back again on the grand stand at 4.30, and as the time for Jenatzy's arrival was approaching, presuming he had not met with any delay, interest in the race was again at a high pitch. At 4.45 a bugle sounded, and as a car hove in sight, the crush on the grand stand began to look dangerous. It was Jenatzy, who, as he swept across the finishing line at the centre of the Grand Stand, received a splendid reception. But had he won? Théry had still twenty-eight minutes before him, and he passed last time ten minutes ahead of his rival. Five

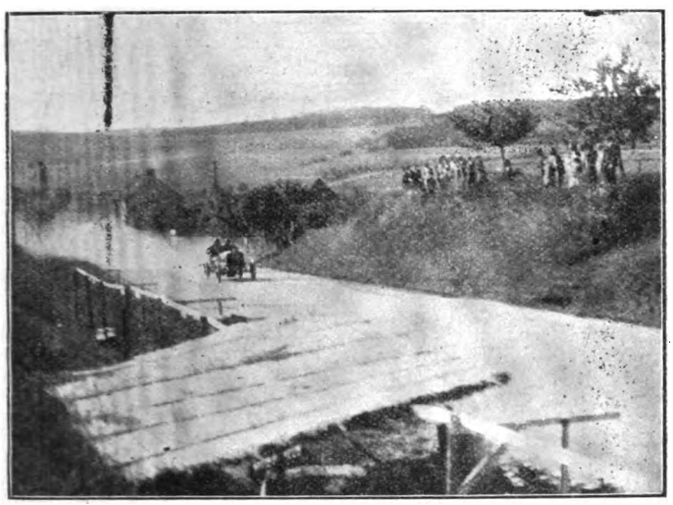

Photo by] Théry travelling at full speed near Usingen. [Mr. Frederic Coleman.

o'clock came, but no Théry. A minute later a bugle sounded and a deafening roar arose as Théry rounded the bend, the winner by 11 min. 20 sec. The people on the stands were wild with excitement. It was altogether a remarkable scene. Théry, on arrival, drove up the course, saluted the Kaiser amid a thunder of cheers, then again with roses in his hand. Théry, whose running had been uneventful, appeared quite fit, though he said he had had nothing to eat since the start. The Kaiser afterwards held a reception in the Royal box of the officials of the A.C.F., including the Baron de Zuylen and the Chevalier René de Knyff. M. Brasier, the designer of the winning car, who was standing in front of the Royal box, looking very pleased, was assailed by his compatriots, who shook him enthusiastically by the hand. Then the Kaiser beckoned to him, and received him in the Royal box. M. Brasier afterwards called for three cheers for the Emperor, which were lustily responded to by all the French present, who were all much exhilarated by the recapture of the cup. Gallic cheers followed for Théry and the Emperor, who shortly afterwards left the stand with the Empress and his retinue. This was the signal for a general exodus, the Grand Stand was rapidly emptied, and the interest in the race was over. Every one, except a few faithful followers of each nationality, seemed to have forgotten about the remaining competitors, who kept on dribbling in at rather scattered intervals.

Soon after Théry's arrival Hautvast came through and started on his last round. His car was now going well, and his final lap proved the fastest of the four. About twenty minutes later De Crawhez came in at the end of the third round, and as the race was practically over decided to give up. There was now a long wait, De Caters arriving at 6.13, and the others following at intervals of from five to ten minutes. The first Englishman home was Girling, at 6.55 p.m., Jarrott coming in last but one at 7.36, meeting with a hearty reception from the British visitors, who had waited until the end. Jarrott's delay was due to a leaky radiator, while Cagno had been stopped on account of his tyres. Shortly before eight Rougier arrived, and thus the 1904 Gordon Bennett race was at an end. As the cars finished the race they were boarded by an observer and driven to Homburg, where they were re-weighed. Edge, who had had bad luck throughout, did not finish his last round owing to an accident to his clutch near Wehrheim.

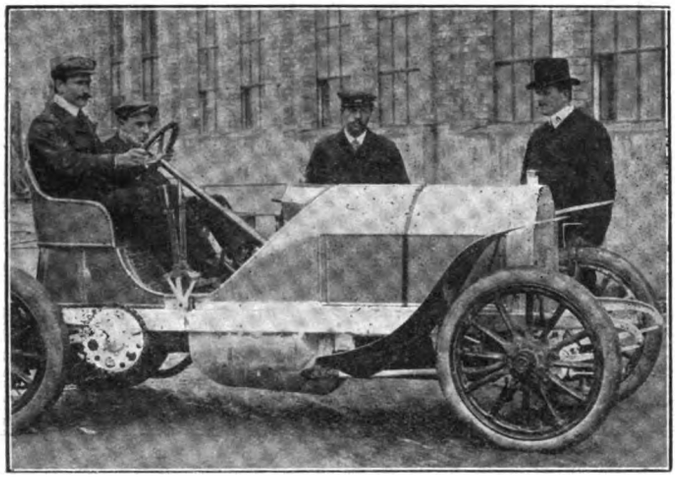
18.	Rougier ...	...	7	48	...	2	33 51

On the termination of the race, the definite results of which will not be known until to-morrow, the Emperor sent a congratulatory telegram to President Loubet, who suitably replied. The course was admittedly a difficult one, and in more than one part actually dangerous. The wireless telegraphic system proved useless, and the telephone arrangements broke down. The German Automobile Club is, however, to be deservedly congratulated on so vast a meeting, which happily passed off without serious accident of any sort.

THE OFFICIAL RESULTS.



HOMBURG, June 18th.

The International Gordon Bennett Commission met this morning under the presidency of the Duke of Ratibor and con-

12.	Jarrott ...	... Wolseley	England	7	36	52

Jarrott as he appeared at the Starting Point.

All three French cars came in, this assuring them the Montagu team prize as well as the Cup. Out of the English, German, Austrian, and Italian teams, two cars each finished, while of the Belgian team only one is in the classification. Théry, Jenatzy, De Caters, Girling, Jarrott, and Rougier went through without a puncture. Théry's average speed works out at 88½ kilometres (55⅜ miles per hour). Girling's average was 47½ miles an hour, and Jarrott's 46 miles.

An interesting summary of the net times per circuit of the first four is given below. The times of the English competitors are also added. A reference to the table will show what splendid running both the French and German drivers made. Théry's time for the first and second laps showed a difference of only twelve seconds in favour of the second lap. The third took him a fraction over three minutes more, while the last round was the quickest of the four.

No.	Driver.	1st Lap. h.	m.	s.	2nd Lap. h.	m.	s.	3rd Lap. h.	m.	s.	4th Lap. h.	m.	s.

1904	Saalburg-Limburg-Saalburg	343½	Thery	Richard-Brazier	5	50	3	55⅜

The weather has quite changed, for while yesterday was fine and excessively hot, to-day the rain has come down in torrents, and the tour of the course which it was intended to hold was made only by a very few of the visitors. As a result of the continuous downpour a general exodus has taken place. Most of the competing firms are preparing to take back their cars, and comparatively few of the drivers are staying to take part in the races at Frankfort-on-Main to-morrow. To-night a banquet was held at the Kurhaus, at which the representatives of the various foreign automobile clubs were the guests of the German Club. Prince Henry of Prussia presided. After the toasts to the Kaiser and the President, Théry's health was drunk, the hero of the occasion responding briefly and modestly to the good things that had been said of him. Afterwards there were fireworks and illuminations.

Digitized by Google

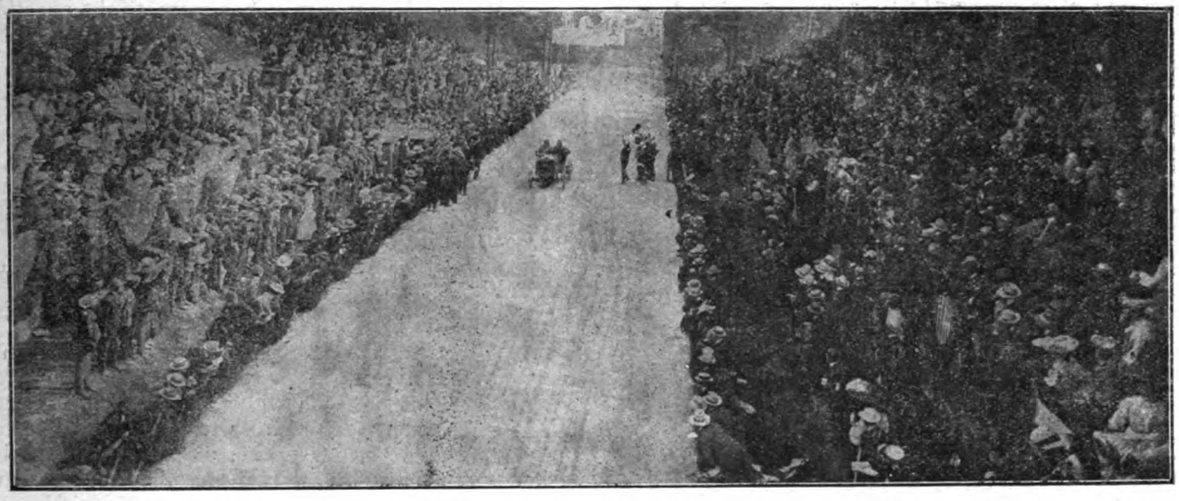
Although the race was run off without serious accident, a fatality occurred on the course near Saalburg on the 16th inst., the Mercedes car of Baron Leitenberger, of Vienna, skidding at a sharp corner. The car overturned into a ditch, and the Baron his wife and the mechanician were all injured. They were taken to the hospital, where the former succumbed the next morning.

FOLLOWING THE RACE IN LONDON.

While the racing monsters were speeding over the Taunus course, a crowd of enthusiastic British motorists were watching the progress of the contest as recorded on a large screen at the A.C.G.B.I. in Piccadilly, W. By this means telegrams from the representatives of the Club at the starting point came with pleasant frequency, giving the times that the various competitors completed their circuits, which were promptly translated to the screen. At one point there was a cessation of news, explained by a later message that the club secretary had been enjoying a good lunch. News of mishaps to Edge lowered the hopes of those who predicted British success, while the steady running of Girling, who obtained the third place in the second lap, occasioned much delight. A report that Jenatzy had killed a man was the sensational item of the day; but this was, happily, unfounded, and general comment was made on the way the cars kept in the running.

All along it was seen that Théry was likely to be the winner, and Mr. J. T. Overton, whose firm has the English agency for the Georges Richard-Brasier cars, was warmly congratulated as each lap showed the French representative gaining on the German holder of the cup. When the result was declared the band, which had performed a selection of music during the day, struck up the Marseillaise, the French flag was hoisted on the club-house, and, with a sporting instinct, the members cheered the name of Théry, who had ridden such a good race.

Unfortunately for the deductions we had drawn from the positions of the cars on the screen as the race was in progress, we discovered, when the special report on previous pages arrived, that the order of starting announced on the cards supplied at the Club had not been followed. Thus the value of the enterprise was destroyed, although the pleasure of the day remained.



HOW THE NEWS WAS RECEIVED IN PARIS.

PARIS, Saturday.

Théry's victory in the Gordon Bennett Cup race has given immense satisfaction in Paris. It was a bitter disappointment to Frenchmen when the trophy was wrested from them, and now that it is once more in their possession they will make a supreme effort to retain it. As soon as the news was known at the Club-house of the A.C.F. the French flag was hoisted, and the exterior of the building on the Place de la Concorde illuminated. The sporting papers brought out special editions, giving the result of the race, and these were bought up rapidly. At the Georges Richard Works, at Ivry, great excitement prevailed when the announcement of Théry's victory was made. The men were allowed to cease work, and quickly the exterior of the factory was decorated with flags.

A few particulars of the winning car may not be without interest. The frame is of pressed steel. The four-cylinder engine develops from 80 to 85-h.p. The valves are all mechanically actuated, and the ignition is by magneto. A special form of automatic carburettor is employed. The power is conveyed through a leather-faced cone clutch to the gear box, which gives four speeds forward and a reverse, with a direct drive on the top speed. From the differential shaft side chains transmit the power to the rear road wheels. The frame is carried on long springs, provided with a special cushioning device known as the Truffault.

Up to the time of the Eliminating Race in France the name of Théry was not a very familiar one, although those who have been connected with the automobile movement in this country since the early days of the Act will remember him as one of the expert drivers of the little 5-h.p. Decauville at the show in the Deer Park, Richmond. Since then Théry has put on flesh and is now a heavy weight. His principal successes, previous to taking part in the eliminating trials, had all been accomplished on voiturettes. His racing career dates from 1898, when he drove a Decauville voiturette in the Paris-Amsterdam race. In 1899 he competed in the Tour de France race, and finished second in his class. In 1900 he won the Coupe des Voiturettes from Bordeaux to Perigueux. The following year he finished fifth in the light-car section of the Paris-Bordeaux race. In 1902 he started in the Paris-Vienna contest, but broke his brakes in descending a steep hill near Arlberg, the car turning over. Later in the same season he met with a spill in the Circuit des Ardennes. He, however, finished the 1902 racing year by winning the Gaillon kilometre climb in record time, being the first driver of a light car to reach a speed of 120 kilometres per hour. Last year he finished fourth in the light car section of the unfortunate Paris-Madrid race. Besides being an expert driver, cool and daring, he is a thorough mechanician, having passed through the workshops, and was, therefore, familiar with every part of his car.

Thery Finishing.—The Scene at the Saalburg.

AN Austrian chauffeur named John Pfabigan died in hospital at Newport, Mon., on Tuesday morning from injuries received in a motor-car accident. Deceased was driving a car down a hill near Caerleon when he applied the brake too quickly, with the result that the car overturned and Pfabigan was pinned beneath it.

THE DELAHAYE PETROL CARS

WE are able this week to illustrate the friction clutch used on the Delahaye cars, the British agency for which has lately been secured by the Saxon Motor Company, Limited. The clutch is of the simple conical type and is notable for an original method of securing the leather friction covering to the cone. The latter is cast with eight depressions

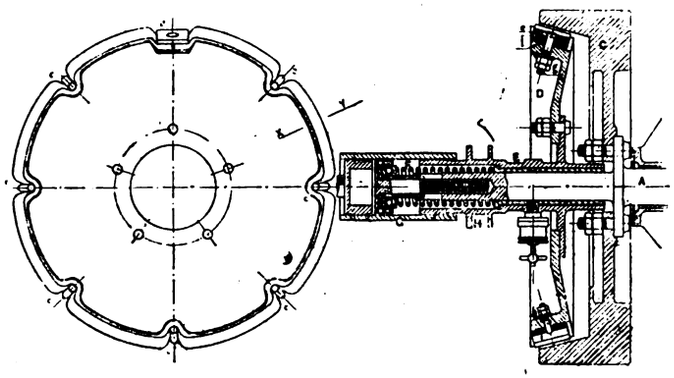

Fig. 1.—End View and Cross Section of the Delahaye Clutch.

n its outer surface and is provided with a leather band, which is drawn into these depressions by T bolts. The heads of the bolts are below the surface of frictional contact. The two ends of the clutch are held by a bolt of special form, the head of which is wider than the others. The advantages of this method of securing the leather covering are that it is held very firmly and can more readily be renewed than when riveted to the cone,

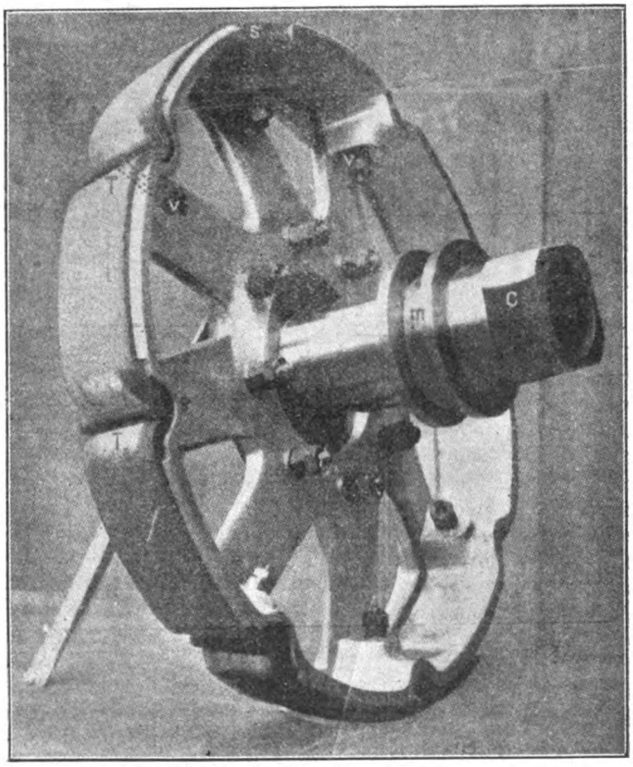

Fig. 2.—General View of the Delahaye Clutch.

without taking off any shaft or large part of the car. The spring is also arranged in a rather original way. An extension is screwed into the end of the crank shaft, and this extension carries near its outer end an adjustable threaded collar and a ball thrust bearing, against which the spring presses. The spring is surrounded by a sleeve, to which the clutch cone is bolted, and presses at the forward end against the end of a bushing within this sleeve.

The 12-h.p. Delahaye car is provided with a twin-cylinder vertical engine (100 mm. by 140 mm.), while those of the 16-h.p. and 24-h.p. vehicles have four cylinders. The lever controlling the ignition is so arranged that as the latter is retarded an exhaust-valve lifter is brought into play, thus facilitating the work of starting the motor. The cars are driven by side chains, and in the 12-h.p. and 24-h.p. types the gear box does not enclose the differential; in this way, by increasing the length of the shaft between the gear box and the differential, any desired length of frame for side-entrance cars can be obtained.

CONTINENTAL NOTES.

A Motor-Bicycle Trial at Cannes.

Sixteen riders competed in the Criterium de Motocyclettes held by the "Cote d'Azur Sportive." The run was from Nice by a round course to Cannes, the total distance being 113 kilometres. The points taken into account in making the awards were regularity of running, speed on the level and on hills, and the facility of starting. Of the sixteen competitors eleven finished, the first place being secured by Lamberjack, on a 2¾-h.p. Griffon, and the second by Gaillet on a 2¾-h.p. Werner.

◆ ◆ ◆

Tyre Protection.

M. Paul Meyan refers once more to the question of the use of old tyre covers in a recent issue of "La France Automobile." His 24-h.p. car, with passengers and petrol, etc., weighs about 30 cwt. He runs with an old cover on the off-side rear wheel, and detachable anti-skid protector of leather on the left rear wheel. On his way back from Italy the protector was renewed at Marseilles, after which he drove a total distance of 2,346 kilometres (1,460 miles), without a puncture. He has not worn out a cover or air tube since February 1st in covering 7,100 kilometres (4,430 miles), whereas last year in the same time he wore out four covers and eight or nine inner tubes.

◆ ◆ ◆

Motor-Omnibuses in Germany.

A service of electrical motor-omnibuses, in which the current is conveyed to the motors by means of overhead wires, is on the point of being established between Johannisthal and Nieder Schöneweide. The 'buses, each of which will accommodate sixteen persons seated and six standing, are being made by the Allgemeine Electricitats Gesellschaft, of Berlin, and are designed to attain a maximum speed of 12½ miles an hour. The introduction of motor-omnibuses is merely a temporary expedient, as an electric tramway is to be constructed to connect the districts in question as soon as the local conditions permit of the work being executed. Probably the experience with the 'buses may be such as to cause the local authorities to alter their plans.

◆ ◆ ◆

A Touring Competition at St. Etienne.

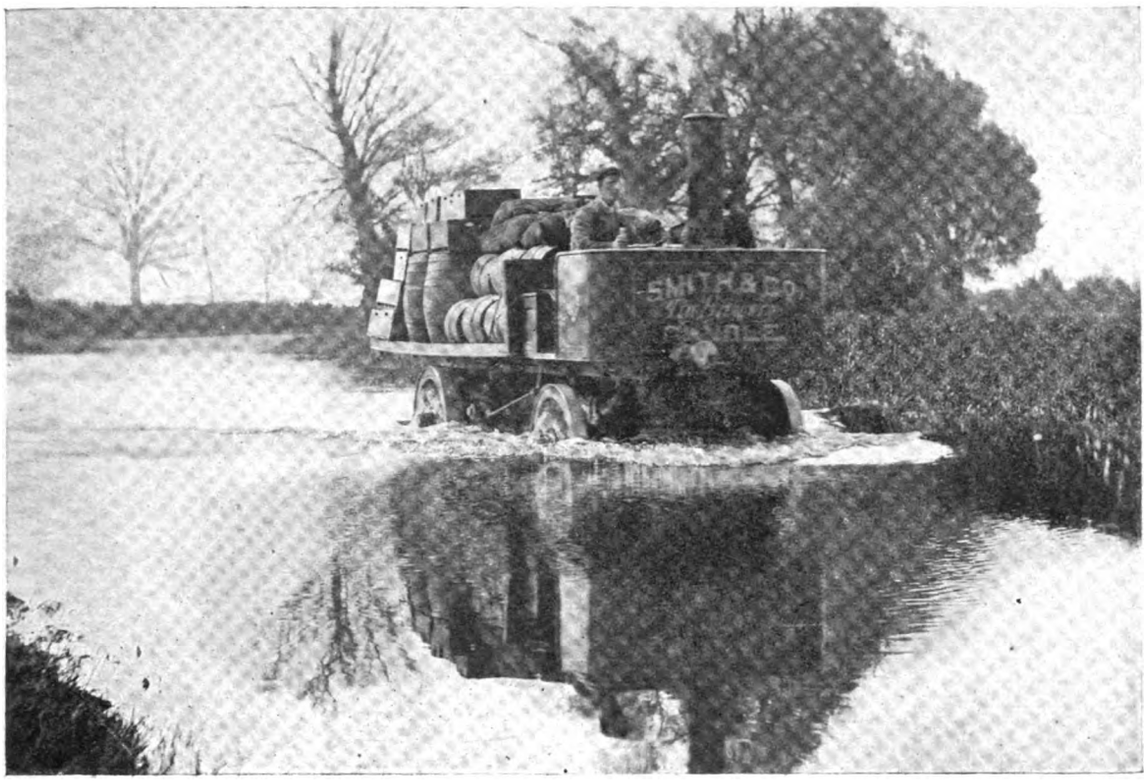
Twenty cars left St. Etienne on the morning of the 12th inst. for Clermont-Ferrand, the first stage of the two-days' touring competition organised by the Automobile Club Forezien. The distance was 235 kilometres, which was successfully covered by all but three of the competitors. The first to reach Clermont was M. Jolhois on a Peugeot. The return trip was made on the 13th inst., eleven being classified, the first place being taken by M. Perret on an 18-h.p. Peugeot, and the second by M. Laperto on a 20-h.p. Automoto.

◆ ◆ ◆

The Circuit des Ardennes.

The Gordon Bennett Cup race over, attention is now being centred on the Circuit des Ardennes, which is to be run off next month. A slight change has been made in the course, which will enable the race to be run over a distance of 600 kilometres (about 373 miles) without a single stop, and without any controls. The new circuit comprises a total of 59½ kilometres (about thirty-seven miles), which, added to the 85½ kilometres (about fifty-three miles) of the old circuit, gives for each lap a

Digitized by Google



course of about ninety miles. The route of the old circuit has been almost entirely repaired, especially in the following places :—The turning at Longlier, rounded off last year as far as the top of the hill; a short but rather stiff road leading to Léglise; the whole of the forest of Aulier as far as Habay-la-Neuve; and further on the rapid descent in the turning of the route from Martelange to Bastogne. The last part of the road leading to Neufchateau has also been put in good condition. The bad turning at Recogne has entirely disappeared. Altogether over fifty entries have so far been received for the race.

◆ ◆ ◆

Starting Big Motors.

The German Daimler Company are now fitting their 60-h p. Mercedes cars with a special starting arrangement. The device, which is stated to greatly facilitate the starting of these monster engines, is actuated by rack and pinions attached to the four cams of the exhaust valves. A straight forward movement of the rack revolves the pinions and lifts the valves by means of a worm inside the casing of the plungers.

miles. This proved a victory for Henze on a Cudell; time 8 min. 10 sec.; Gleich (Adler) being second, and C. Lorenzen, of London, on a Beaufort, third. Event No. 3 was a five-mile race for light cars weighing 400 kilos and over, with one or two-cylinder motors up to 14-h.p. inclusive; open to amateurs; besides the driver, an adult passenger had to be carried. This was won by Fritz Opel on an Opel-Darracq, his time being 8 min. 10 secs. The fourth race was one of ten miles for large alcohol driven two-seated cars weighing over 650 kilos, up to 40-h.p.; open to amateurs; W. Poege on a 60-h.p. Mercedes secured the first place in 12 min. 29 sec., thus securing the prize offered by the Kaiser. Some excitement was caused in this event by Fritz Opel, who finished second, running off the track. The fifth event was an eight-mile contest for heavy two-seated cars, weighing over 650 kilos, up to 24-h.p. inclusive; open to amateurs; it resulted in a victory for Fritz Opel (time 11 min. 5 sec.). Race No. 6 was for touring cars over 1,000 kilos, up to 30-h.p. inclusive, with

One of the Lancashire Steam Motor Company's Standard 4-ton Lorries traversing a Flooded Road near Oundle.

Track Racing at Frankfort.

In connection with the Gordon Bennett week the Frankfort Automobile Club held a meeting on the Oberforsthaus trotting track, at Frankfort-am-Main, on Sunday. There was a general exodus from Homburg either by motor or train, and when we arrived we found all Frankfort on its way to the park for the great automobile meeting. The afternoon's sport was tame after Friday's big contest, but the scene was charming, the green course, with its background of pine forest, being thronged with a gaily dressed crowd. Among the spectators were Prince and Princess Henry of Prussia. Considerable interest was shown in the events even by the English visitors, as for the first time one or two British cars were among the competitors. One lap of the track is equal to one mile, that is 1,609 metres. The first race was for motor-cycles; open to amateurs; the machines to be started by pedalling and without assistance from anybody; distance, three miles. The winner was Nicodemi on a Puch machine; time 4 min. 49 sec. The second event was an alcohol competition, open to alcohol-driven cars weighing 400 kilos and over, up to 15-h.p.; to be driven by professionals; besides the driver an adult passenger had to ride in the car; distance five

compete touring carosserie, for four persons; open to amateurs; besides the driver a passenger had to be carried; distance ten miles. This was a well-contested event, Adam Opel on a 26-h.p. Opel-Darracq being first in 15 min. 24 secs., and P. Martin on a Coventry Daimler second in 15 min. 28 secs. The last event of the day was the race for the Peter Cup, which is limited to amateurs and cars weighing over 650 kilos., up to 60-h.p. inclusive. Besides the driver, a passenger had to be carried; distance ten miles. The contest provided the excitement of the afternoon, one of the cars missing a sharp turn on the loose sand of the course and waltzing wildly round in the adjoining meadow; fortunately no serious accident resulted. The race was won by M. Poege, on a 60-h.p. Mercedes, in 12 min. 12 sec., Opel being second in 12 min. 17 sec. and Branda (Darracq) third in 15 min. 35 sec. The cup has to be won twice in succession by the same driver on a German track before it finally lapses into his possession. As Poege won the race last year, the cup now becomes his own property. Between the contests Thery took his car round the course to the sound of the "Marseillaise" and enthusiastic cheers.

THE HILL-CLIMBING POWER OF MOTOR-CARS.

(*Concluded from page* 351).

THE impossibility of exactly comparing petrol engines on the basis of their piston displacement, and the total lack of information which exists regarding transmission efficiencies, render any attempt to predict the hill-climbing power of cars almost futile. Some conception of the relative grade negotiating capacity of two cars may, however, be obtained by the use of the formula with the transmission efficiency ignored or estimated. The result will be what has been called an "educated guess," and that is the kind of figuring that we shall have to be satisfied with in connection with petrol cars for some time to come. If one has a machine of satisfactory hill-climbing powers, but is contemplating the purchase of another vehicle, it would certainly be worth the time and trouble involved to apply the formula to his old car and then to the contemplated purchase, and, if the result was much smaller in the case of the latter machine, to hesitate a little before buying.

It must be perfectly obvious that any machine, which has an engine capable of giving any net power, and a transmission system of any efficiency at all, must theoretically be capable of climbing any hill in case the gear be low enough. This is practically true to a considerable extent. Many a poor hill climber may be made a good one by a reduction in the number of teeth in the driving sprocket or an increase of those of the chain wheel on the axle, but this increase of hill climbing ability will inevitably be at the expense of the maximum speed of which the vehicle is capable. Hill climbing power may always be indefinitely increased with a corresponding diminution of speed capability, and on the other hand speed may be largely augmented, up to the point where air resistance becomes the governing factor, with a corresponding reduction in ability to overcome grades. It is rather astonishing that the owners of machines which are ineffectual hill-climbers but speedy on the level are not willing to sacrifice a little of their swiftness in order to successfully meet severe grades. Almost every owner accepts his machine as geared at the factory and prefers to discard the car rather than to invest in new sprockets, and thus lose his fear of hills.

Of course a point may be reached in gear reduction for hill climbing at which it becomes useless to carry the process further, and this is the point at which the driving wheels begin to slip on fairly good footing. The slipping point for a certain tyre is determined by the weight which it is carrying. In order to increase the traction and defer the slipping point, the vehicle weight should be largely concentrated upon the driving wheels; but of course the application of this rule is greatly restricted by the undesirability of unduly overloading one pair of tyres, and also, perhaps, by the dangers of increased skidding said to arise from an unequal weight distribution. The typical European touring car has sometimes been criticised on the ground that too little of its weight is carried by the driving wheels, on account of the engine being placed directly over the front axle and nothing being directly supported by the traction wheels, except the tonneau load and perhaps a tank and the silencer.

The majority of cars of the American type, remarks Mr. A. L. Clough, in the "Horseless Age," carry a greater proportion of their total weight on the driving than on the steering wheels, and some of them perhaps carry the weight somewhat too far toward the rear. In quite a number of these cars, particularly those using the double opposed horizontal type of engine, the longitudinal centre of gravity must be nearly midway between the axles. A great many people appear to think that this is the proper place to have it, in order to secure the greatest degree of immunity from skidding. Failure of traction on good footing is a phenomenon not very commonly met with, and loss of adhesion in sand or mud would in some cases find a doubtful remedy in any increase of weight applied to the slipping wheels.

There is a tradition current that heavy cars are poorer hill-climbers than light ones. This or the very opposite may be true according to circumstances. The fact is that two machines having equal gears, wheel diameters and transmission efficiencies will possess hill-climbing capabilities in proportion to their respective "abilities," or, in other words, in proportion to their respective effective horse power per unit of weight. The truth of the statement will thus depend upon which type, the heavy or the light, can show the greatest engine power relatively to its weight. This will generally be the type in which, other things being equal, the motive power plant has the greatest "weight efficiency," that is, the greatest effective power considering its weight. Now, it is a fact that in general the heavy vehicles, such as touring cars, carry multiple cylinder engines and the two-seated cars make use of single cylinder motors. Several considerations render it possible to build a substantial multi-cylinder engine of higher weight efficiency than can be obtained in a single-cylinder construction. Owing to the nearly constant torque produced by a three or four cylinder construction, a relatively small flywheel is required, and this is a material saving, as the flywheel forms a large fraction of the total weight of a moderately speeded single engine. The crank shaft of a four cylinder motor being under the influence of a nearly constant torsion of constant direction, rather than the intermittent torque of changing sign characteristic of the single cylinder, may be safely reduced in cross section, and its weight relatively reduced, despite its somewhat greater length. Weight per horse power can be saved in some other directions. Then, again, the four-cylinder engine requires only one carburettor, one silencer of moderate size (both of which are in use without cessation), and one circulating pump, and the proportion which the weight of these accessories bears to the

The above illustration depicts the two Milnes-Daimler petrol motor vans recently put in service by the Midland Railway Co. in London. The vehicles are kept at work practically day and night, a double shift of drivers being employed.

Digitized by Google

whole motive power weight is smaller than with the single-cylinder construction. Cars making use of multiple engines certainly ought to show greater "ability" than those using the single type, whether they be classed as heavy or light vehicles.

The number of "gears" or "speeds" which a car should possess is a matter of continual discussion among automobilists, and there are many pros and cons, but when the matter of hill-climbing capability is under discussion there is little doubt that, aside from all considerations of cost, a three or four-speed gear is very advantageous. The main thing is to be sure that the lowest gear is chosen low enough for the very worst conditions. Where only two speeds are provided for, there is a temptation to make the low gear somewhat higher than it ought to be, so as to render travelling less annoyingly slow at times when the high gear fails to carry. When the road is just difficult enough to preclude the use of the high, the engine is very lightly loaded on the low, and, unless it has good throttle control, will make bad work of it. Under these particular conditions one is really using an engine of two or three times the capacity necessary, and one is always wishing that the low gear was a little higher. When, however, the worst is encountered one may be inconsistent enough to wish that the low was lower. The middle or intermediate gear is just what is wanted to fill the gap. Then one may be contented to make the low gear as low as it ought to be, to meet all emergencies, knowing that it will rarely be called into requisition. The fact that a three speed sliding gear transmission device need not cost so very much more than one of two speeds, and a four speed gear of this type not so much in excess of the three speed arrangement, is likely to make this system the popular one in the future. No one who has ever used a three or four speed gear is likely to be satisfied with any two speed arrangement.

One important characteristic of any motor, as far as its hill climbing capability is concerned, is its ability to give its full power per stroke, even if slowed down almost to the stopping point. Such a motor will often "hang on" and successfully negotiate a hill upon which another may fail. Tightness of the piston and valves, correct spark position, a carburettor capable of giving a uniform quality of gas at all times, and plenty of flywheel capacity, are the important requisites for the attainment of this condition. Even if the piston fits badly the charge may be drawn properly and a sufficient compression realized when at high speeds, as so little time is allowed for leakage; but when the speed is extremely low the full amount of the charge is not sucked, especially if the inlet valves are automatic, and so relatively long a time elapses during the compression stroke that quite a little of the induced charge escapes around the rings or through leaky valves, and the charge that remains never reaches the intended compression pressure. The energy per stroke is therefore much diminished, the motor loses a little of its speed each revolution, begins to labour, and finally stops long before it would be expected to do so from considerations of size and design.

Unless an efficient automatic ignition regulator forms a part of the engine it is very difficult to keep the ignition time correct at low speeds; and if not so maintained, the motor rapidly loses its speed and stops either owing to a spark so early occurring as to cause negative work to be done on the piston, or so late as to uselessly transfer most of the energy of the charge into the silencer.

There are many carburettors still in use which, while producing a mixture of reasonably constant quality within quite a range of gas demand, produce a very weak mixture at very low speeds. Since the amount of petrol passing the spraying nozzle in a given time is dependent upon the degree of vacuum surrounding it, and this is proportional to the speed of the entering air (the contraction of the air passage remaining constant), it is plain that at very low speeds, when the velocity of the entering air is small, the supply of petrol may become inadequate to form a rich mixture because the vacuum, increasing as it does more than directly with the air velocity, will then be insufficient to cause as active spraying as necessary; while at high air velocities more than enough may be sprayed.

It is only when a correctly adjusted automatic air intake is provided which increases the degree of contraction inversely to the velocity of the entering air that a perfect mixture may be obtained at all speeds. Somewhat similar results may be obtained by increasing the petrol flow at very low speeds, or an auxiliary air intake may be used which opens as the gas demand increases and thus corrects the excessive richness of the charge likely to be drawn at high speeds. A motor which, through any of these causes, does not run well at low speeds, will force its operator to make an early change of gear when climbing hills and will "pick up" slowly if it is once slowed down. If the operator waits too long before abandoning the high gear, he is likely to find that in the stroke so much momentum has been lost that the middle speed will not carry and he is forced to resort to the lowest gear.

The last recourse in hill-climbing is the use of flywheel momentum to urge the car along by degrees. When the lowest gear fails to carry the only thing one can do is to speed the motor to the limit, engage the clutch and proceed until the motor is just about to stop; then disengage the clutch and apply the brakes and repeat the process, gaining a few feet at each repetition. This treatment is abusive in the extreme to all mechanical parts of the machine and is at best a desperate expedient.

HOW TO ENJOY MOTORING.

MR. F. T. SHOLES, vice-president of the Automobile Club of Cleveland, U.S.A., gives the following valuable advice on how to enjoy motoring. A great share of pleasure in owning and operating an automobile, and certainly a large part of the economy in doing so, depends upon one's mechanical tastes applied in the same manner that a lover of good horses cares for his stable, and it is generally admitted that machinery seems to respond to sympathetic care quite as readily as intelligent animals. A driver of either may enjoy a fast run and daring feats of skill with the same care and judgment without creating "doctor bills" in one case more than in the other, and with the factor of salvage very much in favour of the automobile. It is the careless or reckless driver who pays well for his pleasure.

One car that I personally know of was discarded by its owner on account of "troublesome repairs." It passed into the hands of a mechanically-inclined and enthusiastic buyer and cost him one tyre and £5, besides petrol and oil, for a year of hard, steady running. Another has been used continuously by the same owner, who has kept close account of his expenses, for three years, at an average cost of £30 per annum, including tyres, insurance, rent of stable, petrol, oil, and all expenses, as well as professional overhauling of the machinery during each of the last two years to keep everything tuned up for efficient work to the owner's ideas. Others of my friends have not fared so well, but in nearly every case this result is traceable to some distinct lack of proper care, as the manufacturers are generally keen to recognize a legitimate defect when it occurs, and are more than willing to replace anything of that character gratuitously.

Do not run your car beyond absolute control at any time and do not play "stunts" with it, like putting on full power immediately after starting, or try to stop with brake and reverse within one or two lengths of the car. Start, drive and stop as the good locomotive engineer does, so that your passengers realize nothing but the pleasures of delightful motion; and, when you put the car in the motor-house after your trip, give it a small share of the same kind of attention you would give your favourite horse at such a time.

HAVING the points of a sparking plug too far apart is liable to cause great difficulty in starting. This, of course, is particularly noticeable in single-cylindered engines, as in multi-cylindered motors the engine may get fairly started by the other cylinders. Small De Dion cars which have steadily refused to start have gone off first turn after the plug points were put closer together.

MOTOR CYCLING NEWS.

THE return just issued shows that during the five months ending with May last 321 motor-cycles were exported from this country, their value, together with those of motor-cycle parts, amounting to £14,789.

◆ ◆ ◆

THE growing popularity of motor-cycling in South Africa is indicated by the news of the formation of the Johannesburg

Motor-Cyclists to catch Motorists.—One of the Police Motor Cyclist Corps, whose duty it is to prevent furious driving in Lincoln Park, Chicago.

Motor-Cycling Club, the object of which is to promote runs to various parts of the Transvaal. The first official run of the club took place on May 29th, from Johannesburg to Rosherville, a small place about five miles away.

◆ ◆ ◆

THERE seems to exist in the minds of many motor-cyclists an impression that there is no necessity for a motor-cycle to carry a registration number on the back provided the front plate is carried longitudinally and is numbered on both sides. Mr. C. G. Gray, the hon. sec. of the Motor Cycle Union of Ireland, was invited to wait on the Assistant Commissioner of the Dublin Metropolitan Police with respect to this subject, and it was impressed upon him that there is no doubt about the law on the point. The information will be embodied in the next circular to the members of the Motor Cycle Union; but, in justice to other motor-cyclists who are not as yet members of the Union, it is as well that this view on the part of the authorities should be made known to the public generally.

◆ ◆ ◆

AFTER the two riders left in in the Peterborough Motor-Cycle Club's reliability trial, Mr. B. C. Holmes, riding a 3½-h.p. Vinco-Minerva, and Mr. T. Woodman, 3¼-h.p. Lightstrung, had decided to divide the prize, as announced last week, the committee resolved that another run should be made, and this, to the relief of both men, who were getting heartily tired of having nothing happen, decided the event, for Woodman punctured, thus leaving Holmes the winner at 625 miles. Mr. Holmes is the manager of the Peterborough depot of Heighton's, Limited, the maker of his machine.

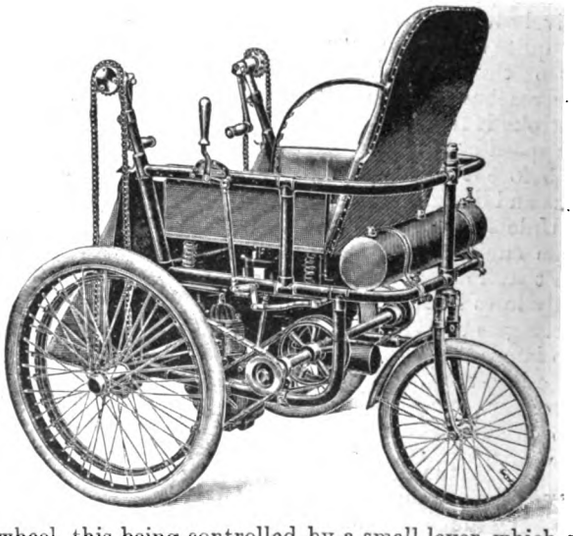
◆ ◆ ◆

THE Federation of American Motor-cyclists has made a radical move with a view to attaching a more definite meaning to a motor-cycle record than at present exists, owing to the fact that the weight of a machine is not restricted in racing. The majority of the American records were made on a ponderous four cylinder motor-cycle built for racing only and of no practical use for ordinary road work. The Federation passed a resolution at its last meeting, requesting the National Cycling Association to accept no records made on machines weighing over 110 pounds.

◆ ◆ ◆

A MOTOR-BICYCLE endurance test is about to be held by the National Federation of American Motor-cyclists. The contest proper will cover a period of six days, as follows:—July 2—a run from New York to Albany. July 3—Albany to New York. July 4—One hundred miles paced regularity run. July 5—Tests in New York, comprising hill-climbing trials and starting, stopping and slow speed tests. July 6—A run from New York to Wilmington, Del. July 7—Wilmington, Del., to Cambridge, Md. There will be three classes of awards, for, respectively, those who participate in the events of July 2, 3, 4 and 5, for those who participate in the events of July 5, 6 and 7, and for those who take in the entire programme.

◆ ◆ ◆



THE Archdukes Joseph Ferdinand and Heinrich Ferdinand of Austria are now ardent motor-cyclists. They have each recently acquired Laurent-Klement double-cylinder motor-bicycles.

◆ ◆ ◆

MR. J. E. YOUNG, Salem, Madras Presidency, India, who has one of the Singer gear-driven motor-bicycles, writes that he has now run his machine over 1,050 miles, over roads which would surprise many riders at home. "My longest rides were 103 miles, 83 miles, and 68 miles, the last with a lady in a trailer over a hilly and bad road innocent of culverts. It would have surprised you, I think, to see the machine with trailer and passenger splashing in the muddy nullahs, throwing up a beautiful fountain of water, and bouncing out on the other side."

◆ ◆ ◆

A GERMAN firm, Herr R. Assmann, of Mannheim, has lately brought out the motor-tricycle, specially designed for the use of invalids, illustrated herewith. The power is supplied by a 2-h.p. air-cooled engine arranged under the seat. The crank shaft carries on its end a wide pulley, the power being transmitted by a flat belt to a small countershaft at the rear. On the latter are mounted fast and loose pulleys, so that by shipping the belt a free engine can be obtained at any time. From the countershaft the power is transmitted by light belts to pulleys attached to the front wheels. The steering is actuated through the single

back wheel, this being controlled by a small lever which can be at the rider's left or right hand as desired. Speeds up ten miles per hour can, it is claimed, be attained by the tricycle, which is fitted with the hand-driving gear usually provided on this class of machine, so that the rider may help the motor on stiff gradients, or propel the tricycle home in case of failure of the engine to work.

HERE AND THERE.

COL. LORD BINNING has just acquired a 12-h.p. Wolseley shooting brake.

A SECOND motor-'bus has commenced running between Old Steine, Brighton, and Hove.

THE Gardner-Serpollet Company have lately completed a 40-h.p. steam landaulet for General Friedericksz, of St. Petersburg.

A 20-h.p. Spyker Car at Lyme Regis.

MESSRS. MARTIN SMITH AND COMPANY, LIMITED, has been registered with a capital of £2,000, to carry on the business of manufacturers of and dealers in motor-cars, etc.

MESSRS. H. E. AND F. MORRISS, of Stroud Green Road, London, W., who are devoting much attention to the repair of steam cars, have just issued a very complete catalogue of replacement parts and accessories for this type of automobile.

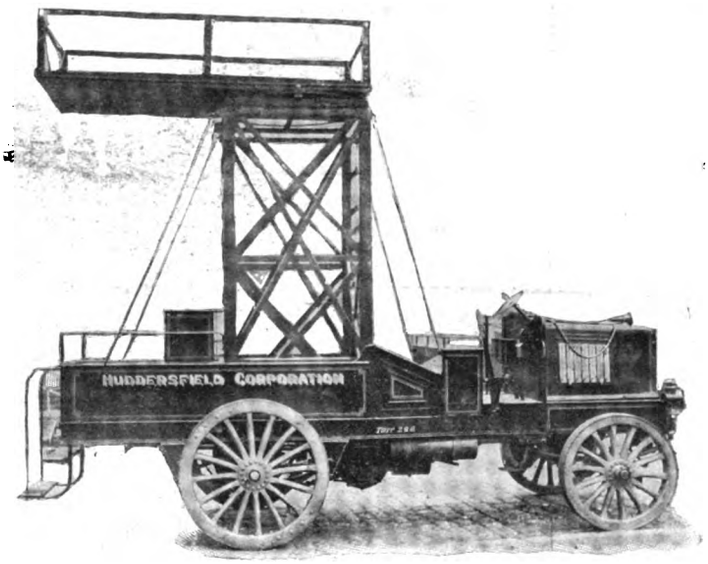
THE Sale Electrical Installation Company, of 43, School Road, Sale, near Manchester, have a garage with accommodation for several cars, and keep a staff of mechanics for repair work. Plant for the charging of accumulators has also been installed.

The first Important Curve on the Gordon Bennett Course near Saalburg.

THE Automobile Club of America has issued its 1904 handbook. The membership list contains 544 names, including 106 associates. Of the active members all but thirty-five are owners of cars, and more than a score are possessors of several vehicles each.

THE North British Rubber Company, Limited, have received an order to supply Clincher-Michelin motor tyres for one of the King's cars. In the Glasgow to London non-stop run, a car fitted with Clincher-Michelin tyres obtained the only gold medal awarded in Class B.

MESSRS. W. M. CAFFYN AND SONS have opened a well-equipped motor garage at 12, The Colonnade, Eastbourne.



MESSRS. GEORGE POLKEY, LIMITED, have appointed Messrs. Hendry Bros., 28–34, Robertson Street, Glasgow, their sole agents for Scotland.

THE Laystall Motor Engineering Works have been opened by Messrs. F. T. Bersey and Company, at 27 and 29, Laystall Street, Rosebery Avenue, E.C.

A SERIOUS fire has occurred at the South Hants Motor-Car Company's works, Broad Street, Portsmouth. All the office books and fittings were destroyed and the company will be pleased to receive copies of catalogues and lists.

THE Chief of the Police at St. Louis has issued an order for the enforcement of the regulation requiring automobiles to carry drip pans to prevent petrol and oil from dripping to the street. The penalty for neglect is a fine of from £1 to £20.

THE accompanying illustration shows a Tower Wagon operated by petrol motor, which has recently been supplied by the Thornycroft Steam Waggon Company, Limited, to the Huddersfield Corporation, for the purpose of inspecting the overhead conductors connected with the electric tramways. The

motor is of 20-h.p., and the fully loaded vehicle is capable of a speed of twelve miles an hour. The illustration shows the vehicle fitted with steel tyred wheels, but these, we learn, are merely temporary, the solid rubber tyred wheels not having arrived at the time the photograph was taken.

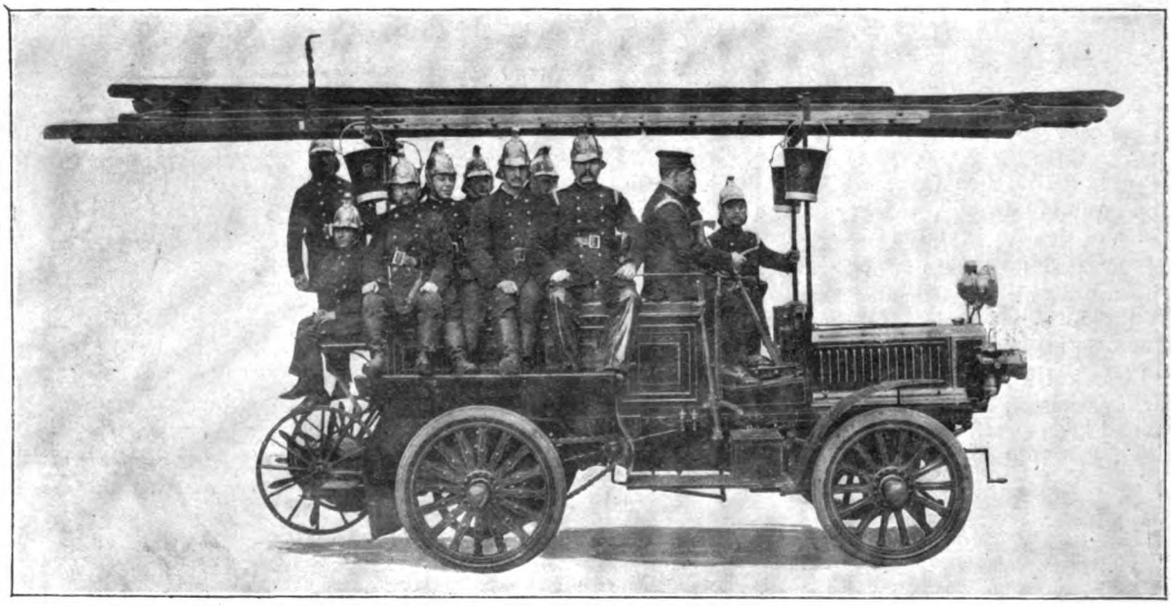
THE London Stereoscopic Company, Limited, have published an album of sixteen photographs of scenes in the Isle of Man during the recent eliminating trials, by Mr. Elward Kennard. Mr. Kennard in a few words of introduction pays a tribute of praise to the warm hospitality of the Manxmen towards the motorists.

The closing of the first course in the Y.M.C.A. school of automobile instruction in Detroit, U.S.A., was celebrated the other day by a banquet, at which the Educational Director, Mr. W. B. Van Akin, acted as toastmaster. The principal address of the evening was made by Dr. Rudy, the Chairman of the Automobile Committee of the Y.M.C.A. He stated that the course of lectures just completed was only a preliminary one, and that next autumn, when the school reopens, the number of students will be much larger. The school will then be divided into classes, the first being for beginners, the next a machinists' class for all who successfully pass the examinations in the first class and for others who are of mechanical bent and have some knowledge of machinery; a third class for persons who wish to learn to drive motor-cars, and a fourth class in thermo-dynamics.

Digitized by Google

THE Gratze Patents and Engineering Syndicate, Limited, has been formed with a capital of £5,000, to carry on the business of manufacturers of speed indicators, etc.

THE proceedings at the Speech Day at Wellington College were delayed owing to the break-down of the motor-car in which the King and Queen drove over from Windsor.



MR. KARL AUFHOLZ has taken over the management of the Balcombe Motor Company, Balcombe Street, Marylebone, N.W. This company has a large and up-to-date garage open at all times, day and night, capable of storing up to twenty cars.

MESSRS. CHENARD AND WALCKER inform us that Mr. Walter Gutmann (late manager of the Weston Motor Syndicate, which has gone into voluntary liquidation), of 2, Bury Street, St. Mary Axe, E.C., has been appointed sole agent for their cars.

MR. J. D. BISHOP, motor-car agent, of Albert Street, Barrow-in-Furness, has sent us a sample tube of "Auto-Grindene," a preparation designed to do away with the trouble and inconvenience hitherto associated with valve grinding. A tube can easily be carried in the tool box and is always ready for use, being invaluable when a valve has to be replaced on the road. It is supplied in two sizes—for motor-cycles and cars.

THOSE who are interested in the new Palmer cord tyres will be pleased to hear that the Palmer Tyre, Limited, had the option of fitting some of the cars representing Great Britain and Ireland in the Gordon Bennett race. It is much to their regret that they could not do this, owing to the fact that the special size required had not previously been made by them. The time between the trials at the Isle of Man and the race was not sufficient to allow them to complete the new plant and tests necessary for a new size.

THE works of the Ryknield Engine Company, Limited, at Burton-on-Trent have been visited by a party of directors and officials of the North Staffordshire Railway, among them being Mr. Tonman Mosley (chairman), Mr. Phillips (general manager), and Mr. Crosbie Dawson (engineer). Special interest was displayed in the first of a new type of four-cylinder car which is now approaching completion. Orders for this type have already been placed by Lord Burton for a shooting brake, and by Sir Oswald Mosley for a landaulette. The company has decided to have the cylinders for their cars cast separately next year, instead of in pairs as at present, and they will therefore be able to add a 15-h.p. three-cylinder car to the existing types of two-cylinder 10-h.p. and four-cylinder 20-h.p.

A Durkopp Fire Salvage Wagon, recently introduced by the Motor-Car Emporium, Ltd. The vehicle was undergoing tests by Members of the London Fire Brigade when the Photograph was taken.

MESSRS. QUIBELLS, LIMITED, has been registered with a capital of £500 to acquire the business known as "Quibells," and to carry on the business of manufacturers of and dealers in motor-car houses and motor-car and motor-cycle accessories, makers of motor and other cycles, etc.

"ENTIRELY new method of locomotion just discovered (patented). Steam, electricity, and all artificial forces dispensed with. Any vehicle propelled, any speed, and immediately controlled by this wonderful invention, simply by geared mechanism by hand of driver. No vibration. Absolutely safe." Such is the announcement we find in the advertisement columns of a daily paper.

A COMMITTEE of civil engineers appointed by the Roads Improvement Association to consider the construction of new and the maintenance of existing trunk roads, has resolved (1) that a central department should be established to determine the direction and control the construction of new trunk roads. (2) that the central authority should exercise control over existing trunk roads, with power to determine their width and the frontage lines of buildings on such roads. Provided always that no new building shall be erected within fifty feet of the centre of a trunk road, and the local authority shall pay suitable compensation for unoccupied land within the existing fences.

AT the meeting of the Highways Committee of the L.C.C. the clerk of the Council reported that he had from April 20th to June 4th, 1904, registered 506 motor-cars and 365 motor-cycles, thus making the total number of cars and cycles registered up to the last-named date 3,420 and 2,428 respectively. He had also issued during the same period 1,338 licences to drive motor-cars or cycles, and general identification marks for motor-cars had been assigned to seventeen manufacturers or dealers, the total number of licences and general identification marks issued being 8,533 and 264 respectively.

THE Northampton Accumulator Company has commenced the manufacture of the "N.A.C." accumulators at West Bridge Works, Northampton. Mr. A. Schanschieff, whose name is well known in connection with storage battery work, is the company's chief engineer. An illustrated catalogue has just been issued describing the battery for lighting purposes, also for motor-cars and electric traction service. The battery is claimed to be the outcome of twenty years' experience, and the plates are said to possess all the advantages of pasted plates, though they are as solid as those of the Planté type. Full working instructions appear in the list, and particulars as to capacities, weights, and prices are tabulated.

CORRESPONDENCE.

INCONSIDERATE DRIVING.

To the Editor of *The Motor-Car Journal.*

Sir,—A recent case illustrates the wide divergence of opinion which may exist as to the speed of a motor-car at a given time. A Member of Parliament was summoned for driving at an excessive pace. With the merits of the case, which was dismissed, I have nothing to do. There were three witnesses for the prosecution. One of them deposed that the defendant was going at the rate of 25 miles an hour, another "at the speed of an express train," and the third described the pace as "very fast, about 14 miles an hour." The first witness was a policeman, the second a potman, and the third an electric tram-car driver.

I have no doubt that each witness stated what he honestly believed to be true, and herein lies the great difficulty of motorists, who, however moderate their pace, are nevertheless often assailed with reproaches and even abuse when they are proceeding with the greatest regard for the convenience of others, and in the event of an accident bystanders are always ready to affirm that the motorist was proceeding at some unreasonable and frequently impossible pace.

No doubt, in the instance I have cited, weight was given to the evidence of the tram-car driver, who was an "expert" witness, but it might have been very hard on the defendant if a person who knew nothing about pace had chanced to be the third witness.

A short time since I was gliding down a slight hill which joins four roads, with my clutch out, at the rate of about five miles an hour, whereupon an individual angrily demanded what I meant by "tearing down the lane at 20 miles an hour," and I have not the least doubt that had the slightest accident occurred this person would have cheerfully gone into the witness box to swear in all good faith that I was dashing along at 20 miles an hour.

That many motorists are reckless and inconsiderate cannot be denied. It is therefore necessary that evidence as to speed should be very carefully weighed, lest the man who habitually drives carefully be punished by reason of unreliable testimony.—Your truly,

W. J. Bosworth, Colonel.

SOLID TYRES.

To the Editor of *The Motor-Car Journal.*

Sir,—Could any of your readers give me their experience with the De Nevers solid tyres? I have had so much trouble with pneumatic tyres since I commenced motoring a few weeks ago, that I am inclined to make the change. The chief point I wish to consider besides comfort is, how much do the tyres reduce speed in hill climbing? It would not matter if the speed were slightly lower on the level. My car is a 10-h.p. two-seater, and is rather heavily built, weighing over 11 cwt.—Yours truly,

F. A.

ENGINE STARTING DIFFICULTIES.

To the Editor of *The Motor-Car Journal.*

Sir,—I have a two-seated car made by the Speedwell Company, with a 6-h.p. De Dion engine and carburettor. The motor has run very well for a thousand miles or so, but now I have the utmost difficulty in starting it. The only way I can get it to go is by putting petrol in at the sparking plug, then it will start off at a furious rate, although I cannot regulate it. The compression and everything appear to be all right. My idea is that the carburettor has gone wrong. I have had it out on several occasions but it appears in good order. I should be very pleased, as an old reader of your valuable *Journal*, if you could advise me on the matter.—Yours truly,

F. Crossley.

[Our correspondent's difficulty is, in all probability, due to a slight sticking of the inlet valve; this would cause great difficulty in starting, although, once started, the motor would run all right. If this were the cause, it would be impossible to get a good suction by turning the starting handle, as it is not possible to turn this quickly enough to overcome the sticking.]

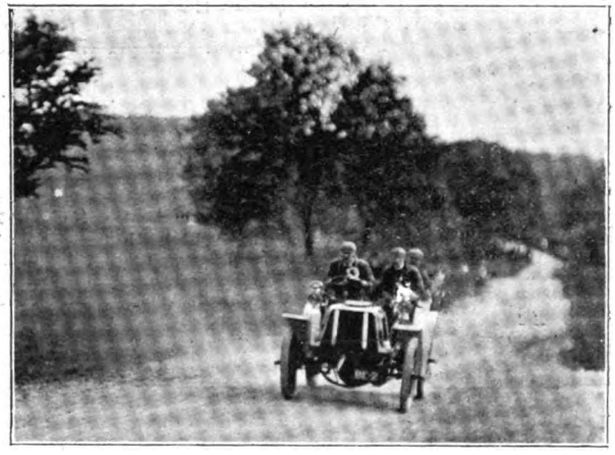
THE WORKING COSTS OF MOTOR-WAGONS.

To the Editor of *The Motor-Car Journal.*

Sir,—Referring to "Scott's" letter in the last issue of the *Journal*, I, too, would be glad if some reader could say if it is possible to get a petrol motor for a timber merchant's business to carry loads of one and a half to two tons of long material in rather hilly country. A reasonable-priced vehicle that could be worked with moderate expenses is what I require.—Yours truly,

Timber Merchant.

CUTS IN TYRES.



To the Editor of *The Motor-Car Journal.*

Sir,—Regarding the enquiry in the last issue of the *Journal* as to cuts in tyres I find the following treatment very satisfactory. Jack up the wheel and sit flat on the ground with the wheel between knees; then with a long French nail pick out all flints and dirt and use "Patcho," pushing it with the nail well and deeply into the cuts; do this slowly, allowing the "Patcho" to congeal. By the time you have been round the wheel once you will notice the "Patcho" has shrunk, then press in a little more where required, and allow the wheel to remain off the ground for an hour.—Yours truly,

A. 445.

Mr. W. S. Richardson on the 18-h.p. Richardson Car at the Starting Point.

Sir Hickman Bacon on his 12-h.p. Panhard.

THE HILL-CLIMBING COMPETITION OF THE LINCOLNSHIRE AUTOMOBILE CLUB. (*See page* 380.)

THE GROWTH OF MOTOR KNOWLEDGE.

To the Editor of *The Motor-Car Journal.*

Sir,—For some time the belief has been gaining ground that the steadily-increasing use of motor-cars should be accompanied by a corresponding growth of knowledge concerning them. No attempt is made now to deny that the automobile is a machine—sometimes a fairly simple one, at others an exceedingly complicated one—nor to shrink the logic of that admission, to wit, that at least a modicum of mechanical knowledge must be possessed by those entrusted with its care and management. That we are, as a nation, gifted with more than ordinary mechanical knowledge has been often proclaimed. But in hugging this belief we are apt to forget that a faculty lying dormant is of little practical value. The man who has a strain of mechanical ability in his make-up, but who has never had occasion or seen fit to use it, is not a safe person to entrust with a machine which may at any time need the attention of a practical man—one able to make an adjustment, or discover and remove a source of trouble which would otherwise seriously interfere with the working of the vehicle.

Requirements of this kind exist whether the person concerned be owner of the car or merely in charge of it. In the latter case the possession of some mechanical knowledge is reckoned on as a matter of course. Without it he could not obtain, much less retain, his position. But with the owner it is frequently very different. He may—in fact, in most cases he does,

Digitized by Google

prefer or is obliged to drive the vehicle himself, and the question that interests him is, how much mechanical knowledge and ability is required of him? Many agents, through lack of courage, dodge this question, and instead of pointing out the necessity of acquiring at least a superficial knowledge of the engine, transmission gear, ignition system, etc., in order to drive it intelligently, they gloss over this phase and permit the purchaser to delude himself with the belief that he has but to touch the button and the machine will do the rest. Of course, this belief is certain to be shattered, but the awakening is not a pleasant one. It has been predicted by more than one close observer of the automobile movement that its ultimate effect will be to make us a nation of mechanics. The bulk of the motor-cars of the future, they point out, will go into the hands of people of moderate or limited means. Naturally, as has already been pointed out, they will familiarise themselves with the working of the machines, and learn to adjust and keep them in order. Whether this will be a difficult or an easy task will depend upon circumstances—upon the inherent ability of the student. At the present time the educational movement is spreading and gaining strength in all parts of the country. People are interested in the automobile, and that they seek practical knowledge on the subject is evidenced by the success of the few motor-car schools that have so far been established in this country.—Yours truly,

T. M. M.

SPARKING TROUBLES.

To the Editor of *The Motor-Car Journal*.

Sir,—I should be glad if you, or any readers of the *Journal*, could give me any help in connection with the trouble I am experiencing with the engine of my single-cylinder car. I find that sometimes the first spark from the sparking plug is a very good one, but that the succeeding ones gradually get weaker. Is this the fault of the accumulator, coil, or the sparking plug? I found this the case lately with a new De Dion plug, and finally had to put back the old one in order to get the engine to start.—Yours truly,

F. J. I.

[The most probable cause of the trouble lies in the accumulator, as the spark being good at first and gradually getting weaker points to the accumulator being exhausted, though it has enough pressure to start. The result should be the same with both the new and the old plug; but, as "F. J. I." found the engine would start with his old plug and not with a new one, this result is most likely due to the fact that the points of the old plug were in better adjustment to suit the power available, which would be weak. The voltage of the accumulator should be tested with a 4-volt lamp. If the lamp glows brightly for a few moments and then gradually dies away to a dull red, the accumulator requires charging.]

COST OF MAINTENANCE.

To the Editor of *The Motor-Car Journal*.

Sir,—I am a doctor and am perfectly ignorant of motor-cars, and I wonder if you will be good enough to give me some information, as everyone tells one something different. If I bought a small car and looked after it myself—by this I mean, going and taking lessons in driving and in regard to the internal anatomy of the beast—about what should it cost p.a., leaving out boy's wages and stable, and of course petrol? The hills in my district are pretty tall; what h.p. ought I to have? I suppose 6-h.p. would hardly do, would it? I should want a car to carry three on emergency (my little girl as third). I have no wish to travel a hundred miles an hour, and should use the car partly for my practice and also for afternoon runs, and possibly once a year on a tour. What about tyres? Are not solid best? I am a bad hand at mending punctures on my bicycle. About buying a car, I would like to give about £100, but would go a bit over if necessary. Can one, a novice like myself, dare to buy second-hand? Finally, what car would you suggest, and about what would its life be, and would it be better to wait till next year in the hope of cheaper cars?

I fear me I have dosed you with questions, and I am afraid you will consign me to a place where motor-cars are no more and petrol is kept outside in the cool; but my excuse is that a novice in motoring is helpless. Each car, *re* advertisement, is the best, and when one's resources are limited a mistake to begin with would settle one's chance of driving at all.—Yours truly,

Perplexed.

STEAM CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—I should be very pleased to hear of any English firms making a simple and reliable steam car. My idea of such would be a steel channel frame, with either a simple or compound vertical engine working under the bonnet in front; from the engine the power transmitted to the live axle by a universally jointed driving shaft; flash generator and paraffin burner fixed below the driving seat; tonneau body which could be made removable for a light van for trade purposes. There need not be a lot of unnecessary complications, which only add to expense and often puzzle people. The weight not to exceed 15 cwt., and price not more than £250. I think there is a great time coming for steam, if engineers will only give their mind and make a properly constructed car. Petrol cars are not altogether liked by the public, and all sorts of nasty remarks are passed on them; a good many people cannot stand the vibration.—Yours truly,

Lancelot Wood.

A Benz Car Query.—F. C. B. writes:—"Can anyone advise or suggest an improvement for quietening a two-cylinder 16-h.p. Benz car with horizontal 1902 engine and four speeds? The top speed and next speed are fairly quiet, and the two bottom speeds rather noisy."

Speed Indicators.—Replying to Mr. Francis Chapman, all particulars of Dr. Winter's speed indicator can be obtained from Mr. C. J. Pafford, Southey Street, Penge, S.E.

An oil container belonging to a motor-lamp has been taken to Mr. R. Baines, 41, Chester Road, New Ferry. It was found on Cheshire roads.

CLUBS AND ASSOCIATIONS.

SOUTH-EAST ESSEX.

The inaugural meet of the newly-formed South East Essex Automobile Club was held at Bridge House, Prittlewell, when 14 cars and 11 motor-cycles attended. The brilliant weather rendered the meet even more successful than was anticipated by those who were responsible for the formation of the club, and the cheerful sunshine was a most happy augury for the club's future. Much to the regret of the committee, it was found impossible to send invitations to all the motorists in the district, but it is hoped that this will not deter them from attending any future functions which may be organised to forward the sport of motoring. Noticeable among the gathering was the number of ladies. It is the intention of the club to hold weekly meets in various localities, and any information with respect to the same, or any other matters connected with the club, can be obtained from the Hon. Secretary, Mr. R. L. Curtis Bridge House, Prittlewell. Among those members present at the inaugural meet with cars and cycles were the following:—Messrs. Baersalmon, Burrup, Calder, R. L. and A. P. Curtis, Cripps, Crane, Crookham, Drury Ellis, Foster, Green, Herrtage, Jarratt, Jewell, Kerridge, Lister, Morgan, Parsons, Sloman, Spencer, Warnery, and Winter.

LINCOLNSHIRE.

Although the wind was rather boisterous, the sun shone brilliantly all day, and the periodical run of the members of the Lincolnshire Automobile Club to Market Rasen on Thursday, last week, on the invitation of Mr. and Mrs. A. A. Padley, took place under pleasant conditions. In connection with the run Mr. Padley had arranged an interesting hill-climbing competition, and gave two prizes—a motor timepiece to the first and a motor jack to the second. Upwards of thirty cars attended, and twenty-four of them took part in the competition. Bully Hill, where the event took place, is over one-third of a mile in length, with a gradient, in places, of one in six. The following were the leading times:—

Mr. W. S. Foster, Lincoln, 24-h.p. Georges Richard, 1 min. 35 sec.
Sir Hickman Bacon, 12-h.p. Panhard, 2 min. 4 sec.
Mr. W. R. Pennell, Lincoln, 10-h.p. Locomobile, 2 min. 5 sec.
Mr. W. S. Richardson, Lincoln, 18-h.p. Richardson, 2 min. 5 sec.
Mr. F. Richardson, Sibsey, 10-h.p. Wolseley, 2 min. 6 sec.
Mr. C. W. Pennell, Lincoln, 12-h.p. Richardson, 2 min. 6 sec.
Mr. Jeffrey, Gainsborough, 12-h.p. Darracq, 2 min. 7 sec.
Mr. R. M. Wright, Lincoln, 9-h.p. Clement, 2 min. 20 sec.
Mr. W. Nissler, Lincoln, 8-h.p. De Dion, 2 min. 22 secs.
Major Goddard, Lincoln, 12-h.p. Richardson, 2 min. 27 sec.
Mr. J. S. Nainby, Thorganby, 7-h.p. Panhard, 2 min. 42 sec.
Dr. P. Sharp, Brant Broughton, 12-h.p. Richardson, 2 min. 43 sec.

Three cars, a 12-h.p. Gladiator, 6-h.p. De Dion, and 8-h.p. De Dion, were in difficulties, and the first two were assisted, while the latter returned, and afterwards accomplished the distance in 2 min. 38 sec. Mr. A. A. Padley officiated as starter, Mr. W. B. Jevons, of Market Rasen, and T. E. Foster, of Lincoln, as timekeepers, and Messrs. G. and S. Charlton-Jones, of Holton Hall, and Mr. Seagrave, of Lissington, as stewards. After the competition the members returned to Hill House, where they and their friends were entertained to tea. The run was one of the most enjoyable the club has yet held—the competition, of course, adding much to the interest of the gathering.

THE LADIES' CLUB.

The first annual general meeting of the Ladies' Automobile Club of Great Britain and Ireland will be held at Claridge's Hotel, on Thursday, the 30th inst., at noon. A "biograph tea" has been arranged for the same day at 3.15 p.m. The exhibition will include the Gordon Bennett Race of 1904, many pictures taken during the Homburg week, and also a picture taken from Hyde Park Corner, of the L.A.C.G.B.I. on the 9th inst. On Monday, the 4th prox., there will be a club run to The Hall, Bushey, Herts. It is suggested that members should go to Bushey *via* Chipping Barnet and Elstree and return *via* Watford, Stanmore and Edgware.

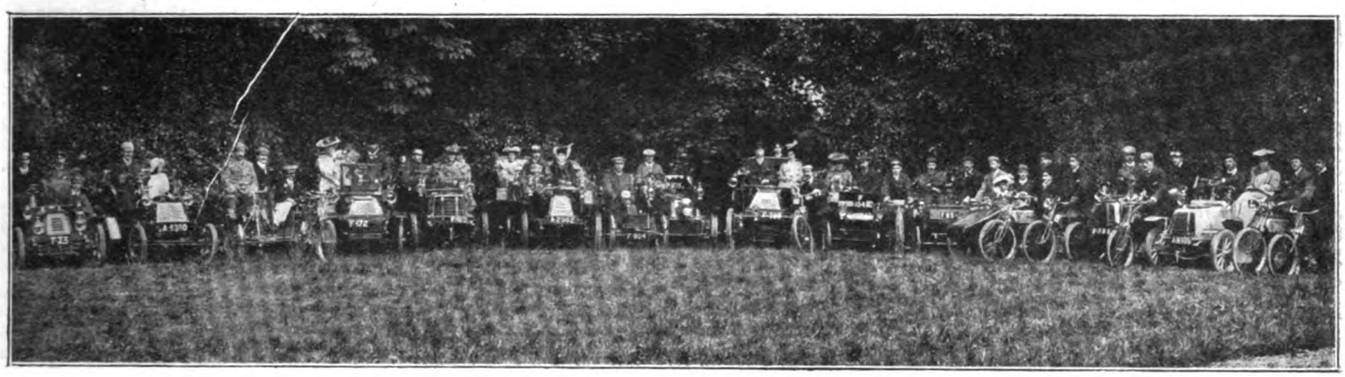
SCOTTISH.

A club meet and picnic of the Western Section of the Scottish Club took place at Turnberry, Ayrshire, fifty miles from Glasgow, on the afternoon of Saturday last. The members of the Turnberry Golf Club had kindly granted permission to have the cars placed within their enclosure and the privilege of the links to any members who desired to play golf. There was a fair turnout of cars. The lunch had been

Digitized by Google

brought on the cars, and the members lunched *al fresco* on the links, after which the afternoon was spent on the course, golfing or otherwise, or on the seashore, as the various members and their friends were inclined.

DERBY.



THE Derby Automobile Club paid a visit to the Ryknield Works, at Burton-on-Trent, on Wednesday of last week. The first car arrived about 3 o'clock, and by 3.30 about fifteen cars had arrived, carrying about thirty of the members and their friends. On the completion of the tour round the works, an enjoyable run was made to Mr. Clay's residence, eight miles from Burton, where the members and their friends were entertained to tea.

SOUTH WALES.

AN interesting gathering of motorists took place at Tintern and Chepstow on Saturday, when the South Wales and Monmouthshire Automobile Club met the Gloucestershire and Herefordshire Automobile Clubs. Lunch was taken at the Beaufort Arms Hotel, Tintern, and tea at the Beaufort Arms Hotel, Chepstow. Over twenty were present at the rendezvous.

NORTHAMPTONSHIRE.

EARL FITZWILLIAM has been elected president of the Northamptonshire Automobile Club, the vice-presidents of which include the Hon. L. C. Brassey, Major Payling and Major Wickham. Mr. E. H. M. Wood is the secretary, and the committee consists of twelve members, with two trade representatives. The headquarters are at the Great Northern Hotel, Peterborough. The opening run took place on June 2nd, to Buckden, resulting in a very successful turnout for the inaugural meet, and everything went satisfactorily. The runs are arranged to take place on every alternate Thursday and Saturday, that of to-day being to Wisbech. The captain of the Thursday runs is Dr. Croxford, and the Saturday runs Mr. F. W. Southwell. The committee are anxious to arrange inter-club meets with any automobile club in the surrounding counties, and the secretary would be pleased to hear from any club with that object.

The First Meet of the South-East Essex Automobile Club.

SHEFFIELD.

THE second annual hill-climbing competition promoted by the Sheffield and District Automobile Club was held on Saturday afternoon from Grindleford Bridge up to near the top of Padley Wood, the distance being a little under two miles. The first twelve in the competition were as follows :—

		Marks.	Miles per hour.	Time over Course. min. sec.
1.	F. Churchill (14-h.p.), Hallamshire ...	1349	13·0	6 54·6
2.	A. S. Fawcett (15), Darracq	1339	13 48	6 40·4
3.	S. W. Fawcett (24), Darracq	1233	13·18	6 49·6
4.	F. Churchill (10), Hallamshire	1187	13·56	6 37·6
5.	Brook Shaw (6), De Dion	1133	10 9	8 14·8
6.	J. E. Evans (12), Darracq	1095	10·3	8 44·0
7.	J. F. Pickering (10), Norfolk	965	10·08	8 55·2
8.	H. Cooper (10), Wolseley	904	9·7	9 12·4
9.	G. W. Grazsbrook (16), Dennis... ...	874	11·66	7 43·4
10.	Ben Hind (9), Clement	860	9·25	9 44·0
11.	Jas. Barber (12), Belsize...	855	8·3	10 51·2
12.	Harvey Foster (10), Wolseley	835	10·08	8 55 0

From the above it will be seen that the local cars—the Hallamshires—had a very good time, Mr. Frank Churchill taking the first prize with a 14-h.p. car, and being placed fourth with his 10-h.p. Hallamshire, which covered the distance in the fastest time. Messrs. Durham, Churchill and Co. are to be congratulated on such a result.

CASES DISMISSED.

AT Barry Police Court, Mr. Thomas Sidney Jones, Cardiff, was summoned for driving a motor-car to the danger of the public at St. Nicholas. P. C. Davies, stationed at St. Nicholas, said he saw the car going towards Cardiff at the rate of sixteen or eighteen miles an hour, and telephoned to the constable at Ely, who stopped the car, and was given the name and address of the driver. Mr. A. M. Ingledew, who defended, contended that the summons was for furious driving to the public danger at St. Nicholas, where the constable admitted no one was in danger. The magistrates, after consultation, dismissed the case. Following this result summonses against Mr. Ernest Reginald Moxey, of Penarth, and Mr. Geofrey Watson, of Newport, for alleged similar offences, were not proceeded with.

AT York Castle on Saturday Pierre Auzeas, chauffeur to Mr. Cecil Cochrane, Gosforth, Newcastle-on-Tyne, was summoned for having driven a motor-car at a speed exceeding twenty miles an hour at Dringhouses, York, on the 8th inst. Police-sergeant Henderson said that the car covered a measured quarter of a mile in 36 sec., equivalent to a speed of twenty-five miles an hour. For the defence Mr. Cochrane gave evidence, and said he told the police-sergeant he did not think they were going at twenty-five miles an hour, as the car was deranged, and one of the cylinders working extremely badly. His driver was an extremely careful man, and in a tour of 2,400 miles had not had the least trouble with the authorities. His honest opinion was that they were travelling about eighteen or nineteen miles an hour. He submitted that the police method of timing, in which an officer had not only to record the time but watch the traffic and pull up the car, was unreliable. The Bench, by a majority, decided to dismiss the case.

THE borough surveyor of Swanage has appeared in the local court as witness against Mr. Alan Hickman, of Coventry, giving evidence that he drove for a measured distance of 550 yards on the promenade at a speed of thirty-two miles an hour. A civilian, who was on a bicycle, also gave evidence to the effect that the car was going at a terrific speed, and in his opinion to the danger of the public. Mr. Staplee Firth appeared for the defence and the Bench dismissed the case.

AT Swansea County Petty Sessions, Mr. Alex. G. Moffatt was charged by the Mumbles police with obstructing a footpath with his motor-car on Monday the 30th ult. John Atkins said defendant drove his motor-car for about twenty yards along the pavement within six inches of his (witness's) door. The road was being macadamised at the spot. On his return journey he did the same thing. Mr. Paton, for defendant, said Mr. Atkins had an animus against motor-cars, and tried to get up prosecutions against them. The magistrates dismissed the case.

CLAUDE WATNEY, 20, Charles-street, Berkeley-square, London, was summoned at Guildford for driving a motor-car in London Road without giving audible and sufficient warning of its approach, on the 29th May. Mr. Staplee Firth defended, and pleaded not guilty. P.S. Hall said at 4.20 on the day in question he was in London Road, opposite Waterden Crescent, when defendant's car passed at a fast speed in the direction of London. The speed increased, and, as he passed Waterden Road crossing, it was quite 15 or 16 miles an hour. Two other cars were coming along, and the driver of the car in question passed between them at about double their speed. The other two cars were going in opposite directions. There was no hooter sounded within his hearing, or any other warning given. The character of the neighbourhood was such that a car going at the speed mentioned should, in his opinion, give some audible warning. By Mr. Firth: He had no evidence of identification. Mr. Firth said the case was disposed of, because the sergeant could not prove defendant was driving, and he quoted the section of the Act dealing with the matter. The Chief Constable asked the Bench to allow him to put in a letter from the defendant, but Mr. Firth said he could not allow it, as the writing of it could not be proved. He did not know the handwriting. The Chief Constable said he should ask the Bench to adjourn the case if Mr. Firth insisted. The letter was in answer to one he had written. Mr. Firth said he found, by looking at the letter, that it was not written by Mr. Watney at all, but signed Claude Watney per J. L., and yet they wanted to put it in.—The Mayor said they must dismiss the case, as the sergeant had very honestly said he could not prove that defendant was the driver.

Digitized by Google

AT Chepstow, on Tuesday, the Hon. C. S. Rolls was summoned to answer a charge of driving a motor-car to the danger of the public at Chepstow on Whit-Monday last. Mr. Rolls was on his way with a friend, Mr. Cawthra, to visit Tintern Abbey, and, according to the police evidence, the car was driven through the crowded streets of the town at a dangerous speed. Mr. Staplee Firth, solicitor, who appeared for the defence, called both Mr. Rolls and Mr. Cawthra, who swore that the car was driven with care, and that the police signal referred to was given in such a manner as to suggest that it was merely intended to warn the motorists to drive slowly along the street. The magistrates ultimately dismissed the summons.

MR. LOUIS SINCLAIR, M.P., Netherall Gardens, Hampstead, was summoned at Stratford for driving a motor-car in a manner dangerous to the public. He was also summoned for failing to give information which would lead to the identification of the driver. Mr. Blanchard Wontner prosecuted; Mr. F. P. Sutthery defended. Constable Dilcock said that on May 20th, at 10.20 p.m., he saw a motor-car going over East Ham railway bridge at about twenty-five miles an hour. Both summonses were dismissed.

GLASGOW TO LONDON TRIAL: HILL FORMULA.

MR. ALEC GOVAN of the Hozier Engineering Company, Limited, has sent the following letter to Mr. Robert J. Smith, the Secretary of the Western Section, Scottish Automobile Club.

Sir,—We would respectfully beg leave to point out that the formula by means of which the number of marks awarded for hill-climbing was obtained, is far from giving just results. In the formula, no note is taken of the relationship of car weight to total weight. Now we take it the function of a motor-car is to carry a load and other things being equal it will readily be admitted that the best car is the one that can can carry the greatest welght on the lowest weight of car. hence the desire for lightness of car. This desideratum is not recognised at all in the formula as, other things being equal, as many marks would be gained by a car weighing say 20 cwt. and carrying 7 cwt. of a load as could be got by a much more ideal car carrying 20 cwt. on a tare of 7 cwt. Yet to get this more perfect car, it would be necessary to make compromises—sacrifices of efficiences, etc., which might tell very heavily against such a car if judged by your formula only.

As an example of how unjustly the formala works out, compare the following results of a light and a heavy car as given in the public report:—

10-h.p., car weight 13 cwt., load carried 8¾ cwt., time 58 sec.
16-h.p., car weight 21½ cwt., load carried 7¼ cwt., time 81½ ses.
Marks gained—First car, 2,152; second car, 2,395.

The former went up without a hitch. The latter had to be pushed up by a mechanic on the car; yet it gained 243 more marks than the first—an Argyll.

Here we have a lowered light car carrying 1½ cwt. greater load in a third less time gaining fewer marks than a heavy slower and greater powered car carrying a smaller load and having to be pushed part of the way by one of its passengers.

In the one case the useful load—the only part that should be considered is forty per cent. of the total, in the other only 25 per cent. Again the light car made 8 34 miles per hour against 5·96 of the heavy car and the light car gained 12-b.h.p. against 16-b.h.p. of the heavy car, while the light car cost £350 against £470 for the other. Yet the heavy car is awarded 343 more marks or a 11 per cent. more to a car that had to be pushed with its small load at a slow speed despite its great engine power.

That the formula is faulty surely needs no further proof, otherwise we might point out that in the first term (w × 60 × L) the constant 60 is much too great according to our experiments. Again in the third term (w × v2) by 22. We cannot tell the reason for "W" having a place at all as, if this is intended what it seems, to be a measure of wind resistance then instead of W, there ought to be some measure of the area exposed to the wind, or a constant only.

CLAIM FOR REPAIRS.

BEFORE the Lord Chief Justice, in the King's Bench division last week was the case of the British Automobile Commercial Syndicate (Limited) v. M'Creery. In this case the plaintiffs sued Mr. R. M'Creery, of 16, Albemarle Street, St. James', S.W., to recover £35 for repairs done to a 7-h.p. Panhard motor-car. The defendant denied liability. Mr. M'Call, for the plaintiffs, said the defendant was a wealthy American gentleman interested in the motor industry and motor driving. In August, 1901, defendant borrowed the motor-car in respect of repairs to which the present claim was made, from Lord Carnarvon, and after a tour on the Continent he sent it to the plaintiffs to be repaired. On December 17 the repairs were completed, and the car was to be delivered on the 18th. While the tank of the car was being filled with petrol in order that it might be ready for delivery a workman upset a lamp which caused a fire and destroyed the body of the car. The plaintiffs had insured not only their own cars but those entrusted to them for repair, and a claim was made upon the London and Liverpool and Globe Insurance Company for the damage to this car. The plaintiffs said they could put the car into proper working order again for £175, and the insurance company agreed to pay that sum Under these circumstances Lord Carnarvon elected to accept the car in the condition in which it was and to receive £175, which amount the insurance company paid to him. The amount for repairs before the fire still remained due, however, but the defendant declined to pay, as he said he had received no benefit. That, however, the learned counsel submitted, was no answer to the action. Several witnesses were called for the plaintiffs, and the defendant and other witnesses gave evidence. His lordship held that the work had been practically completed when the fire took place, and therefore the plaintiffs were entitled to recover. He accordingly entered judgment for the plaintiffs, with costs.

A QUESTION OF BRAKES.

AN important point was decided by Mr. Lane, K.C., at the West London Police Court on Saturday. Messrs. Pickford and Co. were summoned for not having two efficient brakes on their light locomotive, in accordance with the requirements of the Act of Parliament and the regulations of the Local Government Board.

The evidence for the prosecution was to the effect that there was only one brake, a shoe brake to the back wheels, and that this did not constitute two independent brakes. Mr. Staplee Firth appeared for Messrs. Pickford and Co., and argued that the brake usually used for motor-cars of this type was the steam engine, and that that was a much more effective brake than any friction brake that could possibly be applied. Evidence was given of the mechanical construction and of the fact that the steam engine could be used as a very powerful brake, and Mr. Lane held that the steam engine on the motor-car, including the valve arrangements and the reverse gear, constituted a very satisfactory brake for the motor-car, and the case was dismissed.

THE ENDORSEMENT OF LICENCES.

AT Dewsbury, Mr. C. A. Ridgway, magistrates' clerk, stated that in the recent motor-car case in which Mr. T. N. Wendell Holmes was fined £10 and costs for driving a motor-car in a manner dangerous to the public, he failed to ask for the production of the driver's licence that it might be endorsed, and he now asked that it should be produced. Mr. C. L. W. Nicholson, for the defendant, said that he had the licence with him, but claimed that the case having been dealt with they had now no power to endorse the licence. Mr. Holmes had been called upon to pay £16, which was a heavy fine for a first offence, and through his collision with the Ravensthorpe Brass Band there were now four or five actions against him pending in the County Court. Had he been asked to produce the licence at the hearing of the case the fine might not have been so heavy, and he asked, if the magistrates now decided to endorse the licence, that they would remit part of the fine. It was extraordinary that the Motor Car Act should have been drafted in such a loose and lax manner, for as he read it the magistrates had no power to endorse a licence for a first or second offence. The magistrates decided to endorse the licence, and refused to remit any portion of the fine.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Coventry	Driving to common danger	£5, etc.
Stoke	Dangerous driving	£2.
Longton	,, ,,	20s.
Clerkenwell	,, ,,	£5.
Wallasey	,, ,,	20s.
Mortlake	No identification plate	1s.
Guildford	Not giving audible warning of approach	10s.
Hayward's Heath	Furious driving	£20, etc.
Birmingham	,, ,,	£5, etc.
Stratford	,, ,,	£5.
Thorne	No light	15s.
Norwich	Driving carelessly while drunk	Three weeks Imprisonment and £13 11s.
Saxmundham	Above legal limit	£1, etc.
Macclesfield	No trail light	5s., etc.
Lindsey (Lincs.)	No light	5s., etc.
Plymouth	Furious driving	£2, etc.
Cambridge	No light	£2.
Northampton	Reckless driving	£5, etc.
Stoke-on-Trent	,, ,,	£2.
Andover	,, ,,	£5, etc.
St. Neots (7 cases in one day)	,, ,,	£5.
Bamber Bridge	,, ,,	40s.
Lowestoft	No licence	4s. 6d.
Bray (Ireland)	Failing to pull up after accident	20s.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JULY 2, 1904. [No. 278.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT the Royal Agricultural Show last week we had an interesting conversation with a colonial reader of the *Journal*, Mr. James Trackson, of the firm of Messrs. Trackson Bros., Brisbane, who has been in this country for some time enquiring into the various types of heavy motor-vehicles suitable for use in the wool-growing districts of Queensland. Mr. Trackson, who claims to be one of the pioneers of the motor-car in Australia, has recently organised a company in Brisbane under the title of Trackson's Transports, Limited, for the purpose of establishing a service of motor-wagons and road trains to act as feeders to the railways. As a consequence of the recent drought, the roads in Queensland have been practically closed to traffic, and much delay has occurred in getting wool and other products to the railways. The services which are shortly to be started will cover a distance of over 200 miles, and in many parts the vehicles will have to make their way across what are known as bush tracks. After many tests, Mr. Trackson has selected the "Little Giant" motors of Messrs. W. Tasker and Sons, Limited, and is taking out about a dozen of these for service in Australia. He has also recently subjected one of the steam wagons of the Yorkshire Patent Steam Wagon Co. to a very exhaustive trial, as a result of which he has also ordered a couple of vehicles of this type. The trial took place on the 4th ult. on the hilly roads between Leeds and Pontefract, when a 4-ton vehicle successfully carried a load of five tons a distance of twenty-one miles in three hours on a consumption of 165 tons of gas coke and 120 gallons of water. So satisfied was Mr. Trackson with the test that it is more than probable that the first order for two wagons will be quickly followed by others. The illustration on page 399 shows a couple of the "Little Giant" road trams intended for Queensland being taken out for their final test ere being handed over to their purchaser, who is seen at the wheel of the first engine.

◆ ◆ ◆

Dangers to Motorists.

IN Ireland the piece that invariably projects from the rear of carts used in the country districts for the conveyance of timber and similar material is a source of danger to which prominent attention was drawn when the Gordon Bennett race was held in that country. In a lesser degree many of the vehicles met with on English roads are dangerous to passing traffic, as they are apt to take up an unsuspected distance on the road when being turned. What this danger really is was apparent from the accident which has lately happened to a motorist at Hornby, near Lancaster. He was driving carefully along the road when a carter pulled his horse nearer the hedge to allow the car to pass. Unfortunately, the automobile struck the end of the cart, and was overturned, the driver being killed on the spot. At the inquest, the coroner, in summing up, said the accident had evidently happened through the driver trying to get nearer the side of the road as the car was passing. This caused the wheel and end of the cart to project farther into the road at the crucial moment. The collision snapped the steering-rod and the axle, and the car got beyond control and turned over, the driver being killed immediately. The jury returned a verdict of "Accidentally killed."

◆ ◆ ◆

Further Inquiry Necessary.

THERE is assuredly a good case for a thorough inquiry into vehicular traffic of every kind. For not only are many horse-drawn vehicles used in rural districts cumbersome and dangerous, but the operation of byelaws in the great centres of population is not altogether satisfactory, even in London, where covered vans have now to be provided with a side window from which the driver may seem to have an outlook upon the passing world. But many of these devices are mere compliances with the regulations without regard to common sense, and the sooner some definite authoritative investigation takes place the better.

◆ ◆ ◆

Hotels and Cars.

HOTEL-KEEPERS have too often a mean trick of charging motorists at a greater rate than ordinary tourists for accommodation of exactly the same order. It is a piece of scheming which the ingenuity of the official automobile organisation has not yet frustrated; nor is it likely to do so. An interesting ruse has been adopted by at least one motorist, who, when within reasonable distance of the town at which he is likely to spend the night, telephones to the management and fixes the rates he is to pay. These, of course, are settled without any knowledge of the wealth usually associated with the motorist, and only the chagrin of the hotel manager has to be faced on arriving at the destination. But it is not every man who can face that.

◆ ◆ ◆

Hereford and the Trials.

AS was anticipated in the *Journal* a fortnight ago, the town of Hereford will be made the centre of the small car trials to be organised by the A.C.G.B.I. in the autumn of the present year, and the town authorities are placing a drill hall at the disposal of the Club. This will have electric light and an efficient water supply, so that it is likely that the headquarters will have all the accommodation necessary for such an important event as these trials are likely to be. If it is found possible, there will be several circular routes of fifty miles, each of which will have to be traversed twice during the trials. There will also probably be three timed hill climbs, these taking place on ascents with no greater gradient than one in seven. The technical secretary is busily engaged in arranging the details, and the event should do much to further the movement so far as South Wales and the Midland Counties are concerned.

◆ ◆ ◆

Traffic in the Streets.

A CORRESPONDENCE is going on in the Birmingham papers with regard to motor-cars and traffic, a subject which is likely to become of increasing importance in that city during the next few weeks. Several experts who have written to our contemporaries are urging that the three classes of traffic now found in our streets, viz.:—1, slow and cumbersome railway lorries; 2, the horse 'buses and similar traffic;

Digitized by Google

3, the automobile and faster horse traffic; each should be recognised and certain streets prohibited to unsuitable traffic during portions of the day. Mr. C. D. Falcke suggests that in the case of Birmingham the slow traffic should not be allowed in the streets after an appointed hour. The second should be compelled to keep in close proximity to the footpath, thus allowing the quicker traffic free access along the centre of the roadway. These suggestions are all applicable to other towns, and those responsible for local government should give careful heed to proposals of this kind.

◆ ◆ ◆

Success of an Appeal.

THE appeal against the conviction of a motorist reported on another page is the first appeal to Quarter Sessions under the Motor Car Act, 1903. It is worth noting that the Court appears to have taken a judicial view of the necessity of proof of public danger in alleged offences under Section 1 of the Motor Car Act, 1903. It is also clear that the Bench thought there must be very strong evidence positively showing danger to the public before a conviction under this section ought to take place, particularly having regard to the subsequent endorsement of the licences which must necessarily follow on any such conviction. There are several other ways in which furious driving or driving too fast can be adequately dealt with, and this decision indicates that the recent tendency of magistrates in Petty Sessions to try any offence by a motor-car as an offence under Section 1 is a practice which ought not to prevail, and indeed should only be taken in exceptional cases where serious danger has in fact been caused, and ought therefore to be exceptionally punished according to the provisions of this section of the Act.

◆ ◆ ◆

Park Royal and the Agricultural Hall.

AS the "Daily Telegraph" remarks, the attendance of the public at the Show of the Royal Agricultural Society at Park Royal "was the disappointing feature of the meeting." Much discontent was also felt at the little business done by exhibitors, and altogether it would appear that Park Royal has fallen far short of the cheerful anticipations of those who pioneered its establishment. Last year the attendance, excluding season ticket holders and the like, was 65,000; this year it fell to 52,900. At Cardiff, three years ago, it was three times this total. Compared with these results the increasing success of the Cattle, Horse and Dairy shows held at the Agricultural Hall, London, is all the more notable. The truth is that the position of the latter, its popularity with everyone interested in the modern developments of industry and agriculture, and its convenience of access are points that have also contributed to the prestige of the Automobile, cycle and similar shows that are annually held there, to say nothing of the military tournament and other displays favoured with Royal patronage. Looking round at the exhibitions that have been held in and about the Metropolis during recent years, the Agricultural Hall is evidently the only *locale* where unqualified success has been enjoyed. Hence the booking in advance for next year, already exceeding the state of things at the corresponding date for any previous display. Prospective exhibitors should make early application.

◆ ◆ ◆

Children and Cars.

THE journal that has offered a prize to the youngster compiling the longest list of motor-car numbers does not deserve the thanks of parents or motorists. It is a silly proceeding to encourage children to rush into the roadway to take the numbers of passing cars, and many have already had narrow escapes. The old game, not yet played out, of lads throwing their caps under cars, was bad enough, but this new notion is even worse, for girls and timorous boys are participants in the game. Dogs add something to the worries of driving an automobile; these children are equally a nuisance, and the sooner our contemporary closes the competition and awards the prize the better.

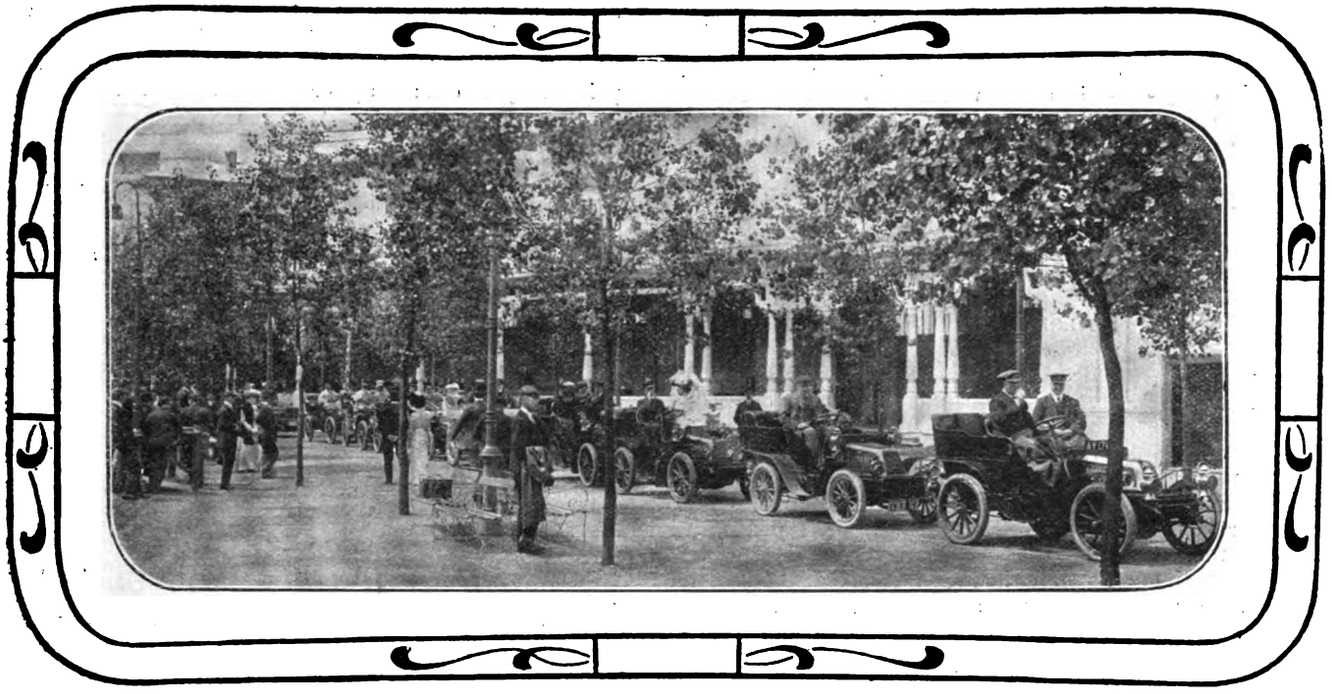
◆ ◆ ◆

A Word of Caution.

AN American contemporary in a recent issue sounds a useful note of warning which may well be repeated here. It appears that quite a number of serious accidents have occurred of late in the United States which may be ascribed to what might be termed repaired patchwork. A car altogether too light in its original construction has been time and again strengthened and repaired by its owner. Parts that proved too light have been replaced by heavier metal, until the total weight of the vehicle has been raised one or two cwts. Some of the crucial parts, however, like wheels and axles, have remained unchanged, and in consequence are carrying additional weight when their original load was far beyond the factor of safety. The overworked metal gives way under some unusual strain, and a

Digitized by Google

dangerous spill is the result. A motor-car of too light design for durability and safety cannot be rendered safe and durable by patching. Unless great care is used in handling it and only moderate speeds are indulged in it will fail at some critical moment as certain as there are laws that govern the strength of materials and the strains to which these are subjected in road work.



◆ ◆ ◆

A Lecture at Bombay.

MR. ERNEST ESDAILE has been lecturing at the Bombay Town Hall on "Why Motor Cars." In making his introductory remarks the lecturer said the Automobile Club of Great Britain and Ireland discovered that in England motor-cars were not popular, and upon investigation they came to the conclusion that the reason was ignorance. Upon this they asked Mr. Esdaile to go to the manufacturers, obtain pictures of the different kinds of cars, and give a popular lecture. The lecturer said at one time he asked a man in the street what a motor-car was, and the man replied "An evil-smelling pastime for the well-to-do." Now, he could say upon the best medical authority that the effluvia arising from the motor-car petrol is a very fine disinfectant. Continuing, he said the motor was almost an unknown luxury in England before 1896. When he found that he had to come out to Bombay he thought it would be best to bring some duplicate views which he had now got an opportunity to exhibit to the public of Bombay under the auspices of the Bombay Motor Car Company, Limited.

Bexhill Automobile Meet.

FOR August Bank Holiday and the two following days an automobile meet and races will be held on Lord de la Warr's track at Bexhill, under the auspices of the A.C.G.B.I. Since the last races the track has been lengthened, and, instead of racing down the track as they did two years ago, it is intended for the cars to race up, finishing at the top of Galley Hill, where a grand stand will be erected. The races will be confined to touring cars carrying their full complement of passengers, and there will be various classes, according to their respective prices. The suggested programme is that on Monday, the 1st August, there will be a meet of the cars in the morning, prizes being given for the most elegant motor turn-out. The races will commence at two o'clock, and will be run off in heats of two cars at a time, from a standing start, the one arriving at the winning post first to be winner. Tuesday will be confined to finishing off the heats, and the finals will also be run. On Wednesday it is proposed that in the morning there will be a battle of flowers and a parade of the cars, prizes being given for the most attractively decorated cars. In the afternoon there will be a motor gymkhana, and in the evening there will be a parade of artistically illuminated cars. A meeting of the town has been called together and various committees have been appointed. The townspeople have taken the matter up most enthusiastically and have already subscribed towards the prize-fund between £250 and £300. Mr. Loveland, of Bexhill-on-Sea, is the secretary, and will be pleased to send entry forms, on application, to readers of the *Journal*.

The Meet of the Nottinghamshire Automobile Club at Trent Bridge. (*See page* 401.)

The Protection Association.

AN extraordinary general meeting of the Automobile Mutual Protection Association was held at Cecil Chambers, W.C. on Tuesday, under the chairmanship of Lord Shrewsbury. The new regulations were finally adopted, the special resolution being proposed by Mr. J. D. Siddeley, seconded by Mr. E. Lisle. The following were elected members of the council:—Messrs. Mawdsley Brooke, Albert Brown, Lt.-Colonel Elton-Burroughs, Charles Friswell, Charles Holmes, E. Lisle, J. J. Mann, John Marston, W. H. Maudslay, W. Lloyd McBride, A. Rawlinson, Bernard Redwood, J. R. Richardson, J. D. Siddeley, and Henry Spurrier, jun. A vote of thanks to Lord Shrewsbury was passed on the motion of Mr. Geo. Monro, jun.

◆ ◆ ◆

Leather and Motors.

THAT leather is a necessity to the motor trade seemed abundantly plain at the Agricultural Hall Show, says the "Leather Trade Review," and it was also very satisfactory to find there are some members of the leather industry who are determined to be early in the field for the business. In addition to the question of leather clothing, travelling requisites and upholstery required for motor work, there seems another outlet which bids fair to absorb quite a quantity of leather. We allude to the leather covers, or "treads," for the protection from puncture and wear of the expensive rubber tyres. Chrome, "raw hide" and sole leather were all in use in some shape or another. The most popular form of

Digitized by Google

leather cover appeared to be a chrome leather band left full substance in the middle and skived off at the edges. A "tread" of stout chrome leather was also attached to the actual cover by several rows of metal rivets, the projecting flat heads of which form a splendid wearing surface. We learnt on enquiry at the exhibition that in France quite a big trade has been done during the past few years in these leather tyre covers, and that in one case a large extension of works has had to be carried out to cope with the demand. It is claimed for the leather tyre cover that, in addition to its being unpuncturable, it prevents the dangerous side-slip, and does not affect the resiliency of the rubber tyre. We heard it hinted by one tyre expert at the Agricultural Hall that there was a difficulty in getting a regular supply of suitable chrome leather in England for the purpose. Our contemporary rather hesitates to believe this, although admitting that the same complaint has been made by people who cut up the leather for motorists' clothing.

◆ ◆ ◆

Petrol Supplies.

NOW that we are in the full height of the motoring season, we would strongly recommend motorists, when starting out on a journey, to do so with full petrol tanks. The current demand for spirit is severely taxing the capacity of makers, and although every effort is being made to keep dealers fully supplied, yet delays are in some cases unavoidable, and in more than one country town south of the Thames lately, on making a stop for additional supplies of petrol, we have been met with the reply "sold out." Just now the arrival of the van loaded with cases of petrol is one of the most welcome events of the day to motor-car agents, not only in the country, but in the London district.

◆ ◆ ◆

The Alake as a Motorist.

ALREADY we have referred to the first motor-car trip of the Alake. He has just had a second experience of the pleasures of motoring, having been driven from Norwich to Elsing on his way to the Norfolk Agricultural Show at Dereham. Great enthusiasm reigned in Norwich during his visit to the ancient city and a large crowd witnessed his departure in a 16-h.p. Gladiator car belonging to Lord Hastings and driven by Mr. Hubert Egerton. To him the Alake expressed his keen pleasure in motoring. Possibly the next incident in the visit of our dusky friend will be the purchase of a car; and then there will be glorious doings in Abeokuta.

◆ ◆ ◆

Motor-cars for Municipal Officers.

WE have pleasure in publishing an article warmly commending the use of motor-cars by municipal officers, written by Mr. E. George Mawbey, the Borough Engineer and Surveyor of Leicester. As recorded recently, he met with an accident owing to forsaking the motor-car for the more primitive form of locomotion, but we are glad to learn that a fortnight's stay at Hunstanton has enabled him to return to Leicester in good condition. With Mr. Mawbey in the photograph on the opposite page are Mrs. Mawbey, Miss Mawbey, and his son Maurice, the latter of whom, with Mrs. Mawbey, are members of the Leicestershire Automobile Club, of which the writer of our article is the popular president.

◆ ◆ ◆

The Maximum Penalty.

THE chairman of the Enfield magistrates has publicly stated that the magistrates of the Edmonton division had been seriously considering the advisability of imposing the maximum penalty upon all motorists brought before them in order that they might protect a helpless public against a real danger. Only in cases where extenuating circumstances could be successfully pleaded would any consideration whatever be shown. There is no doubt that the recent fine weather has brought out a goodly crop of motorists, some of whom, exulting in the warm sunshine, have travelled far and fast. Moderation should be exercised, and then toleration may be expected.

◆ ◆ ◆

The use of Identification Marks.

MOTORISTS, both amateurs and traders, cannot be too careful in dealing with the identification marks allotted by local authorities. A motor-cyclist who borrowed a "number" from a fellow motorist has just discovered that such a proceeding may be associated with considerable expense. He has been summoned, firstly, for fraudulently using the identification mark, and secondly, for using an unregistered automobile, the penalties and costs amounting to considerably more than the expenses of registration and number plate. But, in addition to the prosecution of the borrower, the police summoned the motorist who lent his number, and he, too, was ordered to pay a fine. We would ask motorists to remember that just as the licences issued are to be regarded as personal permits only to be used by the persons whose names they bear, so the registered numbers applied to automobiles are only to be used on the car or motor-cycle described in the registration. Otherwise trouble will result. We shall be glad to hear from readers who find any difficulty in interpreting the Act, so that obscure points may be cleared up for the benefit of all.

THE Mercedes Co., Ltd., has been registered with a capital of £350,000.

THE Sheffield and Lincolnshire Clubs are meeting at Ollerton to-day (Saturday).

CAPTAIN SIR WROTH LETHBRIDGE, Bart., has accepted the chairmanship of the Somersetshire Automobile Club.

AN effort is being made by the Amusements Committee of Hastings to secure an automobile race meeting for the town early in August.

EARL RUSSELL'S appeal against his conviction by the Winchester magistrates has been dismissed at the Hants Quarter Sessions.

A REPORT is current in Paris that the Richard-Brasier car on which Thery won the Cup has been sold to an American millionaire for £2,800.

IN consequence of the great demand for the *Motor-Car Journal* Identification Card, we have decided to supply parcels of half a dozen on receipt of three-halfpence to cover cost of postage.

ANSWERING Mr. Cathcart Wason in the House of Commons, Lord Balcarres has announced that steps were being taken in conjunction with the police to prosecute any person infringing the rule which limited the speed of motor-cars in the Mall to ten miles an hour.

REFERRING to Mr. Govan's letter in our last issue we understand that the Committee of the Scottish Automobile Club (Western Section) in dealing with the report of the cars which required assistance on the hill, decided that the marks gained on the basis of the formula were to form no portion of the results contained in the certificates applicable to those vehicles which are issued, and that finally, no marks were allotted in respect of the hill-climb in these instances.

MR. A. ROSSI, of Britannia Road, Fulham, S.W., has designed a motor-car house, built in sections and bolted together so that it can be easily erected as a tenant's fixture. The floor is well raised from the ground, being built upon heavy joists. Stout weather-boards cover the roof and casement windows increase the effective appearance of the house, which is a distinct advance in construction at a decline in price. Motor-cycle houses are also made by Mr. Rossi, whose catalogue reveals his ideas of economy in cost as well as excellence in design.

MOTOR-CARS FOR MUNICIPAL OFFICERS.

By E. George Mawbey, M.Inst.C.E., President of the Leicestershire Automobile Club.

TWO or three months ago the Editor intimated to me his desire to publish in the *Motor Car Journal* an article on the value of motor-cars for municipal officers. Owing to pressure of work, carrying out an electric traction scheme for Leicester, which will clear the streets of the vagaries, heavy strain and insanitary conditions peculiar to the working of over 400 tramway horses and many other more or less to be pitied animals used by private owners for the convenience (or otherwise) of mankind, I have not before found time to comply with this request.

Very few people seem to have any misgivings or objections about engineering officials recommending the substitution of electric traction for horse-drawn cars, hackney carriages, etc., for the use of the masses of the people; but it is a more delicate matter to recommend the providing of officials with up-to-date mechanical means of locomotion, although the motor-car of to-day offers at once undoubted facilties for saving of time, together with the means for greater personal supervision of work, and increased efficiency of a municipal officer in many ways. This is a subject all the more difficult of approach when officials are already liberally provided with horsed conveyances, and this being so in my case, and having thought myself in a four-wheeled carriage almost as safe as being in a tramcar, is perhaps another reason for my delay, notwithstanding the fact that I am a strong believer in, and a hearty supporter of automobilism, no less for the purposes of work than for pleasure.

I have, however, now been aroused out of my inattention regarding this article by being the other day, together with the chairman and vice-chairman of the Leicester Tramway Committee, suddenly hurled out of this comfortable and apparently safe low-built four-wheeled carriage on to a tramway track.

Mr. E. George Mawbey, M.Inst.C.E., President of the Leicestershire Automobile Club, on his 12-h.p. Darracq.

The horse took fright, got absolutely beyond control immediately smashing down a lamp post, and in another moment leaped short round, overturned the carriage, kept on his own legs, and tried to whirl round over us whilst on the ground, which I managed to get up and prevent by securing him before serious damage was done to the plucky coachman, who was just being dragged round helpless under the fore-carriage.

Having in consequence to remain several days in bed, with badly bruised ribs and other little defects, sternly brought me to the conclusion that I should, after all, have been vastly safer in a motor-car, and this I can say after having had between two and three years' experience, owning and driving three different

Digitized by Google

types of cars for private use, and after many years' experience of horses.

I am, therefore, taking the first opportunity during convalescence of dictating a few notes of my views upon this subject.

Naturally ratepayers would be apt to resent the providing of municipal officers with motor-cars if looked at from the "luxury" point of view; but as the novelty wears off and they become convinced that it is not only no more expensive than the antiquated style, but enables officials to see more often and keep a tighter grip upon and better control of their out-door staffs and works, thereby saving the cost of the car many times over, local authorities will become alive to the advantages of not allowing their chief officials to contribute to the damaging and fouling of the surfaces of their roads and streets by horse locomotion. And it may be truly said that there is no better or quicker way of inspecting roads and streets than with a motor-car, instead of having to rely too much on foremen, for the running of a car is itself an excellent indicator of the condition of the surface. It should be mentioned that several municipalities and other local authorities have already provided their chief officials with motor cars.

I can speak, also, strongly in favour of the use of a car from a health point of view, for I have benefited greatly from the bracings up I have been able to get at week ends with our own car, which I believe has been a great factor in enabling me to get through the heavy amount of special engineering and other work which, as is well known, I have had in hand.

The drawback to cars for business purposes has until recently been their cost and unreliability. This is now, however, being rapidly surmounted, thanks largely to the reliability trials of the A.C.G.B.I. and affiliated clubs.

It must also be said that a large percentage of the disappointing stops on the road are due entirely to the neglect of simple details requiring far less attention and trouble than the feeding and keeping of a horse in a healthy running condition. The carrying of a reasonable stock of the small spare parts would in many instances also avoid delay.

The cost of cars should not now prevent their adoption, and they can be obtained of any size and power suitable for the area to be covered and the work to be done.

Any car can now be fitted with a movable canopy top, or more substantial removable covering, which makes it quite as comfortable for winter use as a closed carriage.

Another proof of the advantage, superiority and economy of cars when there is plenty of work to do is the fact that so many doctors and commercial men have adopted them in preference to horses.

To any brother engineer and surveyor who may wish, and is permitted to have a car for his work, I would say that it will be far the most economical and satisfactory in every way to purchase a perfectly up to-date, solidly-built car of ample power for his work, instead of starting "on the cheap," and to employ an ordinary but reliable driver-mechanic to take care of it, clean it, and execute all the usual running repairs, for which he will have plenty of time at his disposal, and he probably could in some cases be also utilised for other light and suitable duties.

It may be said that this paper is short of information as to the cost of running and upkeep of the car, but this varies so much according to the make and care taken of it, and the miles run, that such estimates would be very variable. Still, many examples may be found in the different motor journals. I might, however, mention that I have found the cost of petrol and lubricating oil for a 12-h.p. double-cylinder car to be about 1d. per mile, and the cost of tyres and non-skid appliances is, roughly speaking, for such a car, something like 2d. to 2½d. per mile; but this must not be taken as applicable to all districts and conditions, and it would be less for smaller cars, which would be powerful enough for comparatively small towns and districts.

Perhaps it is only due to here acknowledge the fact that my appreciation and advocacy of automobilism was given birth to three years ago, when I was installed the President of the Incorporated Association of Municipal and County Engineers, and when the annual meeting was held in Leicester, on which occasion the members of the A.C.G.B.I. and its Nottingham and Midland branches kindly sent me over forty motor-cars, by which a large number of our members were conveyed on their various visits in Leicester and the surrounding districts. This event, which was the outcome of a suggestion of Mr. E. P. Hooley, C.E., County Surveyor of Nottinghamshire, and Mr. A. R. Atkey, hon. secretary of the Nottingham Club, resulted in making many staunch and influential supporters of the cause, some of whom have become enthusiastic motorists either on their own account or by the wisdom of their local authorities, and it is to be hoped that ere long many others will be joined to our ranks.

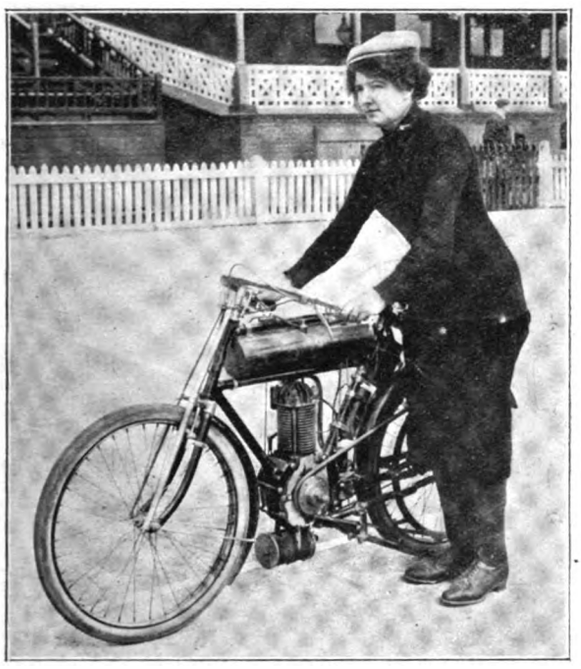
A 2,000-MILE MOTOR RUN.

MR. D. M. WEIGEL and the 20-h.p. Talbot car have both stood the strain of a 2,000 miles motor run which has struck the popular fancy in a way that has added to the respect of the man in the street for the man in the car. To keep the engine of a motor-car running for 2,017 miles—and it might still have been running but for an editorial order—is a feat that has led a wondering crowd to inspect the vehicle as it stands in the show room of the British Automobile Commercial Syndicate in Long Acre, W.C. Since his return to town after his long journey—seemingly made all the longer by the regard paid to the legal limit of speed—Mr. Weigel has been resting, and long interviews as to his experiences have been out of the question. But a few details will be of interest.

The start was made from London on the afternoon of Wednesday in last week, and after a continuous journey of twenty hours Perth was reached, where the Lord Provost and a large contingent of city councillors awaited the coming of the car. While the travellers washed the engine was kept running and the return southward was shortly after begun. London was reached again without incident, and by 3 a.m. on Sunday morning the car was in Perth for the second time, after having encountered bad weather in the north of England. Fortunately the climatic conditions improved on the homeward journey, and at Northallerton, shortly before nine o'clock on Sunday night, the engine was reported to be going better than ever. The car reached London early on Monday morning, when the run was continued to Portsmouth, the return to London being signalised by one of the tyres puncturing on Hammersmith Bridge. Seeing that the Clincher tyres had run more than 2,000 miles such an incident did not detract from the merit of the journey.

Altogether 2,017 miles were covered, the journey occupying five days and four hours—in all 124 hours, during 107 of which Mr. Weigel was at the wheel. At the end of the run there was little wonder that he felt stiff in the hands and that his knees wanted a variation in exercise. Apart from the physical discomfort associated with such a trial there were really no incidents. The vehicle ran splendidly, and but for the fact that the self-imposed limit of 2,000 miles had been covered there was no reason why the engine should have ceased running. Both Mr. Weigel and the makers of the Talbot car are to be congratulated on the performance. The vehicle was actually chosen from stock just before the start.

The cup, presented by Sir Thomas Dewar, which Mr. Weigel thus secures, is to be held by him until some other driver eclipses his record. It is being held by three trustees—the Earl of Shrewsbury, Sir Alfred Harmsworth, Bart., and Sir Thomas Dewar.



MR. H. G. SWEETMAN, of Reading, has opened a motor garage in the High Street, Theale, Berks, where he is stocking petrol and attending to motorists night or day.

MR. F. S. DIMMOCK, of Bridgetown, Barbadoes, imported the first motor-car into the island in July of last year. Since then he has imported two others, and now Mr. F. N. Martinez has returned to Barbadoes with a 12-h.p. Darracq car, so that the prospects of automobilism in the island are looking rosy.

MOTOR CYCLING NEWS.

THE accompanying illustration depicts Miss Maggie Foster, a well-known cyclist, and her Bat motor-bicycle. We understand that she intends to attempt to beat several records in the

near future, and as she has ridden a mile on an ordinary bicycle in one minute fifty-one seconds, some relatively fast times may be expected.

◆ ◆ ◆

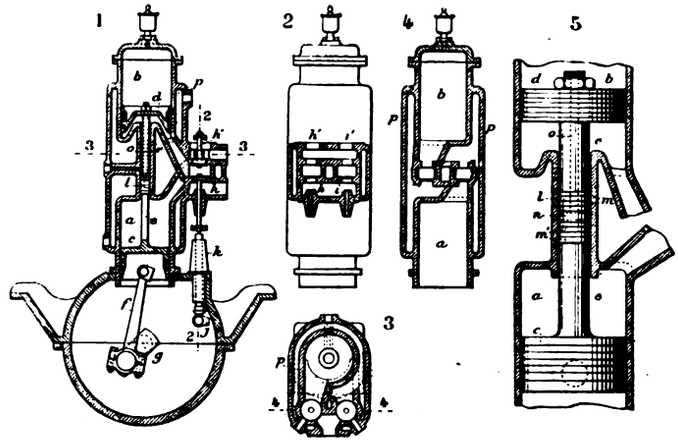
MR. G. P. MILLS, of Nottingham, who holds the pedal bicycle record from Land's End to John o' Groat's, left Land's End at eight o'clock on Thursday morning, the 23rd ult., on a Raleigh 3-h.p. two-speed motor-bicycle, and reached John o' Groat's at eleven o'clock on Saturday morning last, accomplishing the 880 miles in a little under fifty-one hours. The previous record was sixty-four hours twenty-nine minutes.

◆ ◆ ◆

THE Motor Cycling Club will hold a 100-mile passenger trial to-day (Saturday) at Godstone. The course will be twenty-five miles out and home, to be traversed once before lunch and once after, any stop, other than those occasioned by traffic, to disqualify the competitor. The weight limit has been extended to four cwt., but machines must be fully equipped for the full 100 miles journey. In the event of a tie, a series of eight consecutive starting and stopping tests will be made. Ladies only are to be carried as passengers.

◆ ◆ ◆

THE Auto-Cycle Club has now practically decided to run its trials this year in the form of a 1,000-miles tour throughout England, going out by the East Coast as far North as Scarborough and returning via the West of England. The start will take place from the Club's headquarters in Down Street, Piccadilly, W., on Monday, August 15th, finishing at the same place on Saturday, August 20th. All classes of motor-cycles are eligible to take part in these trials, but manufacturers will not be allowed to enter more than three machines in any one class, each of which must be of a different type. The following are the differences which will be recognised :—



Transmission-belt, chain, gear, two or more speeds.
Cylinder capacity machines with engines not exceeding 70 by 70.
Machines with engines exceeding 70 by 70 but not exceeding 76 by 76.
Machines with engines exceeding 76 by 76 but not exceeding 80 by 80.
Machines with engines exceeding 80 by 80 but not exceeding 85 by 85.
Or their equivalent volumes swept out.
Weight. There must be a difference of at least 30 per cent. in weight to constitute a new type of machine.

A class for private owners will be included, but this will only be open to riders who were members of the club prior to June 25th. In this class a medal will be awarded instead of a certificate. The rules and the system of checking throughout will be very strict, it having been decided that any machine which does not arrive at the destination for that night by a given time, must be withdrawn, and will not be allowed to complete the journey.

A DOUBLE-ACTING PETROL ENGINE.

M. A. ELDIN, of Lyons, has sent us the accompanying five drawings and particulars of a double-acting petrol engine he has lately constructed to the designs of M. A. Bon. Many inventors have devoted attention to this question of a double-acting internal combustion engine, but the chief difficulty has been in obtaining a stuffing-box capable of withstanding the high temperature, the explosion taking place on both faces of the piston giving rise to great heat. Referring to the drawings, of which Fig. 1 represents a vertical section of the motor; Fig. 2 a section through the valve chambers, on the line 2 2 of Fig. 1; Fig. 3 a sectional plan on the line 3 3; Fig. 4 a vertical section through 4 4, Fig. 3; and Fig. 5 an enlarged section of the stuffing-box, it will be seen that the cylinder casting forms two cylinders, a b, in line with one another, and the two pistons, c d, in them are rigidly coupled together by a rod, e, which passes through a stuffing-box, o, arranged between them. The design of the stuffing-box is unusual, and takes the form of a long cylinder of small diameter, in which an enlarged collar, l, on the rod works as a piston. Leading into this tube is an oil feed, which not only serves to lubricate the stuffing-box but the main pistons also. Each cylinder has its own set of valves, which are operated in the usual way by two to one gear driven off the crank shaft, and the explosion occurs in them alternately. The engine operates on the usual Otto four cycle, so that in its single form two impulses are obtained during every alternate revolution.

Amongst the chief drawbacks that have hitherto been inherent in double-acting petrol engines of this kind are that the connecting-rod and its bearings are alternately placed in compression and in tension, and that it is necessary to employ some kind of stuffing-box for the piston rod to pass through. The motor illustrated herewith is stated to have been subjected

to a series of successful trials, and among the advantages claimed for it are a reduction in the dimensions and weight as compared with an ordinary two-cylinder engine.

THE Automobile Handbook for the members of the A.C.G.B.I. and the Motor Union has been issued this week, and contains much information of interest to automobilists, and a guide to touring in the United Kingdom and places abroad. The selected itineraries for motorists touring in France have been carefully prepared, and the summary of some of the chief points connected with British highway law will be of service.

Digitized by Google

AUTOMOBILE TOURING.

TOURING by automobile is one of the most enjoyable recreations of modern times. It is in some respects comparable to yacht cruising, but fortunately it is open to a much larger class. There is hardly an owner, even of that class of car not specially built for touring, who does not venture on a trip occupying several days during the summer or autumn months. One often meets with the expression "touring fad," intended to convey the idea that automobile touring will command popular interest temporarily only. While this may prove true with regard to certain outgrowths of the touring movement, automobile touring itself will undoubtedly remain, as there is nothing to take its place. There is no comparison between touring by rail and steamboat lines and that by motor-car. The former mode of travel may be most convenient to those who want to make a trip to the large cities, but most owners of automobiles at periods of leisure during the warm season long to get out into the country, where they may enjoy the healthful, invigorating air and "nature's beauty undefiled." For exploring sections of the country noted for their scenic attractions the motor-car is unequalled.

The great advantage of automobile touring over railway travelling is the independence it gives the tourist. He starts and stops at any convenient time of the day, and when he finds a place particularly to his liking he remains as long as he pleases, dividing his time between the different places visited according to their degree of interest to him.

THE suggested motor-car service at South Molton, Devon, is not likely to become an accomplished fact this season.

THE Midland Automobile Club had a very successful run to the British Camp Inn, Malvern, on the 18th ult. Members and their friends numbered about forty, and there were twenty cars.

THE Garrard Mfg. Company, Limited, have sent a copy of their Motor Book for the current season, this being the sixth edition of a very useful pamphlet issued by the makers of the Clement-Garrard motor-cycle. It has detailed drawings of the various parts of that machine, and also of the Garrard Suspended Tricar, together with useful notes on driving. These will be of interest to many, while the French and English equivalents for the names of the interchangeable parts of motors add a distinct value to the work.

CONTINENTAL NOTES.

A White Steam Car in Germany.

Prince Henry of Prussia is shown in the accompanying illustration on a 10-h.p. "White" steam touring car, seated beside Mr. Walter C. White, who is driving the vehicle. The photograph was taken during the Gordon Bennett race week in Germany. His Royal Highness and Mr. Ellison Armour, of Chicago, took a day's run on the car with Mr. White and Mr. F. Coleman, starting from the Schloss Wolfsgarten, the hunting lodge of the Grand Duke of Hesse, a few miles south of Frankfurt. The party ran over a mountain range and through some beautiful country, and on the return journey covered a measured distance of forty-four kilometres over very poor roads, including the ascent and descent of a range of mountains, in exactly sixty minutes, a good performonce for a 10-h.p. car.

◆ ◆ ◆

The 1905 Gordon Bennett Course.

The *locale* of next year's Gordon Bennett race is already beginning to attract attention. It is reported that an excellent course, 100 kilometres long, has been discovered between Aix-en-Provence, Sainte-Marie, and Salon, in the South of France.

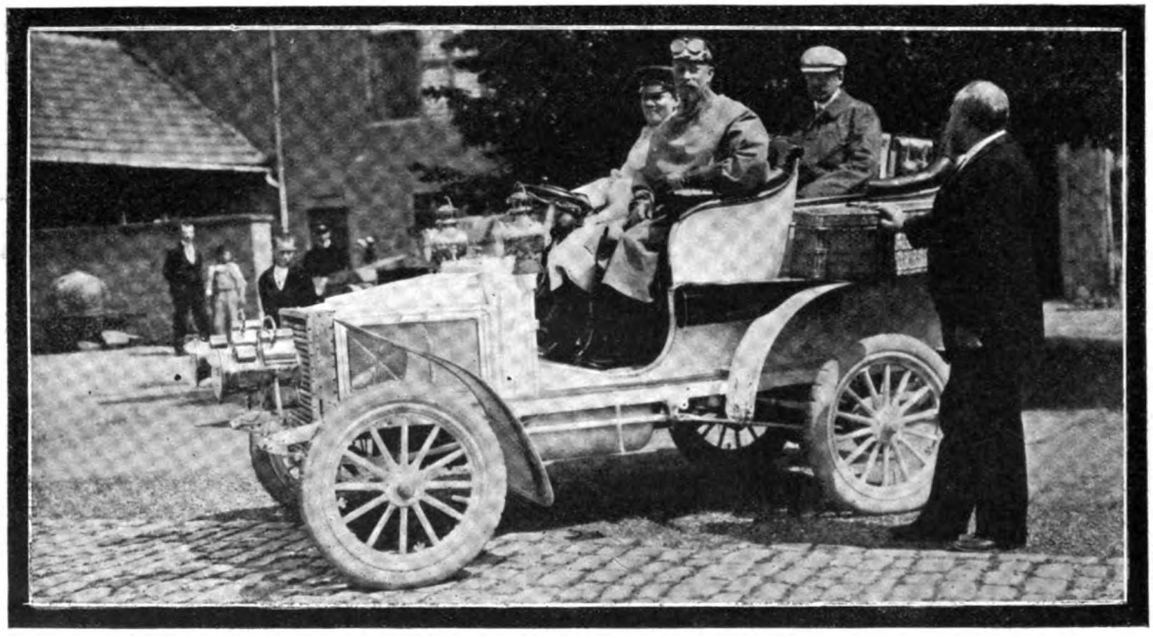


Photo by] Prince Henry of Prussia on Mr. Walter C. White's Steam Car. [Mr. Frederic Coleman.

◆ ◆ ◆

Thery's Return to Paris.

Thery, the winner of the Gordon Bennett race, accompanied by M. Brasier, arrived in Paris on Thursday afternoon of last week. After calling at the Georges Richard works at Ivry they drove on to the club-house of the A.C.F., in the Place de la Concorde, where they were accorded a most hearty reception. The Comte de la Valette acted as spokesman for the A.C.F., while M. Max Richard, on behalf of the Chambre Syndicale de l'Automobile made a short speech congratulating both the designer and the driver on the success of their vehicle in the great international event.

◆ ◆ ◆

More about the Gordon Bennett Winner.

Thery, who is the hero of the hour in Paris, has fallen into the hands of the inevitable interviewer. It appears that he is only twenty-five years of age, yet turns the scale at over fifteen stones. For six years he was in the employment of the Decauville Company, and only joined the Georges Richard Company in November last. Thery, who only made four circuits of the course prior to the Cup race, states that he felt he had, barring accidents, won the contest at the end of the third round, and as

Digitized by Google

a consequence drove with extra caution in the last lap. His liveliest impression during the event was an intense thirst. A subscription is being organised for Thery in commemoration of his victory, and already over £230 has been received.

◆ ◆ ◆

Germany and the Gordon Bennett Race.

Rumours are current to the effect that the Daimler Motoren Gesellschaft will not compete in next year's Cup race, unless it can send a team of three cars; but, in view of the fact that there are several other concerns in the Fatherland capable of building racing cars, the report is hardly anything more than a *canard*.

◆ ◆ ◆

A Novel Speed Indicator.

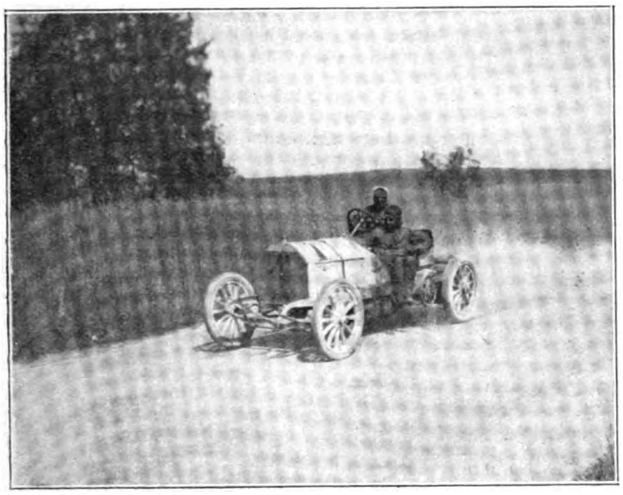
A demonstration was recently given at the police headquarters in Berlin of a novel speed indicator devised by Herr Hans Dahl, the well-known Norwegian artist. The apparatus was fixed to a military Durkopp car early in May. Since then the vehicle has covered some 2,000 kilometres, the instrument working irreproachably the whole time. Herr Dahl groups the speeds, allotting to each group a different coloured disc, which is also inscribed with figures. Speeds up to eighteen kilometres an hour are represented by a white disc, those of 18-27, 27-36, 36-45, 45-56, and higher speeds by green, yellow, red, blue, and black discs respectively. The discs are attached to the front of the car, and the colour easily catches the eye of the motorist, who thus sees at a glance the rate of travelling at any given moment. At night the discs are lighted up from within.

◆ ◆ ◆

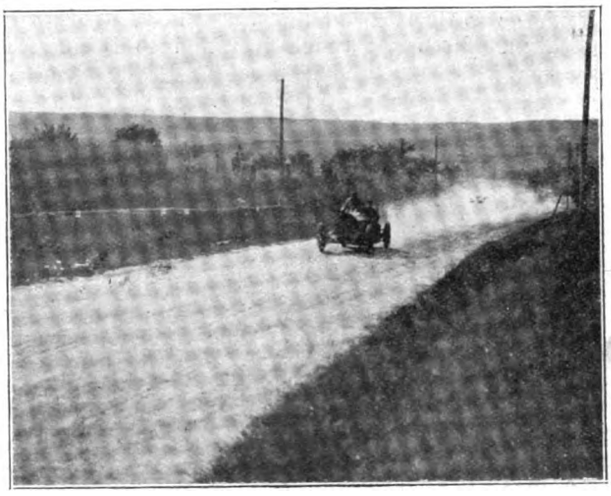
The French Motor-Car Trade.

The French Chambre Syndicale de l'Automobile has suffered the loss of the Marquis de Dion as president. At the annual general meeting recently held he declined renomination, but the Chamber insisted unanimously in making him an honorary president. M. F. Max Richard has been elected in his place, and Messrs. A. Peugeot and Mors were chosen as vice-presidents. The Chambre has now 177 members, who include all the prominent motor manufacturers in France.

◆ ◆ ◆



Motor-Wagons for the French Army.



The French Ministry of War is organising a competition of motor-vehicles suitable for use in the Commissariat department of the army. The price of the vehicles is not to exceed £340, and the three cars adjudged to be the best by the jury will be purchased by the authorities. The trials will be held over a period of eight days in the neighbourhood of Paris at a date yet to be fixed, a total distance of 510 kilometres having to be covered. The vehicles may be propelled either by steam or by motors using petrol, alcohol, or ordinary petroleum. The total weight of the vehicle with its load (which must be at least 1,600 kilogs) is not to exceed 3,400 kilogs. The engine must be at least 12-h.p. at a maximum of 1,000 revs. per min, and a top speed of 16 to 18 kilometres per hour is required. The points to be taken into account in making the awards will be—(1) power of the engine and its simplicity and accessibility; (2) cooling or condensation capacity; (3) fuel and lubricating oil consumption; (4) losses in transmission; (5) losses due to wheel and tyre resistance; (6) efficiency of brakes; (7) manœuvring capabilities; (8) hill-climbing qualities; (9) relation of load to tare weight; (10) average speed; and (11) price. Unfortunately British makers will not be permitted to compete in the trials, the authorities having decided to restrict them to French-built vehicles.

Another "Automobile Week."

The Automobile Club Dauphinois of Grenoble is arranging to hold an "Automobile Week" from the 27th to the 31st July next. According to the preliminary programme that has been prepared, the meeting will commence by a reception at Grenoble on the 27th inst. On Thursday, the 28th inst., there will be a touring competition over a 190 kilometre route extending from Grenoble to the Col de la Dent du Chat and back; on Friday, the 29th inst., a tour of 320 kilometres, from Grenoble to Laffrey (where the times on the hill will be taken), Le Lautaret and back to Grenoble. A series of 500-metre speed trials is to be held at Uriage-les-Bains on the 30th inst., while on the following day there will be a gymkhana in the grounds of the Uriage Thermal Establishment.

THE GORDON BENNETT RACE.

◆ ◆ ◆

A New Dust Preventer.

The Association Générale Automobile is interesting itself in a new dust-preventing preparation invented by a merchant at Nantes. Bitumen forms the basis of the new compound, which is employed in the same way as Westrumite, compared with which, however, it is claimed to be less costly. Some trials with the new product are shortly to be made at Montmorency.

Motoring in the Alps.

Captain Deasy and M. Martini left Martigny on Tuesday morning with three passengers and a quantity of luggage on a 16-20-h.p. Martini car for a motoring tour in the Alps. Starting at fourteen minutes past four o'clock, they proceeded to cross the Col de la Forclaz, 5,694 feet high. The feat, which was successfully accomplished, is one that has never before been attempted by a motor-car. The route is a most difficult one, comprising gradients of one in six and a half ascending, and one in five and a half in coming down.

A 294-MILE NON-STOP BY A "LONDONDERRY" STEAM WAGON.

AS has been previously stated in our columns, the Marquis of Londonderry, K.G., has taken up the manufacture of steam motor-vehicles at his engine works at Seaham Harbour, Durham. The works have already turned out a number of wagons which have proved highly successful, and as negotiations are at present being carried on between the Londonderry principals and several high authorities, the manager of Lord Londonderry's works, Mr. J. Donovan, and his assistant, Mr. E. G. Allison, were deputed to undertake some severe test which would prove the state of perfection to which the "Londonderry" steam wagon had been brought.

Motor-car reliability trials creating at this time a great amount of interest, it was decided that a non-stop run with a fully-loaded wagon from Seaham Harbour to Whitehall, London, would be a satisfactory test of the general construction, reliability and economical running of the vehicle. One of the standard type of commercial five-ton tipping wagons had just been completed, and this vehicle was selected for the undertaking. On four days previous to the date selected for start ng, the machine was run a total distance of 220 miles, was carefully examined on the fifth and sixth days, and at 3 p.m. on Monday, the 20th ult., the vehicle was dispatched on its great task. The route lay from Seaham Harbour, through Stockton to Darlington,

where drivers were changed and the fire cleaned, eight minutes elapsing from arrival to departure. From Darlington the vehicle proceeded to Doncaster, where fresh drivers were waiting, only three minutes being occupied in the change. On leaving Doncaster, the vehicle passed through Retford, Newark, Grantham, etc., on to Stamford, which place was reached at 2.25 a.m. on Wednesday, the 22nd ult. Drivers were again changed at this point, and twenty minutes were occupied in cleaning out the fire and filling up the water tanks. On leaving Stamford the vehicle entered on the last hundred miles of its journey, and proceeded via Biggleswade, Hitchin, etc., to London.

Shortly after passing Biggleswade, the vehicle was joined by Major F. Lindsay Lloyd, Secretary H.M. War Office Mechanical Transport Committee, who rode a considerable distance on the wagon. The speed at this time is given as 8½ miles per hour, and it may be mentioned that the vehicle travelled on the fast gear from Doncaster to London. On reaching Finchley Road, on the outskirts of the City, the speed of the vehicle was reduced to 1½ mile per hour whilst negotiating the congested traffic, and the vehicle arrived at Whitehall at 9 p.m. on Wednesday, the 22nd ult. The most careful examination of the mechanism proved that the vehicle had carried its load safely a total distance of 294 miles—only stopping to change drivers and pick up water—without even a nut or split pin having started. The total time occupied from start to finish was 54 hours, and after taking into consideration the fact that water was very difficult to locate *en route*, the performance of both the machine and drivers is excellent. Ordinary gas coke was used on the journey, and the consumption on the run works out at 1 cwt. for every eleven miles, including the coke used in cleaning the fire at intervals.

As we have already mentioned, the vehicle was one of the Londonderry standard vehicles, and was not specially constructed for the great task it was called upon to undertake. The boiler is of the fire-tube type, and the engines are of the horizontal compound pattern fitted with flat or locomotive side valves. As each relay of drivers rode upwards of ninety miles non-stop on the vehicle, its general convenience in handling and ease in riding may be readily judged. The machine is gear driven, and the ingenious arrangement for keeping the gears in perfect mesh under all circumstances is one of the special features of the machine. The accompanying illustration shows the vehicle on the first stage of its successful journey.

SOME USEFUL NOTES.

WITH the opening of the touring season, and in view of the unusually large number of inexperienced motorists who are just commencing to assume control of cars, there is one point to which attention may be opportunely called just at this time, namely, that safety of operation is the prime consideration to be sought. Not only must the safety of the occupants of the car be carefully guarded, but this care must extend to all other users of the highway. The precautions required to secure it are not only obviously necessary from personal considerations of life and limb, but the reputation of the motor-car is at stake, and its future development largely depends upon a public demonstration of what is a fact—that automobiles are inherently the safest mode of road conveyance. It may be said with a full degree of assurance that there are only two functions of a motor-car in the failure of which serious danger may lie. These are the steering and the braking functions.

IF the brakes of a car are efficient, it may be brought to rest within the space that the careful driver always allows as a margin of safety, and if the steering gear is perfect, any car may always be guided into the path of safety. A car which may be promptly stopped and accurately guided is never a source of danger of itself. That it may be thus controlled depends upon two things: the intelligence of the driver and the integrity of the mechanism which effects these two all-important functions. It is far more important, on grounds of safety, that a new driver should be able to stop his car, than that he should be able to start it. He should be as quick in applying his brakes upon a sign of danger as he is to close his eyes at the near discharge of a gun, and the two actions should be equally automatic, and should need no conscious direction of the will. He should be as able to locate both brakes in the dark as he is to "find his way to his mouth," and there should be as little mental effort required for one as for the other; for it is only when these actions become purely sub-conscious that complete safety is assured. The instructor should train his pupil in the use of the brakes before he gives him any instructions as to clutches or the throttle, for in most modern cars the clutch takes care of itself when the brake is applied, being automatically disengaged.

THE next most important thing for the new motorist to learn is the steering, and as this cannot be mastered unless the vehicle is in motion, it should be practiced at low speeds until it can be performed with accuracy and promptness, and without the necessity of any mental process being performed between the direction desired and the wheel movement. As long as there is any conscious thought of which way or how far the wheel must be turned to secure a desired result, a motorist is not qualified to drive the car at high speed, or through crowded or difficult roads. The essence of safe motor-car operation lies in the automatic and instantaneous response by the driver to visual stimuli relevant to the steering and guidance of his car.

HERE AND THERE.

A MOTOR-CAR club has been formed for Somersetshire. One is also in course of formation in Cumberland.

THE Marquis of Ailsa has just acquired a 12-h.p. Wolseley car through Messrs. Rennie and Prosser, of Glasgow.

THE Right Hon. the Earl of Lonsdale has ordered a 20-h.p. Hotchkiss car from the British Automobile Commercial Syndicate, Limited.

Mr. R. T. Pryor, one of the Founder Members of the Hertfordshire Automobile Club, on his 14-h.p. Crypto Car.

THE officials of the North of Scotland Railway Company are considering the advisability of establishing a motor-car service between Alford and Strathdon.

PERMISSION has been accorded by the Southampton Harbour Board for the trial of motor-boats proposed to be held in Southampton Water on July 26th and 27th.

A MOTOR-CAR driver who was alleged to have been driving in a manner dangerous to the public has had his licence suspended by a Metropolitan police magistrate for three months.

AMONG the birthday honours, the baronetcy bestowed upon Mr. Alfred Harmsworth might be regarded as a recognition of automobilism as well as of journalism. We congratulate Sir Alfred.

BY eighty-five votes to sixty-nine, the House of Commons has decided not to pay the out of pocket expenses incurred by Mr. Joseph Taylor in connection with the Maidenhead Bridge agitation.

THE Daimler Motoren Gesellschaft, the makers of the Mercedes car, which has hitherto had its headquarters at Cannstatt, has now removed the whole concern to the new workshops which have recently been completed at Unterturkheim, near Stuttgart.

AS a result of the success of the "Motobloc" cars shown for the first time in this country at the exhibition at the Agricultural Hall in March last, Messrs. Montague Hawnt and Co. are, we learn, arranging for the introduction, about September next, of a four-cylinder 16-20-h.p. car on similar lines.

FROM Messrs. Mecredy, Percy and Co., Limited, comes a book of over 100 pages on the mechanism of the De Dion-Bouton motor-cars, with admirable instructions as to driving the same by Mr. R. J. Mecredy. It is a revised edition of an earlier volume, and we note that the chapters on the care of the car and roadside troubles have been so much elaborated as to give the book a value to owners of any automobile.

A NUMBER of gentlemen in Penicuik have been interesting themselves in the question of providing a motor-car service between West Linton, Penicuik and Edinburgh, and as a result a car will be hired for a month on trial. It is expected that the journey between Penicuik and Edinburgh, which is nine miles by road and over fifteen by rail, will be completed in thirty minutes, or twenty minutes under the railway company's time.

THE first entries for the W. K. Vanderbilt, jun., cup race were two White steam-cars.

FOR the third year in succession E.I.C. plugs were fitted to the cars which represented England in the Gordon Bennett race.

MESSRS. HUMBER, LIMITED, have issued a new pamphlet containing a series of letters of approbation from owners of the Humberette.

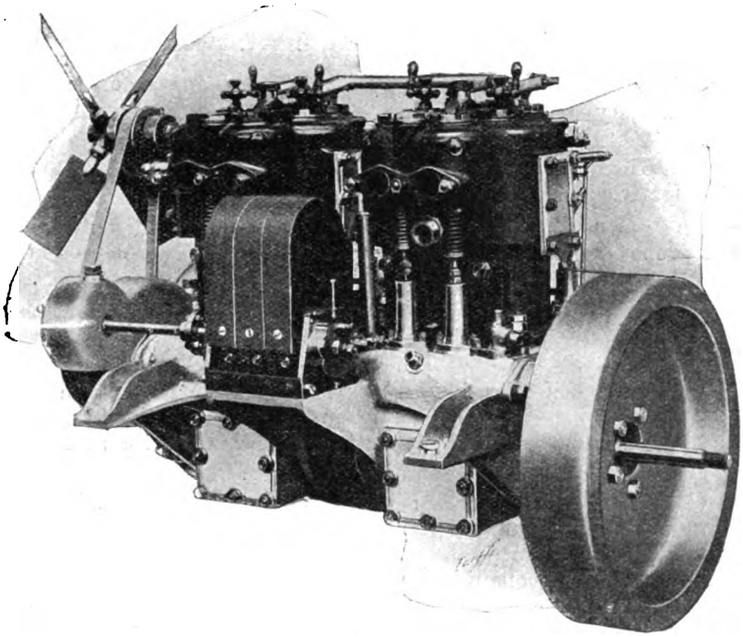
IN the 1905 Budget of the Swiss Ministry of War provision is made for a sum of £600 to be expended in an experimental military motor-wagon.

MR. A. S. ROSS has acquired large works and a garage at 61, High Street, Bloomsbury, W., where he will have facilities for every class of motor-car repairs.

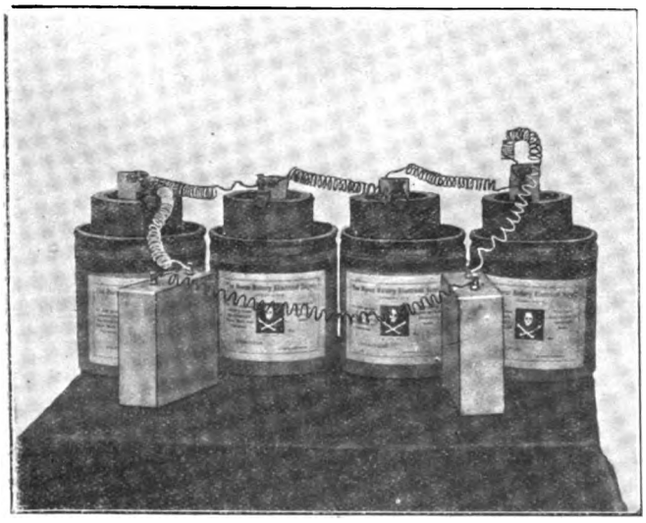
MR. J. A. CUNDY has opened a garage and motor repair depot at 4, The Broadway, Barnes. He has an inspection pit and is well equipped for repairs to all classes of automobiles.

THE Lacre Motor Company, Limited, have arranged with their agents to inform them as to police traps, which will be posted in the garage in Poland Street, W., every Friday and Saturday.

MESSRS. MERRYWEATHER have lately completed a steam motor fire-engine for the Heston and Isleworth District Council. They are also building a similar engine for service at Bassein, British Burmah.



THE illustration herewith is an interesting one, inasmuch as it shows a unique vehicle just supplied to Mr. Harry Rich, of Redruth, Cornwall, by the Duryea Company. It may almost be termed a collapsible carriage; as shown it is "opened out" to its fullest capacity and will carry six people, two on the back seat, two on the front, and two on the principal or driver's seat in the middle. When four persons only are carried they can sit either in front or behind, and the third seat and foot board are then folded up so snugly that their presence is hardly perceived, whilst when two persons only require to use the car, the second seat is folded up in a similar way and the vehicle is to all intents and purposes a standard two-seated phaeton. While dealing with the Duryea Company's cars we may mention that on Thursday, 16th ult., two of the new British-built Duryeas carried out a record drive to Land's End. One was a 12-h.p. doctor's phaeton with two on board, the other a 15-h.p. car with three passengers and baggage. They reached Land's End before 8 p.m. within half an hour of each other, having covered 303 miles of the hilliest country in Great Britain in a little over 16 hours' driving time. The



phaeton left Land's End at 12 30 the next day, and, travelling by a different route, was in Coventry again by 4.30 on Saturday, the 18th ult., having covered 667 miles in three days' driving. The other car covered 560 miles in the three days and was in Coventry again on the morning of Sunday, the 19th ult., after a journey of 607 miles. We need hardly add that the performance is an excellent one, especially when it is remembered that the distance is about 60 per cent. more than the Edinburgh-London run, whilst the nature of the Devon and Cornwall roads is an infinitely more trying test for a car than anything experienced on the Great North Road.

THE accompanying illustration of the engine of the Richard-Brasier car driven by Thery to victory in the Gordon Bennett race is not without interest at the present time. Messrs. Mann and Overton, the British agents for these cars, inform us that the cylinders, which are cast in pairs, are 150 mm. bore by 140 mm. stroke. The crank chamber is a solid casting bored out at

each end to provide hand-holes, and to receive a central plate in which are carried the bearings of the crank shaft. The latter is made out of solid metal, the cranks being set at an angle of 180 degrees. The cylinders are made of cast-iron and bolted to the crank chamber. The valves, which are interchangeable and mechanically operated, are set on opposite sides of the engine, one cam shaft driving the inlet valves and the governor and the other the exhaust valves, the magneto and the fan drawing air through the radiator. The governor, which is enclosed, acts on two throttles recessed into the head of the cylinder between each pair of inlet valves. All the parts are capable of very fine adjustment, so that the best results can be obtained with the least possible weight.

Four Boron Cells charging two 30 ampere-hour Accumulators.

THE Boron Primary battery for accumulator charging was first introduced to the public in the year 1894 by Mr. Henry Warren, Principal of the Liverpool Research Laboratory. The battery as it now presents itself, since its constant evolution, stands as a double fluid cell composed of a specially-constructed carbon cylinder, so formed as to practically overcome polarisation, at the same time entirely dispensing with the carbon plates with which the old form of cell was constructed. The preparation of the carbons is carried out under a scientific process, and is the result of several years' research, involving the use of the costly element boron. The depolariser consists of salt (preferably of sodium bichromate) which, on account of its great solubility, and at the same time the high percentage of chromic acid it contains, is admirably adapted to the purpose. The cell when mounted measures about seven inches by five inches and weighs, when fully charged, approximately eight pounds. The practical E. M. F. is about two volts, whilst the output of current can be extended to twenty amperes. The battery can be left charging accumulators any length of time without damaging the latter, no resistance being required, the batteries being so constructed as to render it impossible to overcharge the accumulators. They can thus be used and afterwards put aside with solution in them for an indefinite length of time without any deterioration.

THE long-distance non-stop craze has spread to America, where Mr. Chas. G. Wridgway, who will still be remembered by many motorists in this country, has lately completed a 500-mile non-stop journey on a 24-h.p. Peerless car.

The Peter Union Trophy won at the Frankfort Track Race Meeting by Herr W. Poege

MESSRS. MOSS AND WOODD, the agents for the Orion motor-vehicles, have removed to larger and more convenient premises at Bannister Road, Kensal Rise, N.W., where a garage and accessory stores are also being established.

THE Town Council of Cardiff are proposing to restrict the speed of motor-cars passing through the town to ten miles an hour, and we are glad to see that Mr. Powell, the assistant secretary of the South Wales Club, is writing to the local Press with proposals.

RECENT additions to the ranks of the Automobile Club include the Duke of Beaufort, the Marquis of Northampton, Sir Thomas Gooch, Bart., Sir Sidney H. Waterlow, Bart., Sir Reginald Cathcart, Bart., the Hon. J. H. T. Byng, Mr. Waldorf Astor, and Mr. D'Oyley Carte.

POT BANK, where the Yorkshire Automobile Club is holding its hill climb, is situated on the road leading from Beckwithshaw to Killinghall, and is approached as follows:—On leaving Harrogate, proceed up Harlow Car road until Moor Park is reached, then take a sharp turn to the right which leads to the Beckwithshaw-Killinghall road, proceed about half a mile, when Potbank will be found, this being the first steep hill down after leaving Moor Park.

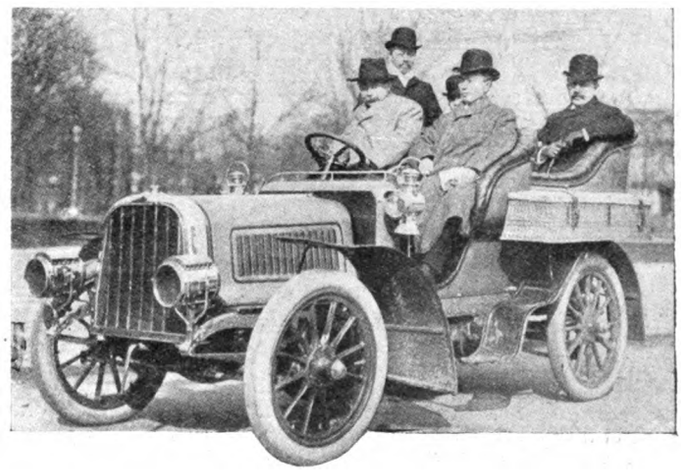
FRICTION AND LUBRICATION.



LUBRICATION may be described non-technically as the art of making things work smoothly. It is a wide term, covering human as well as mechanical relationships, between which there is a close analogy. The necessity of making things work smoothly is apparent to all, and nowhere does this apply with greater force than in the vitals of a motor-car, where lack of smoothness in working is a sure cause of trouble and expense. It is a fair question to ask, for the average owner of an automobile, why won't things work smoothly without lubrication? The answer is found in that natural resistance to motion which is commonly called "friction." This it is the object of lubrication to eliminate as far as possible. Friction can never be entirely vanquished; if it could, then perpetual motion would result as a natural consequence, since once the starting inertia of a body had been overcome, it would continue to move indefinitely.

To appreciate lubrication, the enemy—"friction"—should first be studied. Its laws are few and simple, and may be divided into two classes—static and dynamic. The first deals with the friction of rest, and is given by some the not inappropriate name of "Stiction." Belts and friction clutches come under this heading. The second deals with the friction of motion, with which automobilists are more particularly concerned. The friction of motion may be sub-divided into rolling and sliding friction. The former relates to ball and roller bearings, the latter to plain bearings. In rolling friction the balls or rollers act in a manner closely analogous to the lubricating medium of a plain bearing by keeping the working surfaces apart. If it was possible to make a ball or roller bearing with absolutely no sliding friction, the use of a fluid lubricant might be safely dispensed with, but there is sliding between the balls or rollers themselves, or between them and the cage employed to keep them in position. The amount of sliding friction is lessened when intermediate balls or rollers are used, but it is not entirely eliminated. The extra complication and cost of these bearings qualify their other advantages, and the friction of a well-designed plain bearing, properly lubricated and protected, is very much smaller than many people imagine.

Although the amount of friction is generally stated to be independent of the extent of surface in contact, for practical reasons, this old law needs qualification. If the surface is large, the pressure per unit area is correspondingly small, and may be quite insufficient to squeeze out the film of lubricant—hence the active surfaces are kept at a respectful distance. But with relatively small wearing surfaces the pressure on the lubricant is proportionately greater. The surfaces possess a more penetrative power, which—if it cannot be checked—will squeeze out the lubricant and permit physical contact. This may become so intimate as to start the force of cohesion, with "scoring," or tearing of the surfaces, as an immediate result. The principal object of lubrication is to prevent such a result. Forms of lubricators (or devices for feeding the lubricant to the working surfaces) are almost innumerable. Much ingenuity has been displayed in their construction, with the object of securing a regular feed and avoiding stoppages, which might have very disastrous consequences. A lubricator consists of a reservoir and one or more feeders. It may be portable, as in the old-fashioned oil can, which is perhaps the most elementary form of lubricator. Usually the lubricator is fixed close to the bearing it is to serve, or, shou'd this be inaccessible, it may be fixed at a distance, and a connecting pipe used. The use of an oil-can is extremely wasteful in lubrication, and should the interval between successive feedings be too long, permanent injury to the bearing is likely to result. The same general conclusion applies to all devices which depend for their action upon human adjustment and attention, and I have no hesitation in affirming, remarks Mr. R. Davidson in the "Automobile Magazine," that to expect the user of a motor-car to regularly fill and periodically inspect and adjust a lot of lubricators is highly unreasonable and foolish. Even with a careful driver some lubricators may be overlooked—or in the act of filling them foreign substances may get in—besides, the filling operation is messy and disagreeable, and therefore likely to be postponed, as all unpleasant things are, until the last moment. In preparing a car for service, attention to lubricators forms no small part, and could this be entirely done away with, the time would be shortened and the pleasure of using a motor-car greatly increased.

Speaking broadly, there are two systems of lubricating a bearing. In the first the rate of feeding is adjusted as far as practicable to the actual requirements. In the second the bearing is liberally flooded and the large surplus recovered for use again.

Oil may be supplied to bearings either by the splashing of the mechanism in a bath of oil, or by the oil being pumped over the bearings. Both ways have the advantage of starting and stopping the lubrication simultaneously with the running of the machinery, and without the intervention of the driver, which is a correct principle. The waste of oil is extremely small (if the case is made properly), and consequently the best quality of oil does not become an expensive item when one gallon of it will be ample for 1,000 miles of travel. Splash lubrication answers well in some cases, where all the bearings are in a position to benefit by the splash distribution, but this is not always the case, and the violent agitation of the supply of oil tends to preserve in suspension any fine solid particles of dirt or metal, which should

The Japanese Ambassador to the United States at the wheel of his car.
[*Motor News York.*

be allowed to settle, after which they can be readily removed For the above reasons the writer is somewhat in favour of pumping the oil under pressure. A force pump working under the extremely favourable conditions of dealing with lubricating oil will run practically without attention, and its action may be instantly tested at any time when running, by momentarily pressing a button. The next step is to insure that the oil which is pumped is going to all the bearings. One pump is enough, only the motorist must be sure each bearing gets a proper share of what is pumped. One arrangement is for the pump to deliver the oil into a distributing main fitted with branch pipes, which connect with the several bearings. The objection to this is that some of the branch pipes may become fouled after prolonged use, and the remainder of the branches will obligingly take their brothers' share. Or, if some of the branch pipes are longer than others—which is practically inevitable—the short ones take more oil than the longer ones. This means that the circulation in the larger pipes is less vigorous, and this is the first step to becoming sluggish and finally stopping altogether. Such an attempt at equal sharing or communism must fail, and there is only one effectual remedy for it, which is to compel each of the branch tubes in turn to take the whole of the oil delivery for a fraction of the time, instead of attempting to take a fraction of the delivery all the time. From this conclusion it is a short step to construct such a distributor and to make it do the work required of it.

THE ROYAL AGRICULTURAL SHOW.

—◆—

THERE was a fairly representative exhibit of heavy motor-vehicles and several newcomers in the field of agricultural motors at the Royal Agricultural Show at Park Royal, Willesden, last week; but, unfortunately there was again a dearth of visitors, disappointing both to the organisers and the exhibitors.

The only exhibits of motor-cars for pleasure purposes were those of the Thornycroft Steam Wagon Company and Messrs. Mulliners, Limited, Birmingham. The exhibit of the first-named included well-finished examples of the Thornycroft 10-h.p. two-cylinder and 20-h.p. four-cylinder petrol tonneau cars. Messrs. Mulliner had on view several examples of cars made by Messrs. Berliet, of Lyons, and Messrs. Vinot and Deguingand, of Paris, two French types as yet little known in this country. The Berliet cars run closely on Mercedes lines, being fitted with four-cylinder engines developing from 20 to 25-h.p., and side-chain transmission. The Vinot-Deguingand cars are also of the chain-driven type, and are made with engines of 14–18-h.p. and 10–13-h.p. The body work, by Mulliners, was of a very high order, and in some respects on novel lines, a notable example being a char-a-banc with detachable rear seat for extra passengers. Messrs. Hayes and Sons, of Stamford, exhibited a petrol motor-van to carry from 10 to 15 cwt. at speeds up to twelve miles per hour. The motive power is supplied by a 12-h.p. V-shaped engine, located in the fore part of the frame. The change-speed gear, giving two forward speeds and a reverse, is entirely contained in a case surrounding the differential gear on the rear live axle. The motor drives by pinions at half its speed a universally-jointed shaft, which, at its rear end, carries a couple of bevel pinions, either of which can be made to mesh with bevel rings on the rear axle, the whole forming a very compact arrangement, which is stated to have given excellent results in practice.

Passing to the exhibits of steam wagons, a firm which made its *debut* in this branch of engineering was Messrs. Bomford and Evershed, Limited, who had on view a 5-ton vehicle, the feature of which is the employment of a locomotive type of boiler located transversely across the frame. The engine is of the horizontal compound type, with Joy valve gear. The transmission is on novel lines; two speeds are provided, the power on the high gear being transmitted direct from the engine shaft by a single chain to a differential shaft directly over the rear axle, pinions on the end of the differential shaft meshing with internally-toothed rings bolted to the rear road wheels. We hope to describe this wagon more fully in a later issue. The display of the Wantage Engineering Company comprised one of the "Wantage" standard 4-ton steam lorries, fitted with a water-tube boiler in the fore part of the frame. The engine is of the horizontal compound reversing type, the cylinders being 3½ in. and 6¼ in. in diameter by 6 in. stroke. The transmission is by gear wheels and side chains. A wagon of this type is claimed to be capable of carrying a load of four tons, on fairly good roads, a distance of fifty miles in a day of twelve hours, at an approximate weekly cost of £3 12s. 1d., this including an allowance of 5 per cent. on the initial cost for depreciation. In addition to one of their 5-ton vehicles, Messrs. Fodens, Limited, introduced for the first time a light-weight tractor. This is on similar lines to their motor-wagon, but of smaller dimensions, it being designed to haul, instead of carrying, a load of five tons. A tipping cart and a 5-ton lorry comprised the exhibit of Mann's Patent Steam Cart and Wagon Company, Limited, whose vehicles were described in our report of the exhibition at the Agricultural Hall in March last. The Yorkshire Patent Steam Wagon Company contented themselves with a single example of their 5-ton steam wagons for agricultural or general purposes. This type of vehicle is one which is meeting with considerable success, not only at home, but in the Colonies. Messrs. J. and F. Howard, in their extensive exhibit, included one of their 5-ton steam wagons, of which an illustrated description was given in the *Journal* for February 6th last. Messrs. Wm. Glover and Sons, Limited, attracted attention to their stand by reason of a 6-ton steam motor-wagon, with special watering-van body. The *chassis* of the vehicle is the work of Messrs. Musker, of Liverpool, and contains a number of interesting features, to which we may refer on a later occasion. The motor fire-engine department was represented by Messrs. Merryweather and Sons, Limited, who had on view a self-propelling steam engine, capable of attaining a speed of thirty miles per hour.

The Thornycroft Steam Wagon Company had a novel exhibit in the form of one of their standard four-ton wagons fitted with a steam cream-separating plant to enable farmers to have cream separated at their doors, the vehicle taking away only the cream, so saving the cartage of milk. In addition to several motor wagons, Messrs. Jesse Ellis and Co.'s exhibit comprised a steam motor-'bus designed to carry twenty-four passengers in two compartments.

Messrs. Aveling and Porter, Limited, are among the latest builders of traction engines to introduce a miniature engine to come within the limits specified by the Light Locomotives Act. The engine, which has been named the "Little Favourite," is designed to haul a load of 4 tons at speeds up to six miles an hour; it is mounted on laminated steel springs, and is fitted with winding drum and powerful brakes. Needless to add, the details all bear indications of the careful work turned out by this old-established firm. Messrs. Wm. Foster and Co., Limited, Lincoln, also exhibited a light steam tractor designed to work under the provisions of the Act. It is provided with a single cylinder engine and two speeds. Close by was to be seen one of the attractions of the show, viz., a Pedrail steam tractor. This had been constructed by Messrs. Foster for Diplock's Patent Traction Engine Haulage Syndicate, Limited, and was similar to the traction engine referred to above, except that the hind portion of the engine was not mounted on the usual wheels, but on Diplock's Pedrails, which have already been illustrated in these columns. The "Little Giant" tractors of Messrs. W. Tasker and Sons, Limited, were shown in several forms and sizes, they being made of 4 and 5 nominal horse power, and with single cylinder and compound engines. As mentioned elsewhere in the present issue, a number of these handy machines are being sent out to the wool-growing districts of Australia. Messrs. Wallis and Steevens, Limited, in addition to traction engines and threshing machines of various sizes, were also among the exhibitors of miniature road locomotives for hauling purposes, their engine being of 5-h.p., and mounted on springs both at front and rear.

The Agricultural Motor of the Ivel Agricultural Motors, Limited, again attracted considerable attention, and succeeded in winning the silver medal of the Royal Agricultural Society. In its latest form it is fitted with a 20-h.p. petrol engine and two speeds forward and reverse. It is designed to draw any agricultural implement used in the cultivation of the land and can also be used for pulling loads on the road or for driving all kinds of stationary machinery, such as a threshing machine or chaff cutter. A new tractor, more on the lines of a steam motor-wagon than a traction engine, was the "Simplex," shown by Messrs. F. C. Southwell and Co., The vehicle, which is designed to haul wagons on the road and for pulling ploughs and reapers, &c., on the land, is fitted with a water tube boiler and a novel form of four-cylinder engine of 20-b.h.p. Two speeds are provided, the drive from the engine shaft to the differential shaft being by spur gearing, and thence by side chains to the rear road wheels. Another new agricultural tractor was that to be seen at the stand of Messrs. Ransomes, Sims and Jefferies, Limited. It is driven by a 20-b.h.p. four-cylinder vertical petrol motor fitted with rotary magneto ignition and connected by a friction clutch to steel gearing enclosed and running in oil in a gear box. A transverse shaft from the gear box drives the road wheels by means of chains. The gearing is arranged to give three speeds, viz., 1¾, 3¼ and 6½ miles per hour, and to reverse at each of these speeds by the driver from the seat. The machine is designed to haul ploughs, cultivators, and reapers. For use for driving stationary machinery the shaft is extended through the gear box to the back of the tractor and carries a transverse pulley. The makers claim that the tractor is capable of ploughing about five acres in ten hours with a three furrow plough on a consumption of petrol at the rate of 1½ gallons per hour, or of hauling loads of 7 tons on a level road at the slow speed, or 3 tons at the fast speed. Mr. John Scott, of Edinburgh, had on view two forms of his agricultural motors. These take the form of miniature motor-cars on iron wheels and tiller steering. They can be used as wagon tractors on the road or connected up to ploughs or reapers on the land. One machine was fitted with a 14-h.p. double-cylinder vertical petrol engine, and the other with a four-cylinder one of 20-h.p., both driving through a clutch, change speed gear, and chains. A new agricultural motor, which appears to have many points in its favour, was that exhibited by Messrs. H. P. Saunderson and Co., of Bedford. This is a two-wheel tractor designed to be attached to any agricultural implement or used as a fore-carriage in place of the front wheels of any existing road vehicle. The motive power is supplied by a 10-h.p. vertical double-cylinder engine, designed to use either heavy oil or petrol, and connected by universal-jointed shafts and pinions to the front wheels in such a way that the latter serve both for driving and steering.

The Shrewsbury and Challiner Tyre Company, Limited, brought to the notice of visitors their specialities in the way of motor-car tyres, including an example of the 5 in. "Giant" solid rubber tyre for public service work, and a new combination pneumatic wheel with solid rubber tread. Messrs. Smith, Parfrey and Co. also had a large array of wheels, including a number of the artillery type for motor-cars and wagons, arranged for pneumatic, solid rubber, and steel tyres. The De Nevers grooved solid tyre of Messrs. Liversedge was to be seen at the stand of Mr. J. E. Hayes. The Goodrich solid rubber side-wire tyres were well displayed by Messrs. W. and T. Connolly, Limited, the exhibit of which included a 6-in. tyre, and also a twin tyre for use on public service vehicles. The North British Rubber Company, Limited, had a large exhibit of rubber goods, among which the Clincher solid rubber and pneumatic tyres naturally found a place.

Messrs. Ransomes, Sims, and Jefferies displayed various sizes of their petrol motor lawn mowers, which have already been described in these columns. Similar machines of 2¾-h.p. and 3½-h.p. were shown by Messrs. Thos. Green and Son, Limited. Among miscellaneous exhibitors whose names are well known in the motor world were the Vacuum Oil Company, Limited, and Messrs. W. H. Willcox and Co., Ltd., the latter's display including not only lubricating oils, but also pumps, lubricators, and many other automobile accessories.

IT is proposed to hold a "paper chase" for motor-cars on Saturday, the 23rd inst. The start will be made from Esher, on the Guildford road. The hares will be given a start of about fifteen minutes, over a course of about thirty miles, each one taking a separate route. The hares will from time to time at cross roads leave stretches of the road (limited to a mile) with no paper, and it will be necessary to pick up the trail again in order to resume the chase. Lieut. G. Windham, of Battersea Rise House, Clapham Common, S.W., is organising the event.

CORRESPONDENCE.

THE POLICE AT SLOUGH.

To the Editor of *The Motor-Car Journal.*

Sir,—With reference to the outrage on the Bath road, which occurred on Sunday, the 19th ult., I happened to be spending the day in Slough. Knowing that the police authorities there are very keenly on the alert to trap law-breaking motorists, I walked down the road to where I knew a plain-clothes policeman is generally stationed to take the number of any unsuspecting motorist who may be, in his opinion, travelling at a greater rate than the prescribed limit, and, as usual, the "gentleman in blue," but now attired in an ordinary lounge suit and white waistcoat, was comfortably reclining on the grass in a very secluded spot, quite unseen by any motorists coming up and down the road until directly opposite.

I then took up a position a few yards further on, and watched this gallant officer's proceedings; and whilst there a great number of cars passed us (it being Ascot Sunday), many of whom I recognised, but, apparently, none of them transgressing the law, as I saw no entries made in "Robert's ledger."

I purposely haunted the vicinity during the day, and each time the disguised policeman was "on duty," either seated in the grass or sometimes walking up and down the road swinging a cane, apparently the least interested person in the passing cars.

For the benefit of fellow-motorists I would say that a constable in plain clothes is stationed almost every Sunday at this spot, which is situated at the junction of the two parishes of Langley and Slough, directly opposite the convent, which is on the left-hand side of the road leaving Slough for London. The road here is slightly down-grade, running into quite open country; and it is, I know from experience, a great temptation to let a car out. I have no sympathy with the driver who tears through this town because of its fine road surface, heedless of other legitimate users of the highway, and I regret to say that I have seen many such, my only object in writing this being to warn other careful drivers who may be taken unawares, when the speed at which they are travelling is perfectly safe, and to suggest that the Buckinghamshire police might be much more profitably occupied in endeavouring to catch the "fiends who stretch wires across the road."—Yours truly,

Horace B. Cook.

THE WEIGHT OF CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—I have been looking for some time for a reliable car to carry two or four passengers at what I consider a reasonable price, about £250, and have found considerable difficulty in making a choice. What I find so puzzling is the extraordinary discrepancy in weight, horse-power, and price between a two and four-seated car.

There is no difficulty about getting an excellent voiturette of 6-h.p., weighing about 8 cwt., and costing from £150 to £175; but directly a tonneau is added, the weight jumps up to some 13 cwt., and the price is nearly doubled, but not the horse-power. If it takes 6-h.p. to propel a car weighing 8 cwt., and carrying two persons, how can 8-h.p. be expected to propel 13 cwt. and four persons? There is nothing like the same discrepancy between the 10 and 12-h.p. cars either in weight or price.

I venture to think that manufacturers might, with advantage to themselves and the public, turn their attention to the production of a good substantial car of 8 to 10-h.p.—if possible, with two cylinders—weighing from 10 to 12 cwt., according to the horse-power, and about £250 in price.—Yours truly,

A Constant Reader.

A HINT *RE* TYRES.

To the Editor of *The Motor-Car Journal.*

Sir,—I have found out a tip which I think would be of interest to other readers of the *Journal* who have had occasion to use the Dunlop gaiters, which, by the way, I have found to last longer than the raw hide ones. The vendors of these gaiters supply a stranded wire lace to fasten the gaiter on; these laces take all the paint off the wheels, and if the gaiter has to come off to repair a puncture, the wire lace has to be destroyed to get it undone. I have found that raw-hide laces (the same as used for lacing belts in mills, etc.) do away with all trouble. I ran one of my wheels with the gaiter laced with the rawhide laces over 500 miles recently, and had to take it off three times for punctures. The laces are still as good as when first used, and have done no damage to the wheel.—Yours truly,

BA 64.

STEAM CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—I read in the *Journal* of the 18th inst. a letter from the Watford Engineering Company, in which they mention that a good paraffin burner is required. I might say I run a Stanley car fitted with a paraffin burner and have obtained excellent results. I can easily do twenty miles on a gallon. I bought this car from Mr. Wilkinson, of Manchester, and am more than pleased with it. I have tried several of these light steam cars, but have not the slightest hesitation in saying that for easy riding, speed, and general reliability there is not a car in its class to touch it. I also drive a petrol car, and am as much interested in one as the other.—Yours truly,

Paraffin.

TYRE PROTECTION.

To the Editor of *The Motor-Car Journal.*

Sir,—I notice in the "Continental Notes," in the last issue of the *Journal*, a paragraph concerning the use of old tyre covers as a protection against puncture and wear. Would it be troubling you too much to inform me how they are applied? I presume the beaded edge of the old cover must be cut off, as it would be impossible to fix two beaded edges in the clinch. I fancy I recollect seeing a diagram in one of your back numbers as to the method of fixture; if so, would you be good enough to send a copy containing the instructions for fixing?—Yours truly,

B. H. Flint.

[Some time ago Mr. Paul Meyan pointed out that he used old outer covers superimposed on his ordinary covers; we believe his method was to use old covers of a larger initial size than his covers proper, and attach them by inserting them between the latter and the rims. It has since been pointed out that an old and therefore stretched cover of the same initial size as the normal cover may be used by cutting off its edges and simply placing it over the latter when this is deflated, and then blowing up hard; but this method of attachment was found not sufficiently secure. The obvious extension of the idea was to sew straps to the old covers and

Digitized by Google

secure these to alternate spokes in a manner that will suggest itself to anyone. Any saddler can sew on the half dozen or dozen straps for a few shillings, and the old cover so secured is perfectly firm. Even if it is badly cut the cuts do not gape (though it is advisable to place canvas behind them), and of course there is no wearing surface equal to that of a properly vulcanised rubber one. Owing to the severance of continuity between the attached cover and the ordinary cover puncturing objects that pierce the former are turned at the surface of the latter. The straps should be sewn inside the cover, and there should be one pair of straps for every spoke to make the job a success.]

HINTS *RE* BENZ CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—Having seen several inquiries recently in your columns regarding improvements in 3½-h.p. Benz car, I think the following will be interesting to some readers of the *Journal*. I had occasion whilst staying in Herne Bay to go to Messrs. Root and Clarke's for petrol, and Mr. Clarke, of that firm, very kindly interested himself in my car. He suggested various improvements, and, as I knew him to be reliable, I entrusted my car to him. After a few days he completed the alterations, and the marvellous results far exceeded my anticipations. Its hill-climbing powers have been wonderfully improved, and it now takes hills on second speed, where formerly we had to have recourse to the crypto, and that working with difficulty. The general speed has been correspondingly increased, and the other day my wife, two children, and myself went two miles on the flat in 5½ minutes.—Yours truly,

F. Palmer.

Cudell Car on the Banks of the Rhine a Cologne.

REVISING THE GORDON BENNETT RULES.

To the Editor of *The Motor-Car Journal*.

Sir,—Many suggestions are now being made with regard to alterations in the rules governing the Coupe Internationale, and we now read that at the conclusion of the great race at Homburg, on June 17, the Industrial and Races Committee of the British Automobile Club hesitates to challenge the winning club on the ground that it wants the rules altered to suit its own convenience. It is suggested that the event shall not only be a trial of speed, but also a test of the efficiency of the motor and the car.

What will France and Germany think of such a proposition? Are they likely to consider it for a moment? I think not.

To those who witnessed the race at Homburg it can leave no room for doubt that if a car can travel faultlessly and with almost mathematical precision of time for 350 miles at an average speed of over 60 miles an hour over extremely heavy and mountainous roads, when every part of the mechanism of the motor and the tyres are under the greatest strain which can be imposed upon them, it is sufficiently clear that the great speed attained must have been inseparable from reliability. What constitutes reliability? I fain would suggest that a car is not more liable to break down from excessive than at moderate speed; but from my own personal observation I am convinced that a car is just as likely to break down over a long course travelling on her first as on her second speed in all grades; and, of course, such chances are naturally enhanced when going "all out," whether it be a touring or a racing car.

The Races Committee, I am inclined to think, are on the wrong lay, if this constitutes their prime contention.

What is more necessary than the abandoning of high speeds crowded into short hours is the conditions under which the various cars are qualified to enter.

Let us take the case of France, for instance. No less than ten firms, representing an aggregate of twenty-nine cars, struggled for three places in the Coupe itself. Germany, Austria, Italy, and Switzerland (which unfortunately did not run) are all represented by one make—notwithstanding that each firm conformed to the prescribed rules—and it would have been a triumph for Germany whichever of these machines got home first.

The principle laid down in the rules that each and every part of the car shall be made in the country which it represents is now considered to be wrong and obsolete, since it gives certain makers undue advantage over others, for what proof have we that "all" the parts *are* made in that particular country? Who superintends the construction of the parts? Not only should the various parts be made, but they also should be designed there.

It is quite an easy matter for a great firm to dump down machinery in a foreign country which is not sufficiently developed in this industry to represent itself, if it will give that firm a ten to one chance of winning the race.

I therefore boldly suggest that nearly half the countries represented in this year's race had no moral or competitive right to be there at all (although I frankly admit that I was from a sporting point of view glad to see them), since their cars were not entirely the result of their own creative efforts, but mere copies of a famous make, built to order.

What does this mean? Suppose, for instance, Austria or Italy had won the race. What would have been the result? Germany would naturally have claimed the glory, and the country which won the reputation. The analogy is this, that it would have given a tremendous impetus to the nation, and placed it on a high pinnacle of fame which it never had legitimately earned and did not scrupulously deserve. It is the creative faculty embodied in a product which alone ought to count in its acceptance. An international expert committee should be appointed to approve designs or cars intended for the race, which designs or models built from them should have been prepared by naturalised persons in the country which it is to

Digitized by Google

represent, and, although this method suggests complication, it would nevertheless be fair for all, and the race would always be won on its merits.

France, I believe, would be the first to encourage such a change, seeing that she is supreme in the motor industry, and has suffered in reduced chances of winning more than anyone else.

But to abandon the pure speed element reminds me of a certain great European nation who some years ago proposed disarmament because (it was rumoured) it could not comfortably keep pace with the cost. No, if the progress of France and Germany is too rapid for us, English manufacturers must arouse themselves from their lethargy and achieve something which will place us in the first flight with Continental enterprise, as the coveted trophy appears to be many summers off our grasp now.

M. Georges Prade condemns the condition under which the Gordon Bennett is contested, but offers no solution. He argues that the cars at the French eliminating trials had one chance in ten among themselves, whereas the Pipe and Fiat cars had three chances for three cars, which would give them thirty times more chances than any of the French firms in the actual race. This in itself is obviously unfair, and is considerably magnified when we find that Austria, Italy, and Switzerland were to all intents and purposes representing Germany. Therefore it is not so much the restricting of competitive firms in any one country, as M. Georges Prade contends, but that each respective country's creative faculty shall design as well as manufacture all the parts.—Yours truly,

OWEN JOSEPH.

THE GORDON BENNETT RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the Gordon Bennett Race is over and the results are published, I do not think it would be an unfavourable moment to consider the matter of the selection of the English cars.

Firstly, regarding Edge. After the bombastic letters which he sent to the press prior to the race he must feel particularly humiliated at his performance. I would not criticise hardly if it were not for the fact that he deliberately laid himself open to criticism in the event of his not being successful. The two Wolseley cars—the cars he sneered at—the cars he said were no good, both finished in the race, when he on his Napier hopelessly broke down.

Perhaps Mr. Edge will have learnt that nothing disgusts the sporting Britisher so much as bombast and shouting *before* a race. Wait until it is over, and if there is anything to puff oneself about let it be shown then. The "sporting protest" raised by Edge was too commercial in its insincerity to blind the eyes of anyone; but that which *did* disgust us more than anything was his unwarrantable attack on the Wolseley cars and drivers, remembering the fair manner in which the Wolseley firm has always acted, and remembering how much Edge is indebted to them for his previous success. No, Sir, Edge has not played the game, and the sooner he owns up, the better he will be liked.

In contrast to his action was that of Jarrott, who. I see from the papers, actually took Edge round the course on his racing Wolseley when Edge's car was lying useless with broken crank and shaft. A friend of mine asked Jarrott why he did this, and he remarked that as Edge had not had an opportunity of knowing the road he (Jarrott) wished to do everything in order that England should make as good a show as possible. Remembering Edge's remarks on Jarrott and his car, I marvelled at the sportsmanship of the man.

The selection of the team was the right selection. Girling drove splendidly, and Jarrott also put up one of those automobile fights for which he is renowned in England, and especially on the Continent.

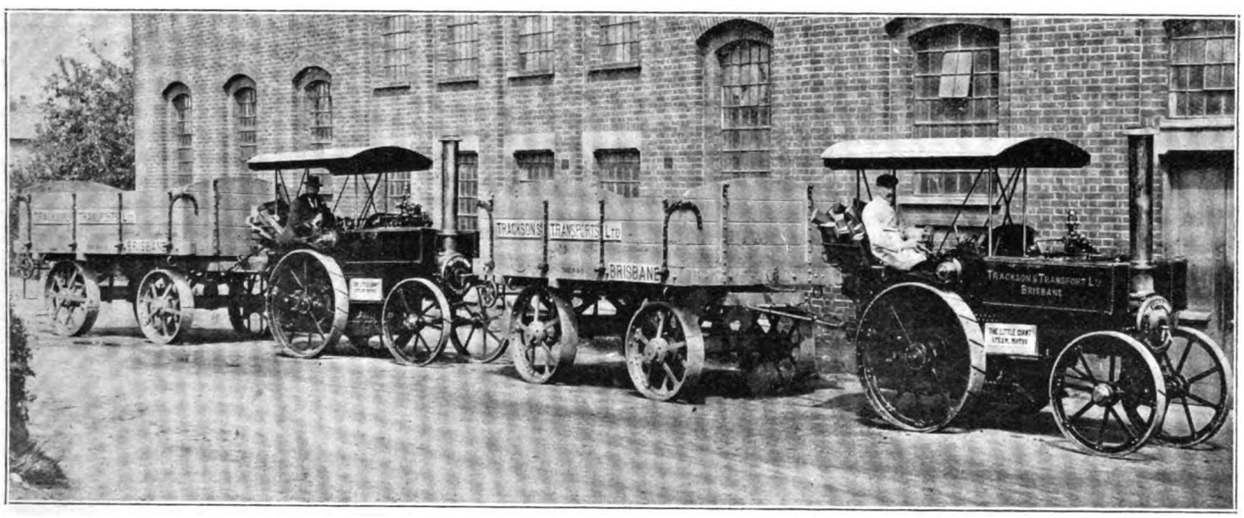
Edge drove well and made a good race until he broke down. In fact, the men were the right men, the cars might have been better, but the luck was not with us; but the great failure was undoubtedly Edge who we did at least expect to finish after the performance of his car in the Isle of Man.—Yours truly,

F. GRAHAM SHARP.

SPARKING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "F. J. I.," would you kindly permit me the following suggestion? The cause of the sparking trouble mentioned is doubtless due to the faulty nature of the accumulator. I have experienced the same trouble, but have now overcome all this by charging the accumulators myself, instead of trusting to the town mains or would-be electricians. I should strongly advise "F. J. I." to procure a set of Boron primary batteries. They have removed my difficulty, and possibly others may have had the same experience.—Yours truly,



DUVAL LAMPSON.

THE GLASGOW-LONDON HILL CLIMB FORMULA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of June 25th a letter written by Mr. Govan, of the Hozier Engineering Co., Ltd., to the secretary of the Western Section of the Scottish Automobile Club. In this he complains that the formula used in the Glasgow to London Reliability Trial for the hill climb is not a just one. I cannot see what his object is in wishing for a ratio between the weight of car and weight of load introduced into the formula, but certainly the load itself is a factor which should be considered. I do not see that the best car is the one that will carry the most weight on a given weight of car, as this means scrimping material in some part or other and leads to unreliability. Experience has shown that the most reliable cars have not proved to be the lightest per horse power, but rather those of heavier construction. The figures he gives for loads are curious and it would be interesting to know how they are made up. The four passengers in the Argyll car weighing 8¾ cwts. would be worth seeing, especially as we know from the reports in the papers that one of them, the driver, was "a mere boy." If the figures he gives, 13 cwts. and 21½ cwts., represent the weights of the cars without petrol, oils water, cushions, tools, and spare gear, I think he is wasting valuable space, as all these are necessary to the car while running and cannot be considered as part of the load, and his deductions are therefore wrong. Referring to his complaint about the third term in the formula $\frac{W \times v^2}{2}$, if he cannot tell the reason why "W" is inserted perhaps he will explain why he accepts v^2. as correct,—Yours truly,

W. A. LAMBIE.

Two of the "Little Giant" Road Trains for Service in Queensland. (*See page* 383)

CUTS IN TYRES.—In reply to "a correspondent who asks if there is any compound on the market for readily filling up small cuts in the outer covers of motor-car tyres," E.Y. 29 suggests Patcho.

TRACK RACING AT FRANKFORT.—The Beaufort Motor Company write us with regard to the performance of their Beaufort car at the Frankfort races on the 19th ult., when the vehicle ran third, as follows:—"We were greatly handicapped owing to our having tested the car with alcohol of a different sp. gr. to that supplied by the race authorities; the alcohol we had been using previous to the races worked exceedingly satisfactorily with our new carburettor constructed for alcohol, but on the race course the judges had every drop of this emptied and refilled by spirit supplied by them. This took place less than a hour before the race, and it was impossible to so adjust the carburettor, in the short time available, as to secure the previous satisfactory running of the engines."

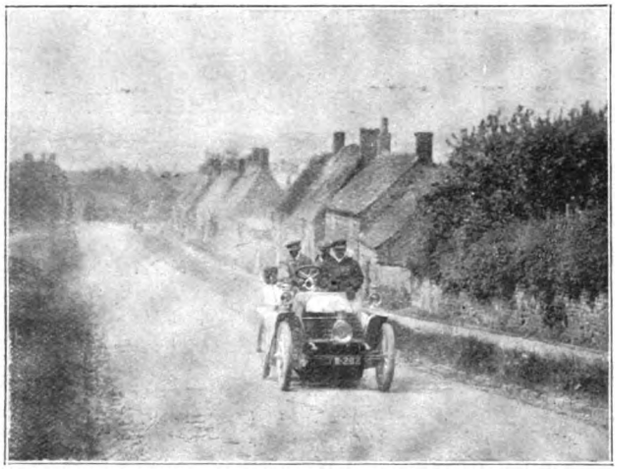
Digitized by Google

CLUBS AND ASSOCIATIONS.

SCOTTISH (EASTERN DISTRICT).

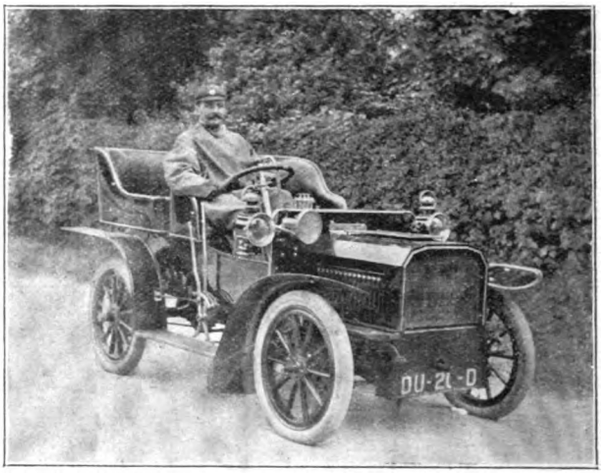
THE Eastern District of the Scottish Automobile Club met on Saturday afternoon at Abbey Green, Jedburgh, the residence of Dr. Blair. The weather was dull and cold, but irrespective of this, there was a good turn-out of Edinburgh and Border motorists, including the secretary, Mr. G. Macmillan, Edinburgh, with his 30-h.p. De Dietrich; Mr. W. H. Sleigh, Edinburgh, 25-h.p. Humber; Major Murray Thriepland, St. Boswells, 10-h.p. Panhard; Mr. Sinclair, Grahamslaw, 16-h.p. Napier; Mr. Ballantyne, Lasswade, 22-h.p. Daimler; Dr. Blair, Jedburgh, 10-h.p. Wolseley, etc. The company were afterwards entertained to lunch by Dr. Blair, when about sixty sat down in a marquee on the lawn. After lunch the health of Dr. Blair was proposed by Major Murray Thriepland, and the doctor in reply said he thought their club had done a great deal to assist manufacturers to show them cars that could go at any speed. They did not want unreasonable speeds, but what they wanted to aim at was that they should be supplied with a reliable car, so that when they went out they could get comfortably back again, and also that the tyres should be very durable and reliable. He thought that the encouragement which they as a club ought to give in future should be on these lines. The company were photographed, and afterwards visited the beautiful abbey and other places of interest in the ancient Royal burgh.

SOUTH LINCOLNSHIRE.



A VERY successful meet of the above club took place on Thursday of last week, when the members and friends were entertained in sumptuous style by the chairman of the club, Dr. Miller, and Mrs. Miller. The weather was beautifully fine, and there was a large muster of motorists present. Gleed, J.P., Mr. F. P. Curtis (Boston), Dr. Reckitt (Boston), and the Rev. M. Wilkins (Croft). Other motorists included Mr. F. Jecook (Gainsborough), on an 8-h.p. Dennis; Mr. G. Garnett (Gainsborough), on an 8-h.p. M.C.C.; Mr. W. A. Tomlinson (Sleaford), on a 5-h.p. Bardon; Dr. E. H. Cragg (the club secretary, Billingborough), on an Enfield quad; and Dr. White (Swineshead), on a 2¾-h.p. Humber cycle. Captain Gleed also invited several gentlemen connected with the county authorities, including the Chairman of the Holland County Council, the Chairman of the Spalding Rural District Council, the Chairman of the Witham Outfall Board, the Superintendent of Police for the district, and several others. An *al fresco* tea was served to the guests on the lawn, and an interesting photograph was taken of the cars assembled in front of the house.

HEREFORDSHIRE.



As we briefly chronicled last week, the Herefordshire, Gloucestershire, and South Wales Automobile Clubs had a very successful inter-club run to Tintern. The arrangements made by Mr. A. Arthur Dale, hon. secretary of the Gloucestershire Club, were excellent, he having had a list of the day's arrangements printed for every member, another printed form for every seat at lunch, and large notices prohibiting smoking in the immediate vicinity of the cars. Lunch was taken at the Beaufort Hotel, Tintern, after which short and appropriate speeches were made by Mr. Hereford, president of the Herefordshire Club, Mr. Wyatt, president of the Gloucestershire, and Mr. Neale, hon. secretary of the South Wales.

PETERBOROUGH.

ON the invitation of Lord and Lady Lilford, the members of the Peterborough and District Motor Club had an opportunity of visiting Lilford Hall, their Northamptonshire seat, on Thursday, the 23rd ult. There was a capital muster of members and friends at headquarters at 2.30 p.m. to

Mr. H. Foster's 10-h.p. Wolseley on Rockingham Hill.

Mr. C. Evinson on the 8¼-h.p. Humber.

THE NOTTINGHAMSHIRE AUTOMOBILE CLUB'S 100 MILE NON-STOP RUN.

A splendid tea was provided in a spacious marquee, and about sixty sat down thereto, after which came the inevitable operation of "facing the camera." A start for home was made shortly after six o'clock. Altogether a most enjoyable afternoon was spent, and the Wrangle meet will long be remembered as a "red-letter" day by all who were present thereat.

Subjoined is a list of the cars and motor-cycles attending the run:—Mr. and Mrs. W. B. Jevons, Market Rasen, 9-h.p. De Dion; Mr. and Mrs. A. A. Padley, Market Rasen, 6-h.p. De Dion; Dr. South, Boston, Baby Peugeot; Mr. and Mrs. A. Beales, Spalding, 8-h.p. Dennis; Mr. A. Green, Spalding, Baby Peugeot; Mr. H. Pilley and friends, Boston, 6½-h.p. Peugeot; Mr. and Mrs. C. Holland, Boston, 4½-h.p. De Dion; Mr. S. G. Lovell, Stickney, 5½-h.p. Wolseley; Dr. and Mrs. Crompton, Benington, Baby Peugeot; Mr. and Mrs. F. Richardson, Sibsey, 10-h.p. Wolseley; Mr. and Mrs. A. H. Holland, Boston, 2-h.p. Minerva tri-car; Dr. Pilcher, Boston, 2¾-h.p. motor-cycle; Mr. F. Saul, Wrangle, motor-cycle; Mr. E. Saul, Wrangle, motor-cycle; and Dr. Allan, Wainfleet, motor-cycle.

LINCOLNSHIRE.

PARK HOUSE, Donington, the picturesque residence of Captain and Mrs. Gleed, was the meeting-place of the Lincolnshire Automobile Club on the afternoon of Thursday, the 23rd ult., and those who attended the gathering spent a most enjoyable time. Between thirty and forty motorists accepted the invitations issued by the host and hostess, and of these close upon twenty found it convenient to attend. The 12-h.p. Wolseley, which Mr. T. W. Mays, of Bourne, has recently acquired, came in for a considerable share of admiration, as did also the 12-h.p. Richardson cars, of which there were four. These were driven by Messrs. Ben Smith (Horbling), C. W. Pennell, J.P. (Lincoln), Dr. Sharp (Brant, Broughton), and Major F. H. Goddard (Lincoln). Peugeots were also *en evidence*. In addition to two 8-h.p.'s, driven respectively by Dr. W. J. Gilpin, of Bourne, and Mr. Chaderton Johnson, of Boston, there were four "Babies," belonging to Captain participate in the run. These included Mr. Percy Mays and Miss C. Mays (Bourne), on a 2¾-h.p. Vinco tricar; Mr. S. Heighton (Peterborough), on a 1¾-h.p. Humber; Mr. W. E. Wadsley (Bourne), on a 2½-h.p. Vinco cycle; Mr. P. R. Heighton and Mrs. Dempsey (Peterborough), on a 4-h.p. Rex; Mr. R. C. Holmes and Miss E. Knowles (Peterborough), on a 3½-h.p. Vinco tricar; Mr. W. Bassett (Peterborough), on a 2¼-h.p. Vinco cycle; Mr. Bowler Gibson and Miss Gibson (Bourne), on a 3½-h.p. Vinco tricar; Mr. F. T. Heighton and Mrs. Heighton (Peterborough), on a 3½-h.p. Vinco tricar; and Mr. W. R. Heighton, on a 2¾-h.p. Vinco cycle. On arrival at Lilford Hall the party were shown over the beautiful grounds. A stop was made at Oundle, where the motorists had tea at the Talbot Hotel. The run home in the evening was conducted under the most pleasant conditions. Needless to say, the outing was immensely enjoyed, the delightful weather largely contributing to the success of the trip.

The members had another meet on Sunday to Hunstanton. Unfortunately it was a stormy day. The party met at Lynn, and then went on to their destination by way of Sandringham; Hunstanton was reached about noon. The Station Hotel was made the headquarters of the party during their stay.

EASTERN COUNTIES.

A VERY successful run of the Eastern Counties' Automobile Club was held to Clacton-on-Sea on Saturday under very favourable climatic conditions. The rendezvous was the open space in front of the G.E.R. station at Manningtree, and those taking part were:—Mr. Egerton, with Mr. and Mrs. Cobbold, in an 8-h.p. De Dion; Mr. R. B. Booth, 9-h.p. De Dion, with Mr. E. P. Ridley, hon. solicitor of the club; Mr. F. A. Snowden, 16-h.p. Argyll; Mr. H. Bloomfield and Mr. Wright, 10-h.p. Boyer; Mr. and Mrs. Godolphin, 6-h.p. De Dion; Mr. C. K. Moseley, hon. secretary, and Mr. L. W. Cotman, 6-h.p. De Dion; Messrs. O. T. and M. Cook, 9-h.p. Darracq; Mr. and Mrs. E. L. Rowe, 5-h.p. Peugeot; Mr. Forbes Gower,

Digitized by Google

with Mr. and Mrs. L. Vulliamy and Mr. Braithwaite, 15-h.p. Darracq Dr. Longworth, who had come on from Grantham to attend the meet, on a 3-h.p. Rex bicycle; Mr. Robert Page, 7-h.p. Panhard; Mr. J. F. C. Hossack, 8-h.p. M.M.C., with Mr. Pritchard; Mr. Page Wood, 10-h.p. Peugeot.

The start was made by Mr. Page Wood at 3.15 p.m., and the route was through Lawford, Horseley Cross, Little Bentley, Weeley, and thence to Clacton. An excellent tea was provided at the Grand Hotel. The hon. solicitor acted as leader in Mr. Hossack's M.M.C.; an excellent return home being made through Ardleigh and the picturesque Dedham Valley.

NOTTINGHAM.

Success attended the reliability trials of the Nottingham A.C. on the 23rd ult., nine out of the twelve starters making non-stop runs. Mr. W. F. Foster, a prominent motorist and member of the club, had offered a silver challenge cup for the best performance on a non-stop run, and the course selected was that from Nottingham *via* Melton Mowbray, Oakham, and Uppingham, to Kettering and home again, a very hilly and trying course indeed. There are several very steep hills, including Kettleby, where the recent hill climb was made by the Club, and Rockingham, near Kettering, and up which all the cars were timed as a factor in the contest.

The manager of the exhibition at Trent Bridge had allowed the start to be from the grounds of the exhibition, and by 10.45 all the cars were in, and an appearance competition was held, Mr. E. H. Joule, 12-h.p. Darracq, winning. The lowest powered cars were got away first, the 4½-h.p. Renault, driven by Mr. S. Harvey, leaving at 11 a.m. The next went at 12, the 8½-h.p. Humber, Mr. C. Evinson, and then cars were started every few minutes. Excellent times were the order, but three cars in particular met with bad luck. The 24-h.p. Simms had serious tyre trouble at starting time, and then, when at Langham, near Uppingham, the fan gear struck work and the driver had to spend twenty-five minutes over it, so retired, as there appeared to be plenty of non-stoppers. The 16-h.p. Georges Richard had tyre trouble following engine trouble, a "short" across one of the compression taps causing trouble. The driver, Mr. F. Hardy, decided to retire rather than make a bad time. Mr. Ross Browne also was unfortunate. He had a bad puncture in his 12-h.p. Georges Richard, but got a new tube in in nine minutes without a jack. He then went on to Kettering, but on the home journey his propeller shaft loosened out, and that detained him; engine troubles followed this piece of bad luck. He, however, pluckily got through, having had two bad punctures. The cup will be awarded by the Committee, who will consider the whole performance. The complete list is as follows, but the three cars not making non-stop runs are marked with an asterisk (*). The table is made up in the order of time taken on the run:—

Name and Car.	Time on hill. M. S.	Time on run. H. M.
E. H. Joule, 12-h.p. Darracq	2 25¼ ..	3 55
R. M. Wright, 9-11-h.p. Clement	2 29⅗ ..	4 2
J. C. Bennett, 12-h.p. Georges Richard	3 8⅘ ..	4 3
C. Hardy, 14-h.p. Daimler	2 31⅘ ..	4 5
A. B. Gass, 10-h.p. Georges Richard	3 3 ..	4 18
W. H. Warburton, 12-h.p. Georges Richard ..	2 44 ..	4 32
C. Evinson, 8½-h.p. Humber	2 35 ..	4 40
H. Foster, 10-h.p. Wolseley	3 50⅘ ..	4 51
F. Hardy,* 16-h.p. Georges Richard	2 8⅘ ..	5 35
Ross Browne,* 12-h.p. Georges Richard ..	2 59¼ ..	5 52
S. Harvey, 4½-h.p. Renault	4 4 ..	7 28
E. H. Arnott,* 24-h.p. Simms (retired).		

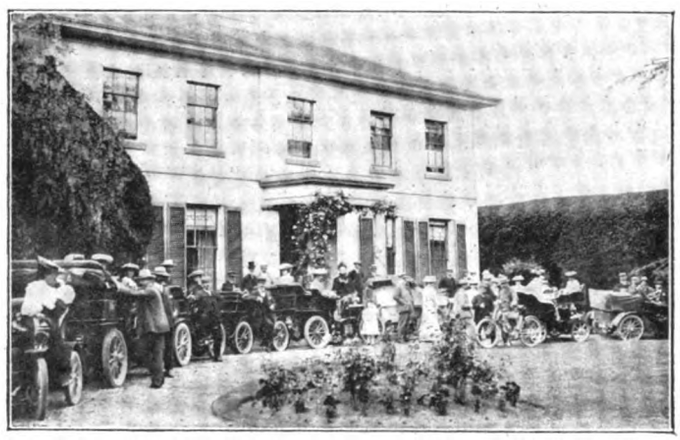
BERKSHIRE.

The third summer meet of the Berkshire Automobile Club was held on Saturday afternoon at Ockwells Manor, near Maidenhead, by invitation of Mr. and Mrs. E. A. Barry. There was a sharp shower about midday, but later the weather cleared, although at times the clouds were threatening, and the run to Ockwells and back was on the whole enjoyed. Among the members of the club present (most of them accompanied by ladies) were Dr. Roalfe Cox, Dr. A. Gordon Paterson, the Rev. J. D. Ouvry, Lieut.-Col. Waring (hon. sec.), Mr. E. Shrapnell Smith, Dr. Norman Joy, Mr. J. G. Carew-Gibson, Mr. C. H. Dodd, Mr. E. A. Potter, Mr. R. W. Fowys-Lybbe, Mr. Simon, Mr. J. Hopkins Walters, Mr. W. H. Taylor, Mr. Vallange, Mr. Wombwell, Mr. Hawes, and Mr. Selkirk. The party also included other guests of Mr. and Mrs. Barry. Dr. A. Gordon Paterson has been elected on the Committee of the Club, who at their next meeting on the 13th inst. will consider further applications for membership.

MIDLAND.

On the 23rd inst. the Midland Automobile Club will hold a hill-climbing handicap at Sunrising Hill, Kineton. The prize will consist of a cup presented by the president, Mr. J. Broughton Dugdale, J.P., and entries should be sent to the hon. secretary of the Midland Automobile Club, Grand Hotel, Birmingham, not later than the 19th inst.

LEICESTERSHIRE.



By the kind invitation of Colonel and Mrs. L. L. Powell, the members of the Leicestershire Automobile Club attended a garden party at The Elms, Melton Mowbray, on Saturday. Twenty-two cars and a motor-tricycle took part in the run, and there were about seventy guests. The automobilists arrived at Melton about three o'clock, and partook of tea at half-past four, after which tennis and other games were indulged in. After tea a letter was read from the president (Mr. E. G. Mawbey) regretting his absence owing to his recent accident, and Colonel Powell despatched a wire to Mr. Mawbey wishing him a speedy recovery. Mr. King proposed the health of Colonel Powell, and that gentleman suitably acknowledged the compliment.

WEST SURREY.

On Saturday last members and friends of the West Surrey Automobile Club met to the number of fifteen at Chiddingfold, where tea was provided at the Rose and Crown. The party included Mr. and Miss Crothers, 9-h.p. Darracq; Miss Houghton, 4-h.p. Peugeot; Major Matson, 6-h.p. Benz; Mr. and Mrs. Pullman and Mr. R. Crothers, 15-h.p. Durkopp; Mr. and Mrs. Wrigley and party, 12-h.p. Clement; and Mr. Buttemer, 10-h.p. Decauville. Mr. R. Crothers acted as photographer to the party, the group being joined by Mr. Halahan's Paris-Madrid Wolseley, though without its owner. The latter has, we hear, undertaken to supply and put down Westrumite on the roads in the village at his own expense, the district authorities having refused a proposal on the part of the club to bear part of the cost of a trial on some road in their district.

CASES DISMISSED.

Mr. Walter Munn was summoned at Basingstoke for driving beyond the legal limit. The car was stopped as he approached the village of Hook. There was the usual trap of two plain-clothes men and one policeman in uniform. He demanded to see the watches, and found the watch was a common Swiss stop watch, and on comparing it with his own it, in one case, showed a variation of three-fifths of a second, and in the other stopped correctly, but almost invariably started backwards. He informed the sergeant that if he summoned him he should claim his watch was not a reliable timekeeper. At the court, the police produced two watches; one they stated had been held by the first and the other by the second man.

The Meet of the Lincolnshire Automobile Club at Park House, Donington.

Mr. Munn informed the Bench he could show them these watches were not reliable, and that they started back instead of starting forward. On comparing the two watches there was a variation between them. He also pointed out that according to the police evidence there was only a difference of twenty-five yards between the second and third man, and that the car was pulled up easily in ten yards, and, therefore, it was obvious the car could not have been travelling at twenty-six miles per hour. The Bench dismissed the case.

A novel point was successfully raised at the Garstang (Lancashire) Petty Sessions by Mr. Willey, of Leeds, who defended Mr. Henry Caress, summoned for furiously driving a motor-car. He contended that the summons was bad on the ground of duplication, disclosing, as it obviously did, two offences, namely, furiously driving and endangering the lives of the public. There was no such offence as furiously driving under the Motor Car Act. The offence, if any, was negligently or recklessly driving in a manner dangerous to the public. The Bench upheld this objection, and dismissed the summons.

Mr. Hughes, of Bedford, was summoned by the Royston police for driving a motor-car at a speed and in a manner which was dangerous to the public, and was also summoned for refusing to stop when a police constable signalled him to do so. Mr. Staplee Firth defended, and the Bench dismissed the case.

William Archdale, Rosneath, Bassett, was summoned at Southampton for driving a motor-car in Millbrook Road, on the 23rd ult., at a greater speed than twenty miles an hour. P.C. Goodridge timed defendant, who covered 220 yards in 20 seconds, which was at a speed of 22½ miles per hour. Mr. Goodwin took the objection that under this section notice had to be given to defendant that proceedings were going to be taken against him, and this had not been done, but the Bench were against him. Defendant estimated the speed he was going at as 19 miles an hour, but it was impossible for a motorist to tell whether it was 19, 20, or 21 miles he was going at unless he sat

Digitized by Google

with a watch in his hand. He only warned one car. The Bench retired, and the Chairman afterwards said there appeared to be such a small margin that they would give the defendant the benefit of the doubt, and the case was dismissed.

CLAIMS FOR DAMAGES.

BEFORE Mr. Justice Grantham and a special jury, the case of "S. F. Edge (Limited) v. Allen" was heard. When this case was called on, Mr. Justice Grantham asked if any of the jurymen were motorists. Two jurymen having stood up, Mr. Justice Grantham said, I will tell you why I ask. I tried an action against a motorist, and the jury were discharged, and we afterwards found out that the three gentlemen who held out were motorists. The jury was sworn, including the two motorists.

The action was brought by S. F. Edge (Limited) to recover damages from James Allen, for injuries to a motor-car, alleged to be due to the negligence of the defendant's driver of a mail van. The defence was a denial of negligence, and a plea that those in charge of the motor-car were negligent. Mr. Colam appeared for the plaintiffs, and the defendant was represented by Mr. Morton Smith. The plaintiffs' case was that on the 4th April, 1903, a car belonging to the plaintiffs, driven by Miss Dorothy Levett, whilst driving through Rosebery Avenue, was run into by a mail van driven by one of the defendant's servants. The car was practically wrecked. The defence was that the car was driven at an excessive speed, and the collision was entirely due to the driver of the car, as it was impossible for the defendant's driver to get out of the way. The case having been fully argued the jury found for the plaintiffs, assessing the damages at £55, £45 15s. having been the actual cost of the repair of the car.

BEFORE Judge Baker at the Louth (Lincolnshire) County Court last week Frederick Allbones, of Grimsby, claimed £20 from Arnold Ellett, of Louth, for damages to plaintiff's motor-car. The jury found for plaintiff £5 12s. 3d. damages.

ALLEGED OBSTRUCTION OF THE HIGHWAY.

ISAAC SOLOMON, of Winchmore Hill, was charged at the Hatfield Petty Sessions with obstructing the highway at North Mymms on May 15th. The complainant, a motor-cyclist, of Barnet, stated that as he was riding his machine along the North Road on May 15th, he overtook defendant, who was driving a dog-cart. Solomon was on his wrong side of the road; and after complainant had sounded his horn he pulled right across the road. The defence was that the pulling across the road was an endeavour to get on the correct side. The case was dismissed.

"NOT PROVEN."

AT Haddington Police Court, on Monday, the hon. secretary of the Eastern Section of the Scottish Automobile Club, Mr. George Macmillan, was charged with having driven a motor-car at a speed exceeding twenty miles an hour. He pleaded not guilty. A police inspector deposed that in August last he had measured off a mile on the Post Road with a tape line at a point west of Tranent. On the day in question, he, with another police constable, watched the car approach. It did a mile in 1 min. 50 secs., or about 33 miles an hour. He timed the car with a stop watch owned by himself. A policeman gave corroborative evidence, and the agent for the defendant asked this witness to read the watch, which was produced, Witness said it was standing at 18 mins. 31½ secs., whereas the correct time was 2 mins. 31½ secs. This, the agent held, showed that the witness had a knowledge of the second hand but not of the minute hand. Witness admitted that he did not understand the mechanism of the watch. Mr. Macmillan said that this was the first time he had had the car out. On the measured mile he had to go slowly several times on account of horse vehicles. He was perfectly "flabbergasted" when the police told him what rate he had been going. Mr. Wilson, civil engineer, deposed that a tape line was the last thing in the world with which a particular distance of this kind should be measured. Mr. McDonald, advocate, said it was impossible, in his opinion, for the policeman to tell the exact time when the car started on the measured mile while they were standing at the termination. In his opinion, the watch was not trustworthy. He had examined it, and he found that the hand sometimes did not go properly back to zero. The sheriff held the charge not proven.

A CONVICTION QUASHED.

BEFORE the Quarter Sessions for the county of Sussex, held at Horsham, Mr. Lumley Smith, K.C., Judge of the City of London Court, chairman, the appeal of Mr. David Singer against a conviction by the magistrates at New Shoreham was heard. Mr. Moresby White (instructed by Messrs. Firth and Co.) appeared on behalf of the appellant. Mr. Boxall, K.C., and Mr. Horton Smith represented the respondent magistrates. Mr. Boxall, K.C., in opening the case, stated that the defendant had driven a motor-car in Southwick, near Brighton, on Sunday, April 17th, 1904, at a very furious rate. The road through the village had several turnings into it, and was about 30 ft. wide, with tram lines in it. There were houses on both sides, and in some places there was no made-up footpath between the houses and the roadway. There was a good deal of traffic, it being about four o'clock in the afternoon, a number of children were at the time leaving Sunday-school. There had been a long hearing of the case at New Shoreham on May 2nd, and the Bench had then unanimously convicted Mr. Singer. A number of witnesses gave evidence which bore out counsel's opening statement. Mr. Moresby White then called Mr. Singer, who stated that he was not driving at more than ten to twelve miles an hour when the policeman stopped him. Four other occupants of the car also gave evidence to the effect that there were no cabs, cyclists, or vehicles in the road, and no children or pedestrians in the carriage way. Mr. Moresby White pointed out the absence of all evidence of actual danger to any single person. Section 1 of the Motor Car Act, he said, was a criminal section, and strict proof of public danger was necessary before the Bench would be justified in convicting. Nobody had been called or had complained, and there was nothing but the merest inference of danger put before the magistrates by the prosecution. After a short retirement for consideration, the chairman stated that the Bench had decided to quash the conviction and allow the appeal, and gave the appellant costs against the magistrates who had convicted him.

POLICE TRAPS.

A MEASURED distance on the Brighton road at Sutton has led to the summoning and conviction of several motorists.

MOTORISTS driving between Berkhamsted and Tring should beware of several police traps.

THE police have a measured 220 yards near the village of Wallop, on the Salisbury and Andover main road.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Marlborough Street, London	Driving dangerously	40s.
Andover	,, ,,	£4.
Belper	Not giving audible warning of approach	£2.
,,	Not stopping when requested	£2.
Berkhamsted	Furious driving	£2.
Walsall	Unilluminated back number	40s.
Camberley	Driving dangerously	20s.
Epsom	Eight cases of furious driving	£3 in each case.
Guildford	Driving without licence	£1.
Mortlake	Reckless driving	£5.
Neath	Driving to danger of the public	10s.
Mark Cross	No licence	10s., etc.
Beaconsfield	Reckless driving	£3 7s. 6d.*
Slough	Negligent driving	25s.
Folkestone	Furious driving	5s.
Kingston	Dangerous speed	£3.
Dublin	,, ,,	£5, etc.
Cowbridge	Furious driving	15s.
Worcester	,, ,,	£10, etc.
Westminster	,, ,,	£10.
Wellingborough	Failing to stop when requested	£10.*
,,	Reckless driving	£10.*
Berwick	No number plate	11s.
Daventry	Furious driving	£3.
Liverpool	Refusing to give name when requested	£5, etc.
Kirkham	Furious driving	20s., etc.
Worcester	Reckless driving	£1, etc.

* Notice of appeal given.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, *39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

COMMENTS.

THE Racing Committee of the Automobile Club of America has issued an official statement with regard to its decision not to select any of the cars submitted for a position in the American Gordon Bennett team. After describing the tests to which the cars were submitted the report states:—"Although the committee had been instructed to make a fairly severe test, it was extremely anxious that America should be represented in the Gordon Bennett race, and to this end it was willing to stretch a point. The committee is unanimous in the regrettable conviction that not one of the cars on its merits is entitled to represent America, and that were any of them allowed to do so there would be a repetition of the same lamentable failures which have characterised the past. Certainly cars which cannot go for a few score miles at moderate speed over asphalt without breaking down, which have to be towed to the starting post, or which cannot reach the starting post within several hours of the starting time, are not entitled to be pitted against foreign cars which maintain a speed of over 60 miles an hour over country roads for several hundred miles in succession."

Inter-Club Meet at Bexhill.

THE Motor Union are arranging for an inter-club meet at Bexhill during the August Bank Holiday week. The gathering of Northern clubs recently held at Buxton proved a great success, and at an informal conference of representatives of the Southern clubs included in the membership of the Motor Union it has been resolved to organise a meet of a somewhat similar character. The suggestion has been warmly taken up by the various clubs in the South of England, and a representative gathering may be expected at Bexhill at the beginning of August. The programme includes, for the August Bank Holiday, a parade of cars in the morning, at which prizes will be awarded to the best-looking cars, some speed trials for touring cars up Galley Hill in the afternoon, and a dinner in the evening. On Tuesday some further trials and possibly a dance in the evening, and on Wednesday a gymkhana and procession of illuminated cars at night. Already about £300 has been subscribed for prize money and considerably more is expected. There is every prospect, therefore, of this meet of Motor Union clubs being a great success.

Dust Prevention Experiments.

WITH the permission of the First District Committee of the Renfrewshire County Council, the Western Section of the Scottish Automobile Club have treated two portions of roadway with Westrumite and one with crude oil, with a view to testing or demonstrating the efficiency of these materials with regard to the prevention of dust and the maintenance of roads generally. The Westrumite is laid for fully one-third of a mile on the Glasgow to Kilmarnock road, above Whitecraigs Station, near Giffnock, and for one half of a mile on the Anniesland road, west of Scotstounhill Station. The crude oil has also been applied on the latter road near to the entrance to Jordanhill estate for a distance of 400 yards. So far the results shown are satisfactory, and special records are being made by the county roads surveyor as to the utility and durability of these applications. The committee of the Club hope, after a more lengthy experience of the experiments, to prepare and issue a report on the subject.

◆ ◆ ◆

The Ladies' Club.

LAST week the Ladies' Automobile Club held a delightful "biograph tea" at their headquarters at Claridge's Hotel, Brook Street, W. As will be seen from the reference on another page, several leaders of the aristocracy were present, and the interest which they took in the pictures of the Gordon Bennett race, as well as of other motor-car events thrown upon the screen, testified to their approval of motoring. We were somewhat surprised, however, that comparatively few drove up to the hotel in motor-cars, the larger number apparently preferring the horse-drawn vehicle, a slight incongruity which, perhaps, will become less apparent as the Ladies' Automobile Club becomes advanced in years and membership. Such social gatherings as that of last week will do much to popularise motoring among ladies, and it is evident that the management of the Club is in efficient as well as enthusiastic hands.

◆ ◆ ◆

Against the Garage.

THE medical officer of health for Marylebone recently declared against garages as noisome buildings inimical to the public health. In another part of London complaint has also been made, and the Works Committee of Westminster City Council have reported receiving a memorial signed by forty-two residents of Livonia Street, Berwick Street, W., drawing attention to the nuisance created by the motor-cars which run in and out of the factory in the above street, stating that the firm have lately taken to doing some of the minor repairs in the street itself, and that the noise of the cars and odour of the petroleum is very objectionable to neighbouring tenants, and that there are sometimes as many as seven or eight cars along the street, which makes it necessary for incoming vehicles to take to the pavement, to the danger of pedestrians. The committee has referred the matter to the town clerk to take such steps as he may deem advisable.

◆ ◆ ◆

Motor-Cars in Ceylon.

WITH a view to finding out (in case of a motor-car mail service being adopted from Colombo to Batticaloa and Trincomalee) whether the bridges on the Bandarawela-Batticaloa Road and the Matale-Trincomalee Road are strong enough for the running of motor-cars, Mr. T. G. Jayawardena, assistant factory engineer, was readily deputed by the Motor-Car Committee to examine all the bridges on the route with a view of ascertaining the strength of the existing large span bridges. These bridges were originally put up for ordinary road

Digitized by Google

traffic some fifty or sixty years ago, being built on the lattice-girder plan. The types of these bridges are weak and were then not strongly built, as they were not much used in those days. Mr. Jayawardena is of opinion that the motor-car would cause a great deal of vibration, for which the present bridges are not strong enough. The work of strengthening these bridges will fully occupy a year, and if a motor service is decided upon, twelve months must first elapse before it is inaugurated. The roads are in excellent order and will be suitable for the running of motor-cars.

◆ ◆ ◆

Motor Fire Engines.

A CONFERENCE of fire brigade officers has lately been held at Glasgow, when considerable conversation took place as to the respective merits of horse-drawn and motor fire-engines. Mr. Bayliss, chief officer of the Manchester Fire Brigade, subsequently expressed the opinion to a press representative that there was no doubt of the early universal adoption of motor fire-engines in this country. Naturally the officers of fire brigades who have to consider the public purse are loth to make experiments with machines that have not had full trial elsewhere. Hence the interest which is being taken in the motor fire-engines now employed at Tottenham and Liverpool. Both, we are glad to learn, are answering the expectations of those responsible for their introduction, a fact upon which all concerned may be congratulated.

Costs in Appeal Cases.

MOTORISTS will read with pleasure the result of the appeal of one of their number from a decision of some local justices to the Quarter Sessions for Oxfordshire, reported on another page. Having convicted a motorist, the latter appealed. Then the local justices became quiet and modest in their bearing, actually neglecting to appear in defence of their decision. The appeal was, as Mr. Weatherly pointed out, a re-hearing, and the respondents, who should have been the prosecutors, did not appear. Without, therefore, arguing the case on its merits, the counsel for the appellant was able to secure a reversal of the previous decision together with an expungement of the endorsement on the motorist's licence. But, more than that, the Bench allowed the appellant his costs against the police—an equitable decision that should be universal in such cases. There is no doubt that if more appeals were lodged greater care would be exercised by the police and magistrates, while the payment of costs in cases they lost would show the county people the expensive policy that has been pursued against motorists.

A New Electric Timing Device.

MUCH interest is being shown by the Automobile Club of America in an electric timing device devised by Mr. Alden L. McMurtry, of that club. The device, which is claimed to be an improvement upon anything of the kind now in existence, will probably be used at the next speed tournament on the beach at Ormond, Fla. Mr. McMurtry's machine, it is stated, will not only record the time for a completed distance, but will give as many intermediate times as desired. For example, in a ten-mile run the time will be recorded for each mile and for each quarter mile also, if necessary. Pending the granting of patents, the construction of the device will not be disclosed by its inventor beyond the fact that wires are strung along the course and are connected at one end with as many stop watches as it is desired to have recorded times.

◆ ◆ ◆

Another Bill.

INTRODUCED by Mr. D. J. Shackleton, and supported by Messrs. Bell, Crooks, and Henderson, a quartette of Labour members who seem to take a comprehensive view of their duty to their constituents, is the Bill to provide for the Regulation of Traffic in Streets. The main clause is one insisting that "no person shall act as driver of, or have sole charge of, more than one cart or carriage drawn by one or more animals in any street in the district of a public authority, and no person shall fasten, or allow to be fastened, to the rear of any such cart or carriage, any other cart or carriage drawn by one or more animals, or any animal drawing a carriage." Any person acting in controversion of this enactment will be liable to a penalty not exceeding 20s. for the offence. There is little chance of the Bill becoming an Act during the present Parliament, but the authorship of the measure is interesting.

◆ ◆ ◆

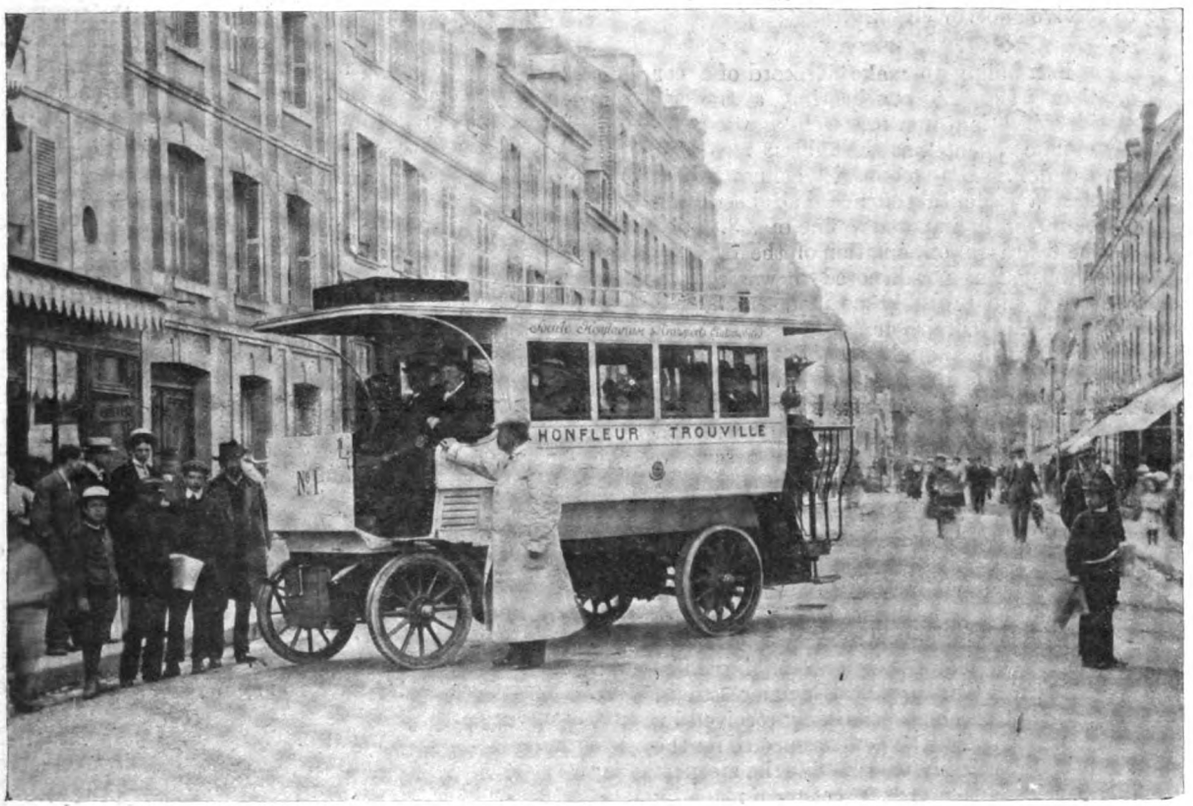
Good Roads in America.

THE good roads movement in the United States has, during recent years, become of the very first importance. Conventions are constantly being held with a view of promoting the movement. At the National and International Good Roads Convention held in the city of St. Louis in May, Mr. Frank Z. Wilcox, of Syracuse, New York, was appointed a special commissioner to study the road system in England for the purpose of a special report to the Convention next year. He has now arrived for the purpose of fulfilling his commission, and is the bearer of letters of introduction to the Roads Improvement Association of this country and to others. He proposes investigating the condition of the roads and the systems of management in operation in various districts, especially in the case of the country roads.

◆ ◆ ◆

"Privilege" for M.P.'s.

IN seeking to escape a fine by pleading the alleged privileges of a Member of Parliament, Mr. Louis Sinclair is not contributing much to the advance of automobilism. He recently drove his car—A 2388—on the off-side of three refuges in Regent Street, and, when summoned at Marlborough Street Police-court, his solicitor mentioned that Mr. Sinclair, as a Member of Parliament, had, by Act of Parliament, a special privilege of having and taking a clear road to and from the House of Commons. Mr. Sinclair, in his evidence concerning the alleged privilege, said he would like to say that in the vicinity of the House of Commons the policemen, in order to facilitate the ingress and egress of members, made them go on the wrong side of the refuges. Mr. Denman, the magistrate, remarked that no doubt there was good reason for the course being adopted in the vicinity of the House, but not in the present case in Regent Street. Mr. Sinclair had spent some time at a club after leaving the House, and he thought the privilege could not apply. In the end a fine was inflicted. Such alleged privileges cannot be reasonably



Digitized by Google

maintained at a considerable distance from the House, and we are rather surprised that such a lame defence should have been offered.

◆ ◆ ◆

Necessity for Good Work.

RECENTLY a car broke down on one of the southern roads, an occupant being killed. A temporary failure of the brakes, a weakness in construction at any point, or an undiscovered flaw in material, may result in immediate danger and cause suffering and pain. A great responsibility rests with manufacturers in allowing no negligence, and in ensuring every care in the construction of their vehicles. The standard of quality must be rigidly maintained and nothing done that is likely to create an adverse feeling to motoring on the grounds of the public safety. With the eyes of the Legislature as well as the magistrates upon motor-cars it behoves makers to strain every effort to secure that only the best workmanship and creditable material is used in automobiles.

One of the 16-seated De Dion Petrol Motor 'Busses for the service between Honfleur and Trouville.

(La France Automobile.

Roads in Essex.

THIS week the Essex County Council are considering a recommendation of their Highways' Committee with regard to scheduling certain roads for speed restrictions or prohibition under the Motor Car Act. The committee, doubtless on the recommendation of their chief surveyor, has come to the conclusion that the clauses in the Act dealing with reckless driving are, in themselves, sufficient protection for the public, and therefore recommend that no prohibition or restriction as regards speed in the country area be made at present. This is a distinct advance from the resolution of the Essex County Council last October, when it was resolved that the Motor Car Bill, then before Parliament, was not sufficiently stringent, and that for certain offences the magistrates should have the power to inflict imprisonment upon motorists without the option of a fine. The friendly disposition of Mr. P. J. Sheldon towards motorists is responsible for a great deal of the more friendly feeling now existing. In his report on the maintenance of Essex roads for the year just closed he has much that is satisfactory to say with regard to the condition of the roads, which last year cost £65,518 for 604 miles of rural roads. We note that in his report he points out that the clearing of ditches by the sides of the main roads has been the most troublesome detail of rural road management that has happened for many years, and he suggests that a short Act of Parliament might be adopted, making the procedure with defaulting owners as simple as that relating to the cutting back of hedges. This would do something to help to make easier the onerous duties of road surveyors.

◆ ◆ ◆

Motor-Cycles and Side Slip.

THE report of the Auto-Cycle Club's side-slip trials has just been issued, and the judges are of opinion that although there is in connection with all of the devices ample scope for improvement, not only with a view to increase of efficiency, but to simplification of details and ease of manipulation, the devices serve a useful purpose, while the disadvantages are small. There were five entrants in the trials, and in our "Motor-Cycling News" we give the recommendations of the judges, who have bracketed the devices of Mr. W. Maitland Edwards and the Parsons Non-Skid Company first.

◆ ◆ ◆

Accidents in the Metropolis.

A MISHAP to the Earl of Dudley, and an accident which proved fatal to Sir W. Rattigan, M.P., have served to give emphasis to the statement made by Mr. Akers-Douglas, the Home Secretary, in reply to Captain Donelan, to the effect that during the year ended May 31 in the Metropolitan Police District 1,743 accidents to persons and property were occasioned by motor-cars and 214 by motor-cycles. In these accidents seventeen persons were killed and 601 injured. Such incidents, together with the sensational headlines in which certain journals freely indulge, serve to maintain a lingering popular prejudice against motor-cars.

A Doubt on Official Returns.

AT the same time we can scarcely credit the figures given with such official authority. They are said to relate only to the Metropolitan area, and the death roll of seventeen with 601 persons injured is certainly more lengthy than we had expected. In fact, we would venture to suggest that the details should be given in order to satisfy the public as to the accuracy of the return. It hardly seems creditable to imagine that 1,743 motor-car accidents, practically five a day, have occurred in London. That would seem to exceed the actual number for the whole of the country. In the police returns what are included as accidents? Apparently any stoppages observed by the police are duly reported, and are evidently useful to swell the volume of "accidents." If this is so, it is manifestly unfair for the Home Secretary to offer these to the House of Commons as accidents, and, if it is not so, we should like some satisfactory explanation as to how the return is made up. At present motorists will feel that there is something wrong, and their confidence in officialdom is likely to receive another check.

◆ ◆ ◆

Keep a Record.

FOR failing to make a record of a car that was sent out bearing a trader's identification mark a well-known automobile agent has just been fined in London. His counsel acknowledged that a technical offence had been committed and the magistrate instantly imposed a fine of £3. The lawyer hoped he would be heard in extenuation of the offence; but the magistrate, being busy, was not disposed to waste time unduly, and said the fine would probably be increased if the speech were made. With an admirable self-sacrifice the counsel refrained from uttering the thoughts that burned within him. But the moral of the story is that traders cannot successfully plead ignorance of the regulations, that they need not expect to be let off because their delinquency is merely a technical one, and that the cheaper way to run a business is to keep to the regulations of the law. And one of these is that no trader's mark of identification may be employed without an entry of the same being made in a register kept for the purpose.

◆ ◆ ◆

Australian Advance.

THE Automobile Club of Victoria had an outing recently at Heidelberg with the object of demonstrating the adaptability of motor-cars for climbing hills. The State Governor, Sir Reginald Talbot, rode out on horseback, being received by Dr. C. Ryan and Mr. W. H. Felsted. The course selected for the contests was just over 1,000 yards in length, and the steepest gradient was 1 in 6½. Meritorious performances were made by 10-h.p. Tarrant, 10-h.p. Rochet, 16-h.p. Decauville, 10-h.p. Argyll and 4½-h.p. Oldsmobile cars. The last run of the season of the club was to Sorrento early last month. Another interesting automobile event was a social gathering. In view of Mr. W. E. Fisher's (secretary of the Automobile Club of Australia) early departure for America, Mr. John Gibbs (acting-secretary) and Mrs. Gibbs extended an invitation to the members of the club and their friends to meet at their country residence at Parramatta, in order to wish him *bon voyage*. Between fifty and sixty attended in their automobiles. The president (Mr. Jones) proposed the health of Mr. Fisher, and referred to the valuable assistance he had given in the organisation of the club. Mr. Fisher was, he stated, really the founder and promoter of the club. In reply, Mr. Fisher stated that during his visit to different cities in America, England, and the Continent he hoped to profit by experience he would gain when visiting larger clubs, such as the Automobile Club of America, the Automobile Club of Great Britain and Ireland, and the Automobile Club of France, and would endeavour on his return, with the assistance of the popular officers of the club, to put it into still better working order, and popularise its movements.

The Gordon Bennett Race.

ALREADY challenges for next year's contest are reaching the French Automobile Club, and that from the A.C.G.B.I. is on its way, the Wolseley Company, Messrs. Lionel de Rothschild and S. F. Edge having decided to enter cars. We believe that Mr. Rothschild will compete with a Siddeley car, the advent of which into racing circles will be regarded with interest. On Tuesday Mr. Alfred Bird gave a dinner in honour of the British competitors in the Gordon Bennett race and the makers of the cars to meet the Duke of Sutherland, the newly-appointed President of the Club. About thirty gentlemen were present, and the determination was valiantly expressed not to waver in the attempt to regain the Cup.

◆ ◆ ◆

The Dewar Cup.

ON Tuesday afternoon a luncheon was given at the Savoy Hotel, London, in connection with the Dewar Challenge Trophy. Sir Thomas Dewar formally handed the cup to the trustees, the Earl of Shrewsbury and Talbot and the Earl of Wilton, and the former then made the presentation to Mr. D. M. Weigel in recognition of his recent feat of endurance. In the course of the proceedings it was announced that M. Fournier, of Paris, had sent in a challenge for the cup. The principal conditions attaching to the contest are:—The cup shall be held continuously by the winner until a challenge is received; competitions shall not take place more than twice in one year; the distance of the non-stop run to be not less than 2,000 miles; not more than three changes of drivers to be allowed; no observer to act for a greater distance than 150 miles; and a minimum of four persons to be carried throughout the whole route in such competition. In acknowledging the presentation Mr. Weigel, who, by the way, was able to see his performance depicted on the biograph at the Alhambra on Wednesday evening, said he had tried to show the public what a motor-car was capable of doing, and in concluding the proceedings Sir Thomas Dewar expressed a hope that English manufacturers would assert their supremacy in the industry.

MR. J. GLASS is disposing of the Firefly Motor Company, of Croydon.

THE photograph of Mr. E. George Mawbey in our last issue was by Mr. F. Ralph, of Hunstanton.

LORD WINDSOR has become president of the South Wales Automobile Club, which is negotiating for a site for a club garage.

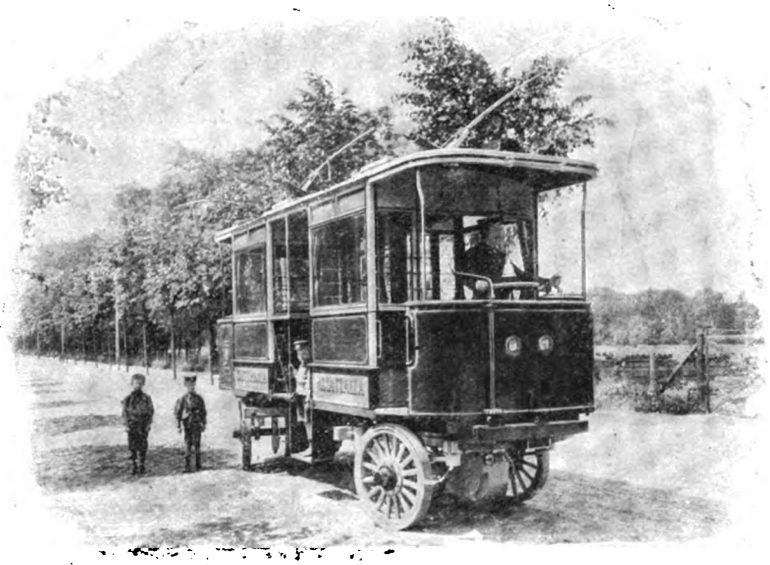
MR. E. W. LOVELAND, 6, St. Leonard's Road, Bexhill, is secretary of the Bexhill Automobile Meeting, to be held on the first three days of August.

THE first of the new steam motors and carriages for service between the Midland Railway Station and Heysham Harbour has arrived at Morecambe.

MESSRS. FRISWELL LIMITED have declared interim dividends of ten per cent. on the ordinary shares, and six per cent. on the preference shares for the half-year ending June 30th last.

AT the inquest concerning the death of Sir W. Rattigan, M.P., the jury returned a verdict of accidental death. They added that they considered the car was unsafe, but exonerated the driver from blame.

THE output of Argyll motor-cars last month from the works of the Hozier Engineering Co., Ltd., was sixty-six complete vehicles. During the quarter just ended no less than 156 cars were turned out—an excellent proof of the reputation of the Argyll vehicles and the capabilities of the Hozier Co.'s works.



MESSRS. ELLIMAN, SONS, AND COMPANY, of Slough, have issued a second edition of their R.E.P. book which gives a series of useful hints for first aid in accidents and ailments. Every motorist, in fact every tourist, will find this a handy volume to carry when on tour, its many practical points being clearly and authoritatively set forth.

THE SCHIEMANN ELECTRIC OMNIBUSES.

OMNIBUSES, worked by electric current drawn from an overhead system of conductors, owe their existence to the desire to avoid the special track essential to tramways, the cost of which forms such a large proportion of the total capital of a tramway undertaking. Not only do they need no special track, but they can be put upon any good ordinary road without modifying it and without interfering in any way with the general traffic. They are suitable in any country or district for communication between villages of comparatively little importance where the cost of electric tramways would be prohibitive; and especially so in countries such as Italy, where water power is abundant and electricity is for that reason producible at a low cost. Early in 1882 an electric omnibus on these lines was put upon the road in the neighbourhood of Berlin by Messrs. Siemens and Halske for purposes of experiment. The rear axle was worked by chain gear from two electric motors fixed under the seat of the driver, to which current was taken from the overhead line through two flexible cables which served, not only for conveying the current, but also for trailing the current collector. This consisted of a small but rather heavy car with eight wheels running upon two overhead conductors which were supported on wooden supports at the side of the road.

In 1900, Messrs. Siemens and Halske, in conjunction with Mr. Max Schiemann, of Dresden, installed a line of electric omnibuses to run from Koenigstein along the Biela Valley for a distance 1¾ miles at a speed of about 7½ miles per hour. From two overhead conductors current was led to the motor by two trolley poles and sliding shoes of such a length and construction as to allow the omnibus to deviate 9 ft. 10 ins. from the line of conductors without breaking connection with them. The accompanying illustration represents an omnibus built by the same firm and shown by the Societa Eletricita Alta Italia at the recent Exhibition of Modern Decorative Art at Turin. It consists of a car body resting upon two bogies, each with two wheels and each fitted with a spring-suspended motor of the usual small tramway type driving the wheels of the omnibus through gearing. The two axles are movable and connected by two cross ties, an arrangement giving the vehicle a considerable degree of mobility. The trolley poles are very light and carry at their ends "skates" which are so constructed as to allow a deviation of 11 ft. 6 ins. from the normal line of the trolley wires and permit the omnibus to turn quickly aside to avoid collision. The omnibus is fitted with electric light, signal lamps, electric brakes, lightning conductor, etc. It weighs 4½ tons, accommodates twenty-two passengers, and is worked by a single driver. Thus when a vehicle is overtaken there is no need of standing still on one particular track, from which there is no swerving, until the driver sees fit to get out of the way. The rail-less 'bus simply bears to the right or the left, as the law demands, running over any road that any other vehicle can travel.

General View of Electrical Omnibus.

Quite recently a new form of electric omnibus, illustrated on page 416, has been designed to embody the results of experience gained by previous experiments and actual working of this form of transport in ordinary use. It resembles in appearance the ordinary horse omnibus and is claimed to fulfil all the requirements of this kind of vehicle. At the front is the driver's seat, and at the back a platform with standing places, and also the entrance. The axles, wheels, steering gear, and driver's platform, as well as the complete electrical equipment, are attached to two longitudinal girders and bolsters, to which the car is also bolted, and from which it can readily be removed to allow of repairs being executed easily and quickly. The controller which serves to regulate the speed is provided with a hollow shaft through which the shaft of the steering gear passes, both shafts being fitted with hand wheels, one of which is arranged over the other in such a way that the driver can conveniently handle both at the same time, a point of great importance in ensuring safe driving.

On the right of the controller are two brakes, viz., a foot brake which is used for service stops, and a hand brake for use in emergency or for holding the car on inclines.

The car has seating accommodation for thirteen people inside, and standing places for six on the platform. The windows at the side are removable, and during the summer may be replaced by waterproof curtains. A locker may be fixed under the driver's seat for carrying mails, etc. The floor is provided with ash battens and one or two trap doors for inspection of the motors. The two poles with current collectors are fixed to the roof, the great length of the poles, combined with the peculiar construction of the sliding shoes, allowing the car as much as 9ft. 10 in. of lateral movement, relatively to the overhead conductors, without fear of the shoe leaving the trolley wire. The roof is provided with a low rail to accommodate luggage. The weight of the car when empty is about 3½ tons. About two-thirds of the load is borne by the rear axle, and about one-third by the front axle, a distribution of weight which leaves the steering wheels lightly loaded for steering, and the rear wheels heavily loaded for purposes of adhesion. The wheels have wooden naves, spokes and felloes, and steel tyres. Each axle is supported by three laminated plate springs. The two rear wheels are driven by two 8½-h.p. direct-current motors, giving sufficient power to propel the car at a speed of about nine miles per hour on good roads, and to enable it to negotiate short inclines of 5 per cent. The motors drive the naves of the wheels through a double reduction gear, consisting of spur wheels for the first reduction and a chain for the second, the spur wheels being provided with a gear case to protect them from dust and water. The motors are completely enclosed.

The car is provided with all necessary apparatus, such as hand and automatic switches, fuses, two lightning arresters, and other fittings, its lighting being effected by means of one or two lamps in front of the car, two or four 16 c.p. incandescent lamps in two fittings with glass globes inside the car, and one canopy lamp. It is easily handled in traffic, and can be turned round quite easily when it reaches the end of the route. The trolley wire, which is twenty feet above the level of the street, does not interfere with other traffic.

Messrs. Siemens Brothers, Limited, who are introducing the system into this country, inform us that the total cost of an omnibus, completely fitted as described, is about £500.

SOME experiments have been made at Widnes with regard to the dust on the roads in that district. A solution of calcium chloride is sprayed from watering carts, and not only is the result reported as satisfactory but the preparation is economical in use.

CONTINENTAL NOTES.

Another Projected Motordrome.

At regular intervals reports as to projected motordromes in France cause a flutter of excitement in Parisian motoring circles. Unfortunately the majority of them fade away like castles in the air, and the long-looked-for motor-racing track is still *non est*. The latest scheme emanates from Riva Bella, in the department of Calvados, where it is proposed to establish a track five miles to the lap, and 82 ft. wide.

Automobiles in France.

In a recent issue the "Velo" devoted considerable space to a statement in regard to motor-cycles and automobiles in France for the year 1903. The figures published by our contemporary show that on December 31st last there were in France 1,310,223 ordinary cycles, 19,816 motor-cycles, and 19,886 automobiles. These figures show that there is in use one cycle per 30 inhabitants, one motor-cycle per 1,966, and one car per 1,959 inhabitants. As regards the motor-cycles, it is curious to note the manner in which these are distributed in the country. Paris heads the list with 5,337 machines = 26·9 per cent., then comes the Northern district with 3,036 machines = 15·3 per cent., followed by the East, 1,919 = 9·7 per cent. In the automobiles, the order is :—Paris, 6,085 = 30·6 per cent.; North, 3,040 = 15·3 per cent.; East, 1,995 = 10·0 per cent. In continuation of these figures, it is estimated that at the present moment there are 25,000 automobiles in use in France, as against only 5,286 at the end of 1900.

One of the latest 10-12-h.p. Double-Cylinder Argyll Cars with side entrance body.

A Motor-Bicycle Trial in Holland.

A motor-bicycle reliability trial is to be held at Maestricht, Holland, on the 6th and 7th August. Each day there will be a run to Nimegen and back, a distance of 265 kilometres, the trip finishing up with ten laps on the Maestricht cycle track.

The A.C.F. Banquet to Thery and Brasier.

At the last meeting of the Committee of the A.C.F. it was decided to offer a banquet to Thery and Brasier at the club house in the Place de la Concorde, Paris, on Thursday, the 7th inst., in commemoration of their success in the Gordon Bennett race.

An International Motor-Bicycle Race.

The Motorcycle Club de France proposes to organise an international race for motor-bicycles for a cup, to be competed for on the lines of the Gordon Bennett race. It is suggested that a race should first be run between French riders of motor-bicycles to secure the best team of three, after which a notice should be issued to foreign countries that they were ready to receive challenges for the international event.

The Calais-Dover Motor-Boat Race.

M. Loubet, the French President, has presented a prize consisting of a handsome Sevres vase for competition in the forthcoming motor-boat race from Calais to Dover.

Maritime Motor Ballooning.

It is announced that M. Henri de la Vaulx, the marine aeronaut, is now completing his preparations for a third Mediterranean cruise in a specially constructed balloon, some particulars of which were given at last week's meeting of the Academy of Sciences. On this occasion M. de la Vaulx will employ a 20-h.p. petrol engine attached to the car, which will work an aluminium screw 23 ft. in diameter. M. de la Vaulx having already proved, by two ascents of 41 and 35 hours respectively, that the apparatus designed by his partner, M. Herve, enabled a balloon to pass with safety over the sea, now wishes to show that the same kind of balloon is to a certain extent capable of resisting the elements and is not quite at the mercy of the wind. He does not pretend that the new balloon can actually be steered, but only that it marks a stage in that direction.

Motor-Cars in Russia.

Negotiations are reported to be in hand with regard to the establishment of a motor-car factory at Kiew. It is also stated that Count Grocholski proposes to organise a public service of motor-vehicles for the transport of both passengers and goods between Kiew and Zytomir.

The Mont Cenis Hill-Climb.

The annual hill-climbing competition up Mont Cenis, organised by the Italian Automobile Club, is to be held on Sunday next. There are categories for racers and tourists with the usual classes in both sections. Some fast times are anticipated, as among the vehicles entered are the three Fiats which represented Italy in the Gordon Bennett race.

A Subscription for the French Gordon Bennett Mechanicians.

Following on the subscription for Thery, which has now reached over £300, M. Paul Sencier, of "L'Automobile," is organising one for the mechanicians of the three cars which represented France in the Cup race. The part played by the mechanicians during the course of a big contest is, he considers, apt to be overlooked, and it is with the object of recognising their useful labours that it is proposed to get up a fund on their behalf.

Partinium.

A feature of the French motor industry is the increasing use of the light alloy known as "Partinium" for such parts as crank chambers and change speed gear boxes, etc. Formed early in 1901 with a capital of £46,000, La Societé des Usines de Partinium has established works at Puteaux, near Paris, covering an area of over 4,000 square metres, where about 200 men are now employed in turning out the light alloy in a variety of forms. Recent improvements permit the company to produce crank chamber, gear box, and other castings of all sizes, on the interchangeable system and of uniform quality, while, in addition, Partinium, which can be forged and welded just the same as iron, is supplied in sheets, angles, or of any rolled section for the use of motor-carriage builders. Having established an excellent connection among automobile constructors in France, the Partinium Company are now taking steps to bring the advantages of their products before motor-car builders in Great Britain.

The Dauphine Automobile Week.

The date of the "Automobile Week" of the Automobile Club Dauphinois, of Grenoble, referred to in this column last week, has been postponed, and it is now to be held from the 3rd to the 7th August.

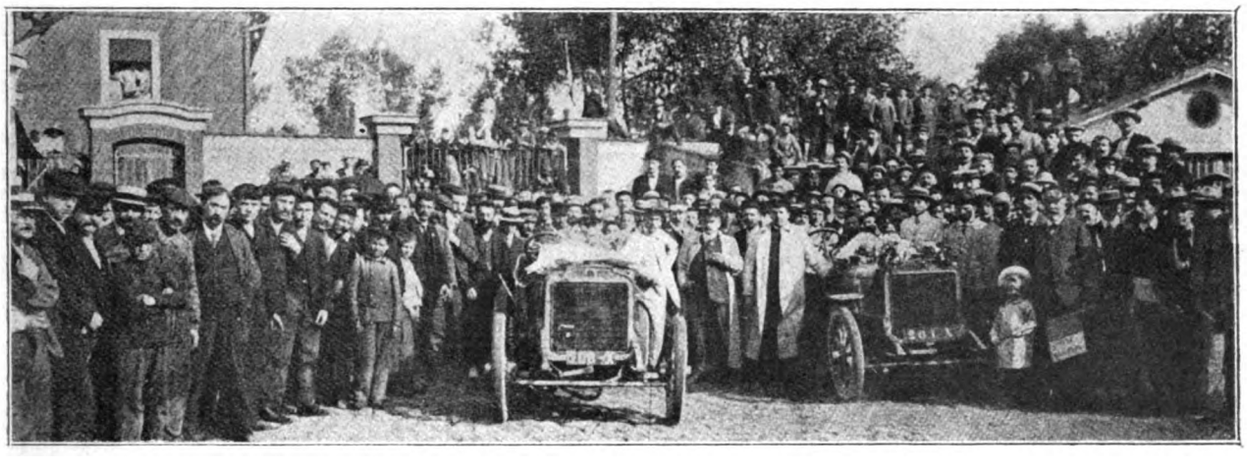
Digitized by Google

The Circuit des Ardennes.

The attention of the motoring world is now centred on the Circuit des Ardennes races, which are to be held on the 24th and 25th inst. The weighing-in will take place at Bastogne on the 23rd inst. On the following day the race for voiturettes and motor-cycles will take place, the competitors being started at minute intervals from 7 a.m. The distance is 240 kilometres, representing five rounds of the following course:—Arlon, Habay La Neuve, Etalle, Vance, Arlon. The "battle of the giants"—the heavy and light racers—is reserved for the 25th inst. For these the distance is 600 kilometres (375 miles), consisting of five rounds of the following circuit:—Bastogne, Champlon, St. Hubert, Recogne, Neufchateau, Habay-la-Neuve, Martelange, Bastogne. The whole stretch is to be sprinkled with Westrumite, and there will be no neutralisations or controls, so that it will be possible for the cars to go the whole 375 miles without a stop. The start will take place at 5 a.m. and the cars will be despatched at intervals of one minute. The entries, which are restricted to four cars of any one make, so far include Panhard, Mercedes, Mors, Wolseley, Napier, Clement-Bayard, Pipe, Hotchkiss, and De Dietrich. A grand stand is to be erected at Bastogne, the price for seats on which has been fixed at 20 fr. each. Intending competitors and visitors can obtain full particulars of the meeting from the Automobile Club de Belgique, 5, Place Royale, Brussels.

◆ ◆ ◆

Stage.	Distance.	Machine.	Rider.	Time Occupied.
10. Foug-Arches	112	Knap	M. Clouet	3 10
11. Arches-Belfort	99	Peugeot	Lanfranchi	2 25
	1,127 Kil.			29 32



Only ordinary motor-bicycles with engines of not more than one third litre cylinder capacity, equal to about 2½-h.p., were allowed to compete. Osmont was delayed by fog, while a delay occurred at Foug owing to the non-appearance of the dispatch rider, the tenth stage being undertaken eventually by M. Clouet. Thus, while the actual time occupied was about thirty-six hours, the message was carried a distance of over 700 miles in the net time of 29 h. 32 min.

◆ ◆ ◆

The Ostend Meeting.

The automobile meeting at Ostend commences on Thursday next, the 14th inst., by a series of five kilometre speed trials for touring vehicles on the Nieuport-Snaeskerke road. On the 15th inst. the racers will indulge in a ten-kilometre trial on the same road. For Saturday, the 16th inst., a touring competition is being organised, while on Monday, the 18th inst., there will be a series of kilometre speed tests on the Snaeskerke-Ostend road. Close upon fifty entries have been received, including three Pipe cars, three Darracqs, three Clement-Bayards, a Panhard, a Hotchkiss, a Gobron-Brillie, and Baron de Caters' 90-h.p. Mercedes.

◆ ◆ ◆

The Reception of Messrs. Thery and Brasier at the Georges Richard Co.'s Works. [*L'Automobile.*

The Brest-Belfort Motor-Cycle Relay Ride.

The motor-cycle relay ride organised by the "Auto" for the purpose of demonstrating to the military officials and the public generally in France the possibility of carrying a despatch from the extreme western coast to the eastern frontier of the country by means of relays of riders driving motor-cycles was carried out on the 27th ult., the start taking place at one minute after midnight. The distance was 1,127 kilometres, or rather over 700 miles, this being divided into eleven stages of approximately sixty-three miles each. Eleven motor-cycle firms responded to the invitation of our contemporary to enter machines for the ride, and there were therefore eleven official racers bearing the despatch, they being accompanied by two supplementary riders in the event of mishap. The various stages, the riders, and the time occupied are shown in the appended table:—

Stage.	Distance. Kil.	Machine.	Rider.	Time Occupied. H. M.
1. Brest-Louargat	101	F.N.	Osmont	3 54
2. Louargat-Broons ...	92	Alcyon	Lyonel	2 9
3. Broons-Vitre	90	La Francaise	Derny	2 11
4. Vitre-Pre-en-Pail ...	100	Werner	Bonard	2 17
5. Pre-en-Pail-Tillieres ...	110	Gladiator	Aster	2 38
6. Tillieres-Paris	105	Clement	Laureau	2 43
7. Paris-Chat.-Thierry ..	99	Griffon	Demester	2 9
8. Chat.-Thierry-Couvrot	108	Lurquin et Coudert	Coudert	2 10
9. Couvrot-Foug	111	Knap	Mme. Clouet	3 46

French Motorists in England.

Preparations are well in hand for the De Dion Bouton excursion to the South of England. The motorists taking part in the tour will leave Paris on Sunday morning by road for Calais, where the cars will be embarked on a special steamer for Dover. The tour will commence at the English port on Tuesday morning, the day's destination being the residence of Sir David Salomons at Tunbridge Wells. The excursion will last until the 25th inst., and will end with a banquet, at which the Marquis de Dion will preside. The King has accorded permission for the visitors to inspect Windsor Castle during their sojourn in England.

◆ ◆ ◆

Fatal Accident to Beconnais.

Parisian motorists met with a shock on Sunday last on the receipt of the news that Beconnais, the well-known racing chauffeur, and his mechanician Bernhard, had both met with a fatal accident near Labouheyre, between Bordeaux and Bayonne. Beconnais was driving a Darracq racing car, and it is surmised that one of the tyres burst when travelling at a high speed, causing the car to deviate from its course and dash into a tree. The true cause of the accident will, however, probably never be known, as it was not witnessed by anyone, an agricultural labourer being the first to discover the two dead victims. Beconnais first sprang into renown by his speed performances on the motor-tricycle; during the last two years he had driven Darracq cars, being among the competitors in Paris-Vienna and Paris-Madrid.

THE AUTOMOBILE FOR MEDICAL MEN.

EVERY day almost we see a new convert to automobilism, and, as often as not, the latest convert is a medical man. The question as to the merits of the automobile for the medical profession is an extremely interesting one, and well worth discussing. What are the essential requirements for an automobile which is to be used by a doctor? They may safely be enumerated as follows:—(1) Reliability, (2) adequate speed, (3) protection from inclement weather, (4) general handiness and compactness.

If a motor-car is to be of any real service to a medical man, it must be absolutely reliable. That is, it must be a sure starter, and reliable on the road. With the perfections of the modern automobile there is no difficulty whatever in obtaining an easy-starting car, nor is there any question as to reliability on the road as regards the mechanical part of the vehicle. The question, however, is the tyres. In the above-mentioned list of the requisites for a doctor's car No. 2 states adequate speed; this must necessarily be so, as, in the event of an urgent call, the sooner the doctor is upon the scene of sickness the better; consequently, every doctor's car should be capable of a speed of twenty-five miles per hour on the level, and this speed is rather

Sight-seeing at the St. Louis Exhibition.

open to question with solid tyres. There are some cars built specially for solid tyres, and will stand running twenty-five miles per hour, but there are few, if any, really suitable for the medical man. As regards pneumatic tyres, some people state that they are useless, whether for a medical man or anyone else, but these statements usually come either from people who have been most exceptionally unfortunate with pneumatic tyres, or from those who have not tried them. The difficulty can be solved by either fitting a sound compound tyre, or by using pneumatic tyres a size larger than should be really used for the weight of the car.

Requirement No. 3 in the above list mentions protection from inclement weather. This is, we consider, a point that motor-car manufacturers have not given as much attention to as they might. At the conclusion of this article a specification, so that all details may be clearly explained, will be given which, in our opinion, would form the ideal doctor's vehicle. A glass front, in conjunction with a good hood, affords very efficient weather protection and is not a very expensive extra to a car; nor is it necessary that the hood should be real leather; a real leather hood for a two-seated car will cost at least £20 extra, whereas a hood made of water-proof material, as some of the Cape cart hoods are, should not cost more than £6. For his professional use the doctor will not require anything more than a two-seated car, with a platform at the back, so that a basket may be fastened thereto to carry all necessary articles. As regards the handiness and general compactness, under this heading several details may be mentioned. The car should be perfectly easy to enter from either side, therefore the speed lever should either be well set back or mounted upon the steering column. Either of these arrangements may be found in several small cars now on the market. It will be observed that we are referring to small cars only. There are, of course, large cars which can soon be made suitable for a medical man, but as the majority of doctors who are considering the use of the automobile for their practice are thinking about economy as well as utility, the large car is out of the question. What a doctor requires is a neat turnout which will successfully take the place of a horse and carriage, and, at the same time, be less expensive in upkeep, and he will obtain all this in a good two-seated car. Silence of running has not been remarked upon, as every day cars are becoming more silent, manufacturers having realised that silence is one of the essential points of a modern automobile.

A medical man should choose a car with a two-cylinder engine. It will be quieter than a single cylinder, and much steadier running, and, in the rare event of one cylinder failing, there remains the other to take one to his destination. Two systems of ignition are advisable. The popular high-tension from accumulators is nowadays almost perfectly free from trouble, but things do happen, and very often—usually—when least expected, and in the case of a medical man going off to a case of urgency, a derangement in the ignition might mean the death of the patient. We would therefore suggest that the best plan would be to have a magneto high-tension ignition, and the ordinary high-tension to fall back upon if required.

Some doctors advocate the use of two cars, so that they may be sure of one car being in thorough order. This, doubtless, is a good plan, but only open to fairly wealthy men; besides, the plan rather reflects upon the reliability of an automobile. There is absolutely no reason why one car cannot, with decent attention, be kept in thorough working order. A specification is appended which we think gives a fair idea of a doctor's car.

Body.—Two-seated, with platform at back.
Hood, etc.—Removable glass screen and light hood, as explained above.
Gearing.—By spur-wheels. Change speed lever must either be on steering column or set well back at driver's side.
Engine.—Two-cylinder 7-8-h.p.
Ignition.—High-tension magneto, with accumulars in reserve.
Weight.—Approximately eight cwt.
General Remarks.—Details usually overlooked in cars to be carefully attended to. All taps, etc., to be placed in accessible positions.

THE annual outing of the Coventry Motor Fittings Company, Coventry, was held on the 2nd inst., the venue being the White Swan Hotel, Stratford-on-Avon. The weather turned out beautifully fine, and the party, numbering about twenty-five, had a most enjoyable day.

IN February the General Committee of the Motor Union, acting on the suggestion of Mr. Granville Kenyon, resolved that a letter should be sent to the County Council of Kent, drawing their attention to the necessity for a warning board at a dangerous spot on Farnborough Hill. Since that date communications have been received from non-motorists drawing attention to the pace at which drivers of motor-cars descend this hill, unaware of its danger. A further letter was accordingly addressed to the Kent County Council, which has elicited the following reply:—"The place you mention is well known to the County Surveyor, and is one of those on which he recommends the erection of a notice. The whole matter is under consideration, but I have little doubt but that the point in question will be one of those upon which a notice will be placed."

Digitized by Google

SOME USEFUL NOTES.

A THING that is exceedingly hard on the motor is what is known as "knocking." Ordinarily this occurs when the spark is set to occur too early in the stroke for the speed at which the motor is running, and the result is loss of power and excessive wear of the bearings. When the motor is heard to be knocking (and the motorist very easily learns to recognize it) the ignition should be retarded gradually until the point is reached where the knocking ceases. This will give the maximum power of the motor with the charge admitted to the cylinder.

◆ ◆ ◆

KNOCKING may, however, occur from various causes, such as loose flywheels, pre-ignition in one or more cylinders, uneven spacing in the commutating device, loose connecting rod or main bearings. To one accustomed to diagnose a case of "knocks" it is usually possible to detect trouble with the ignition, although the wisest sometimes are led astray.

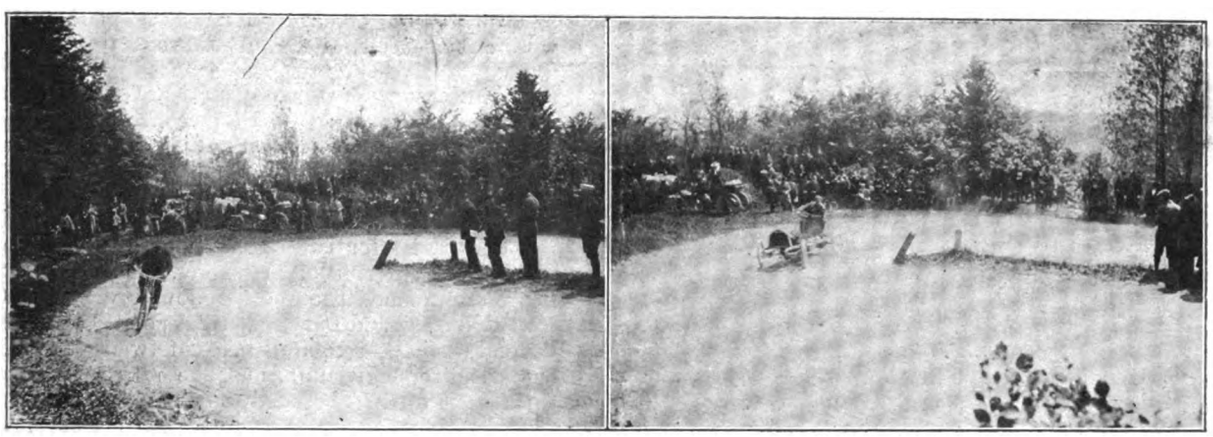
◆ ◆ ◆

WHEN the flywheel is keyed on, no matter whether straight or taper, the key should fill the keyways both on the sides and top and bottom, and care should be taken to see that the keyways are straight, and not slightly "skewed." When satisfied that the flywheel is not loose, turn the engine over slowly by hand, if more than one cylinder, and note at just what position each crank is when the coil begins to vibrate. It is very seldom a two or four cylinder engine will ignite or make contact at exactly 90 degrees, 180 degrees, or 270 degrees, and the smaller the commutator the more the liability of improper and incorrect spacing. In two-cylinder vertical engines using contacts ninety degrees apart, it is much harder to keep the distance accurate on account of excessive wear on one side. Try the ignition advance, taking care to avoid danger of a "kick back." If still unable to localise the trouble, it may be then possible to locate the defective cylinder by stopping out one and two, then one and three, one and four, two and three, two and four, and three and four by holding down the vibrators with the fingers.

◆ ◆ ◆

CAREFULLY examine the connecting rod, crank end, and connections before unscrewing the bolts holding on the caps, and note which, if any, is loose. If this one corresponds to the one that showed trouble when "stopping out," it is reasonable to suppose that you have located the trouble. If, however, the connection is not loose, and when the bolts are unscrewed the upper end seems firm, the only thing to do is to remove the piston. Then the top of the piston, as well as the head, will almost certainly be found to be covered with a reddish deposit of carbon, which becoming incandescent, ignites that particular cylinder in advance of the others, particularly when advancing the spark at low speed. Power is thus expended before the piston gets to its uppermost point, and the result is a strong metallic knock very like that made by a loose connection. The remedy for this condition is to thoroughly clean off this deposit, and to use less cylinder oil, or oil of a thinner consistency and free from impurities.

◆ ◆ ◆



LOOSE connections are much more frequent than they should be, and the causes for such conditions may be usually explained in one of the following ways:—Frequently the cap is not sufficiently stiff to stand the strain on the exhaust stroke, or the bolts may be too far apart. The crankpin may not be parallel with the piston pin, and the result will be that the crankpin bushing will wear bell-mouthed at each end and only get one-half of the bearing it was designed to have. The axis of the cylinder may not be exactly at right angles to the axis of the shaft, and may not be directly over the crankpin as designed. These conditions are not imaginary, for a writer in the "Automobile" states that he has met with them in actual practice.

◆ ◆ ◆

SHOULD these loose connections prove troublesome, the best plan is to have some one who is familiar with steam-engine practice, in case no responsible petrol motor repairer can be found to "line" the engine cylinders, pistons, connecting rods and crankshaft. There is another frequent cause of loose connections. Improperly bored or distorted cylinders will permit leakage of the hot gases past the piston rings, with the result that the oil in the crank-case and bearings is burned up. Distortion to cause such a condition is most likely to happen to cylinders that do not have water circulating completely around them.

◆ ◆ ◆

THERE is one knock in petrol engines entirely distinct from all others that becomes more and more noticeable with use, and unless attended to may cause no end of trouble. It is especially objectionable and annoying, because excessive wear of connecting rod bushings may usually be traced directly to it. Some engineers allow a loose fit, sidewise at the upper or gudgeon pin end of the connecting rod, between the "cheeks" of the piston, relying upon the lower connections to "line" the connecting rod with reference to the gudgeon pin. While this may suffice as long as the gudgeon and crank pins are absolutely parallel, as soon as there is any appreciable wear, the upper end of the rod is liable on the upstroke to be forced to the right or left, and *vice versa* on the down-stroke to the left or right longtitudinally, with a resulting noise which often cannot be located unless one has had previous experience with a similar case. This will result in a "bell-mouthed" wear at both ends of the connecting rod; and, as the bearing will only be on one-half of the bushing, the pressure per square inch of projected area will be twice that for which it was originally designed. The only remedy is absolutely perfect alignment of all working parts.

The Recent Austrian Hill-Climb on the Exelberg—a Sharp Curve on the Course. The right hand picture shows Herr F. Opel, one of the German Gordon Bennett Team, taking the Corner on an Opel-Darracq Car. *[Allgemeine Automobil Zeitung.*

MOTOR CYCLING NEWS.

THE Motor Cycle Union of Ireland commenced a busy July on Saturday with a club run to Enfield, starting from the Gough statue in Phœnix Park, Dublin. To-day (Saturday), there will be a hill-climbing competition on the hill leading from Kilmaconoge to Calary Bog. On the 16th the run will be to Drogheda, starting from Drumcondra. On the 23rd speed trials will be held at Portmarnock. The 30th, a run will be held to Athy, one of the "controls" in the Gordon Bennett race of last year, and a competition, for which prizes are offered, carried through. Then on the 2nd prox. another competition will be held, starting at 8 a.m. from Inchicore Bridge.

◆ ◆ ◆

MESSRS. LAKE AND ELLIOTT, whose handy cycle and motor repairers' tools are well known, have lately brought out an apparatus, illustrated herewith, for withdrawing obstinate driving pulleys from the crank shafts of cycle motors. The method of using the "Millenium" pulley drawer, as it is termed, is very simple and is as follows:—The two semicircular pieces are shaped to fit the grooves in the pulleys, and are held there by the two clamping screws, which are long enough to enable them to take practically every motor-cycle pulley on the market; the large screw is then screwed tightly against the end of the shaft spindle

and forces the pulley off the same without the loss of time or risk of damage which attends the ordinary methods.

◆ ◆ ◆

THE judges in the Auto-Cycle Club's side-slip trials recommend "(1) That the gold medal of the Club be awarded to Mr. Maitland Edwards for his device, and that a gold medal be awarded to the Parsons Non-Skid Company for their device. These are bracketed first. On the roads both devices were entirely satisfactory; on the prepared surface the rider of the machine to which the Edwards cover was fixed showed more confidence in the device, and demonstrated a greater ability to resist skidding, as compared with the Parsons Non-Skid. The Edwards cover affords protection to the tyre, is always in position, and is thus always available for a change of road condition. It gives good protection against side-slip, its wearing properties are good, and it is not liable to disarrangement. It slows the machine, however, and stiffens the cover so as to make the tyre less readily detachable. The Parsons non-skid gives good protection against side-slip. It is quickly applied and detached, and is simple and cheap to repair and maintain. It is light in weight, and it does not appreciably affect the speed of the machine, and it can be carried in small compass if desired. It is subject to rather rapid wear if kept in such use as to make it constantly available, and it affords no protection to the tyre.

◆ ◆ ◆

"THAT a third prize, consisting of a silver medal, be awarded to Mr. Hayes for his device. This serves the additionally useful purpose of a stand or jack. It appears to arrest side slip, although the rider failed to keep his machine upright on the prepared surface. This failure appears to be partly due to the fact that he was riding a strange machine, heavier than that to which he was accustomed, and also to the fact that he suffered from over-confidence, and took the greasy patch with less care and caution than did his competitors. The device is subject to little wear, it is always available at the rider's will, and also absorbs power so long as he is holding it in contact with the road. It is subject to be thrown out of usefulness by an involuntary slackening of back pedalling pressure on the part of the rider.

◆ ◆ ◆

"THAT a fourth prize, consisting of a silver medal, be awarded to the Wilkinson Tyre and Tread Company for their device. This appeared to arrest side slipping, and in the tests on the prepared surface, though the rider fell, it was plainly demonstrated that the tread would, under a less severe test, exert holding power on the ground. It appeared to affect the speed to but a small extent; it does not prolong the life of the tyre, but its wearing properties are satisfactory. It is constantly available, but this naturally increases the cost of maintenance. The device entered by W. and A. Bates, Limited, appeared to be satisfactory under ordinary conditions, but on the prepared surface failed completely. It is made of very good rubber, wears well, and the first cost is small. It is possibly better than other patterns of tread on ordinary surfaces, but on thick greasy mud it is doubtful if it would afford any protection."

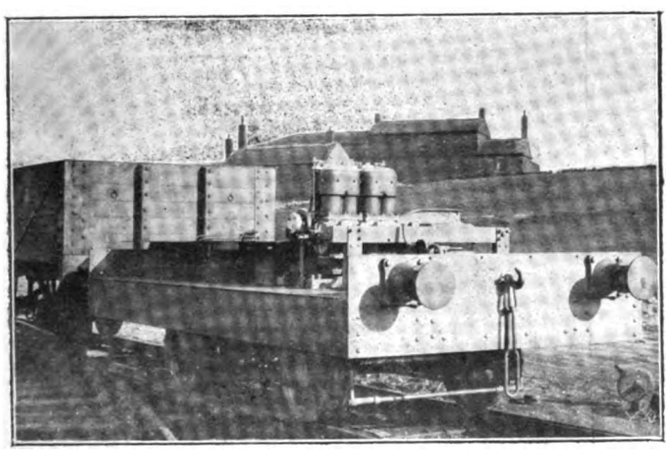
◆ ◆ ◆

THE handbook of the Motor Cycling Club for the current season gives a list of members, the memorandum of association of the club and list of fixtures. In August the Motor Cycle challenge cup for teams of six riders from recognised clubs will be competed for, and in September the most interesting event will be the contest for the Albert Brown trophy.

◆ ◆ ◆

THE accumulators used by Mr. G. P. Mills on his recent record motor-cycle ride were a pair of Peto and Radford's, with semi-solid Peto-Cadett electrolyte. One ran 600 miles and the other completed the journey.

◆ ◆ ◆



ON Saturday last the Motor Cycling Club held its 100-mile reliability trial for two-seated motor-cycles. The competition consisted of two runs of fifty miles, one in the morning and one in the afternoon. The route followed was from Godstone, *via* East Grinstead and Dane Hill, to a point one and a half miles beyond Chailey—a total distance of twenty-five miles. Here a check had to be given up, and the return journey made along the same route. The conditions provided that: (1) The combined weights of driver and passenger must not be less than eighteen stones; the passenger in all cases to be a lady; (3) the machine, fully loaded with petrol, water, and oil for the entire journey, must not exceed four cwt.; (4) no adjustments are allowed, but at the conclusion of the first fifty miles the riders may refil the petrol and oil tanks from supplies carried on the machine; (5) no competitor may cover a less distance than fifteen miles or exceed twenty miles in one hour. Altogether, twenty-one entries were received, of which seventeen started. Of these only five completed the first fifty miles, viz.:—T. Silver (Quadrant tri-car), J. Van Hooydonk (Phœnix Trimo), Densham (Anglian fore-car), Gunn (Lagonda fore-car), and Milligan (Bradbury fore-car). The second fifty miles knocked out Silver, and the committee decided to put into operation a novel test to determine the winner out of the four successful competitors. An out-and-home course of about half a mile each way was chosen near Blindley Heath, with marshals at each 220 yards. At each of these points and at the turn the engine and road wheels of each competing machine had to be brought to a dead stop between two lines ten yards apart. The operation had to be repeated at each point where a marshal was stationed, and the competitor who covered the course in the shortest time was declared the winner, who proved to be J. Van Hooydonk. For second place the committee have to decide between Gunn and Milligan.

MOTORISTS are warned against the police traps on the outskirts of Leeds, and should be extremely careful in the city, as the police are taking vigorous steps against fast driving.

A NEW PETROL LOCOMOTIVE.

THE accompanying illustrations depict a petrol locomotive lately supplied by the Elsworth Automobile Company to the Bradford Dyers' Association for use on their private line. It is to be employed principally for hauling coal from the main line to the works of Messrs. J. Sharpe and Company, Limited. It is built to standard gauge, and to draw a weight of 20 tons up a gradient of 1 in 16. The engine is a four-cylinder one, the cylinders being cast in pairs; each cylinder has a bore and a stroke of 4¾ inches, and when running at a speed of 800 revolutions per minute 30-h.p. is developed. The two inner pistons have an opposite movement to that of the outer ones—that is to say, while the two end pistons are at the top of their stroke the two centre ones are at the bottom. The crank shaft is made in one piece and is provided with a large diameter boss, to which the flywheel is bolted. Mechanically-operated inlet valves are used, these being interchangeable with the exhaust valves. Hardened screw stems are fitted to the ends of the valve plungers, so that the distance between the valve plunger and the valve stem may be kept practically constant. After re-grinding the valves once or twice it is possible for the valve stem to rest on the lifter, thus preventing the exhaust valve fully closing, and resulting in loss of compression and power. By means of the adjustable stem, however, this difficulty is overcome. The locomotive is fitted with two speeds and reverse, the power being transmitted by means of a chain on to a rear live axle. The total weight of the machine is ten tons. Amongst the many advantages which it has over the ordinary steam locomotive is that it is not necessary to keep up steam during the whole of the day on the chance of there being work for it, as some days it will not be used at all, and in case of emergency it is ready for work in half-a-minute, as against a steam locomotive taking twenty minutes to get up steam. We may add that the engines were supplied by the Elsworth Automobile Company, of Bradford, and the cab and frame by Messrs. Knowles and Company. The vehicle is doubly interesting, as in the first place it is the first of its kind in the North of England, and secondly, the whole of the parts were supplied by local firms.

The Locomotive with Cab removed.

The Complete Engine.

THE Lancashire Gas Engine Company send us particulars of an 8-b.h.p. twin-cylinder petrol motor they are now turning out. The engine, which develops 8-h.p. at a speed of 950 revs. per min., and 10-h.p. at 1,200 revs., has cast-iron cylinders 3½-inch bore by 4-inch stroke. The inlet and exhaust valves are mechanically operated and interchangeable. An outside flywheel with ball-thrust bearing to take the end thrust of the clutch is provided, while a governor is mounted on the cam shaft.

FRICTION CLUTCH PROBLEMS.

THERE seems to be a tendency to discard the leather-lined cone clutch integral with the flywheel in favour of the metal to metal type. A very just criticism of the leather-lined clutch is, states an American contemporary, based upon its very sudden and vicious manner of engagement, which not only prevents a gradual and pleasant acceleration of the vehicle but subjects all portions of the mechanism to stresses which are practically of the suddenly applied order, and produce strains unnecessarily severe. While the attempt has been made to eliminate this fault by the use of compound clutches, which provide a preliminary engagement of auxiliary metallic surfaces, just before the leather grips the metal, the expedient has not been generally accepted as practicable. The well-nigh instantaneous engagement of a leather-lined clutch calls for a large amount of stored energy from the flywheel in order to produce the desired vehicle acceleration, and no opportunity is provided for assuming the load in a gradual manner. It must be admitted that the leather-lined clutch is a very serviceable mechanism, exceedingly positive mechanically and subject to hardly any wear.

The metallic clutches which some manufacturers are adopting are designed to allow of a considerable amount of slipping, thus insuring a gradual assumption of the vehicle load by the motor. Furthermore, their design is such that the slip produces very little wear, and they are so constructed that they are in a measure self-adjusting for what little wear takes place.

In order to secure long life in clutches of this type the frictional surfaces must be of very liberal size; so large, in fact, that under no condition shall the specific pressure between them be so high as to force out the oil film which should normally exist between them. If this precaution is neglected and too small surfaces used the metal portions come into too intimate contact and cutting takes place. It is important, too, that the opposed frictional surfaces shall be of properly selected metals and that both members shall not be of the same metal, as the cutting tendency is very pronounced in the latter case. Bronze against cast iron is a very common and successful combination. It is quite probable that if sufficiently good wearing qualities can be obtained in the metal clutches they may exceed in popularity the leather-lined type.

MESSRS. LAMB BROS. AND GARNETT have lately introduced a new sparking plug known as the "L. B. G.," which is of interest to motorists in that it carries with it a guarantee for twelve months. This plug is strongly made, and is insulated by mica. By reason of the special form of sparking points it is claimed to be impossible for the plug to short circuit, and that the flow of electricity cannot leak between the mica discs. Another good point is that no joints or packings enter into its construction.

SOME NEW PUNCTURE PREVENTERS.

OLD cyclists have long recognised that a light chain or wire suspended from a bicycle in such a way that it just hangs on the tyre is a most effective way of withdrawing nails and thorns from the same ere they have an opportunity of puncturing the tyre. For a long time the only device

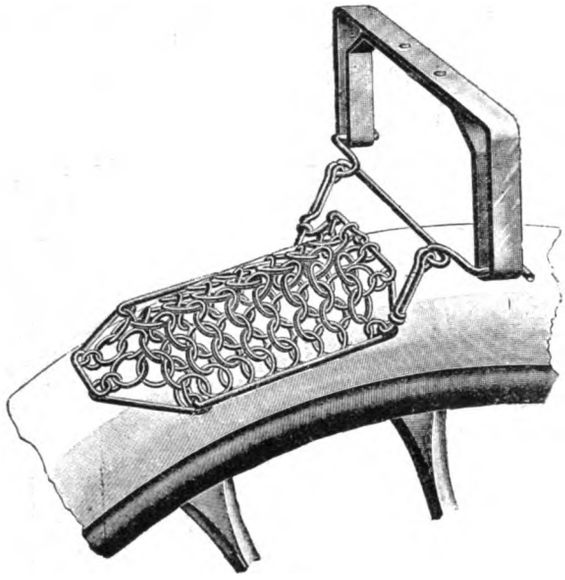

Fig. 1.

of the kind for use on motor-cars was that introduced some years ago by the Michelin Company. Quite recently, however, a number of these useful accessories have been put on the market, three of which we are able to illustrate herewith.

Fig. 1 shows the Bulldog nail and thorn puller for use in connection with pneumatic tyres, recently introduced into this country by Messrs. A. W. Gamage, Limited. As will be seen, the device, which is of French origin, consists of a kind of coat-of-mail held together by a frame of steel wire, and shaped to fit the tyre. In fixing the nail puller, it is necessary to take into account the fact that the wheels of a car spring independently of the frame. It is fixed on the underneath

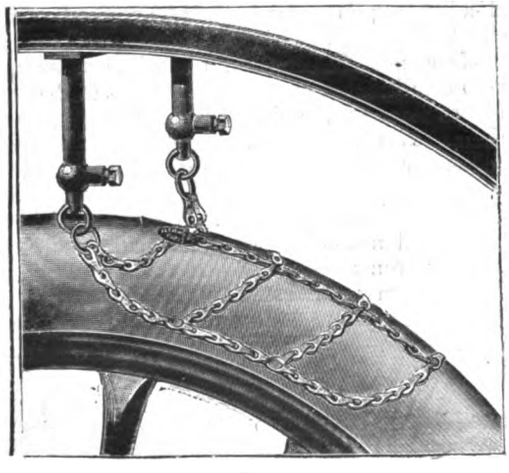

Fig. 2.

part of the mudguard by means of an inverted stirrup, provided with two slots, that allow the stems which hold the extractor to rise and fall with the movement of the wheels. The device can be employed indifferently for either front or back wheels of a motor-car or cycle, and can, it is claimed, be relied upon to withdraw any nails or thorns from the covers ere they have time to puncture the tyre.

Fig. 2 illustrates the "Tigre" nail puller which has recently been brought out by Messrs. Fleming and Company, of Paris. The construction is so clearly shown that no lengthy description is necessary. It may be mentioned, however, that the chains are suspended from pins which can be fixed at any desired position in the supporting bracket, which is itself attached by screws to the underside of the mudguard. The chains are claimed to be unbreakable, and, being of brass, do not rust. Owing to the arrangement of the chains, there are four points at which a nail can be extracted from the tyre, so that should the obstacle get past one point it is almost sure to be caught by one of the others. The "Tigre" can be used on either front or rear wheels, or both, and is made for all sizes of tyres.

The third type of nail catcher that we are able to illustrate hails from Germany, and, as will be seen from Fig. 3, a series of U-shaped pieces of wire take the place of the chains. The device is known as the Triumph, and is made by Herr Emil Deutgen, of the Drahtfabrik, Duren, Rheinland. The wires, which rest lightly on the tyre, are pivoted to a cross-piece, which in turn is bolted to the mudguard. It is made for both the front and rear wheels of motor-cars for various sizes of tyres, while another pattern on similar lines is being manufactured for use on motor-cycles.

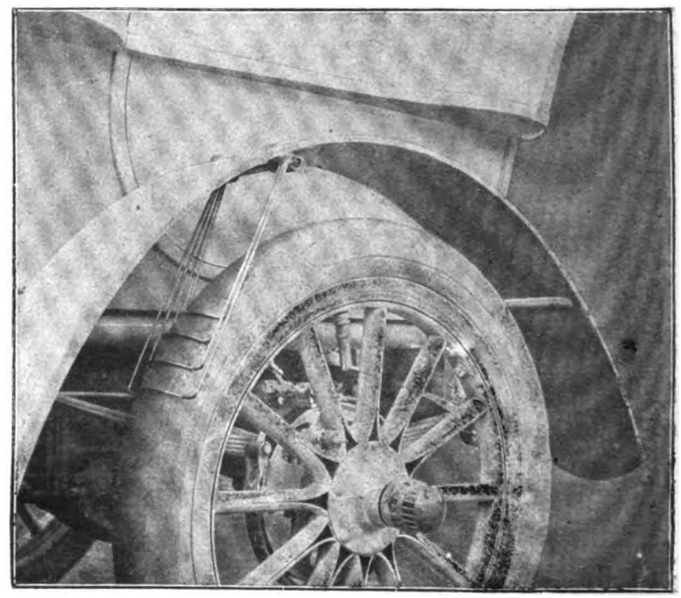

Fig. 3.

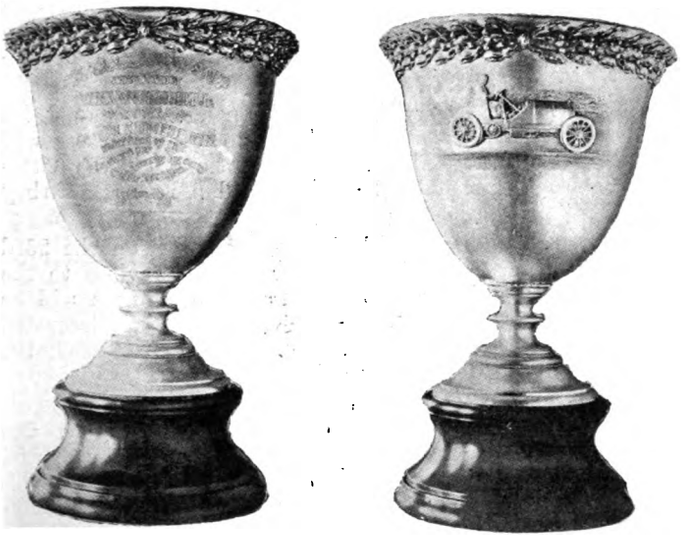
All the devices illustrated have been proved in practice to be most effective in preventing nails and thorns penetrating the outer cover and puncturing the inner tubes, and as they are not very costly, we anticipate seeing the tyres of large numbers of motor-cars fitted with some form of nail-catcher such as are referred to above at an early date.

ACCORDING to official figures 289 licences for automobiles have been issued so far this year in the province of Ontario, Canada. This is an increase of 109 over the total number of permits issued last year.



THE U.S. Government has just purchased two 20-h.p. Winton cars for the use of the Signal Corps. One car is to have a body capable of carrying six passengers, together with a full set of telegraph instruments and tools necessary in repairing telegraph wires.

FROM the Lowestoft Town Committee comes an interesting booklet dealing with the charms of Lowestoft, both inland and on the coast. The illustrations of villages in the locality should do something to induce motorists to pay a visit to this well-known health resort when in East Anglia.

HERE AND THERE.

FRONT and rear views of the trophy presented to the American Automobile Association by Mr. W. K. Vanderbilt, Jr., for an international 300-mile road race, are shown in the accompanying illustrations. The cup is a magnificent specimen of the silversmith's art. On one side, in strong relief, is shown a car in racing trim, standing on the sand of a broad beach, with

an ocean surf in the background. On the opposite side of the cup is the following inscription. "Presented by W. K. Vanderbilt, Jr., to the American Automobile Association, under deed of gift, to be raced for yearly by cars under 1,000 kilos." The cup is about two and a half feet in height and eighteen inches across the top.

THE Kaiser is reported to have ordered a new 40-h.p. Mercedes car since the Gordon Bennett race.

AN electrical trolley-omnibus service is being established between Vörde, Melspe, and Gevelsberg, Germany.

BARNEY OLDFIELD has again severed his connection with the Winton Company, and will in future drive racing cars for the Peerless Company, of Cleveland, U.S.A.

A NEW garage has been opened in Panmure Street, Brechin, by Mr. J. W. Fawns. He has facilities for the charging of accumulators, and undertakes repairs to any class of automobile.

MESSRS. R. A. LISTER AND COMPANY, LIMITED, have just completed in the Station Road, Gloucester, an extensive garage in charge of a skilled motor engineer who will undertake repairs. Petrol, etc., will be stocked.

DURING the recent races at Ascot the whole of the route in the neighbourhood of the course was sprinkled with a 10 per cent. solution of Westrumite, with the result that, despite the heavy traffic caused by the races, the dust was most effectually laid.

THE employees and office staff of the Doherty Motor Accessories Company, Limited, Coventry, journeyed in brakes to Stratford-on-Avon last Saturday on the occasion of their annual picnic. After dinner the company dispersed to indulge in boating and other recreations. A smoking concert was held in the evening, at which Mr. W. H. Doherty presided.

THE Great Western Railway Company's motor-car service between Slough Station and Beaconsfield has proved a great success, and it was officially announced at Slough that the company will now run a frequent service of motor-cars from Slough Station through Eton to Windsor and back. This service will place Eton in direct communication with the Great Western main line.

MR. W. CORNWALL, of the Pioneer Cycle Company, has opened a garage at 141, Hertford Road, Edmonton.

THE parks of Edinburgh are to be mown with one of Messrs. Ransomes, Simms and Jeffries' motor grass mowers.

THE Cudell motor-car works at Aix-la-Chapelle were destroyed by fire a few days ago. Over twenty complete cars were burnt and valuable working drawings lost.

THE Marquis of Londonderry, K.G., has accepted the office of vice-presidency of the Automobile Mutual Protection Association. The other vice presidents are Sir David L. Salomons, Bart., Lt.-Col. R. E. Crompton, C.B., and Mr. Charles Cordingley.

A MOTORIST has been fined at Bow Street (London) police court for using a motor-car in St. James' Park for the purpose of instructing a man how to drive. His pupil was fined 20s. and 2s. costs for exceeding the regulation speed and 10s. and 2s. costs for driving a motor without a licence.

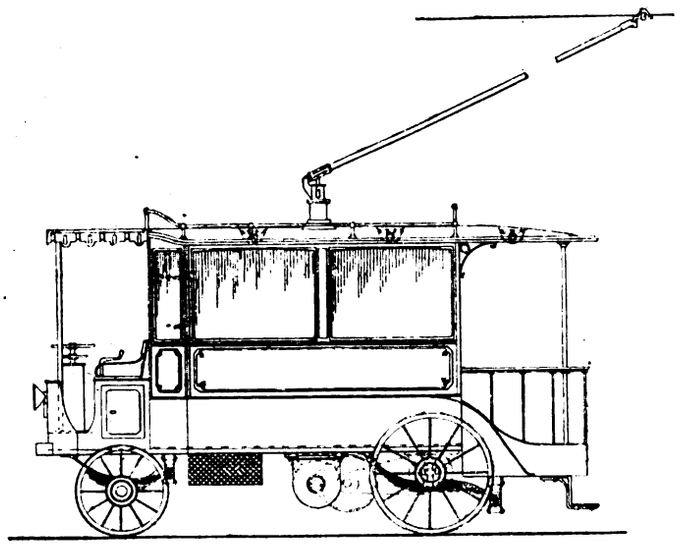
MESSRS. S. BOWLEY AND SON have found it necessary to designate the grades of their motor spirit by such distinctive brands as will not likely be confounded with those of other makes. The two grades which they are distilling will in future be known as "Special" and "Express." The former will give the user the benefit of four to five miles an hour more than the latter, which has taken the place of "A" grade, but is slightly superior in quality.

MESSRS. J. W. BROOKE AND COMPANY, LIMITED, have lately been constructing for Mr. Arthur Robinson, well known as the inventor of the Robinson expanding shaft governor, a set of spring wheels for use on motor-cars. The Arthur Robinson patent compensated spring wheels, as they are known, have recently been tried on a Brooke car weighing 22 cwt. over very varying and hilly roads, and have given very satisfactory results. In fact, Mr. Maudsley Brooke informs us that the claim of Mr. Robinson that his wheel is the mechanical equivalent to pneumatic tyres is more than likely to prove correct.

THE New Motor Face Shield Company is bringing out a new device for motorists the name of which is sufficiently indi-

cated in the title of the concern. The lower part of the shield is secured to the waist by means of a belt, and a rest is also provided to prevent it coming in contact with the hat. It affords ample protection from wind and dust, being of mica in a polished wood frame, and can be used without requiring the use of the hands. The shield can be seen in the show rooms of Messrs. A. Dunhill, Limited.

Digitized by Google



THE Durham County Motor Transit Company, Limited, has been registered with a capital of £4,000. The first directors are Messrs. R. Clark, J. Hoden, J. T. Taylor, T. Raine, and J. G. Shaw, and the registered office is 22, Cheapside, Spennymoor, Durham.

THE East Central district of Scotland is dealt with in Messrs. A. and C. Black's new guide, edited by Mr. G. E. Mitton. This series of Guides, with their large and numerous district maps, is already well known, and the present volume is written in a style that should well sustain the reputation of the series.

FROM the Locomobile Company of Great Britain, Limited, comes a copy of the 1904 catalogue of Spyker cars, which gives illustrations of several types, together with views of the motor, carburettor, etc. We may add that the Spyker cars are made in three sizes—14-h.p., 20-h.p., and 25-h.p.

ARISING out of the successful parade of motor-vans and wagons held on the Thames Embankment on April 30th, the Committee of the Motor Van and Wagon Users' Association have voted a sum of £5 to the police in recognition of the great assistance they rendered on that occasion.

THE charming village of Bidford-on-Avon now possesses greater attraction for motorists in the fact that petrol and sundries can be obtained at the garage which is being erected at the foot of the bridge, where repairs will also be carried out. Motorists will be supplied at any time of the day or night.

Elevation of the Schiemann Electrical Omnibus. (See page 407.)

MESSRS. G. T. RICHES AND COMPANY are introducing an improved form of the special sparking plug designed for use in connection with the Eisemann high-tension magneto ignition, the new pattern being so arranged that there is little likelihood of its becoming fouled. A new terminal for ignition wires, known as the "Amac," is another of Messrs. Ritchie's latest specialities.

MESSRS. METHUEN AND COMPANY have issued a new work on English Architecture, written by Mr. T. D. Atkinson, and illustrated with a large number of drawings mainly by the author. A useful glossary of terms, a chronological list of buildings, and a copious index add to the value of the volume, which will be read with interest by all to whom the historic buildings of our country appeal.

FROM the Touring Club of Italy comes a copy of its 1904 handbook, a work which, although printed in Italian, will be found of great use by British motorists visiting Italy. It includes a directory of the leading towns and villages, the names of the hotels, petrol depots and motor repairers being set against each. The T.C.I. is also issuing a series of well-got-up railway handbooks, those to hand describing the journey by rail from Milan to Bologna, Verona, and Turin respectively, illustrations being given of the principal places *en route*.

THE industrial motor vehicle competition which the French Automobile Club is organising has been postponed from August to October next.

A FIVE-TON Yorkshire steam wagon was exhibited at the Leicestershire County Agricultural Show by Messrs. Arthur Studd and Company, Limited, the Leicestershire and Northamptonshire agents for this vehicle.

THE North British Rubber Company, Limited, have issued a booklet giving a list of the agents from whom Clincher-Michelin covers, tubes, etc., can be obtained. It is accompanied by a map showing all the cities and towns where the agents of the company are located.

AUTOMOBILISTS who wish to test the non-slipping qualities of Edwards' Patent Bands will be pleased to hear that these will be sent on approval under certain conditions by the Otto-Bennett Motor Company, 8, Snow Hill, London, E.C., and if they do not fulfil expectations, can be returned.

A MOTOR gymkhana will be held at Harrogate on the 23rd inst., and will commence with a motor parade previous to the lifeboat procession. Prizes to the value of 10 guineas will be given for the best decorated car, and also for the best undecorated car, and second prizes will be given. After the procession the gymkhana will be held on the football ground.

ON Saturday last the annual outing of the Wolseley Tool and Motor-Car Company's employees was held, about 600 members of the office and works staffs travelling by special train to Llandudno. The sports meeting in connection with this outing has been postponed till Saturday, the 16th inst., when the various events will be contested on the private testing track attached to the works.

THE Stern-Sonneborn Oil Company forward a price list of the "Sternoline" and "Sternol" lubricating specialities. These include Autosternol oil for air-cooled cylinders and other varieties for water-cooled cylinders and the bearings of motor-cars. Occentoline, 800 F. oil, has an unusually high flash point and fire test, retaining its viscosity to a great degree at very high temperatures. Gearoline, Sternoline, and similar specialities also find mention in the pamphlet.

MEMBERS of the automobile clubs of Buffalo and Toronto are trying to bring about an arrangement between the Governments of the United States and Canada which will tend to facilitate the passage of motor-cars from one country into the other. At present the laws in either country require that a fourth of the total value of a car must be deposited with the customs officers. It is intended that a special foreign touring certificate and the guarantee of the respective clubs take the place of the present deposit system.

MR. R. DAVIDSON, of Colombo, Ceylon, who recently imported a 10-h.p. Beaufort car, has lately completed a successful trip to Nuwara Eliya. Starting on the morning of the 14th May at 5.30 p.m. from Colombo, he drove his car via the Gunigatenne Gap and through Dimbula and Nanuoya to Nuwara Eliya without a hitch of any sort. Nuwara Eliya was reached at 5.30 p.m., which, considering that he started at sea level and had reached 6,200 feet above the sea, must be considered no mean feat. Mr. Davidson describes the condition of the roads in some parts as atrocious, especially a little distance out of Colombo, where the road was axle deep in mud. The following morning, after taking a few friends for a tour round Nuwara Eliya, Mr. Davidson started on his return journey to Kandy, via Ramboda Pass. Some of the corners at the zigzags on the pass were so sharp as to necessitate the car being backed occasionally, but no difficulty was experienced with bullock carts, and the only complaint that Mr. Davidson has to make is as regards the large number of stray cattle to be found on the roads. Reaching Kandy in the afternoon a halt was made there for the night, and at 5.15 the next morning Mr. Davidson and his companions left for Colombo by the old Kandy road, which was reached in exactly five hours. Altogether the tour of 240 miles is considered the most successful from a motoring point of view so far accomplished in Ceylon.

CORRESPONDENCE.

TOURING IN IRELAND.

To the Editor of *The Motor-Car Journal.*

Sir,—I was interested in the letter of your correspondent in issue of the 18th ult., which has just reached me—being on tour in Ireland. I have found that, with one or two exceptions, Irish hotel charges for very indifferent accommodation are excessive. As, for instance, at an hotel in Malahide, seven miles from Dublin by road (a very bad one), and directly on the main line of railway to the north, soda water is 6d. per bottle. At an hotel in Bray, ten miles from Dublin, also directly connected by rail, the charge is 1s. 6d. for whisky and soda, and 2s. 6d. for chop for lunch. At Kingstown I was charged 9s. for cut from the joint and some cheese for two. and they could not give me anything off the "grill," having none! Having suffered under this for some time, we now carry our lunch, etc., with us in a luncheon basket, which has paid for itself over and over again within the last six weeks, to say nothing of being quite independent. The north of Ireland I found fairly reasonable. The tourist, especially motoring ones, should avoid the so-called tourist hotels. Keep to main roads, and when putting up at any place, settle the charges before accepting the "thirst for blood" the Irish innkeeper has for the motor-car. If I tour in Ireland again I will camp out, the Irish farmer being a delightful person, and only too glad to help in any way. In two cases where we were hung up (tyre troubles), we had lunch at a farmhouse, ham, eggs, and beer, clean and nice, and they refused to accept any charge for same—in fact, we were treated so well, that on my return I sent a small present to the mistress of the farm, and I have just had a letter thanking me and saying they appreciated it all the more as they did not expect it.—Yours truly,

K 125.

AUTOMOBILE TOURING.

To the Editor of *The Motor-Car Journal.*

Sir,—Referring to the short article on this subject in the last issue of the *Journal*, I have frequently noticed that some motorists get through a tour in the most comfortable and enjoyable way, while others manage to spoil their journey for themselves or others, or both. The two indispensable qualifications are tact and contrivance. One tactful person doing everything in the right way at the right time, picking up valuable bits of information from those he comes in contact with, having the faculty of securing a comfortable room at a hotel, and the like, in fact, brings enjoyment into a journey when the opposite sort of person would spoil it entirely. Happily for the whole party if the host possess this priceless disposition, for he will impart it also to his guests. The other part is contrivance—the useful faculty, for one thing, of taking along what will be needed and leaving the rest at home. Experience teaches how much to take, and what, if any, to have sent on. A good bump of contrivance, aided by common sense, will bring hope out of calamity at very short notice. The item of luggage is only a part of it, as all the arrangements from day to day need the same happy frame of mind and spirit to carry them through with the largest amount of pleasure. One must learn to be his own mechanic as well as his own driver—at times at least. As a matter of experience, the breakdown rarely happens within easy distance of a well-equipped repair shop, but almost invariably halfway on the road to or from Nowhere. The right sort of knowledge, backed up by the ability to put it into practice in an emergency, means additional comfort and money saved on a tour. The intelligent use of a motor-car for distance work on the road—which means getting the most out of it at the least expense of care and labour and without injury to the vehicle—calls for more than a familiarity with routes and road rules, or even a close study of books of instruction in care and management.—Your truly,

Munchausen.

NON-SKIDDING DEVICES.

To the Editor of *The Motor-Car Journal.*

Sir,—Can you or any of the readers of the *Journal* recommend a reliable non-skidder? I hear that metal plates absorb the power, chains are apt to break, and leather treads with studs do not prevent skidding. During the two years that I have read the *Journal* I do not remember to have seen any device referred to as entirely satisfactory. —Yours truly,

Geo. G. Tucker.

SOLID TYRES.

To the Editor of *The Motor-Car Journal.*

Sir,—Can and will any of the readers of the *Journal* having cars fitted with solid rubber tyres other than "Clincher" give me their experience and opinions of the best to use? I have sacrificed speed and the luxury of pneumatics, but I believe it to be impossible to have suffered greater trouble or danger had I used pneumatics. My greatest annoyance has been owing to the tyre creeping in the rim and flinging out, and the makers say that they cannot do anything to prevent this, notwithstanding that the gears of my car are six, ten, and sixteen miles per hour.—Yours truly,

Chas. Lucas.

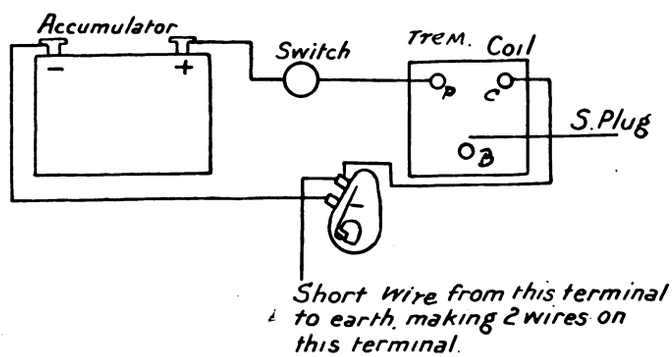
A SUGGESTION REGARDING INDUCTION COILS.

To the Editor of *The Motor-Car Journal.*

Sir,—One of the annoyances of the motor-car repairer is that of the method of wiring up different makes of induction coils for motor-cycles and cars. What with the different methods of coil winding and the variation in the number of terminals, it is frequently impossible to say which is the high tension terminal and whether positive or negative. The reason of all this trouble is that there is no recognised rule for marking the terminals of induction coils. One maker uses one kind of denomination and another maker another. The matter is further complicated owing to the fact that the continental makers of coils mark many of the terminals by initials, not of the names of the windings of the coil but of the continental names of the parts on the machines to which they have to be connected up. This makes it difficult, u less one is acquainted with practically all the coils on the market, to prescribe in cases where only the initials on the terminals are given as a guide. A lot of time and trouble would be spared if makers of coils could get together and decide upon a standard nomenclature for the different terminals of the coils.—Yours truly,

F. W. R.

ACCUMULATOR AND TREMBLER COIL.



To the Editor of *The Motor-Car Journal.*

Sir,—Will any of your readers tell me if I can get a trembler coil to work well with my present trembler and cam with a V piece cut out, or must I make a wipe contact? I have an 8-h.p. single cylinder Darracq car. I have had great trouble in starting the engine, and I have just discovered the cause. When the connecting plug was pushed in the end came against a nut on the dashboard and caused a short circuit.

How often should the engine have a charge of oil? I purchased a little book of wrinkles which stated that the engine should have a full charge every quarter of an hour. I use a lot of oil and get misfires and dirty plugs.—Yours truly,

First Car.

[We take it that the form of contact breaker with the V slot is of the De Dion type. If this is so, it is quite possible to connect this to the

trembler coil with good results. The connections will be clearly seen from the accompanying sketch. With regard to the quantity of oil required, this is undoubtedly too much, and we should advise the quantity to be lessened to half to commence with, or even to less if this is found to still give trouble.]

HITCHON'S PATENT TRANSMISSION GEAR.

To the Editor of *The Motor-Car Journal.*

Sir,—Having seen the above at the Motor Car Exhibition, but not being personally acquainted with anyone who has used same, I would thank you very much to let me know through the columns of the *Journal* as to whether any of your numerous readers have used the gear, also the advantages and disadvantages of the same. I am rather taken with the gear, but I should like further particulars before adopting it.—Yours truly,

J. Stennett.

KNOCKING IN THE ENGINE.

To the Editor of *The Motor-Car Journal.*

Sir,—The engine of my double-cylinder car has developed a knock which I cannot locate, and I venture to invoke the aid of the readers of the *Journal*. It sounds just as if the crank shaft bearings were loose, and is not the click or knock that is heard from advancing the ignition too far. The noise comes from both cylinders. I have had the engine to pieces, and found the piston rings and crank shaft bearings in excellent condition. The engine runs with perfect regularity, has full power, and never misses an explosion. The valves have been carefully ground, and new springs put on the stems, of the same strength, as nearly as I could determine Both cylinders register 65 lbs. pressure each, and hold it. By carefu' adjustment of the ignition and mixture the engine can be made to run so you can scarcely hear it, and this with full load and with any of the speeds! But let the accelerator be opened, or a slight rise in the road be met, and the humping will commence alarmingly. Even when the knock occurs

Digitized by Google

the engine works with regularity, and there is no difference in the sound of the escaping discharge. Everything sounds perfectly normal with this extra noise added, and sometimes I am inclined to think it must be outside the engine. The car has three speeds forward, sliding gear transmission, and bevel gear drive, and the noise is not only heard, but the knock felt in the machine. There are no explosions in the silencer, and the engine never overheats.—Yours truly,

PUZZLED NOVOCASTRIAN.

A USEFUL CRADLE AND TURN-TABLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your readers may be interested in the accompanying photograph of Webb's cradle and turn-table. The picture shows a 10-h.p.

Georges Richard sufficiently raised in front to enable under work, rendering the use of a pit unnecessary. The cradle takes to pieces in a minute or can be left up in the stable and the car run on to it by its own power.—Yours truly,

R. H. TETLEY.

CLEANING OUT SILENCERS.—"Sparking Gap" writes:—"Can any reader suggest a way to clean out a silencer without removing it? I have one that is hard to get off and take to pieces."

CUTS IN TYRES.—In answer to a recent correspondent, Messrs. R. Lord and Company, of Blackburn, write that they supply a rubber amalgam specially intended for filling up small cuts in the outer covers of motor tyres.

FUEL CONSUMPTION OF MOTOR-WAGON.—Several readers of the *Journal* have written to point out an obvious error in our Comment last week referring to the trial of a Yorkshire steam-wagon. The consumption of coke on the twenty-one mile run was, of course, 156 lbs. The distance was covered in three hours, gradients up to 1 in 12 being taken on the high gear.

PETROL AT HARWICH.—"H. R. G." writes:—"I would warn motorists to replenish their petrol tank before going near Harwich, as the only agent stocking petrol refused to supply me after dark or on Sunday."

THE STANLEY STEAM CAR.—In reply to the Baroness de Reuter, full particulars of the Stanley steam car can be obtained from Mr. F. Wilkinson, Princes Chambers, John Dalton Street, Manchester.

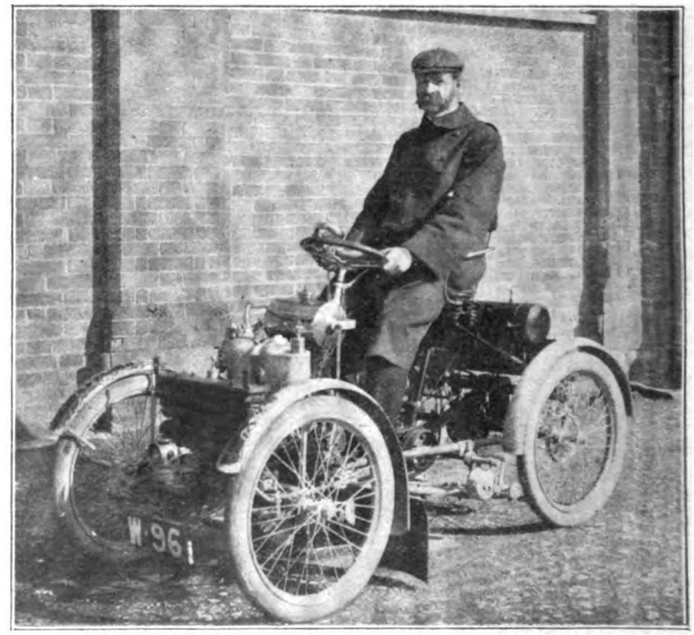
MAGNETO IGNITION.—S. L. Hollis writes:—"I should be very much obliged if you could give me information about a good book dealing with the magneto ignition for motors. Where could such a book be obtained and what would be the price?"

SOLID TYRES.—T. E. Henderson writes:—"Will any of your readers explain why solid tyres reduce the speed of a car? Is it the extra weight of the rubber, or want of elasticity?"

CLUBS AND ASSOCIATIONS.

NOTTINGHAM.

THE committee of the Nottingham Club have awarded the Foster silver challenge cup to Mr. C. Evinson, who drove a 8½-h.p. Humber. Mr. R. M. Wright, Lincoln, 9-11-h.p. Clement, is placed second. Both earned full marks, but the lower price and power of the former gained premier position. The Clement was rather faster on the hill, and was second fastest on the whole run. A photograph of the winner was published on page 400 of last week's issue.



LINCOLNSHIRE.

THE following officials of the Lincolnshire Automobile Club attended a committee meeting at headquarters, the Saracen's Head Hotel, Lincoln, on the afternoon of Friday, the 1st inst.:—Sir Hickman Bacon, Bart. (president), Mr. C. W. Pennell, J.P. (vice-president), Capt. J. A. Cole, J.P., Mr. W. R. Pennell, Capt. Newsum, Mr. Cyril Nelson (the hon. solicitor), and Dr. K. H. Cragg (the hon. sec.). Capt. Cole (chairman of the Administrative Committee) presided. The secretary reported that the secretary of the Lincolnshire Agricultural Show had acceded to their request for an enclosure for members' cars at their annual exhibition at Great Grimsby during the middle of July, and provision would be made accordingly.

An invitation for a joint run with the newly-formed Northamptonshire A.C. to a convenient place in the southern part of Lincolnshire was accepted, and the secretary was instructed to fix the date some time towards the end of the season, and suggest that Stamford would be a suitable meeting-place.

The following gentlemen were elected to membership of the Club:—Mr. Hugh Peacock (Gretford Hall), Mr. Thomas Ives (Lincoln), Capt. E. Tatchell (Grantham), and Mr. F. H. Atkinson, M.D. (Grimsby). Others proposed for election were Mr. H. Marshall (Gainsboro'), Mr. A. Robinson (Grimsby), Dr. Sharpley (Kirton-in-Lindsey), and Mr. Gent (Gainsborough).

Had Saturday's weather held fine, instead of being a succession of heavy storms, there would have been a very notable muster of motors at the Hop Pole Inn, Ollerton, Sherwood Forest, Dukeries, on the occasion of the united meet of the Sheffield and Lincolnshire clubs. As it was twenty cars were driven over and the occupants had a pleasant time, particularly as the evening turned out very fine. The district is a most beautiful one, and the roads are always good. The cars were placed in the covered yard of the inn during tea, but afterwards were put in the large open space outside, and an imposing row was made up. Those participating in the meet included Mr. and Mrs. J. H. Pickford and Mr. C. H. Pickford, Sheffield, 10-h.p. Wolseley; Mr. and Mrs. E. H. Coupe, Mr. Clark and Mr. Hobson, Sheffield, 24-h.p. Darracq; Mr. and Mrs. C. W. Pennell, Lincoln, 22-h.p. Martini; Mr. C. D. Leng, Sheffield, and Dr. Bell, London, 10-h.p. White steamer; Capt. S. A. Cole, J.P., Roxholme (Chairman Lincs. A.C.), 14-h.p. Durkop; Mr. and Mrs. F. Churchill, Mr. F. B. Cawood (hon. sec. Sheffield A.C.) and Mrs. Cawood and Mr. G. F. Flather, 14-h.p. Hallamshire; Dr. P. and Mrs. Sharp, Brant Broughton, 12-h.p. Richardson; Capt. H. E. Newsum, Capt. Bradwell and Mr. J. R. Richardson, Lincoln, and Mr. Stevenson, London, 18-20-h.p. Richardson; Mr. Living and Mrs. J. R. Richardson, 12 h.p. Richardson; Mr T. Danage, Sheffield, 10-h.p. Duryea; Mr, Mrs. and Miss Tomlinson, Sleaford, and Mr. E. Cragg, M.D. (hon. sec. Lincs. A. C.), 8-h.p. Bardon; Mr. G., Mrs. and Miss Garnett, Gainsboro', 8-h.p. M.M.C.; Mr. Ellin, Mr. Oates and Mr. Halliwell, Sheffield, 8-h.p. M.M.C.; Mr. and Mrs. Jecock, Gainsboro', 8-h.p. Dennis; Mr.

Mr. Blyde, of Sheffield, on his converted Quad, at the joint meet of the Sheffield and Lincolnshire Clubs at Ollerton. The machine has wheel steering, water-cooled engine, and change speed gear.

Churchill, Mr. Kirkham, Sheffield, 6-h.p. De Dion; and Mr. and Mrs Clark, Sheffield, 6½-h.p. Gladiator.

YORKSHIRE.

POT BANK, a hill in the form of the letter S, about two miles from Harrogate, was the scene of the hill-climbing trial of the Yorkshire Automobile Club. The course was half a mile in length, the gradients varying every few yards. Starting from the bridge over the Oak beck the road rose for a distance of 41 yards at an angle of 1 in 41. At

Digitized by Google

this point the first curve was encountered, the road turning round to the left at an inclination of 1 in 10 for 140 yards up to the second curve, which turned sharply round to the right, and for 82 yards had a gradient of 1 in 7. This was on the outside of the curve, while inside the gradient was something like 1 in 4 or 1 in 5. Just round the corner there was a run of 190 yards at a gradient of 1 in 9·5, and then a straight run to the finish, with 161 yards at 1 in 16, 193 yards at 1 in 24, at 73 yards at 1 in 43.

Early in the morning Mr. A. W. Dougill, of Leeds, the hon. sec. of the club, with a party of helpers, made the arrangements for telephoning

The Yorkshire Automobile Club's Hill-Climb at Pot Bank — Mr. S Kirk on his 24-h.p. De Dietrich Car.

Photo by [*Bacon and Sons.*

from start to finish and for timing the cars. Mr. Borland's electrical timing gear was brought into service. In this the breaking of the thread at the starting point liberates a lever which, through electrical communication, sets going a stop-watch at the other end of the course, and in like manner, when the rider snaps the thread on passing the finishing post, the watch is immediately stopped, and the time can thus be taken to the fifth of a second. Mr. F. J. Borland, of Leeds, and Mr. H. A. Jones, of Bradford, were the official timekeepers; Mr. George Blackburn, of Leeds, was the starter; Mr. W. Penrose Green, of Leeds, and Mr. J. Chippendale, of Harrogate, were the marshals; and the general arrangements were carried out under the direction of Mr. Dougill. The results of the trials cannot be ascertained for some time. The times made do not alone govern the results, which are regulated by a system in which the weight of the car and passengers, the cubic capacity of the cylinders, and the time taken in ascending the hill are the prime factors. Altogether about twenty cars entered for the event and half a dozen motor-cycles, but of these only seventeen cars and two cycles competed, the results being as follows:—

Owner.	h.p.	Make of Car.	Time. M. S.
1. A. Farnell, Bradford ...	28	Daimler	1 13 2-5
2. S. Kirk, Leeds	24	De Dietrich	1 39 2-5
3. E. E. Broadbent, Bradford	16	Celtic	2 4 1-5
4. H. Johnson, Harrogate ...	16	Wolseley	2 6 1-5
5. H. Johnson, Harrogate ...	22	Napier	2 12 3-5
6. B. Bagshawe, Leeds ...	15	Napier	2 21 4-5
7. J. W. Smith, Leeds ...	12-14	Argyll...	2 26 2-5
8. H. Johnson, Harrogate ...	12	Wolseley	2 30
9. Williamson, Leeds ...	14	Clement	2 31 3-5
10. T. H. S. Atkinson, Leeds	11	Talbot	2 41 2-5
11. E. H. Hepper, Leeds ...	15-20	Belsize	3 7 1-5

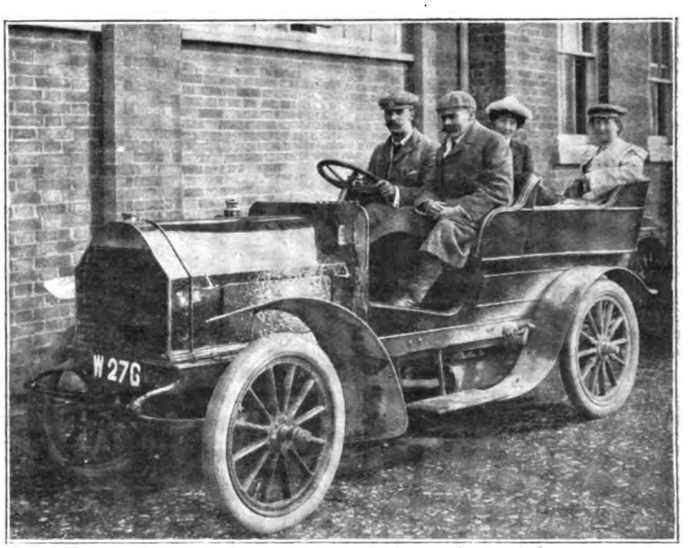
SCOTTISH.

THE Western Section of the Scottish Automobile Club are not holding a run to Mauchline, to-day as previously arranged. On the 23rd inst. they will hold a meet at Philiphaugh, Selkirk, on the invitation of Mr. W. S. Steel, who has also invited the Eastern Section of the club to partake of his hospitality.

MANCHESTER.



ON Saturday last the members of the Manchester Automobile Club, by the kind invitation of Mr. Roger C. Parr, one of the members, paid a visit to Grappenhall, Heyes, near Warrington, a mansion which stands in a park of about 120 acres. The members arrived at intervals from three to four o'clock; afternoon tea was served in the house. During the afternoon the members and their friends wandered round the ornamental grounds and inspected the conservatories and orchid houses. There were in all twenty-five cars and about ninety passengers.

READING.

ON Sunday the members of the club and their friends were entertained by Mr. J. Montgomerie Napier. Mr. Napier received his guests at Roselawn, his beautiful riverside residence, and, after enjoying a chat on the lawn upon motor topics generally, the party was conducted to a steam launch provided by Mr. Napier, and the trip up the river was greatly enjoyed. The beautiful scenery of the Thames Valley is now looking at its best, and presents a much better appearance when viewed from the river than from the dusty highways. Luncheon was served on board, and tea was provided at a river-side inn at Clifton Hampden. The return journey was completed about 8.30 p.m., and, after bidding adieu to their genial and hospitable host, the guests set out for home by automobiles. Those present included Mr. and Mrs. C. H. Dodd, Dr. and Mrs. A. C. Major, Mr. and Mrs. Tabor, Mr. and Mrs. J. V. Moinet, Dr. J. Hopkins-Walters, Dr. Truman. Dr. Deane, Mr. W. H. Phelps, Mr. Walters, jun., Mr. A. E. Newton (Hon. Sec.) and Mrs. Newton.

LADIES' AUTOMOBILE CLUB.

THURSDAY of last week was a busy day with the Ladies' Automobile Club. The annual general meeting was held at Claridge's Hotel, with Lady Edward Spencer Churchill in the chair, when the report presented referred to the recent progress. During the six months that the club's headquarters were at the Hans Crescent Hotel the membership increased from 130 to 219 members. In April the club moved into its present quarters at Claridge's Hotel, and since that time seventy-nine new members have joined, making a total of 298 members. On the 20th April, at an extraordinary general meeting of members, the Duchess of Sutherland was elected president and the executive committee was empowered to elect a fourth vice-president. This they have since done, and Lady Edward Spencer Churchill has consented to act in this capacity. While the club was at the Hans Crescent Hotel the vice-presidents invited the members to a biograph tea and the club accepted the hospitality of Mr. Cordingley at his Automobile Exhibition at the Agricultural Hall. On the 9th June, the first meet of the club was held in Waterloo Place, the cars afterwards proceeding *via* Pall Mall, the Mall, Buckingham Palace, where the King and Queen watched them pass, to Hyde Park and Ranelagh. Following the meeting was a biograph tea, when several scenes from the Gordon Bennett race were shown with evident approval from the ladies present, who included Lady Cecil Scott Montagu, Lady Beatrice Rawson, Lady Edward Spencer Churchill, Lady Margaret Jenkins, Lady Colvile, Baroness Campbell Von Laurentz, Lady Hartopp, Lady Salomons, Mrs. Bruce Porter, Hon. Mary Portman, Mrs. Lindsay Lloyd, Mrs. Wilson Noble, Hon. Mrs. Charles Forester, Mrs. J. Biddulph Martin, Miss Pilcher, Mrs. Mark Mayhew, Mrs. T. B. Browne, Mrs. Douglas Hall, Mrs. Chas. E. Shaw, Miss Goldney, Mrs. Gerard Leigh, Mrs. Elliot, Mrs. Piggott, Mrs. Carpenter Rowe, Mrs. Montefiore, Mrs. Gunston, Miss G. Wilson, Mrs. Richardson, Mrs. R. W. Buttemer, Mrs. Stracy Clitherow, Mrs. Roget, and Miss d'Esterre-Hughes.

The Joint Meet of the Sheffield and Lincolnshire Clubs at Ollerton.—Mr. F. Churchill on his 14-h.p. Hallamshire Car: seated at his side is Mr. F. B. Cawood, Hon. Secretary of the Sheffield Club

On Monday twenty-four members and friends of the Club were entertained by one of the members, Mrs. Herbert Lloyd, at her home, Coombe Farm, Addington, Surrey. Among those present were Mrs. Gerard Leigh, Miss Cristabel Browne, Mrs. Foyster Bowen, Mrs. Copland, Miss Eastwood, Mrs. S. F. Edge, Mrs. Edmunds, Mrs. and Miss Hartung, Miss Violet Stubbs, Mr. and Mrs. Wilson Noble, Mrs. Piggott, Miss Jackson, Nurse Parker, Mr. and Mrs. Studley, the Misses Evans and the Misses Parker, Miss Violet Needham, and Miss d'Esterre-Hughes (secretary).

MORE APPEALS ALLOWED.

AT the Trinity Quarter Sessions for Oxfordshire, before Sir W. R. Anson, Bart., M.P., Mr. Richard H. Demuth, of Court Barton, Creech St. Michael, near Taunton, appealed against a conviction under the Motor Act, 1903, by the justices of the Wootton North Petty Sessional Division, sitting at Deddington, by whom he was fined £5 and costs. Mr. F. E. Weatherly (of the Western Circuit), and Mr. Cecil Walsh (of the Oxford Circuit), instructed by Messrs. Poole and Boulting, solicitors, Taunton, appeared for the appellant, and the respondents were not represented. Mr. Weatherly asked the Court to quash the conviction, which was under Section 1 of the Motor Act. The appeal was upon the merits and also upon a point of law, but having regard to the fact that the respondents did not appear, he asked Quarter Sessions to quash the conviction on the ground that the respondents had not appeared, without going into any question of merit or law at all. The case of the Queen against Purdey made it clear that where the respondents did not appear it was the duty of Quarter Sessions to quash the conviction without any more ado. In that case the Recorder had quashed a conviction, and the question before the Court was whether the Recorder was right in quashing the conviction because of the non-appearance of the respondents. Chief Justice Cockburn said: "In the ordinary course of practice at Quarter Sessions, where an appeal against a conviction is heard, the necessity is thrown upon the person who had appeared as prosecutor to make out such a case as would sustain the prosecution, and if no one appears to sustain it, it becomes the duty of the court to give effect to the appeal and quash the conviction upon the presumption that the prosecutor is unable to support the conviction, inasmuch as he does not appear to do so." They had given notice of appeal on the merits, and, of course, they had safeguarded themselves also by giving a ground of appeal on a question of law. His submission was they need not go any further, inasmuch as the respondents had not appeared. The appeal was a re-hearing, and the respondents were in the position of prosecutors. The position was this—here was a prosecution in which the prosecutor was not present, and they had to do in Quarter Sessions what they would do in Petty Sessions, dismiss the charge. On the authority of the Queen v. Purdey they should quash the conviction. The Chairman said there could be no doubt, under the circumstances, the appeal must be allowed. An appeal being in the nature of a re-hearing, as there was no case offered by the police, who were the original prosecutors in the matter, there was nothing for the court to deal with. The case, therefore, fell to the ground, and the conviction would be quashed. Mr. Weatherly said he wished to mention a new point. Upon a conviction under this Act the licence of the person convicted had to be endorsed, and the licence of Mr. Demuth was endorsed. He thought he was entitled to have that endorsement expunged; it was only a consistent conclusion of the decision of the Bench. The Chairman said the licence would go back to the Petty Sessions to be expunged. Mr. Weatherly remarked that he had one other application, and that was with regard to costs. He asked them to say that in the circumstances they ought to allow such reasonable costs as their clerk or taxing master thought fit. Of course, it would only be against the police, and not against the Justices. He concluded there was in Oxfordshire a fund—it would not come out of the pockets of the police inspector—to meet cases of this sort, and he very strongly urged that costs ought to be allowed. The Chairman, after consultation with the magistrates, said the Bench was clearly of opinion that reasonable costs ought to be allowed—the same to be taxed out of Court by the Clerk of the Peace before the adjourned Sessions on July 23rd next.

AT the Surrey County Quarter Sessions, held at Kingston-on-Thames on Friday, the 1st inst., before a bench presided over by Sir William Vincent, an appeal by Mr. William Mosenthal, of 38a, Porchester Terrace, W., was heard. Mr. Mosenthal was summoned before the Kingston bench on the 26th May last for driving a motor-car upon Pains Hill Bridge at a speed which was dangerous to the public. The police gave evidence to the effect that Mr. Mosenthal, on Sunday, May 15th, at 12.40 p.m., drove a large motor-car in the direction of Ripley at an excessive rate, and in their opinion dangerous to the public. They also gave evidence that there were a number of people and cyclists on the bridge and that the car was going at a speed of twenty-five miles an hour. Mr. Mosenthal, on the other hand, said he was proceeding along the road at about eight to twelve miles an hour; there was no traffic on the road at all; he pulled up in about twelve paces, and could not have done so if it had been going over twenty miles an hour. But, notwithstanding this evidence, the Bench convicted him and fined him £5, and, in addition, endorsed his licence. On the appeal Mr. Lushington appeared for the respondents, Mr. Horace Avory, K.C. (with him Mr. A. Moresby White, instructed by Mr. Staplee Firth) appeared for Mr. Mosenthal. Mr. Avory, in addressing the Bench, pointed out that the justices must take into consideration the whole of the circumstances of the case before arriving at any decision, and impressed upon them that it was no offence under Section 1 of the Motor Car Act, 1903, to drive at excessive speed unless there was positive evidence to prove danger; he also urged upon the Bench that the important question was, what were the special circumstances in this case which would make the speed dangerous, and in speaking of the evidence for the respondents, he said it was absolutely impossible for the witnesses to tell the speed of the car when they only saw it for a distance of about 100 yards. Mr. W. Mosenthal bore out his evidence given at the police court, and two cyclists, who were on the bridge at the time, gave evidence to the effect that they were not, nor was anybody, endangered. The Bench retired, and after long deliberation returned to court, when the Chairman said the Bench had decided to allow the appeal, and the endorsement on Mr. Mosenthal's licence was ordered to be erased.

MR. VICKERS, of Cadogan Square, W., was summoned by the Andover police for motoring at a speed which was dangerous to the public, and convicted. He appealed to the Quarter Sessions held at Winchester, being represented by Mr. G. F. Mortimer, instructed by Mr. Staplee Firth. The appeal was allowed, the conviction was quashed, and the endorsement on the licence was ordered to be cancelled.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Lewes	Driving unregistered car	10s., etc.
Lincoln	Driving without licence	12s. 6d., etc.
Northwich	Furious driving	£5.
Gainsboro'	No light on motor-bicycle	£1, etc.
Worthing	Excessive speed	£4.
Birmingham	Negligent driving	40s.*
Bow St. (London)	Above 10 miles an hour in St. James's Park (several cases)	20s., etc.
Blofield	Driving recklessly	£4, etc.
Worcester	,, ,,	20s. etc.
Nottingham	,, ,,	20s.
Birmingham	,, ,,	40s.*
Norwich	Not keeping motor-cycle on right side of road	10s., etc.
Bodmin	Driving recklessly	5s.
Bromley (Kent)	Driving to common danger	40s., etc.
Dublin	Using a false number	£5, etc.
,,	Failing to produce licence	40s., etc.

Southampton	Dangerous speed	40s., etc.
Lewes	Driving unregistered car	10s., etc.
Stratford	Driving without licence	10s., etc.
Saxmundham	Exceeding legal speed	20s., etc.

* Notice of appeal given.

POLICE TRAPS.

THERE is a measured quarter of a mile just north of Findon (Sussex).

A POLICE trap is in operation in Moortown Village, near Leeds. The Harrogate road from Leeds *via* Harewood is being patrolled and car and cycle numbers are being taken. The trap is one that works both ways, and is from the Chained Bull Hotel to a point about 250 yards above Moortown Church.

ON the London road, Hook, is a measured distance of 220 yards.

CASES DISMISSED.

AT the Huddersfield Borough Police Court Charles Mitchell, Chapel Hill, was summoned for driving a motor-car in Woodhead Road, on the 8th ult., at a speed exceeding twenty miles an hour. Inspector Taylor, who timed the defendant over a measured quarter of a mile, said that he covered the distance in 31 sec., equal to 29 miles 56 yards per hour. There was no evidence of corroboration as to the speed, and Mr. F. A. Reed, who appeared for the defendant, said that there was no case to answer. This contention was accepted by the Bench, and the summons was dismissed, as was also a summons against the defendant for not having a car registered.

THOS. W. BUSH, of Hammersmith, was summoned at Chertsey for recklessly driving a motor-car at Weybridge, on June 15th. An Egham groom said he was in Bridge Road on a bicycle when the motor, going at a rate of twenty miles an hour, struck the back wheel of his bicycle, and knocked witness off insensible. Defendant said the complainant lost his pedals as he came from Balfour Road into Bridge Road. The fact was that the bicycle was going so fast that he could not stop it and ran into the wheel of the motor. A gentleman who was in the car corroborated this, and the case was dismissed.

MR. A. R. POAT, of Grosvenor Square, W., was summoned at Epsom on Monday for motoring at an excessive speed. He was defended by Mr. G. F. Mortimer, instructed by Mr. Staplee Firth. The prosecution failed to establish the fact that anybody was endangered and the case was dismissed.

AT Watford, on Tuesday, Henry Wilkinson, chauffeur to Mr. J. B. Joel, Grosvenor Square, London, was charged with driving a motor-car to the common danger on June 18th. Mr. Staplee Firth defended. The police evidence was that the defendant was travelling at twenty-six miles an hour down Clay Hill, Bushey. The defendant said his speed was fifteen miles an hour. Mrs. Joel, who, with Mr. Joel, was in the car, gave corroborative evidence, and contradicted the constable's statement that he was in plain clothes. The constable (recalled) said he had made a mistake. The Bench dismissed the case.

THE

Motor-Car Journal

VOL. VI.] LONDON, SATURDAY, JULY 16, 1904. [No. 280.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

LARGE numbers of foreign motor-cars continue to be imported into this country, the number last month being returned at 581, of a value of £248,579. Parts were responsible for £46,733, bringing up the total for June to £295,312, as against £252,345 in the preceding month and £258,578 in June, 1903. So far this year, that is to say, for the first six months, the imports stand at £1,267,830, or approximately £203,000 more than in the same period of last year. Passing now to the exports of British automobile productions, the returns are somewhat disappointing, only 27 vehicles being shipped last month, these with the "parts" being valued at £16,300. For the six months ending with June the exports are, however, returned at £139,930, or roundly £7,100 more than in the corresponding six months of 1903.

◆ ◆ ◆

A False Police Trap.

MR. ALBERT G. STERN has performed a useful service to his fellow motorists in drawing attention to the fact that a police trap on the Braywick road, between Windsor and Maidenhead, had been incorrectly measured. It appears that towards the end of last month, while driving from the Royal borough, he was stopped by a police-sergeant and two constables for attaining a speed of twenty-six miles an hour on his motor-car. He was informed by the police that he had covered the 220 yards at this rate, and, feeling certain that a mistake had been made, Mr. Stern procured a tape measure and measured the distance in the presence of the sergeant and his two constables. There was no doubt that the distance was only 202 instead of 220 yards. Nevertheless a summons was issued, and Mr. Stern was preparing to defend the case, when he received an apology from Major Poulton, the chief constable of Berkshire, and also a note to the effect that the summons had been withdrawn.

◆ ◆ ◆

Carry a Tape.

MAJOR POULTON says that the police were under the impression that the distance was correct, but, on its being subsequently measured, Mr. Stern's measurement was found to be accurate. In view of the large number of cases where the measured distance has been used to convict motorists, we would suggest that some grave errors of justice have doubtless taken place, for we cannot believe that this particular instance is merely an isolated one. It would appear that motorists must now add a tape measure to the other equipments of their cars in order to verify or otherwise the measured distances along which the police take the times.

Motor Ambulances.

IN a speech in London, a few days ago, Sir William Collins, the chairman of the Education Committee of the London County Council, urged the immediate necessity of an up-to-date ambulance system for London, where, he said, 10,000 street accidents were annually attended to by the police, who were not equipped with the means of transporting patients to hospitals with the speed with which they ought to be conveyed. At the time of the last Motor Car Exhibition at the Agricultural Hall some members of the Metropolitan Asylums Board were making diligent inquiries as to the possibility of a motor ambulance for the conveyance of patients from one or other of the institutions of that authority to other places, but little has been heard of the proposal. We trust, however, that the time is not far distant when manufacturers generally will recognise the coming demand for motor ambulances, and such speeches as that of Sir Williams Collins are to be welcomed as preparing public opinion for the innovation.

◆ ◆ ◆

The Motor Union.

IN view of the success of recent appeals from magisterial decisions, and of the good work which has been done in obtaining notice boards and warning signs at various dangerous corners, we trust that there will be no delay on the part of the individual owners of cars in joining the Motor Union. This organisation has undoubtedly justified its existence in the energy with which it is directed, as well as the usefulness of the work it has already done. A great future is ensured for the Union. Its membership is not only influential, but it is widespread, and, so far as Great Britain and Ireland are concerned, it is likely to be of permanent value to the automobile movement.

◆ ◆ ◆

The Recognition of the Road.

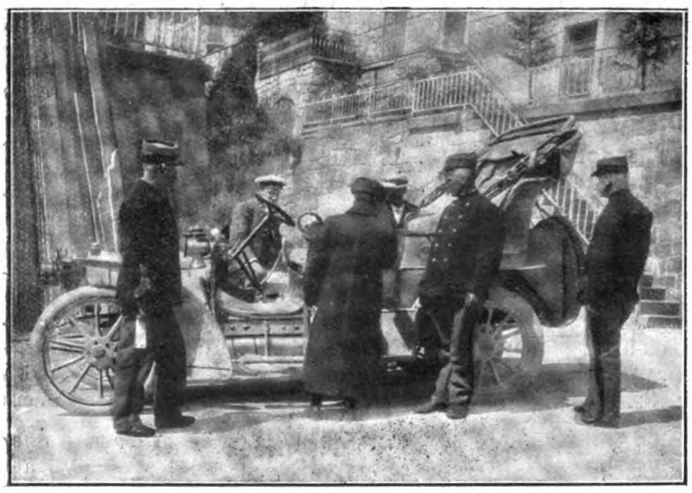
THE education of the people with reference to the road proceeds rapidly, and not only are the local authorities in the country recognising the new factor that has been introduced by the automobile, but the importance of the subject has been impressed upon some of our recent influential visitors. In an interview on the conclusion of his trip through Great Britain, the Alake of Abeokuta expressed himself as having been much impressed by the importance of roads as he had seen them in England, and declared his intention of taking steps to promote extensive road making in his own country. Such a remark, coming into association with his evident delight in motoring, should encourage not a few firms to take an interest in Abeokuta, a country they have hitherto ignored.

◆ ◆ ◆

In Ireland.

NOT only is Abeokuta to be improved in regard to the roads and highways, but, despite the antediluvian wailing of a few shortsighted councils, substantial progress is being made in Ireland. At the quarterly meeting of the Athlone Rural Council, the County Surveyor recommended that a large number of payments to road contractors be deferred as the surface treatment of the roads was not satisfactory. He said the use of

Digitized by Google



motor-cars had become so general, these modes of conveyance called attention to the surface of the roads, and contractors should try and satisfy present day requirements, and not be content with what was a good enough state in the past. The question was whether they could produce that surface which would satisfy the motorist. He feared they could not without greater expense. The thing most necessary in the keeping of a public road was to attend to it more frequently, on the principle that to prevent injury was better than to repair. The Council approved of the action of the County Surveyor.

◆ ◆ ◆

An Australian Run.

POSSIBLY the final run this season of the Automobile Club of Victoria was held on June 4, 5 and 6, the route being that skirting the bay via Mordialloc, Frankstone, Mornington and Schnapper Point to Sorrento. The party, including seven ladies, numbered about thirty; and, although the roads for many miles were under water, and in consequence the other portions were very greasy, no accidents occurred, the trip finishing at the time arranged for. The cars included two 16-h.p. Decauvilles, a 12-h.p. Knowles, a 9-h.p. De Dion, two 6-h.p. De Dions, two 6½-h.p. Humberettes, etc. On the road home a call was made for afternoon tea at Mr. Crooke's, Aspendale Park, where the new track for motor-racing is being prepared by him, mainly for the use of the Club's members, of which he is on the committee. Although only in existence less than six months, the Club has already over 150 members enrolled, the majority of course living in Melbourne and suburbs.

◆ ◆ ◆

Motor-Cycles in War.

AT a meeting at the Royal United Service Institution, Mr. A. Graham Murray, the Secretary of Scotland, has been pointing out that if we had fairly good roads to negotiate the motor-cycle would be of the greatest possible service to the military authorities. At the same meeting Major M'Nalty read a paper on the value of mechanically-propelled vehicles for military purposes, urging that the necessary features about an automobile for military uses were that it should use a heavy and less volatile oil instead of petroleum spirit, should be of a standard pattern, as silent and raising as little dust as possible, should be reliable for hill-climbing and passing over difficult ground, handy to control and easy to repair on the field. When these conditions were complied with the use of motor-cars must obtain serious consideration. A motor-cycle could be maintained at a much less cost than a horse, and its simplicity and rapidity of action were greatly in favour of its use. He mentioned that in the South African war there was a saving of as much as £50,000 by adopting mechanical transport for stores. Writing us with reference to the subject, Colonel W. J. Bosworth says there is no doubt as to the efficiency of many of the machines now in the market for military service, but asks for information as to the tyres available to give reliability to the vehicle while not detracting from the speed.

◆ ◆ ◆

The Use of Oil in Road Making.

WHILE on this subject it may be of interest to note that Mr. Edwin Cannan, M.A., has prepared a report for the Roads Improvement Association, in the course of which he says: — It seems desirable to carry out some further experiments with the object of discovering whether, with the aid of oil, a hard and durable crust can be formed at reasonable expense on the top of a sound macadam road in this country and climate. For the purpose of ascertaining whether oil would lay dust, it was doubtless necessary to experiment on a public road, but that oil will lay dust may now be regarded as abundantly proved. The objections to its use in the simple Farnborough method are (1) the expense, which, at the lowest computation, is more than the whole cost of maintenance of thousands of miles of English roads on which the increase of motors is likely to make dust an intolerable nuisance, and (2) the unsatisfactory effect of the oil in wet weather. In order to discover what we now wish to know, whether oil can be employed usefully and at reasonable expense (taking into account the rise in price which will inevitably result from a large increase of demand), not as a liquid to be sprinkled on the top, but as a material to be inserted in the upper portion of the road surface, it is quite unnecessary and undesirable to make the earlier experiments on a public road and allow fools and children to see half-done work. The earlier experiments can be conducted perfectly well on a very small and inexpensive scale on a private carriage drive or in a timber yard.

◆ ◆ ◆

The Alpine Adventure.

OF the running of trials there is no end, and various, indeed, are the forms that such tests are now taking. It is not so very long ago when a thousand miles trial extended over a week, and many of the competing cars were found extended along the road. Now such a test is regarded with nonchalance by makers, and other factors than merely reaching the destination are taken into account in making the awards. Non-stop runs from Glasgow to London, and others of 2,000 miles and more, have set records for the motorist of the future to go beyond. Now Captain Deasy, having explored Tibet and done other adventurous things, has conquered the Alps on his trusty motor-car and demonstrated anew the possibilities of the man and the motor. For these long rides are equally a tribute to the stamina of the participants as of the reliability of the car that carries them over mountains and across the Continent.

◆ ◆ ◆

Motor-'Buses in the South.

SEVERAL applications have been made to the town council of Worthing with regard to motor'-bus services, and these having been discussed by the General Purposes Committee, the Council has been recommended, "that the several persons who had been making inquiries on the subject of motor-omnibuses should be informed that the Council would offer no objection to the granting of licences to run such vehicles provided the Council's conditions as to speed, routes, and the bye-laws relating to omnibuses plying for hire were complied with." This was seconded and adopted. Replying to an inquiry, the Mayor said every application for licences would come before the Council for approval. Nearer London the movement for motor-'buses makes progress, and petitions are being signed in Farnham, Haslemere, and the districts round, to the London and South-Western Railway Company, asking them to inaugurate a motor-omnibus service between the two towns. The signatories state that the proposed service would link up the two branches of the railway, would traverse many increasing and attractive

Digitized by Google

villages and districts, and bring a large additional traffic to the railway by increasing the facilities of travel. It would also be the means of adding to the number of houses erected, thus lowering the district rates, improving local trade, and extending the fields of employment for local people.

◆ ◆ ◆

The Canine Nuisance.

Dogs are as troublesome as children on the road, and anything that can minimise the nuisance they have become to motorists is to be welcomed. Hence the action of Superintendent Williams, of Welshpool, is to be recommended to the police authorities in other districts. He was travelling on a motor-bicycle when a dog rushed at him, and, catching hold of his leg, nearly brought him to the ground. The result was that he charged the owner with keeping a dangerous dog. At the court the Superintendent said he did not wish to press the charge, but he wanted to demonstrate to the people of the locality that they must keep their dogs under control, a view which the chairman of the magistrates endorsed in making an order that that should be the fate of the offending canine.

◆ ◆ ◆

Keep a Record.

Several traders who have lately been summoned for failing to keep a record of the cars sent out without the general identification mark upon them have pleaded, in extenuation of their offence, that it was only a technical one. This, however, has been worn so thin that it is now of no avail, and traders should certainly, knowing the law, take every precaution to see that it is carried out, unless they wish to involve themselves in considerable unnecessary expense, to say nothing of the worry and unpleasantness of attendance at a police court. The regulations with regard to the use of these traders' marks are so clear and explicit that there really should be no excuse for intelligent persons not carrying out the provisions. We recognise that in some minor details they are irksome, but no good is done by wanton neglect to carry them out.

◆ ◆ ◆

"It's an Ill Wind," etc.

Motorists who have driven along the roads near Skegness will realise how very hazardous they are, being for the most part narrow and extremely twisting and turning and all with deep dykes on either side. A week ago four motorists had a rather memorable experience of these roads. At one of the many double turns, where the road is banked every way, the car, failing to get round properly, gradually slid into the dyke and overturned, throwing three of the four out, luckily clear of the dyke and car, the fourth jumping from the tonneau right over the dyke and barb-wire fence. A passing motor-cyclist brought a gang of men and a derrick and the car was soon lifted out and was able to resume its journey. While the car was being lifted out a man from Wainfleet hastily collected several loads of people in his wagonette, and, at a charge of sixpence each, made money in taking them to see the spill.

The Nice Touring Competition. Some of the Cars at Saint Tropez.

Police Traps Again.

Once more are the police active, and again in Surrey and Sussex. In the former place the venue is Oxshott, Superintendent Marks' district, and the other Henfield, in the notorious West Sussex district. In the latter place, just before an acute right angle turn, the policeman steps out and proudly displays his watch-time, permanent apparently—59 4-5 secs.—the distance half a mile, the other constable being concealed in a shed. The position of this building is such that the two policemen cannot possibly see each other, and the watch carried by the man who stops the motorist is an extraordinary-looking arrangement, costing possibly a few shillings. In Richmond Park, too, nearly all motorists are worried and held up by hidden parkkeepers on foot and horseback and asked if they are aware ten miles is the highest speed they can travel in Royal Parks. These annoyances

Digitized by Google

usually happen in practically unused portions of the Park, and where there is an entire absence of traffic—other than motor-vehicles.

◆ ◆ ◆

A Demonstration with Burst Tyres.

An impression seems to have arisen amongst a section of the public that if a mishap happens to the tyre of a motor-car, a calamity is sure to follow. Such an idea all motorists know is a ridiculous one, and the ever resourceful Mr. S. F. Edge thought that for once and for all the idea should be dispelled. Therefore, he issued invitations to large numbers of the Press to meet him at the Crystal Palace on Tuesday, and between sixty and seventy representative journalists took advantage of the invitation. The programme Mr. S. F. Edge laid out was a severe one, including a touring car going at full speed having two tyres burst on the road, then this touring car to travel with deflated back tyre and to have all four tyres burst. To make the demonstration more convincing, a Napier racing car was brought on the scene, and it was proposed that two tyres should be burst and the same car run again with a tyre loose, with a view to it being run off at full speed, if possible.

◆ ◆ ◆

The Cars pursue their Course.

At the start the trials were somewhat disappointing owing to the difficulty of causing punctures in the Dunlop tyres. Broken glass bottles were freely used, as well as boards with spikes, more than twenty of the latter being scattered about in one instance. Ultimately, however, Mr. Cecil Edge collapsed his tyres, and it was shown that the 15-h.p. Napier did not swerve in the least. Then Mr. S. F. Edge used his racing Napier, collapsing his tyres on two occasions, in each instance the car continuing its steady course. The greatest demonstration of all was his endeavour to shake off a loose deflated tyre. This was found a most troublesome proceeding, and, notwithstanding that Mr. Edge swerved all over the track, with a view to shake the recalcitrant tyre, it was only after several trips that the outer cover came off, travelling thirty or forty miles an hour, and smashing ironwork and innumerable fairy lamp globes. Mr. Edge said he did not know the tyre had come off, and certainly the car maintained its steady course, although it ploughed up the road for some distance. To the pressmen, the demonstration was certainly a most convincing one, and we do not think any of those gentlemen who were present can again indulge in the alarmist writing which is so common a feature of the general press.

◆ ◆ ◆

The Bexhill Meet.

The programme of the Bexhill meet for August Bank Holiday has reached us, and while it is well calculated to arouse popular interest and provide a good entertainment for the day, we should have been better pleased had the names of some of the officials appeared thereon. If Mr. Basil Joy or some other well-known organiser of such events had been responsible for the carrying through of the event more confidence might have been felt in the affair. Perhaps it is not too late for such a suggestion to be carried into effect.

◆ ◆ ◆

Proposed Restriction at Bury.

Mr. E. Pearse Burd, of the Local Government Board, has held his first enquiry in Lancashire with regard to the ten-mile limit. This took place at Bury on Tuesday last, when the Automobile Club and Motor Union were represented by Mr. E. Shrapnell Smith. The North-East Lancashire Club delegated their president, Mr. Wm. Birtwistle, J.P., Blackburn, Mr. Robert Crossley, Clayton-le-Moors, and Mr. S. Briggs-Bury, Accrington. The Manchester A.C. deputed Mr. Victor O'Neil to speak for them, whilst Bolton automobilists had an excellent witness in Mr. H. T. Scowcroft, J.P.; Mr. James Whitehead, son of the late High Sheriff of Lancashire, and Dr. Nuttall, of Clough Street, Bury, spoke for the immediate vicinity. The whole case for the various clubs was controlled and presented by Mr. W. Rees Jeffreys, who was opposed by the Town Clerk of Bury, Mr. Haslam. Only two witnesses were called in support of the application, the Borough Engineer and the Superintendent of Police. The general conclusion of all present was that Bury made out no case, especially in view of the fact that the majority of the streets within the proposed area—a radius of three-quarters of a mile from the Parish Church—are wide and straight.

◆ ◆ ◆

The Southern Roads.

The week-end, as all our readers know, was a warm one, and it was expected that motors would be out in numbers, but the most enthusiastic motorist could never have anticipated such numbers as were seen on the Brighton roads on Sunday last. They were practically in procession, and to the four-cylindered car the two-cylindered cars were a nuisance, occupying the middle of road, and the one-cylindered car owner was an unreasonable object to the former. The give and take of some motorists on public roads is not as it should be, and we are inclined to the opinion that the most inconsiderate users of the roads are the owners of small cars.

◆ ◆ ◆

Visit of French Motorists.

With a dozen De Dion cars between thirty and forty French motorists have arrived in England for a tour in the south, the itinerary being shown in the map published on another page. Landing at Dover on Tuesday morning, they spent a few hours in the town, and then, headed by Mr. J. W. Stocks, made for Hastings, where the first stage of the journey ended. Our friends from across the Straits are having a hearty welcome in the various towns through which they pass, and nothing but pleasant recollections should remain at the conclusion of their trip. The party was entertained by Sir David Salomons at Tunbridge Wells on Wednesday.

Mr. F. F. Wellington has been appointed manager of the British Automobile Commercial Syndicate, Limited, of Long Acre, London, W.C. Mr. D. M. Weigel retains his position on the Board.

In the Marlborough Police Court, Mr. Windsor T. White has been fined 40s. and 2s. costs for trying to drive a motor-car in London in the American way, on the right side of a refuge instead of the left.

Mr. T. W. Holmes, who knocked down and injured with his motor-car four members of the Ravensthorpe Band, was at Dewsbury County Court on Wednesday ordered to pay £65 damages and costs.

Mr. T. Shaw has just driven a 15-h.p. Napier car from London to Dundee *via* Edinburgh, Glasgow, and Perth, a distance of 530 miles, in 24½ hours. From Dundee, Mr. Shaw intended to drive to Inverness and there complete his non-stop run.

The executive committee of the A.C.G.B.I. have adopted a resolution recommending that permits for non-stop runs or trials should not be granted to newspapers or private individuals, a view with which we are in entire sympathy. This recommendation is to be considered at a special meeting of the club committee.

The Wilton-Cox Device Company are now prepared to appoint agencies in Great Britain and Ireland for the sale of their bands. In Mr. Weigel's recent run one tyre was defective, notwithstanding which it ran about 900 miles before it was worn out. When he replaced it with another cover which had not the Wilton-Cox device, it had a puncture at once. He replaced this cover again in London by another fitted with the device and had the same result as with the other three covers which were fitted with the bands, that is to say, on all the tyres fitted with the bands there was not a single puncture in the whole 2,017 miles run.

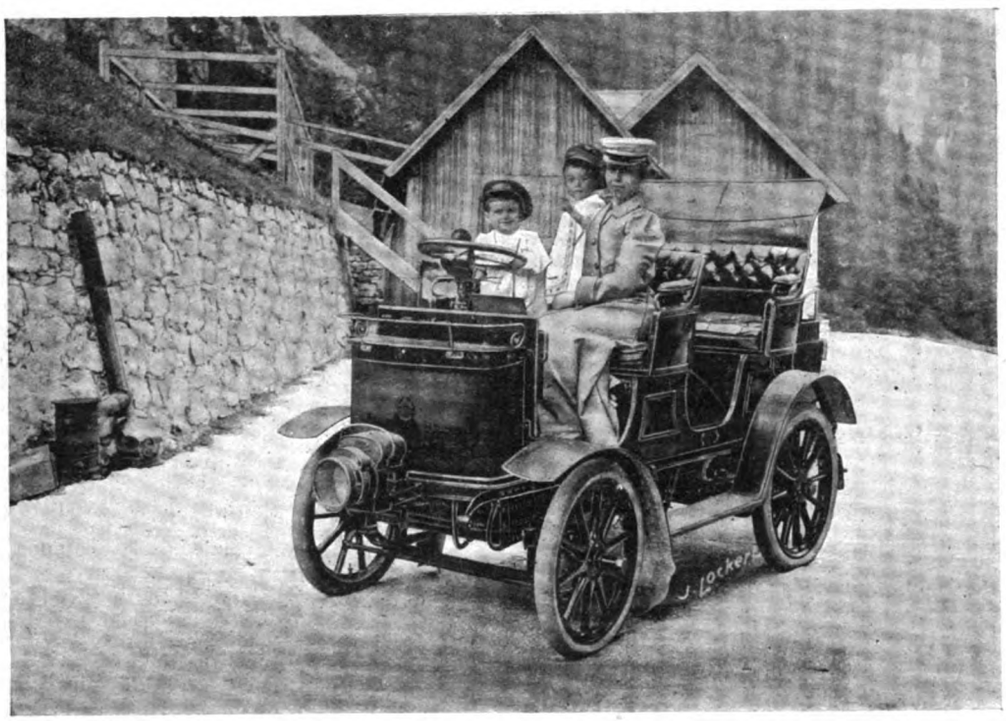
SEASIDE SERVICES.



A FEW summers ago, at one of the East coast seaside resorts, a motor-car was wont to rush about the place in a wayward and grunting fashion. Ever and anon it would come to a standstill, to be immediately surrounded by a group of curious sightseers anxious to gaze upon the spectacle, but uncomplimentary in their remarks as to its appearance. And then the perfume! It encouraged those whose noses had a tendency to turn upwards to undoubted movement in a skyward direction. When the vehicle was coaxed again into a panting movement and set out upon its journey as though in pain, people stood back upon the pavement and wondered as the mud-bespattered, dowdy car plied for hire among those who had gone to the place for pleasure, not for a doubtful recreation.

In fact, the seaside motor-car of a few years ago was a kind of outcast among automobiles — a veritable roadside tramp that threatened to vibrate its passengers into certain opposition. Things are now righting themselves, however, and the law of the survival of the fittest applied to automobilism is evinced in the elimination of the unfit. That wretched, weary, wanton motor-car no longer disports itself on the sea front, to the alarm of the visitors and the amused indignation of the residents.

Our southern coast is developing an interest in motor-vehicles that shows an enterprise as great as that which animated railway magnates in the early days of the train. Eastbourne's municipality has made a great advance, and the vigour with which it has carried out its motor-'bus programme has incited other local bodies into a spirit of inquiry. At Folkestone and Sandgate private enterprise has provided the people with good automobile services, and at Hastings equally satisfactory provision has been made. Bournemouth has well-known public motor-cars; motor-'buses cannot long be delayed in that district. And at Torquay, where hilly roads have been a trial of strength for the motors, 'buses without horses have carried thousands of passengers with prospect of great success. Brighton, too, is not ignorant of automobile service, and during the present summer no town of any importance is likely to be without its service of motor vehicles.

On the other coasts inquiries are afoot and whisperings of projected services at the leading resorts are frequently to hand. Those interested in such developments must consider the essentials of success before actually embarking in operations. Only good types of vehicles must be selected, and here recent experience in the towns already named will be useful. Care must be paid to the condition in which the vehicles are sent out for their daily runs. There must be no slovenliness, and the cars must be thoroughly cleaned and overhauled each day. Drivers of neat appearance must be found and everything done with a view of ingratiating the service in public favour.

Then a fixed tariff and time table must be established and rigidly adhered to. This is a factor of success which was entirely wanting in the earlier services. Now that the vehicles have so much improved that reliable time keeping can be practically guaranteed, there should be no difficulty in running the cars or 'buses absolutely to time. It is an important consideration. The time table should be made known in the locality, so that new visitors need not waste opportunities for taking trips to adjacent places.

A Young Driver of a Serpollet Steam Car. [*Le Chaufeur.*

Projectors of public services at the seaside should not imagine that the novelty of the motor-car will be its seaside justification. The sense of innovation has largely disappeared, and people now use motor-cars because of their convenience, not because they are new means of conveyance. Hence the necessity of securing reliable, steady drivers as well as cars with similar points of commendation. With bold advertisement, accurate running to time tables and economy in garage expenses there should be good profit for small syndicates locally financed at any of our seaside resorts. Such ventures can have the benefit of the experience of the successful services now running in the South, and also the assurance of public favour which has been liberally given to well-organised fleets of automobiles.

THE Tractor Machinists, Limited, has been registered with a capital of £10,000 to carry on the business of iron and steel founders, makers of motors and motor engines for carriages. The first directors are Messrs. H. Oviatt, R. Heywood, and J. S. Cropper, and the registered office is at 30, Fleet Street, E.C.

FIRST ACROSS THE ALPS.

BY ONE OF THE PARTY.

TO climb and climb for 185,755 feet among the Alps in fifteen days. Such was the self-set problem. The accomplishment was even quicker, despite the fact that no fewer than 3,011 kilometres had to be covered up hill and down dale to find the hills to climb. The journey from Neuchatel through Switzerland, Italy and France over thirty-four of the highest mountain passes in Europe and countless climbs back to Geneva was made in 12½ days on the road on a 16-20-h.p. Martini car driven in turns by Captain H. H. P. Deasy, who ascended the mountain railway to the summit of the Rochers de Naye last October, and Monsieur Max de Martini, the winner of this year's Rochet-Schneider Cup; the other occupants of the car being M. Georges Prade, whose place was taken during part of the time by M. Alphonse Steimes, of the "Auto," and Mr. H. Massac Buist.

The story of the first mountaineering tour ever planned to be undertaken by motor-car is one of unqualified success from start to finish. We never knew what it was to worry about the car. When the inner man had been attended to and we desired to resume the road the tanks were filled with more petrol, lubrication was looked at, and we were away. Even punctures were unknown, a triumph for the Continental tyres. It is the general belief, of course, that almost any road you care to take on the Continent is incomparably better than our English highways, but the notion is a fallacy pure and simple. For instance, take those wonderful straight and level stretches leading into and out of stately, suffocating Turin. They were planned and built by the greatest road-makers the world has ever known; but, alas! the Cæsars and their vassals are no longer responsible for their upkeep. Of course we expected rough surfaces among the mountain passes, for we were first across two, or rather the second turned out to be a pass only existing on Taride's route map, after we had mounted for 18½ kilometres over an extremely dangerous and difficult mule track. This was along the Col du Charvin, which is reached by way of Valloire and skirting St. Jean de Maurienne. In many cases, too, we found that we were the second across. Even without waiting to be told by the map that certain routes we proposed to travel were impracticable, or by the natives that they had only seen one other motor-car on those heights before, and that nothing like so large a vehicle, there were always mute truth-tellers ahead of us to indicate the fact; for we invariably found that in parts where motor-cars were unknown mongrels were every now and again suddenly appearing immediately in front of our bonnet. But they did not bark or jump from one side to another, instead they put their tails between their legs and scampered ahead along the very middle of the track until sheer exhaustion drove them into the first means of refuge that presented itself.

But to the story of the climb. As is pretty widely known by now, the great feat of the tour was the passing over the Forclaz, a dangerous and forbidden passage 6,496 feet high on the Tete-Noir route from Martiny to Chamonix, a distance of twenty-five miles across the Swiss-French frontier. To have taken it under the most favourable weather conditions and with the car having a short instead of an extended wheel-base would have been sport enough for the intrepid. As it was, however, there had been rain within a few hours of our setting forth, and the length of the heavily-weighted car was more than half as long again as that of any mule-drawn vehicle taken over the pass. But we were anxious not to be delayed in our tour. So we agreed to pay the burliest of the local guides a sum of 100 francs.

It was fourteen minutes past four in the morning when the five of us mounted the car, and, with all our luggage on board, stole quietly out of Martiny in the opposite direction from that we designed to pursue. We had not gone a couple of miles when the ascent proper began. Almost from the beginning the path pursued a serpentine course, the average coils by which the track almost doubled on itself being at distances of from 50 to 100 yards, with the gradient steepest at the most difficult parts of the turns. the average rise from Martiny to the summit being 1 in 6½. Moreover, where the road was not treacherous with the wet it was rendered dangerous by the presence of patches laid with large round loose stones that went hurtling down into the precipitous depths below as the driving wheels span round in the vain endeavour to get a grip. The bends were so abrupt that many of them could not be taken without backing and advancing the car three or four times in both directions, there being only a yard to move in either to the rear or forward, and the surface of the track getting worse and worse with each passage, so that side-slips were often felt. Many measurements of our outer wheel tracks were taken, when we found that it had been no uncommon thing for us to pass within a foot of the very verge of a sheer drop into space, the narrowest margin measured being 3½ inches. Yet, for all our trouble, we reached the summit in an hour from the start.

But there was no time to spare, for the descent was, in the guide's opinion, more dangerous than the climbing up, and there was the "douane" to be passed before the officials were up. The turnings proved to be at longer intervals, but they were more dangerous, because at those parts, as elsewhere, the track, instead of being banked up, sloped away towards the unguarded edge, while all the way down those in the car had the great mountain towering over them on the one side, and on the other space until the eye lit on depths hundreds of feet below. A moment's giddiness or loss of nerve would have brought us to the bottom in record time. Happily for us Captain Deasy has been bred a mountaineer from the days of his wanderings and explorations in Tibet and about Central Asia, while Max de Martini was born among the heights where he has spent his life. So in the place of a swift descent we went down considerably slower than we climbed up. The "douanier" was not on duty when we passed his abode, but the sound of our coming had awakened him, and the sight of his astonished face as he thrust his unkempt head out of the window and rubbed his eyes hard to assure himself that he was not dreaming made us laugh loud and long. At Vallersine telegraph office, where we drew up for the first time, the innkeeper could not conceive that we had really come from Martiny, despite the fact that he knew full well we had not passed him at any time in the opposite direction, that there was but the one way over the mountains, and that the chief of the guides was with us to tell the tale. The fame of the exploit preceeded us wherever we went.

If that was the most difficult achievement from the sporting point of view, there were others almost equally trying as far as physical endurance was concerned. We have wandered high and low in three countries, but if you are to climb 185,775 ft. you must also go down, no mountain of that height being yet discovered on the earth's surface. Hence we sought sea-level at Nice, which was practically a deserted town owing to the summer heat, and a few hours later were up above the snow-line, glad of every available wrap and a bout of snowballing to keep the circulation going. Desp te all precautions we were seized one after the other with internal chills that made motoring anything but pleasant and the mere thought of food impossible. For all that the trip was thoroughly enjoyable, the only regret in connection with it being that we had not six or eight weeks instead of a few days in which to do it.

THE Collier Tyre Company, Limited, are removing from 210, Shaftesbury Avenne, to 127, 128, 129 and 130, Long Acre, London, W.C., where they hope to be installed in a fortnight's time.

ACCORDING to a report from the Highways Committee presented to the London County Council on Tuesday the clerk of the Council had from June 18 to July 2 registered 149 motor-cars and ninety-one motor-cycles, making the total number of cars and cycles registered up to the last-named date 3,768 and 2,697 respectively. The clerk had also issued during the same period 371 licences to drive motor-cars or cycles, and general identification marks for motor-cars had been assigned to three manufacturers or dealers.

THE "BAKER" CHANGE SPEED GEAR.

THE planetary type of change speed gear, so largely used by American motor-car builders, have hitherto received but little attention at the hands of European designers. Messrs. Joseph Baker and Sons, Limited, of Willesden Junction, have, however, been devoting their attention to this type of gear, and exhibited an example of the same at the Motor Car Exhibition at the Agricultural Hall, and of which we are now able to give the illustrations in Figs. 1 to 4. The standard gear, as shown in the reproduction, is for three speeds forward and one reverse motion, the reductions arranged being at present 3 to 1, 5 to 1 and 10 to 1, *i.e.*, on the fast speed the engine will be going three revolutions to one revolution of the road wheels on the car. The gear can of course be arranged for any speeds, the ratios naturally varying for different power cars.

There is only one lever necessary to change the speed, and it is impossible to do anything to injure the gear in speed changing; furthermore, the teeth of the gear wheels are always in mesh. There is also no clutch, the gear being free in between each different speed, the brake bands, as will be seen from the illustrations, practically forming a separate friction clutch for each different speed.

The gear runs in oil and the changing of speed is effected without shock; the brake bands before mentioned, which are tightened up gradually by means of cams worked by the single change-speed lever, slip slightly when they are being put in, thus avoiding any sudden load being put on to the teeth in the gear. This slipping action is also utilised when driving in traffic, and enables the driver to control the speed of the car from zero up to the gear on which he is running at the time. For instance, when running on the top speed the lever can be pulled into the mid position between the top and the second speed, which will give a free engine; it can then be started up again by gently pulling the lever into the top speed position again, or into the second speed position, as required; this can of course be done

equally well between any of the intermediate speeds. Another feature of the gear that will be found very useful to nearly all drivers, especially where a small and cramped stable is used for storing the car, will be the way it is possible to use the reverse as a brake, and to go from the slow speed into the reverse speed similarly by pulling the lever over, the reverse speed acting as a brake until the slip is overcome, when the car gradually goes backward ; the forward speed can then be utilised as a brake until the car comes to a standstill, when the lever can be pulled into the mid position between the slow and reverse speeds. The gear has been given an extended trial on an 8-h.p. De Dion car, which the makers inform us has been driven over 5,000 miles without any breakdown or hitch, and without showing any sign of wear.

SOME TYRE DESTROYERS.

THE causes of tyre destruction cannot be too often called to the attention of motorists. A fruitful source of chafing is the carelessness many drivers show when coming up abreast of the kerb. Even if a vehicle runs only a very short distance along the edge of the kerb it will chafe the greater part of the circumference of the tyre, especially in the case of small wheels. The sides of a pneumatic tyre have the least quantity of material to resist wear, as it is obvious that if these were made very thick they would cause the tyres to lose considerably in resiliency. Therefore they are only made sufficiently strong to withstand the pressure to be put upon them. If, in consequence, by accident or carelessness the sides of the tyres become chafed, it is always as well to have the damage repaired by the makers as soon as possible, as this is a comparatively trifling item in the first place, yet if it is left to go on more rubbing takes place, the canvas becomes exposed and subjected to wet, then once the water has thoroughly impregnated rotting of the fabric will very quickly take place.

It seems almost impossible to sufficiently impress upon users of rubber tyres the damage oil will inevitably visit upon them. Too many owners permit oil to remain upon the floor of the garage. As all kinds of oils, greases, and the majority of acids have a deleterious action upon rubber, whenever any of these come into contact with the tyres they should be thoroughly removed at once. If allowed to remain the action of the oil is very slow, but equally sure. It softens the rubber, in the first place, reducing it to a spongy mass ; then, when the air enters through the cracks, it hardens again, and so eventually absolutely destroys the entire tyre.

It will often happen that the tyres on the front wheels will show signs of wear long before there are any similar evidences upon those on the rear wheels. When this occurs it is always well to see if the front wheels are parallel with one another. Although they may have been when the vehicle left the factory, it is possible that through straining a very permanent set has been given to the wheels, resulting in a lateral inclination towards one another, the result of which is a certain amount of dragging action all over the tread of both tyres, since one tyre is inclined to run in the one direction while the other is equally bent on going in the opposite direction.

An easy method of testing whether the wheels are parallel or not is, remarks a writer in the "Automobile Magazine," to make a pencil mark, or ink mark, as near as possible on the centre line of the tread on both tyres. Measure the distance between these two marks, and cut off a piece of string to the exact length between the marks. Then move the vehicle until the marks are directly opposite the previous part of the circle from which the measurement was taken. Again try the string, and if it is found that the distance is either greater or less, steps should be taken to have the wheels set outwards or inwards, as the case may be, to bring them parallel again.

THE South Wales Motor Company have secured an order from the Cardiff Corporation Tramways Department for two motor tower wagons.

CONTINENTAL NOTES.

The A.C.F. Banquet to Thery and Brasier.

One of the most brilliant functions so far held at the club-house of the A.C.F. in Paris was the banquet on Thursday of last week in honour of Thery and Brasier, the driver and designer of the winning Georges Richard car in the Gordon Bennett race. About 200 were present at the dinner, over which Baron de Zuylen presided. At his right was M. Chapsal representing the French Minister of Commerce and Industry. Speeches were indulged in by the Baron M. Max Richard president of the Chambre Syndicale de l'Autombile, the Marquis De Dion, and M. Chapsal, the latter announcing the intention of the Government to decorate M. Brasier with the Cross of the Legion of Honour. M. Charron then presented Thery with Government bonds of the value of £480, the result of the fund organised in his favour, it having been decided at the last moment that the bonds would be more acceptable than the *objet d'art* it had at first been intended to give him. More short speeches followed, including one by Brasier in acknowledgment of the kind things that had been said of him, and the evening was brought to a close by a cinematograph display of the Gordon Bennett race.

One of the Birmingham Motor Omnibuses. The vehicle is a 24-h.p. Milnes-Daimler; it carries 36 passengers, and runs between New Street, Five Ways, Hagley Road, and the Bear Inn Hotel, a distance of 3½ miles.

Motor-Cars for the German Army.

The German military authorities are organising a competition for a small petrol car suitable for use in the army. The vehicle required must be capable of carrying two persons anywhere a horse and cart can travel. A maximum speed of twenty-five miles per hour on level roads and a capability of climbing hills of 1 in 5 are required. The cooling of the engine must be so arranged that even at slow car speeds frequent renewal of the water supply will not be necessary. The petrol tank must have a capacity sufficient for a journey of 125 miles. Full particulars of the competition, which closes on the 1st October next, can be obtained from Die Versuchs-Abteilung der Verkehrstruppen, 12, Wilhelmstr. 101, II., Berlin, S.W.

The French Motor Show.

The seventh annual Salon d'Automobiles is to be held in the Grand Palais, Paris, from the 9th to the 25th December next.

More Automobile Clubs in France.

The Automobile Club de l'Aude has just been formed at Narbonne. Already over sixty members have been enrolled. A

Digitized by Google

preliminary meeting has also been held at Tarbes with the object of forming an Automobile Club of the Pyrenees.

◆ ◆ ◆

The Flying Kilometre in Twenty-five Seconds.

One day last week, as a result of a wager that the Panhard racers built for the recent eliminating trials could not exceed a speed equal to 135 kilometres (84 3-8 miles), M. Teste made a trial against the watch on the well-known Dourdan road. Timed by Messrs. Tampier and Gaudichard, of the A.C.F., he succeeded in doing the flying kilometre in 25 sec., equal to 144 kilometres (ninety miles) per hour.

◆ ◆ ◆

Objectionable Fumes and Excessive Lubrication.

The French Automobile Club has issued a warning to motorists with regard to excessive lubrication, and the consequent clouds of objectionable fumes emitted by many cars. The notice adds that the authorities have decided to take severe measures against anyone guilty of thus inconveniencing the public.

◆ ◆ ◆

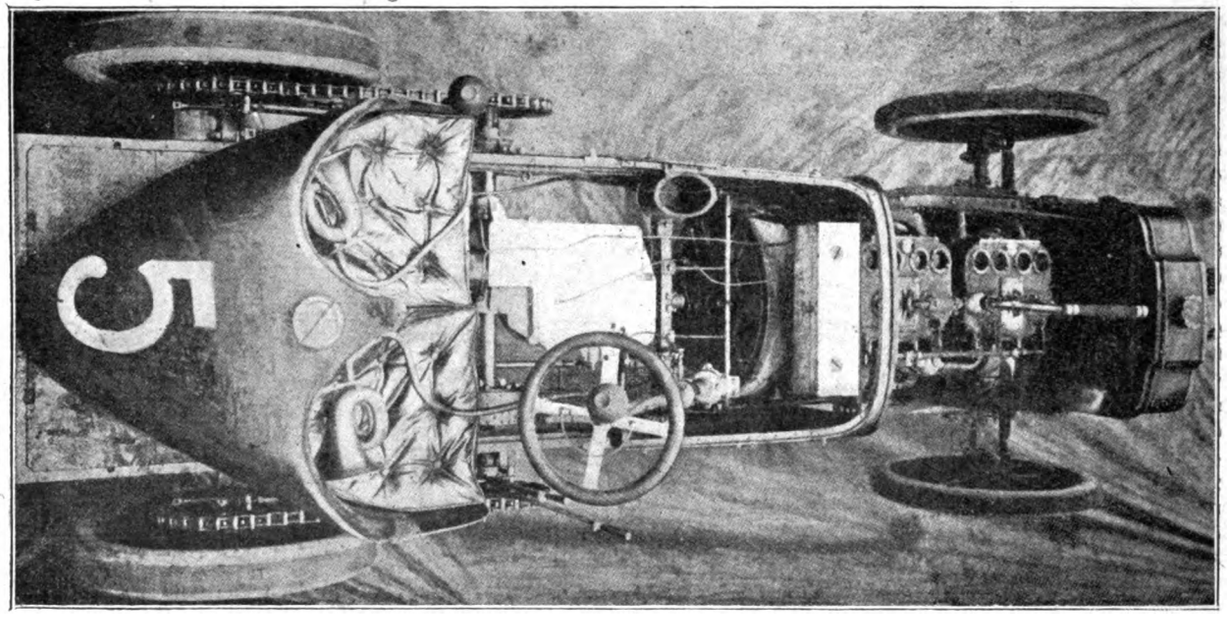
Hill-Climbing on Mont Cenis.

The annual hill-climbing competition from Susa up Mont Cenis, organised by the Italian Automobile Club, was held on Sunday last in glorious weather. Among the spectators were the Queen of Italy, the Princess Laetitia, and the Minister of Posts and Telegraphs. In the racing car section, the three Italian Gordon Bennett drivers, Lancia, Storero, and Cagno, competed on Fiats, in addition to Florio on a Panhard and Vitalis on a Rochet-Schneider. The best time up the hill (22 min. 24 sec.) was made by Lancia, Florio being second. In the light racer class, Ceirano on an Itala car was first in 28 min. 52 sec., while Tamagni on a Marchand secured the first place in the motor-bicycle section in 28 min. 29 sec.

◆ ◆ ◆

Motor Mail Vans in Bavaria.

The Bavarian Ministry of Transportation has recently obtained tenders for a number of motor cars for mail service. Five patterns of cars are intended to be utilised, of which three are to be used for the service within cities and two on highways in the country. The vehicles for country service are intended chiefly to be utilised for the transportation of both passengers and mails, thus covering the regular mail-coach routes. In addition, another class of smaller cars will be built, intended to deliver and collect mails, and possibly also goods, at points having no railway connection.



A New Air-Ship.

Some trials have this week been held at Puteaux, near Paris, of a new air-ship, built to the designs of M. H. Francois for the St. Louis competition. The motive power is supplied by a 24-h.p. Prosper-Lambert four-cylinder petrol engine which drives four screw propellers, one at each corner of the framework. No rudder is provided, steering being controlled by stopping one or other pair of the propellers.

A Novel Reliability Trial.

A bronze trophy, valued at £200, to be known as the Coupe des Alpes Francaises, has just been offered on the proposal of M. Viallet, president of the Syndicate d'Initiative du Dauphin, and vice-president of the Automobile Club of Grenoble, for a reliability run over the touring roads of the French Alps during the space of one year. The cup will be open to all motorists except those in the immediate neighbourhood (viz., the departments of Isere, Savoy, Upper Savoy and Upper Alps), and will be a test of reliable running at a speed of sixteen miles an hour. The trial will begin on August 1st next, and will end on July 31st, 1905. A total of between 1,500 and 1,600 miles will have to be covered, and every car will have to carry at least one passenger for every cylinder of the engine. The course will be split up into stages, but the competitors may take the stages in any order they like, and may start and finish where they choose—the only point of importance being that the above-mentioned speed must be adhered to as closely as possible all through. A constant succession of "sixteen miles in the hour" will be of greater value than an average of sixteen miles obtained by, say, one run of eight miles and another of twenty-four miles in the hour.

Plan View of the Richard-Brasier Car which Thery drove to victory in the Gordon Bennett Race. [*La Vi. Automobile.*

THE Great Eastern Railway Bill has been read a third time and passed, after the insertion of an amendment agreed upon between the Post Office and the railway company to assert and protect the rights of the Post Office to require the conveyance of mails by the motor-car services of the company.

MAKING an ascent in a balloon from the Crystal Palace a few days ago, Mr. C. F. Pollock, Mr. J. T. Moore-Brabazon, and the Hon. C. S. Rolls, of the Aero Club, had a somewhat exciting experience, the balloon being carried towards the sea at a great rate. A safe landing was made, however, in a field three miles beyond Grays, the journey having been accomplished in thirty-five minutes.

MOTOR CYCLING NEWS.

We are this week able to illustrate the Pearson motor-bicycle made by Messrs. Pearson Bros., of Elm Grove, Portsmouth. As will be seen, the frame of the machine is of special construction, the design being such that increased strength is given to the bottom bracket and steering head. The machine is made in two sizes—3¼ and 4-b.h.p.—the motive power in both cases being supplied by an Aster air-cooled engine. The usual high-tension system of ignition is adopted, while the mixture is furnished by a Longuemare carburettor with throttle control. The power is transmitted to the rear wheel by a belt. The brake power provided is sufficient not only to control the machine down steep hills but also a trailer.

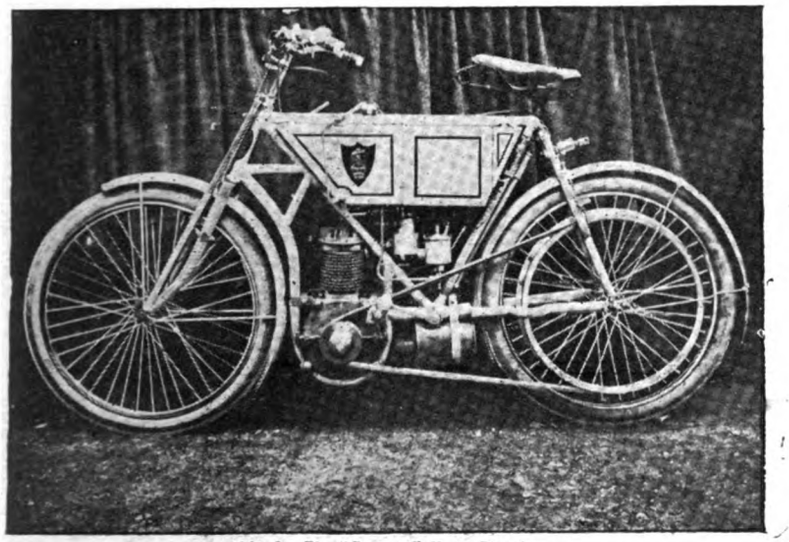

Fig. 1.—The "Pearson" Motor-Bicycle.

The 200 miles reliability trial of the Ulster centre of the Motor Cycle Union of Ireland will be held on the 19th inst., on which day the president of the Union, the Hon. Leopold Canning, is to be married at Westminster Abbey.

The Reliability Trials of the Auto-Cycle Club will take the form of a circular tour of 1,000 miles, starting from London and proceeding *via* Yarmouth, Stamford, Scarborough, Oxford, and back to town. The date upon which the event will commence is the 15th prox., and entries will have to be sent in by the 23rd inst., otherwise an enhanced entrance fee will be charged.

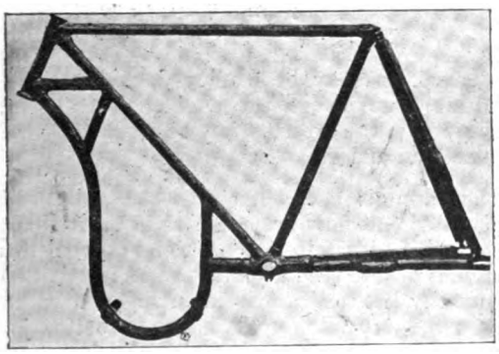

Fig. 2.—The "Pearson" Motor-Cycle Frame.

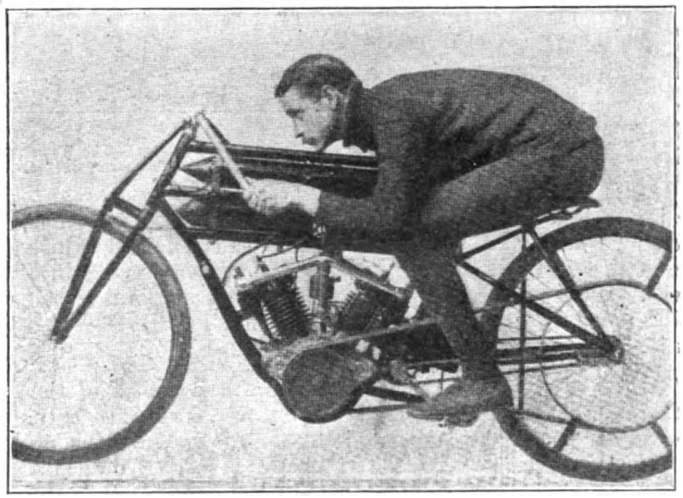
The Liverpool Motor Club held their annual 100 mile non-stop reliability test on Saturday afternoon to Shrewsbury and back. Only six actual starters—five on motor-bicycles and one on a car—appeared. Many more had promised to enter, but owing to the course being changed at the last moment many were unable to start. Promptly at 3.25 the competitors left Eastham Church, having to do the 100 miles in between five and six hours. All accomplished the outward journey to Shrewsbury, but on the return the car had a stop at Whitchurch through an accumulator wire breaking, and so had to abandon the contest. The remaining five finished without trouble, and will run again to-day (Saturday) to decide the winner.

The Motor Cycle Union of Ireland held its first hill-climbing competition of the year on Saturday afternoon last. A very steep hill was selected for the event, leading from Kilmaconoge, co. Wicklow, up the Sugarloaf mountain to Calary Bog. The distance covered was something over a mile and a half, and the gradient was exceedingly steep. Thirteen entries were received for the pedalling class, and of the eleven who competed ten reached the top of the hill. Nine of the ten entries for the non-pedalling class competed, and six of them succeeded in getting up the hill without pedal assistance. The first named class was won by H. S. Huet on a 3½-h.p. Minerva, and the non-pedalling class was won by A. Summers on a 3-h.p. Triumph, that rider ascending the hill in faster time than the winner of the pedalling class. The results of both classes are appended.



Pedalling Class.

		m.	s.
1.	H. S. Huet, 3½-h.p. Minerva	3	35 3-5
2.	C. B. Franklin, 2¾-h.p. F. N.	3	39
3.	A. Summers, 3-h.p. Triumph	3	47 4-5
4.	F. A. Wallen, 2½-h.p. Triumph	3	49 3-5
5.	C. G. Grey, 2¾-h.p. Bowden	3	58 1-5
6.	Rev. Stevens, 2¾-h.p. Phœnix	4	15
7.	J. G. Drury, 2-h.p. Triumph	4	21 2-5
8.	H. A. Evans, 3-h.p. Singer	4	28 4-5
9.	H. J. Seymour, 2¾-h.p. F. N.	5	41 2 5
10.	R. E. Price, 2¾-h.p. F. N.	5	50 2-5

Non-Pedalling Class.

1.	A. Summers, 3-h.p. Triumph	3	34
2.	C. B. Franklin, 2¾-h.p. F. N.	3	41
3.	H. A. Evans, 3-h.p. Singer...	4	36 1-5
4.	F. A. Wallen, 2½-h.p. Triumph	4	57¼-5
5.	H. S. Huet, 3½-h.p. Minerva	5	2 4-5
6.	R. E. Price, 2¾-h.p. F. N.	6	8 4-5

At the race meeting promoted by the Worthing Excelsior Cycling Club on the local sports ground, E. Baruch Blaker made a successful attack on the three and five miles motor records for the Worthing track. The three miles record was made two years ago by W. W. Genn, of Wimbledon, who with 100 yds. start covered the distance in 5 min. 55 sec.; while the five mile track record stood to the credit of T. H. Tessier, who with 200 yds. start covered that distance at the Club's 1901 race meeting in 10 min. 33 secs. Last week Blaker, with a flying start from scratch, reeled off the first mile on his 2¾-h.p. Bat in 1 min. 48 secs., or at the rate of over thirty-three miles an hour; the first three miles were negotiated in 5 min. 27 sec.; while his time for the five miles was 9 mins. 12 3-5 secs.

Mr. G. H. Curtiss, on the 8-h.p. Motor-bicycle, on which he covered 10 miles in 8 min. 54 2-5 sec., averaging 53 2-5 sec. to the mile, on the Daytona-Ormonde Beach, Florida, U.S.A.

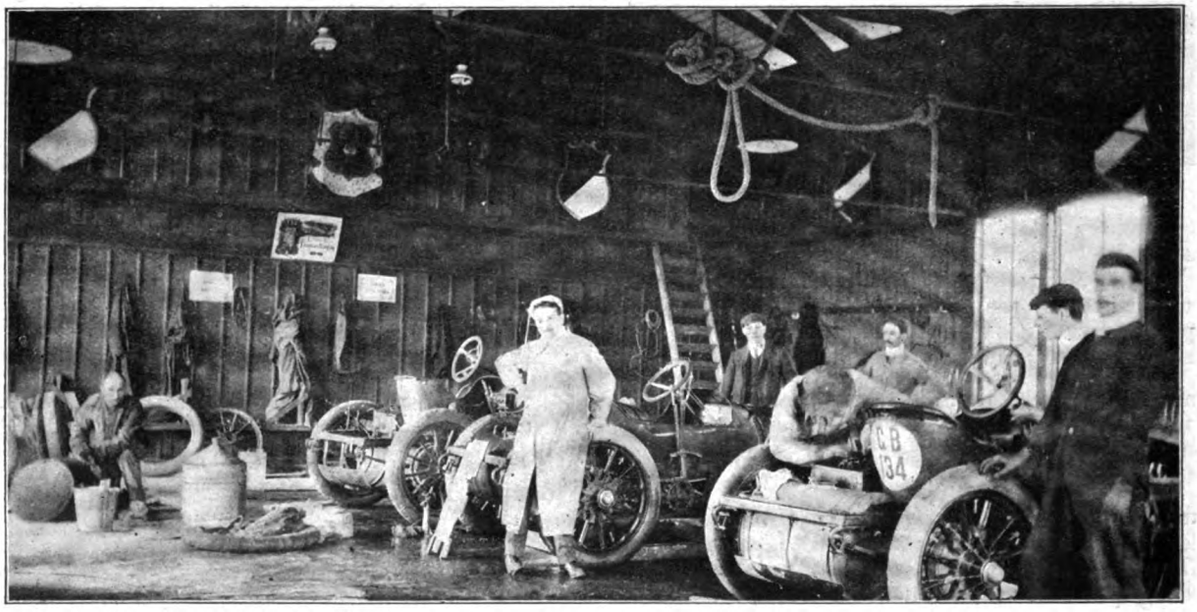
SOME USEFUL NOTES.

A LARGE proportion of the minor troubles which fall to the lot of the automobilist have their origin in faulty and leaky joints, and, in view of the large and increasing number of recruits to the ranks of car-owners whose mechanical training is only at its commencement, a short and somewhat elementary treatment of the usual methods of packing and re-making such joints may not be without its uses.



JOINTS are numerous—often unnecessarily so—in most modern motor designs, and any improvements which reduce their number or size—as the frequent practice of casting cylinder and cover in one piece, or that provide for ground joints without packing—are to be welcomed, provided that they do not involve castings being too complicated or necessary renewals being costly; but some will be inevitable in any design, and the materials available for making them may next be considered.

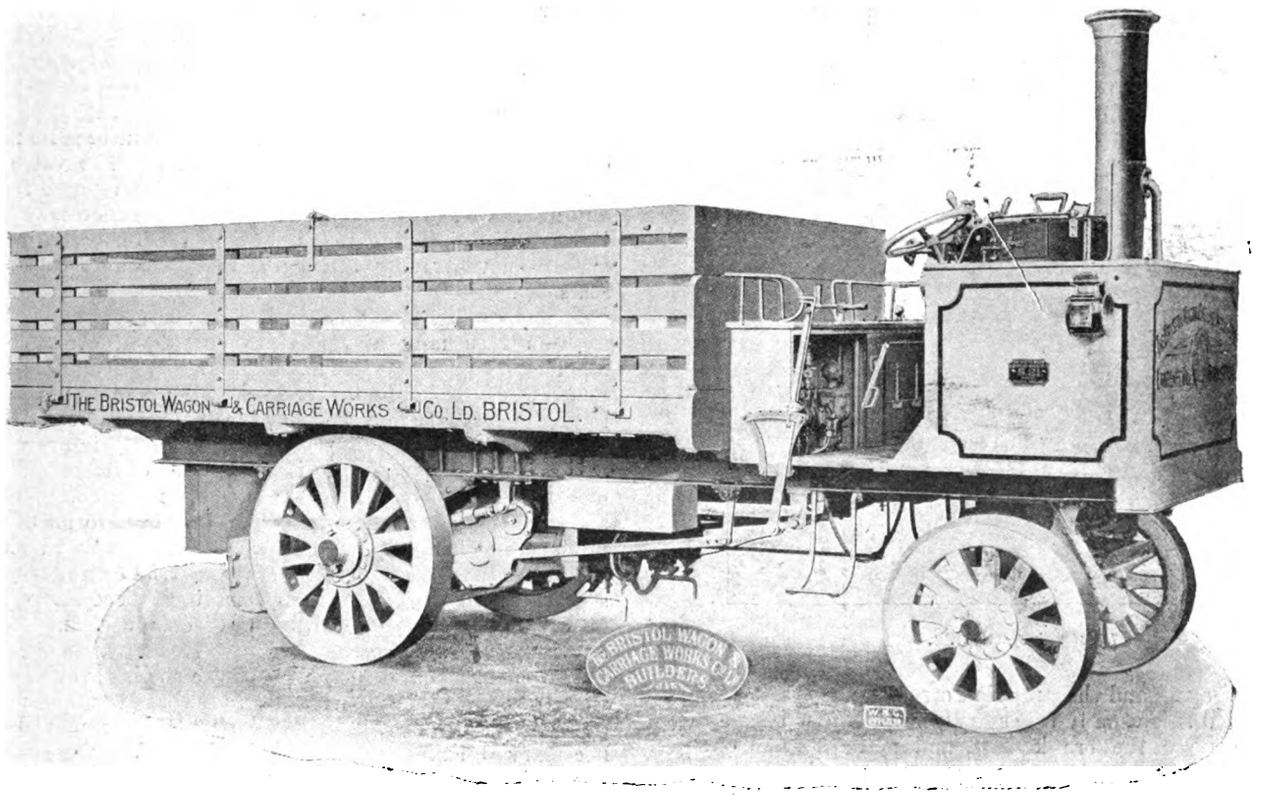
OF these the principal are soft metals, fusible or infusible, as lead and copper; asbestos, in the form of soft or hard sheet, string, and sheet of a third variety on a wire-gauze base and containing some rubber admixture, which, though used for steam-pipe joints, is to be avoided for most motor-car purposes; leather rubber; and finally the old familiar hemp and red lead, which atter is mixed with an equal part of white lead and made into a thick paste with linseed oil, and is always useful when making screwed unions in pipes which do not have to be often disunited.

THE selection of these will depend on the purposes of the joint, whether it has to resist high temperatures, steam heat only, water, oil, or petrol; and the best joint of all is one in which no packing is needed, *i.e.*, when the surfaces can be got to such a degree of truth that when drawn together with only a smear of oil or red lead, or even without this, a tight union is obtained. This may be done easily and cheaply by grinding when the surfaces are not large and studs or other projections do not interfere with the necessary rotation of one surface on the other; while when this is impracticable it must be done by scraping, which, though an expensive method, requiring some skill, would, in the writer's opinion, repay its more frequent employment. In default of this, packing is necessary, and the most usual material for this is asbestos, the chief objections to which are its fragility, necessitating care in handling, and the fact that it does not stand water well, though unaffected by heat or dry steam.

ONE principle to be borne in mind when making joints is that the thinner the packing is the better, and the thin hard blue asbestos sheet is on the whole most satisfactory, especially where a water joint is unavoidable. For this purpose it should be soaked in linseed oil, or smeared with tallow (the writer generally makes the tallow into a thin cream with a little petrol, which ensures its rapidly penetrating the sheet), and may be also blackleaded on each surface to render its removal easier when the joint is to be re-made; but with a difficult joint this is better omitted.

BLACKLEAD has an awkward way of forming hard concretions on iron surfaces which are very adherent, and the greatest care must be taken in removing such, with any fragments of old packing, especially about the bases of studs, etc., before beginning to make a joint, and clearing out the grooves usually present to retain the packing. Bolt holes should be punched (or, better, cut with small curved scissors) amply large, and burrs of asbestos round them avoided, while there should be no broken lines or folds in the sheet. Where the bolts are light, or few in number, the softer white asbestos may be employed, and screwed up at intervals, allowing time before the engine is used again. For combustion joints only, the asbestos may be used plain, or rubbed with a little blacklead and grease.

The Gordon Bennett Race.—The Wolseley head-quarters.—The Wolseley Co. secured the use of a gymnasium and dancing-room at Usingen for the storage and "mise-au-point" of their cars in the International Contest.



A USEFUL packing is made of asbestos covered with thin copper where small joints only are concerned, but it is not easy to get sufficient pull on it safely in the case of a large area. In small cycle engines, where such a joint is used for the cylinder head, it is frequently left too broad, and cutting it down to about one-eighth or three-sixteenths will enable a better joint to be made without excessive pull on the bolts.

FOR the benefit of those who look after their own cars, one or two practical points may be mentioned in connection with any attempts to examine or replace balls. In removing the wheel, the cone and lock-nut are unscrewed in the same direction as the run of the wheel, *i.e.*, the thread is left-handed in the case of the right wheel, and *vice versa*, the left being thus the same as the cap. The cones and cups and balls should be all carefully examined after cleaning, and if worn rough, renewed at the earliest opportunity.

THE "BRISTOL" STEAM-WAGON.

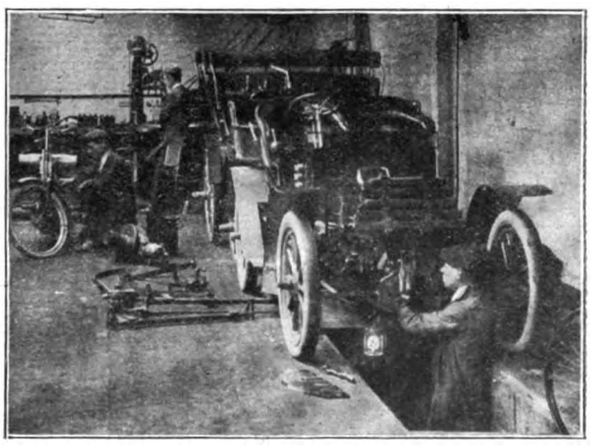
ANOTHER addition to the list of British builders of heavy steam vehicles is the Bristol Wagon and Carriage Works Company, Limited, one of whose four-ton wagons is illustrated herewith. As will be seen, the boiler is fitted in the fore-part of a steel channel frame; it is of the vertical water-tube type, and is arranged for coke firing. It is provided with injector, stop and safety valves, water, blow-off and feed cocks, and also an auxiliary feed pump. The working pressure is 200 lbs. per square inch. The fire-box is fed from the top, through a vertical flue; the outside shell is so mounted that it can be removed for cleaning purposes. The engine is of the horizontal two-cylinder compound reversing type, with ample bearing parts, all arranged to work in oil. The vehicle is gear driven throughout, two speeds being provided, the latter being easily controlled by the driver from his seat. The gear wheels run in oil and are protected from dust. Steering is controlled by means of a worm fixed to an inclined steering

General View of the Bristol Steam Wagon.

spindle, worked from the driver's seat, and made to gear with a steel quadrant firmly secured to the front central pivot, on which the front axle rotates. The brake is also arranged to be operated from the seat by means of a screw, and is of the double block type, working on both the rear road wheels. The latter have steel hubs, spokes of English heart of oak, the felloes of ash, and the tyres of stout wrought iron. Strong forged arms are secured to the felloes to take the driving thrust, so that no strain comes on the spokes or hubs. The rear wheels are 37 in. diameter, with 7 in. wide tyres, the front pair being 28½ in. by 5 in. The axles are of steel, the front one being fixed and moving on a central pivot; the rim axle is of the Cardan pattern driven direct by gearing. The axle boxes are of cast steel, lined with gun metal bushings. The water tank, which has a capacity of 120 gallons, is fitted with water lifter and strainer, and also drain cocks, and cocks for testing the level of the water. The overall length of the vehicle is 17 ft. 9 in., and the width 6 ft. 6 in.; any type of body can, of course, be fitted to the frame.

PREPARATIONS FOR DRIVING.

TO the fortunate individual who has ordered a new car, the coming season is one of anxious expectation as to the behaviour of the vehicle. Not everyone is financially able to order each year a strictly up-to-date car, and such an one must be content to make the old vehicle serve him another season. He will naturally be ambitious that his car shall make as creditable an exhibition as possible among the more advanced automobiles of his friends, and to further this end he will seek to make upon it such improvements in appearance and equipment and such repairs and readjustments as the car may seem to warrant from financial considerations. Too extensive remodelling and too great additions to the equipment of an old car are, of course, inadvisable. They are too much like putting new wine in old bottles, but it is certainly advantageous, if not almost mandatory upon the conscientious owner, to put the mechanism, such as it is, in the most perfect possible condition, favourable for doing its best work.



Sometimes it occurs to the owner of a two-seated car that he would like seating capacity for two more passengers, and he may, after careful consideration as to the strength of the *chassis*, decide to provide himself with a detachable tonneau. It may be that this conversion is very seldom actually warranted on strict engineering or economic grounds.

Adding the extra seating capacity may make advisable or necessary a lengthening of the wheel base, with its accompanying extension of the frame, re-location of springs and radius rods, lengthening of chains, possible moving of tanks or machinery, and so forth. Since a greater weight is to be carried by the same engine power, the car may have to be geared down to maintain its hill-climbing capacity under the changed conditions, and leaves may have to be added to one or both pairs of springs, or auxiliary spiral springs or rubber buffers be supplied to take care of the increased load.

It is well to keep in close touch with the manufacturers of one's particular car, with a view to taking advantage of whatever improvements they may have made which are applicable to

Digitized by Google

the old type. An improved carburettor may have been brought out; an advanced form of contact maker may have been evolved, the clutch may have been improved, or some new wrinkle in lubrication or control may have been adopted. Ordinarily the manufacturers are accommodating and reasonable as to furnishing these improvements for attachment to old cars, and they are usually made with some regard to fitting their earlier product. Passing now to the motor, this may need some little attention; perhaps it has developed a "knock," in which case the reciprocating parts should be examined to ascertain whether there is any undue looseness in the bearings of the connecting rods on the crank or gudgeon pins. If any such is found in the former place it should be taken up. Looseness on the gudgeon pin is not so easily corrected, as no chance for adjustment is usually provided, and ultimately, if the wear continues, the connecting rod hole and the holes in the piston bosses will have to be bored or reamed out to a size just large enough to true up the holes, and a new pin, made of steel, hardened and ground to the exact size, will have to be fitted. A knock may be caused by looseness of the engine upon its frame, and these fastenings should be made secure beyond peradventure. Occasionally the key which secures the flywheel to the crank shaft works loose, and, if this occurs, the keyway is fairly certain to be destroyed, the engine the while knocking badly. If the keyway has not been torn out, the key may be

A Useful Inspection Pit.

driven home again and the trouble corrected; but if it has become deformed it is usually necessary to cut a new keyway on the opposite side of the crank shaft, and perhaps a new one in flywheel boss. Possibly the annoying knock may be due to the fact that the crank shaft bearings are worn. Sometimes means are provided for adjusting these important parts, but in many cases the only remedy is the making and fitting of new bushings. A lack of lubrication is usually responsible for any rapid wear in such bearings, unless they are too small, and one should be sure to remove the cause as well as to repair the damage.

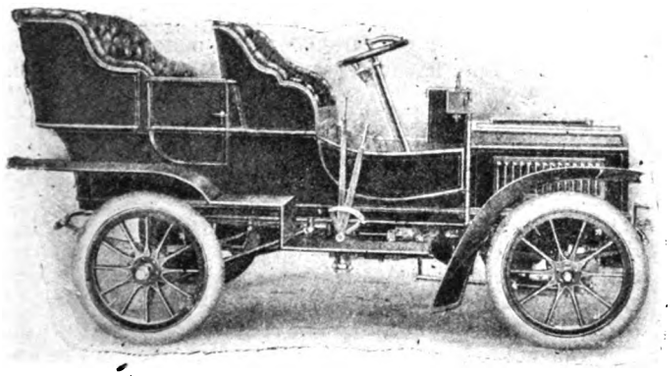
It may be that the engine has lost its compression to a serious degree. This defect should be corrected before the car is again put into service. If the engine has ever possessed good compression it is hardly likely that the difficulty is in the fit of the piston in the cylinder, unless it has run dry repeatedly and cut badly, or unless the gudgeon pin has protruded and scored the cylinder walls. It is, of course, possible that a piston ring may have broken, or the rings, if not pinned in position, may have turned in such a way as to have brought their joints into the same straight line, thus allowing an escape of gas. Unless it involves much labour, pistons may well be withdrawn occasionally, and they, as well as the inside of the cylinder, carefully examined. The piston rings, if they are correctly formed and doing their duty properly, should be worn uniformly bright and smooth throughout their peripheries. Sometimes defective rings may profitably be replaced by more accurate ones; but if the cylinder is not perfectly cylindrical in section, or of uniform diameter at different points, this avails little.

It is more probable that the valves are at fault and are leaking. The successful grinding of valves is not so simple a matter as it would seem to be, but is really quite a little art in itself. It requires considerable deftness, some patience and a willingness to work gently and carefully, with frequent applications of the abrasive to the surfaces. If one tries to use force between the valve and its seat when grinding, distortion of the surfaces will take place, and they will never meet properly in service. Some prefer quartz powder to emery for valve grinding, and use water rather than oil. Sometimes an exhaust valve may be found so deeply pitted as to render its smoothing up by grinding alone an almost interminable job. In this case the valve may be centred in a lathe and a tool set so as to take a light chip from the bearing surface, care being taken to preserve the angle as it was originally.

After the valves have been ground to a perfect seat—and this may be roughly tested in case they are removable by seeing if they will hold petrol—the valve-operating mechanism may require examination. The valve stems should operate freely in their guides, but not much wear should be allowed. The push rods of mechanically-operated valves should be maintained in such adjustment as just to clear their valve stems. This allows of a positive seating of the valve under the influence of its spring, and still insures its maximum opening under the influence of the cam. The valve springs should be demonstrated to be of normal strength, free to act and unbroken. Occasionally, loss of compression may be due to leaks around sparking plugs or compression cocks, or it may arise from the faulty fitting of valve chamber caps or valve seats.

The owner who "never has had any trouble" with his ignition is usually an individual possessed of a very short memory. Spark troubles are familiar to most motorists. The main thing is to find the weak point which most requires improvement. It may be that the manufacturers of the car in question may be able to supply an improved form of contact device; but, if not, the contacts in the old one may be smoothed up or entirely renewed, if necessary, and a perfect adjustment secured. Improved forms of sparking plugs are continually being introduced, amongst which may be found one that may at least warrant a trial during the coming season. The wiring of the car sometimes becomes oil soaked or otherwise damaged during a season's use, and it may be advantageously replaced.

If there has been trouble with the cooling system now is the time to remove its cause. The radiator or tank may have developed leaks, and, if so, they should be removed and the necessary brazing or soldering done. Where rubber hose connections are employed to flexibly connect the several elements of the cooling system, this material is sure to deteriorate after a couple of seasons' use and should be replaced. Unions or couplings in the circulating pipes may need a little attention to keep them tight. The stuffing box of the circulating pump shaft may have begun to leak on account of the failure of its packing, and a new one should be inserted in the gland. If a belt is employed to drive the air fan, it may be that it will be found so much stretched or worn as to necessitate its replacement, or, at least, that a portion be cut out and the belt hooks be re-inserted in holes cleanly cut with a belt punch so that they may not tear out. In instances in which a chain is used to operate the pump it should be carefully adjusted, or if the adjustment provided is not sufficient to tighten it, a link should be taken out. If the chain shows the slightest tendency to ride the sprockets it may be considered worn out and ought to be replaced.



(To be concluded.)

At least two Scotch coachbuilders are energetically taking up the construction of motor-car bodies, viz., Mr. George Thompson, of Stirling, and Mr. A. C. Penman, of Dumfries.

HERE AND THERE.

THE latest addition to the models of Humber cars is a 10-12-h.p. double-cylinder vehicle, which, in view of its relatively low price, should quickly come into vogue. In the new car many of the Humber features are retained, notably the tubular steel frame. The engine is located under a square bonnet, the front opening of which is filled in by a ribbed radiator. A belt driven fan is also provided to induce a current of air through the radiator. The water circulating pump, which is driven off the half-time shaft, is so mounted that it can readily be detached when necessary. The usual high-tension system of

ignition is adopted, the coil and accumulators being carried in a box secured to the dash-board, so that they are not only accessible, but only short lengths of ignition wires are necessary. Three speeds forward and a reverse are controlled by a single lever, the transmission from the gear box being by cardan shaft and bevel gear. The steering wheel is of the single-arm open type, enabling the throttle and ignition levers mounted on the steering column to be easily manipulated. The car has a long wheel, permitting it to be fitted with a luxurious side entrance double-phaeton body.

MESSRS. BROWN BROTHERS have issued an attractive coloured show card of their cars, which are now made of 7, 8, 9, and 12–14-h.p.

A 12-h.p. Gladiator, with Cape Cart Hood, specially built for a motorist in India. The vehicle is fitted with solid tyres, and a special water-tight arrangement under the engine and gear case, to enable it to ford streams, etc.

THE Bass Rock Cycle and Motor Company, of High Street, North Berwick, have opened a motor garage, where they will keep a stock of petrol and motor spirit.

THE Durand Non-Skid Tyre, Limited, is the title of a company formed to acquire and take over the agency owned by Messrs. J. E. Hutton and J. A. Wilding, in connection with the Durand non-skidding tyres for motor-cars and other vehicles.

A PUBLIC motor-car service was inaugurated last week between Dieppe and Varengeville.

THE "Thor" Motor-Car Company has opened a garage at 45, Horseferry Road, Westminster, S.W., where repairs of all kinds can also be carried out.

THE exports of automobiles and parts from the United States during July last amounted to £34,254 as against £28,854 in the corresponding month of 1903.

THE Automobilists' Guide Book for France, published in the French language by the Continental Caoutchouc and Gutta-Percha Company, Hanover, has just been issued.

MR. W. BIGGS, the local agent for Wolseley and Humber cars, has recently added a garage to his premises in Derby Street, Ormskirk, where a stock of motor accessories is being kept.

THE Dunlop Motor Company, Limited, of 39, John Finnie Street, Kilmarnock, has been formed to acquire and carry on the motor branch of the business of R. and J. F. Dunlop, cycle and motor manufacturers.

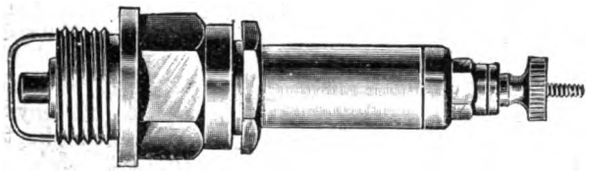
THE Woking district is the subject of the latest sheet map issued by the Ordnance Survey. This is on a scale of two miles to the inch, and will be useful to motorists travelling in one of the most delightful regions of the south of England.

THERE is in Boston, Lincolnshire, a very good example of a coachman-gardener motor-car driver. He is employed by Dr. Rickett, a well-known medical man, whom he drives, and

quickly learnt to operate the "Baby Peugeot," and prides himsel on being able to do his own running repairs. The accompanying illustration shows the doctor and his man on the little car.

FROM Turner's Manufacturing Company, Limited, comes a copy of a new catalogue they have just issued of the Turner-Miesse steam cars. Illustrations are given, not only of various parts of the mechanism, but also of several types of carriage bodies, including one of a handsome side-entrance landaulet. The list concludes with a number of testimonials from users of these English-built steam cars.

THE Pope Manufacturing Company, of Toledo, U.S.A., has completed a 60-h.p. racer, which will compete in the Vanderbilt Cup race in October next. The motor has four cylinders, 6 in. bore by 7 in. stroke. The inlet valves are automatic, and the cylinders are jacketed with copper. Three speeds forward and a reverse are provided, the power being transmitted to the road wheels by side chains.



MR. E. LISLE has just ascended the Constitution Hill, Swansea, on a 12-h.p. "Star" car with four passengers. The hill is 936 feet long, and rises to a total height of over 200 feet, the average gradient being 1 in 5·04. The steepest gradient is 1 in 3½, and this occurs for a length of about 150 feet at the bottom of the hill, and for a similar length at the top of the hill; the flattest gradient is 1 in 7 for a short length only in the middle of the hill.

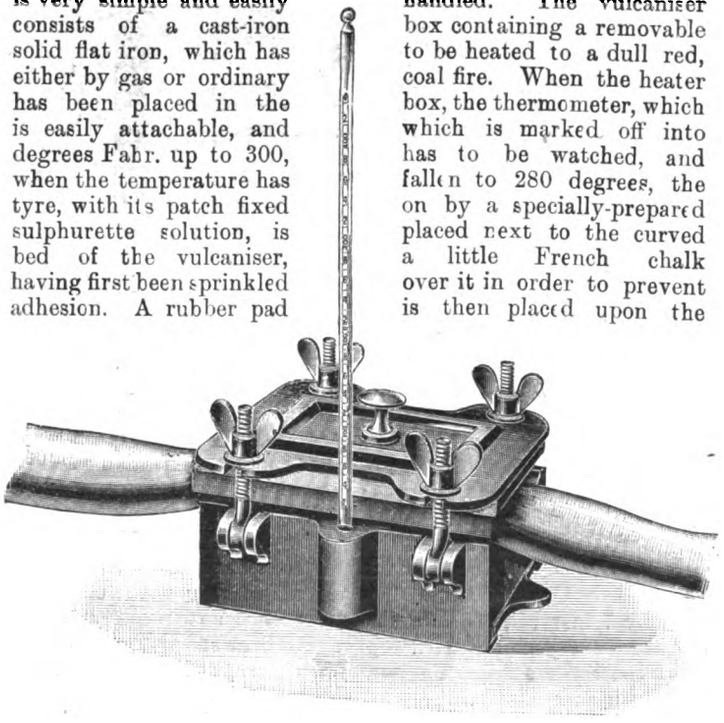
THE Upper Norwood Ratepayers' Association is interesting itself in a motor-'bus service for the locality.

FOR a design for a motor-car body, the Coach Makers' Company have awarded a silver medal to Mr. A. N. Meier, of Redhill, and a bronze medal to Mr. J. J. Brown, of the same place.



THE special feature about the sparking plug shown in the accompanying illustration is that the sparking points cannot get displaced, and the inventors, Messrs. Statter and Company,

Birmingham, claim that a far better spark can be obtained from a comparatively large surface than from a needle-like point. The plug appears to be well made, and is easily taken to pieces.

THE other day Mr. J. E. Hutton took one of the standard 8 h.p. three-cylinder Panhard touring cars up Porlock Hill, driving it the whole way up this stiff gradient without assistance. As indicating their confidence in these vehicles, Messrs. J. E. Hutton, Limited, state that they will guarantee the light touring model to attain a speed of thirty-five miles an hour on the flat, carry five people up Putney Hill on third speed at twenty miles per hour, and six people up the steep gradient of Netherhall Gardens, N.W., at eight miles per hour.

A NEW portable vulcaniser, known as the "G.B.," has lately been put on the market by the County Chemical Company, Limited, Birmingham. It is now generally conceded that punctures repaired by ordinary rubber-solutioned patches are not always a success when applied to motor tyres, owing to the fact that during the running of the tyres the heat occasioned thereby often liquefies them, and the patches, owing to the creeping tendency of the outer covers, are eventually displaced. The new vulcaniser, which has been designed to overcome these difficulties, is very simple and easily handled. The vulcaniser consists of a cast-iron box containing a removable solid flat iron, which has to be heated to a dull red, either by gas or ordinary coal fire. When the heater has been placed in the box, the thermometer, which is easily attachable, and which is marked off into degrees Fahr. up to 300, has to be watched, and when the temperature has fallen to 280 degrees, the tyre, with its patch fixed on by a specially-prepared sulphurette solution, is placed next to the curved bed of the vulcaniser, a little French chalk having first been sprinkled over it in order to prevent adhesion. A rubber pad is then placed upon the

tube, next a wood block, and finally the top plate, which is screwed firmly and evenly down by means of the thumb screws. When the temperature has fallen to 240 degrees—this occupies from ten to fifteen minutes—the process of vulcanisation is completed. The device is designed for use by amateur motorist and trader alike, and requires no special skill. It is handy and fairly light, and is sold at a moderate price.

AN Anti-dust League is being formed in connection to the Swiss Touring Club.

THE British Detachable Cycle Motor, Limited, has been registered with a capital of £75,000.

MR. E. J. PENNINGTON is reported to have been arrested in St. Louis, U.S.A., on a warrant issued for his arrest, charging him with conspiracy and fraud.

THE Barnet Urban District Council has decided to affix notice boards in the Great North road running through the town of High Barnet warning motorists against excessive speed.

MR. G. W. BURNELL, of Albion Street, Rugeley, Staffs., who has garage accommodation for twenty cars, has issued a neat card drawing attention to his facilities for the repair of vehicles, the supply of spare parts, etc, and the charging of accumulators.

MESSRS. H. ANDREW AND COMPANY, motor engineers, of Plympton, Plymouth, have sent us samples of their "Simplex" terminals for connecting up ignition wires to batteries or coils. They are made of two brass stud rings, with flanges sufficiently wide apart to take the two halves of the stranded wire which are twisted round them, the flanges of the ring terminal being then squeezed together with pliers over the wire.

THE Homeland Association, Limited, forward a copy of their Handbook for Oxted, Limpsfield and Edenbridge, with their surroundings, written by Mr. Gordon Home. This little work, describing the beautiful district of South-East Surrey and the Border-land of Kent and Sussex, is fully illustrated by drawings made by the author, and by photographs. Included in the book is an Ordnance survey map of the district on the one inch scale.

WE have received from the publishers, Messrs. De Vere and Company, a copy of Mr. T. H. Holding's "Cycle and Camp," in

Route Map of the De Dion-Bouton Excursion in the South of England.

which the well-known motorist tailor describes several days' real enjoyment in camp in Ireland. Much practical information is imparted to all who tour, and the fifty pages of useful hints with regard to the location of the site for the tent, food and cooking appliances, are extremely sensible and to the point. Mr. Holding is no theoretical enthusiast on the subject. He has designed several camping appliances, including a tent of appropriate design and suitable material for use by motoring parties, while the garments he has introduced for outdoor sports generally show the practical trend of his mind, of which much evidence is afforded in the well-written book just placed on our shelves.

FROM Abbott's, of Queen Street, E.C., comes a new catalogue of motor clothing which affords evidence of the enterprise and ability with which the firm is now catering for the sartorial requirements of motorists. Among the specialities we notice the "Wolseley" coat cut with a wide skirt and fitted with wind cuffs, the "Portland" coat—a long double-breasted ulster buttoning back to the shoulder, the Argyll coat, with a yoke and pleat at the back to give additional skirt room when seated, and many other good styles in cloth and leather. The previous experience of the firm in connection with clothing for yachtsmen and sporting men generally has been useful in extending their business to the motoring world, and the waterproof qualities of their garments can be thoroughly relied on. Motor aprons, leggings, etc., are also illustrated in the catalogue, which is completed with a selection of punched rubber mats, rubber matting, etc., as well as some good lines for motor-cyclists.

CORRESPONDENCE.

POLICE TRAPPING.

To the Editor of *The Motor-Car Journal.*

Sir,—I should like, through the medium of your valuable *Journal*, to warn motorists in Leeds and district to keep well within the bounds of the law, for not only are the police "trapping" on most of the main roads leading into the city, but last Friday I had to appear before the stipendiary magistrate to answer the heinous charge of not having my rear number plate sufficiently illuminated at night. My lamp was not out but had smoked the glass rather badly, and just when the policeman "spotted" me I was passing under a street lamp fitted with a powerful incandescent light, which was so strong that it quite swamped my tail light. Though I explained this in court, I had not the slightest consideration shown to me but left the poorer by £1, and with my licence endorsed. On the same day three Leeds gentlemen were charged with exceeding the legal limit at Moortown. The police only timed over the very short distance of 220 yards, and though one defendant was charged with driving at the rate of only twenty-two miles per hour, and his solicitor pointed out that an error of one second would mean a difference of over one mile per hour and proved pretty conclusively, that the police methods of timing were by no means accurate, he was fined £3 and costs, and, along with the rest of us, his licence was endorsed. I would therefore warn motorists in this district to be very careful to give the police no chance, for the unfortunate motor man who once gets inside the Leeds Town Hall, where the law is stretched to its utmost limit in favour of the police and the benefit of the doubt is never extended to the motorist, can only get out again by paying up and looking as pleasant as he can under the circumstances.—Yours truly,

J. Wales Smith.

1. Carry a densimeter. I have been sold various compounds under the name of "Pratt's A."

2. Get lubricating oil in big towns or sent on; small places stock vile stuff, and charge about 6s. per gallon for it.

3. Put car under lock and key; tools have a way of vanishing, mine have more than once.

4. The police are most reliable in giving information, and take any amount of trouble as to good roads, etc.

5. Be careful who charges accumulators Ireland is sadly backward in this respect. The lighting stations in big towns are the most reliable, and the charge is never more than sixpence for a small cell. Have two or three spare cells or good dry battery.

6. The road maps and small guide published by Messrs. Mecredy are very reliable but want bringing up to date in their information as to good and bad roads.

As I have been practically all over Ireland on bicycle, motor-bicycle and car, extending over many years, I would gladly give through your columns any information to those contemplating a tour in this delightful country and in a motor sense "free land."—Yours truly,

R. I.

SOLID TYRES.

To the Editor of *The Motor-Car Journal.*

Sir,—In reply to Mr. C. Lucas' inquiry in your last issue about solid tyres, I have used solid tyres on my motors for six years and have had little or no trouble with them. Sirdars I have found good and reliable, and in several years' use of them I have only had one come off, and that the makers replaced at half price. I average thirteen or fourteen miles an hour on the car on which I use them (it weighs nineteen hundredweight), but up to a month ago, when I had a new engine, I never exceeded eighteen miles an hour. With this weight and speed they will last for about 5,000 miles and perhaps more, but I don't care to use a tyre when it gets worn down nearly to the rim. On another car weighing 15 cwt. (four-seated) and averaging about the same speed (not exceeding twenty miles an hour top speed), which I bought second-hand about a year ago, I have Falconnet solids and I am extremely pleased with them. I have run them about 3,500 miles, and they have not given a moment's trouble and show now very little wear. I do not know what mileage they had done before I acquired the car, but possibly another 3,000. These tyres, which are a French patent, are expensive—nearly £50 a set—but for wear and resilience I can speak most highly of them. It must always be remembered that long and easy springs are almost as important as good tyres for comfortable travelling. I cannot understand Mr. C. Lucas' tyres flinging out at the speeds he mentions.—Yours truly,

Edgar Soames.

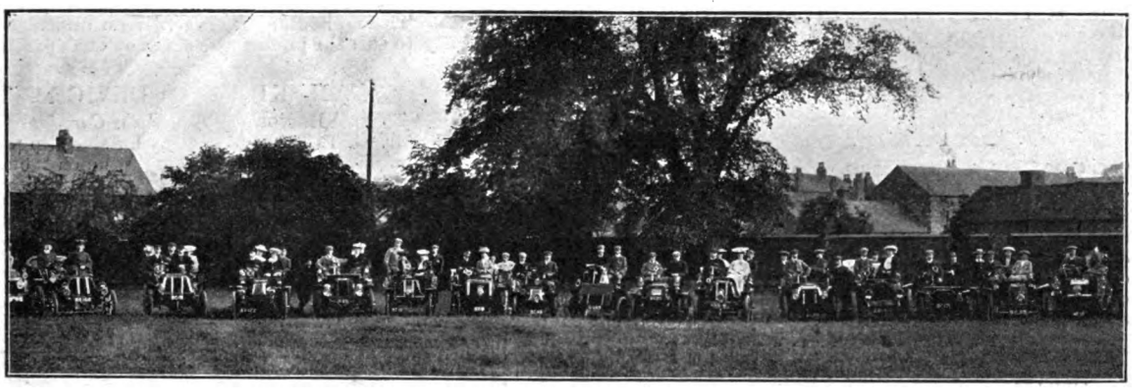

Photo by] **The Meet of the Leicestershire Automobile Club at Melton Mowbray.** *[F. Crown.*

TOURING IN IRELAND.

To the Editor of *The Motor-Car Journal.*

Sir,—In the *Journal* of the 9th inst. I notice a letter on "Touring in Ireland," in which your correspondent complains of the excessive charges made in Ireland. I do not think he knows much of Ireland, or he would not write in the manner he does. I have dined at the best and only hotel in Malahide, namely the Royal, and have had a good dinner there for 1s. 6d., and also have lived in Bray, which is thirteen miles from Dublin, and not ten. I can honestly say that I have always been treated better and cheaper by the Irish hotel keepers than anywhere I have travelled in my life. Your correspondent also speaks about Kingstown, seven miles from Dublin, in which he states he was charged 9s. for two cuts from the joint. I am positive he cannot know much of Ireland. I have visited the country from north to south, and my impression is this, that as a genuine race of good-hearted, open, honest people give me the Irish (on their own soil), before any race of people in the world. I am not an Irishman myself, but if I were I should be proud of the honour. I can travel Ireland through on 10s. a day, including all, and am open at any time to prove it to any of your readers who are going to tour Ireland.—Yours truly,

H. Douglas.

To the Editor of *The Motor-Car Journal.*

Sir,—I fully endorse the letter of "K 125" in your issue of the 9th inst.; in fact, he does not put the case strong enough. There is no getting away from the fact Irish hotels are, it is much to be regretted, extortionate, and the unfortunate motorist appears to be their ready prey for any small necessity, such as simple lunch or refreshments. At one hotel my bill for one night, including plain dinner—soup, joint, cheese, butter, and bottle of Bass—bed, plain breakfast, garage for small car (open shed), came to 16s. without the necessary tips. At a delightful place called Enniskerry I was charged for tea, with ham and eggs for two, 7s. If I might add a little advice to the Irish tourist, I would say:—

THE SIX-CYLINDER NAPIER.

To the Editor of *The Motor-Car Journal.*

Sir,—I took my opening run last Saturday and Sunday on my new six-cylinder Napier, and was struck with the general smoothness of the running and absence of fatigue in driving, due to only one or two changes of speed during a day's drive. There are but three speeds forward, and I find the third speed (direct drive) is in use nearly the whole time, the throttle varying the speeds on slopes and through towns. It is possible to come down to walking pace on the top speed, and to climb all gradients above about 1 in 15 on the same notch. The only hills requiring the second speed between London and Folkestone, Dover, Hastings, Tonbridge, Hadlow, and London were Sandgate Hill, entering Folkestone, for a few yards, the Valiant Sailor Hill, between Folkestone and Dover, River Hill, Sevenoaks. Level crossings are scarcely felt, the long springs taking the shock.—Yours truly,

Roger H. Fuller.

Digitized by Google

MOTOR-WAGONS IN SOUTH AFRICA.

To the Editor of *The Motor-Car Journal.*

Sir,—I enclose an open letter for H. D. Fadelle, of Trinidad, in reply to his recent communication, which I trust you will be pleased to forward. Although at first sight this may not appear to you as being favourable to motor-vehicles, in reality it is so, as there is far more harm done to the motor industry by the class of vehicle which is being exported at present than by anything I could say. At the present time here in South Africa it is an impossibility to sell a motor-lorry of any description owing to the bad name they bear, and the high cost of

running them in comparison with horse-drawn vehicles. This is not the fault of the motor but of the designing, and until the makers at home wake up to the possibilities of the colonial trade it is far better for the industry that the vehicles should not be exported.

I enclose you a small photo of myself and wife taken on the road to Pietermaritzburg with our 4½-h.p. Renault car.—Yours truly,

J. A.

IMPROVEMENTS IN SMALL CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—I note with interest Mr. Palmer's notes in your issue of the 2nd inst., *re* improvements in his small car. I recently purchased one of these and am surprised at the work I am able to get out of it. When I first had it about eight miles an hour was all I could get out of it, and after one journey of a hundred miles it struck work. Finding it was losing compression, I had a new exhaust valve made and fitted it. Still the car refused to budge, so I took the piston out and had new rings fitted (this was the only part I did not do myself). After this the car went much better, but as I had to stop every fifteen miles for water I joined up the petrol and water tanks to make one water tank. In this particular type the tank on one side of the car is for water and the one on the other side is used for petrol. Having converted my petrol into a water tank, I joined up two tins which had been made to fit under front seat, and ran a small copper pipe from them to the carburettor (Longuemare). The capacity of tins is 4½ gallons. This gave me water capacity for thirty-five miles and petrol for 120 miles. However, I was not satisfied, and in looking through the *Journal* saw an advertisement of Ratcliffe Brothers, of Frinton-on-Sea. In reply I received some particulars of their M.O.I. valve which appealed to me, so invested in one. The result far exceeded my expectations, I got more pace and very much better hill-climbing capacity out of the car. Then I did away with the leather belting and substituted webbing ones which have now been run over 500 miles yet do not show any signs of wear nor have yet had to be tightened. I give them an occasional dressing of Gripoline. I can now get fourteen miles an hour out of the car, which is four years old and fitted with solid tyres.

Could any of your readers give me any idea of the road from London to Wrexham *via* Aylesbury, Buckingham, Kidderminster and Shrewsbury? Whether it is very hilly, good surface, etc.? Also which would be the least hilly route to Aylesbury? I have driven my car a hundred miles in eight hours, part of the way being to Cambridge *via* Epping, Bishop's Stortford and Great Chesterford. I should start from Stratford, and would prefer not to have to travel through London.—Yours truly,

East-End

IGNITION BATTERIES.

To the Editor of *The Motor-Car Journal.*

Sir,—It may interest some readers of the *Journal* to know that we have found and have been using for some time an electric battery which combines the portability of the dry battery with the lasting power of the wet battery. We refer to the cells known as "Transport" cells, and supplied by Siemens Bros. They have to be filled with liquid like a Leclanche, but in shape they are similar to a dry cell. They are watertight, and the voltage is better than the ordinary dry cell, while the resistance is much less. Our Mr. Arthur Hoare has recently driven 5,000 miles on an 8-h.p. De Dion with these cells. During that time the cells were rinsed out once with warm water, and fresh sal ammoniac solution was added. The cells have the advantage of being strongly made and reasonable in price, and we cannot think why they are not more frequently used in England.—Yours truly,

The Bombay Motor Car Co., Ltd.

KNOCKING IN ENGINE.

To the Editor of *The Motor-Car Journal.*

Sir,—In answer to "Puzzled Novocastrian's" letter in the last issue of the *Journal*, with regard to knocking in engine, I may say that I had a similar experience with an engine whilst testing the same, and which I eventually discovered (after taking the engine down four times) to be due to the connecting rod just touching the cam shaft. This only occurred when the engine was running at full power. On taking the engine down there was almost one-sixteenth of an inch clearance, but, either owing to a slight spring of the crank shaft or the centrifugal force, there was sufficient to cause a decided knock. No doubt if "Puzzled Novocastrian" carefully overhauls his engine something of this sort will present itself.—Yours truly,

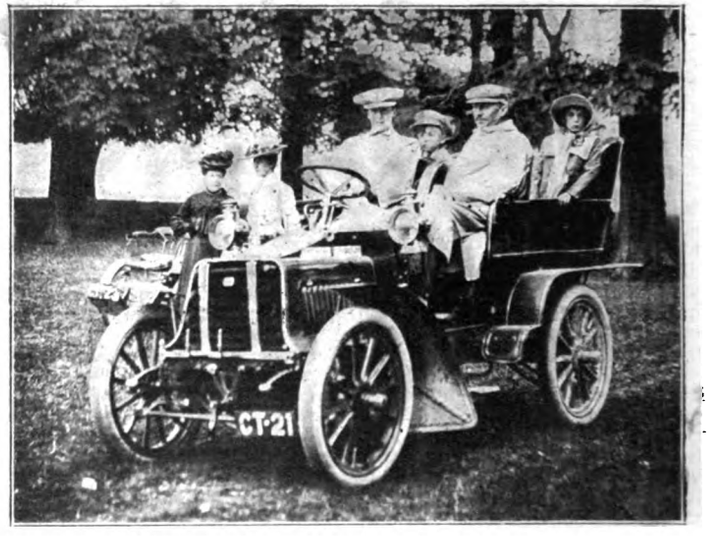
H. J. K.

USEFUL TOOL FOR CONNECTING UP DRIVING CHAINS.

To the Editor of *The Motor-Car Journal.*

Sir,—In a recent issue of the *Journal* you illustrated a tool for fastening chains to motor-cars after removal for cleaning or other purposes, under the column "Useful Hints." Will you be good enough to let me know the name and address of the maker of this article, or where it can be obtained, as I am unable to meet with it in the trade.—Yours truly,

Chas. Rata.



[The device we illustrated in our issue of the 30th April is not on the market. There should, however, be no difficulty in getting one made locally to suit the pitch of the chain on one's particular car.]

NON-SKIDDING DEVICES.

To the Editor of *The Motor-Car Journal.*

Sir,—*Re* Mr. G. T. Tucker's enquiry for side slip preventing device, may I say, as one who has spent some years, much thought, labour, and money on this question, that I advise this gentleman to get, if he can, a front-driving, front-steering car, the steering gear to be strong and of the irreversible type, and he may defy and forget side-slip.

This with plain tyres merely. If he would be ultra secure let him add any good non-side-slipping device to the back tyres, or, if he prefer, to all four. He will then find that the word side-slip will have no meaning for him. He will, of course, round corners at a reasonable pace,

The Hon. Mr. and Mrs. Maurice Gifford on their 12-h.p. Sunbeam Car, on which they won the Point-to-Point Race at Grimesthorpe Park. (See page 439.)

for no design of car and no tyre device will ever render one "fool proof" against a force known as centrifugal.—Yours truly,

Non-side-slip.

SOME NEW PUNCTURE PREVENTERS.

To the Editor of *The Motor-Car Journal.*

Sir,—We notice an article in your last issue dealing with some new puncture preventers, and amongst them you illustrate a type of nail-catcher hailing from Germany. We would like to mention that we

Digitized by Google

made and fitted something very similar to this contrivance to a Serpollet car, which answered the purpose exceedingly well. We have never publicly solicited orders for these, as we really did not find much demand, except from private users of cars who may have seen the attachment, and our only object in referring to the matter is to show that this preventive originated in England.—Yours truly,

THE ECLIPSE COPPER COMPANY.

NAIL PULLERS.—Replying to several correspondents, the Tigre nail puller illustrated in the last issue of the *Journal* is obtainable from Messrs. Fleming and Company, of 23, Rue Vicq d'Azir, Paris.

BOOKS ON MOTORING.—T. L. W. writes :—"Could any of the readers of the *Journal* tell me of some handbook of motoring such that a novice might master the intricacies of the motor with something akin to ease? I desire a book which might deal, not so much with the motor-cycle as with a light four-wheeled car whose management is comparatively easy." T. L. W. would probably find "The Motor Book," by Mr. R. J. Mecredy, and published by Mr. John Lane, suit his purpose.

OPENING FOR REPAIR SHOP.—F. C. would like to hear of a town, preferably on the south coast, where there is a good opening for a motor repair shop and garage.

KNOCKING IN ENGINE.—Replying to "Puzzled Novocastrian's" question, S. A. Jones recalls a similar case in which he found the connecting rod of the engine knocking against the crank case.

NON-SKID BANDS.—Replying to Mr. C. R. Hamilton, full particulars of the Lempereur non-skid bands can be obtained from Messrs. Mann and Overton's, Limited, Victoria Garage, 7A, Lower Belgrave Street, London, S.W.

THE STANLEY STEAM CAR.—Messrs. Galloway and Company of Gateshead write us that the British agency for the Stanley steam car is jointly held by their Mr. W. E. Galloway, Mr. F. Wilkinson, Manchester, and Mr. W. S. Paris, of Southport. They add that "Stanley's have such an enormous demand for their cars in the United States, that we have the greatest difficulty to obtain delivery here, and have to be satisfied with what we can get. At the moment we have just received two cars, but do not think there is much prospect of getting more for some time."

CLUBS AND ASSOCIATIONS.

THE LADIES' CLUB.

ON Wednesday the members of the club met the Berkshire Automobile Club at Holme Park, Sonning, near Reading, by invitation of Mrs. E. F. Rhodes. On the 23rd inst. the members have been invited by Mrs. Ainsley, of Hanworth Park, Feltham, Middlesex, to meet there.

BURY ST. EDMUNDS AND WEST SUFFOLK.

A MOST enjoyable run to Brandon has taken place in connection with the Bury St. Edmunds and West Suffolk Automobile Club. Amongst those assembled were Mr. H. P. Collis with his 8-h.p. De Dion Bouton car; Mr. Leofric J. Hunter (hon. secretary of the Bury Automobile Club); Mr. Reginald Lacy Scott, Mr. Kenneth W. Greene, Mr. W. Montgomery, and Mr. Bouttell on motor-cycles; and Messrs. A. E. Stockbridge and Hubbard. Setting off towards Northgate Railway Bridge, they proceeded along Fornham Road in the direction of Fornham St. Martin, Ingham, and Thetford, thence to Brandon.

LINCOLNSHIRE.

COMPETITION IN GRIMSTHORPE PARK.

DR. GILPIN, of Bourne, provided a novel and interesting afternoon's entertainment for the Lincolnshire Automobile Club on Saturday, upon the occasion of his annual picnic to its members. This was again held in Grimsthorpe Park, by permission of the Earl of Ancaster, and a more delightful spot than the shady recesses of trees by the side of the ornamental lakes it would almost be impossible to find. Here the motorists found refreshing rest, after their long ride in the tropical sun. The competition took the form of a point-to-point race, which was won by the Hon. Maurice Gifford, an ardent follower of the Belvoir Hounds—who with his wife (also a keen foxhunter) have been to the front in many a good run with the pack. Amongst those who put in an appearance were Mr. and Mrs. G. Linnell (Market Deeping), 10-h.p. Wolseley; Mr. and Mrs. C. W. Pennell, and Mr. and Mrs. W. R. Pennell (Lincoln), 16-h.p. Martini; Dr. and Mrs. Gilpin (Bourne), 8-h.p. Peugeot; Rev. M. and Mrs. Wilkins (Croft), Baby Peugeot; Dr. Cragg (the club sec.), (Billingboro'), Enfield Quad; Dr. Benson (Market Deeping), on a 6½-h.p. Humberette; Mr. F. Richardson (Sibsey), 10-h.p. Wolseley; Rev. T. A. Stoodley (Dowsby), 4½-h.p. De Dion; Mr. and Mrs. C. Holland (Boston), Baby Peugeot; Mr. R. M. Wright and Mr. and Mrs. Coombes (Lincoln), 9-h.p. Clement; Dr. and Mrs. Sharp (Brant Broughton), 12-h.p. Richardson; Mr. and Mrs. Shippey (Bourne), 3½-h.p. Gladiator; Mr. and Mrs. W. A. Tomlinson (Sleaford), 5-h.p. Bardon; Mr. W. B. Jevons (Market Rasen), 8-h.p. De Dion; Mr. and Mrs. A. A. Padley (Market Rasen), 10-h.p. De Dion; Mr. and Mrs. T. W. Mays (Bourne), 9-h.p. Wolseley; the Hon. Maurice and Mrs. Gifford (Grantham), 12-h.p. Sunbeam; Mr. George Godson (Asgarby), 6-h.p. M.M.C.; Dr. Reckitt (Boston), 4½-h.p. De Dion; Mr. Johnson (King's Lynn), 14-h.p. Clement-Talbot. Many personal friends of Dr. and Mrs. Gilpin were invited to meet the motorists, and altogether upwards of a hundred sat down to tea under the shelter of the trees. The competition took place afterwards. It was a point-to-point race (regulation speed). Nine entries were received for the event, and the cars were despatched in opposite directions at intervals of three minutes. Competitors were supplied with a tracing from the Ordnance map, which clearly defined the circular course to be negotiated. None of the competitors had previously been over the course. The total distance was ten miles, and the time allowed for completing it was 30 minutes. According to the conditions any competitor completing the distance in less time than the minimum to have each minute counted as overtime. The competition was under handicap, cars above or below 10-h.p. to be allowed or fined (as the case might be), one minute for each horse-power, and cars not carrying their full complement of passengers (four) to be fined one minute for each empty seat. The car whose net time approached nearest to 30 minutes to be the winner of a prize given by Dr. Gilpin. The following was the result of the running after making the allowances and deductions :—

	Time (mins.).
Hon. Maurice Gifford, 12-h.p. Sunbeam	30½
Dr. Sharp, 12-h.p. Richardson	31
Mr. A. A. Padley, 10-h.p. De Dion	32
Mr. R. M. Wright, 9-h.p. Clement	32
Mr. C. W. Pennell, 16-h.p. Martini	35

Other competitors, of whom no returns were made, were :—
Mr. G. Linnell, 10-h.p. Wolseley,
Mr. F. Richardson, 10-h.p. Wolseley,
Mr. C. Holland, Baby Peugeot,
Rev. T. A. Stoodley, 4½-h.p. De Dion.

Dr. Gilpin and Mr. T. W. Mays (Bourne) officiated as starters and timekeepers, and they were assisted in their duties by Dr. Benson, J.P. (Market Deeping), Mr. J. H. Carter, and Mr. E. Wherry.

MANCHESTER.

ON Saturday last the Manchester Automobile Club had a run to Nantwich, making, as usual, the Brine Baths Hotel their headquarters. The photograph given above of the assembled cars was taken on the

Digitized by Google

circular drive in front of the hotel. Sixteen cars took part in the run, and about fifty members and friends sat down to dinner.

LEICESTERSHIRE.

MR. E. G. MAWBEY, M.I.C.E., the president of the Leicestershire Automobile Club, entertained the members of the club to an "At Home" on Saturday at the Hall Hotel, Ashbourne. Twelve cars and two motor-bicycles participated in the journey through Loughborough, Kegworth, and Derby, to Ashbourne. After tea tennis and croquet were indulged in on the lawn, and Colonel L. L. Powell, the vice-president, proposed Mr. Mawbey's health in felicitous terms. Mr. Harding endorsed the remarks, and the toast was heartily pledged. Mr. Mawbey suitably responded. Among the guests were the following:-Mr. and Mrs. Mawbey, Miss Mawbey, Mr. Maurice Mawbey, Colonel Powell, Mr. and Mrs. S.C. Hobson, Mr. Binns, Mr. and Mrs. King, Mr. Orson Wright, Mr. and Mrs. H. B. Harding, Miss Muriel Harding, Mr. E. S. Harding, Mrs. Parker, Miss M. A. Mason, Mr. C. T. Mason, Mr. Earp, Mr. T. Peberby, the Misses K. and M. Peberby, Miss D. Cleland, Mr. T. L. Perkins, Miss Perkins, Mr. and Mrs. H. Warburton, Miss Dickinson, Mr. and Mrs. H. E. Barron, Mr. and Mrs. Baxter, Mr. and Mrs. G. H. Wait, Miss Wait, Mr. and Mrs. H. Bray, Mr. Bates, Mr. Whitby, Mr. S. F. Aspell, Mr. J. Haines, Mr. H. M. Stickland, Mr. T. Fisher, Mr. Alan McAlpin (hon. secretary).

SOUTH-EAST ESSEX.

ON Sunday, the South-East Essex Automobile Club had a run to Danbury. Among those present were Mr. and Mrs. Foster, 7-h.p. Daimler; Mr. and Mrs. Herrtage, 9-h.p. Darracq; Mr. and Mrs. Whittall, 5-h.p. Humberette; Mr. and Miss Sloman, 2¾-h.p. Humber fore-car; Messrs. Brice, 3½-h.p. Brown; Reynolds, 3¼-h.p. Lurquin-Coudert; Dives, 2¾-h.p. Brown; and Taylor, 2¾-h.p. Brown.

YORKSHIRE.

THE final result of the Pot Bank Hill Climb, reported in our last issue, as worked out by the handicaps, is as follows. Account is taken of the gross weight carried, and also the cubic capacity of motor-cylinder or cylinders, and the time taken ascending the hill.

			Handicap Marks.
Class 2.	1st.	Mr. Penrose Green, 8-h.p. De Dion ...	1106
,, 3.	1st.	Mr. Atkinson, 11-h.p. Talbot ...	1554
		Mr. Whitaker, 10-h.p. Lanchester...	727
,, 4.	1st.	Mr. Johnson, 12-h.p. Wolseley ...	1291
	2nd.	Mr. J. W. Smith, 12-h.p. Argyll ...	1176
		Mr. Williamson, 14-h.p. Talbot ...	1154
		Mr. Collenge, 14-h.p. Clement ...	882
, 5.	1st.	Mr. Bagshaw, 15-h.p. Napier ...	1266
	2nd.	Mr. Johnson, 16-h.p. Wolseley ...	1114

,, 7.	1st.	Mr. Martin, 1½-h.p. Bicycle ...	1970
	2nd.	Mr. Bacon, 2¾-h.p. Humber ...	1272

THE BATH ROAD MOTOR-TRAP.

WILLIAM AUSTIN, a labourer, of Cippenham, near Slough, was charged at Beaconsfield, on Monday, with placing wire across the Bath road, between Slough and Maidenhead, with intent to inflict grievous bodily harm on Mr. W. F. Partridge. The prosecuting solicitor mentioned that the offence was committed on June 19, and on that occasion the King and Queen visited Mr. Grenfell at Taplow Court, and returned to Windsor along the Bath road by motor-car. The circumstances of the occurrence have already been reported in our columns, and, after some evidence had been heard, the prisoner went into the witness-box to deny the charge. He was committed for trial.

CASES DISMISSED.

EARL FITZWILLIAM was summoned at Portsmouth for driving a motor-car to the danger of the public. P.C. Dawson stated that at 6.40 p.m. on June 4th he was at the Twyford Avenue end of Commercial Road, when he saw a motor-car coming from North End at a furious pace, and to the danger of the public. Witness stepped out into the road and held up his hand for the car to stop, but the driver went on. The number of the car was A 1488. After Earl Fitzwilliam and his driver had given evidence Mr. Staplee Firth addressed the Bench in defence. After private consultation the magistrates expressed the opinion that while it was a very proper case to bring forward they did not think the evidence was sufficiently conclusive, and they gave the defendant the benefit of the doubt, and the summons would be dismissed.

AT the Bradford Police Court, Claude White, of Emsworth, was summoned for driving a motor-car at a speed dangerous to the public. Mr. W. G. Purnell said that on the 25th of last month the defendant was seen coming down Bank Street into Market Street with his car at a rate estimated at eighteen miles an hour. Mr. Jones, a member of the Yorkshire Automobile Club, gave evidence to the effect that he saw the car going along Tyrrel Street and Bank Street, and turn the corner of Hustlergate. He considered the car was going at a dangerous speed considering the amount of traffic about at the time. After urther evidence had been given, the case was dismissed.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Kingston (Ireland)	No identification plate on motor-bicycle	£5, etc.
Hatfield	No identification plate on motor-bicycle	£1, etc.
Folkestone	No light for rear No.	£1, etc.
Edgware	Reckless driving	£10, etc.
,, ...	Disregarding the police	£5, etc.
Slough	No light for rear No.	15s.
Kingston.....	Excessive speed in Richmond Park	40s., etc.
Mortlake.....	Above legal limit	£5, etc.
Knutsford	Reckless driving	£5, etc.
Liverpool.....	,, ,,	£2, etc.
Marlboro' St., W....	,, ,,	40s., etc.
Liskeard	No light for rear No.	2s. 6d., etc.
South West London	Having improper identification mark	5s., etc.
Lambeth	Unilluminated rear number	£2, etc.
Chertsey	Reckless driving	£5, etc.
Manchester..	,, ,,	£3.
North London	Not producing licence when required	10s., etc.
Neath	Dangerous driving	10s., etc.
Shoreham	No light at rear	8s. 6d.
Warwick.....	Driving to the common danger	£5, etc.
Croydon	,, ,, ,, ,,	£5, etc.
Exeter	,, ,, ,, ,,	£3, etc.
West London.....	Allowing the plate number to become indistinguishable	£1, etc.

HELPING OTHERS RESULTS IN A FINE.

ON Monday, Thomas P. Duffin, Wolseley Works, Birmingham, was summoned for driving a motor-car to the common danger, at Warwick, on Saturday, the 2nd inst. Two Leamington cab drivers swore that the car was travelling at a dangerous pace, probably thirty-five or forty miles an hour. A Coventry car appeared to be racing with the defendants. Shortly after passing the cabs an accident happened, and a dog was killed by the Coventry car and a cyclist named Nicholls had his collar-bone broken. William Nicholls, Solihull, said that no sooner was the dog run over fifty yards away than the car bore down on him, and he could remember no more until he found himself in the hospital. Defendant said he was going at a reasonable pace, was on the right side of the road, and had the car under complete control. He did not know there was a second car behind until Mr. Spencer Hargreaves told him of it. The Bench fined defendant £5. A summons against the other driver, Lee, of Coventry, was adjourned for a week.

With reference to this case the Duryea Company write to say that Mr. Duffin was in front of the Coventry car, and upon noticing the accident returned to the scene and did all he could to assist, and took the injured cyclist to the hospital on his car. Thus he was really summoned because he acted as the Good Samaritan.

POLICE TRAPS.

THERE is a measured furlong on Barnes Common which has resulted in several summonses lately.

AT the foot of a hill at Merstham is a trap well designed to catch motorists travelling south.

NEAR the post office at Water Newton, 81 miles from London, is a stretch of 606 yards, with police at each end.

AN M.P.'S APPEAL.

MR. LOUIS SINCLAIR, M.P., who was recently fined at Marlborough Street (London), Police Court, for driving his motor-car in Regent Street on the wrong side of the refuge, asked the magistrate on Monday to increase the fine of 20s. to a guinea, because he wished to give notice of appeal against the decision, and the Act provided that there could only be an appeal where the fine exceeded 20s. Mr. Denman said he would increase the fine as desired, and Mr. Sinclair, having paid the additional shilling, gave formal notice of appeal.

THE Raleigh cycle upon which Mr. G. P. Mills lowered the Land's End to John o' Groat's record last week was fitted with Clincher motor-cycle tyres. British-made Clincher tyres were also fitted on the Talbot car driven by Mr. D. M. Weigel 2,000 miles.

THE

Motor-Car Journal

VOL. VI.] LONDON, SATURDAY, JULY 23, 1904. [No. 281.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IT was Sir Francis Jeune who, first among our public men, drew attention to the enlarged radius of social friendships which would be made by the motor-car. Not only are long tours now possible in districts hitherto unknown to the railway traveller, but social visits may be paid and business carried on at considerable distances from each other in times hitherto absolutely out of the question. Thus the automobile is becoming recognised in Society circles, and there is no doubt that this merit of the motor-car is the cause of much of its popularity with county families who spend much of their time in the country.

◆ ◆ ◆

The Gordon Bennett Race.

MR. AUSTIN'S suggestion that the A.C.G.B.I. might invite three selected firms to each build a motor-car for the Gordon Bennett race, instead of appointing the British team after an elimination race, has something to commend it and should have full discussion. The expenses of the eliminating test are a heavy drain upon manufacturers, and as our own firms are mainly concerned with touring cars rather than racers, the selection of the three firms would not, in the present state of things, be a very invidious matter. Those that were thus honoured might be asked to produce cars with minimum requirements in the way of speed, acceleration, stopping, starting, etc., and the minimum having been satisfied, no other test should be necessary. Whether further consideration justifies first impressions or not, the fact that Mr. Austin has brought the matter forward warrants its serious consideration.

◆ ◆ ◆

The Motor Horn.

SOME space has recently been wasted in a morning contemporary in a discussion in which correspondents have been advocating the disuse of the horn by motorists. We can quite understand that there are some people who would like to make the public roads as silent as possible, but where this is secured at the expense of the public safety, we totally disagree with these advocates. As a matter of fact, the normal noise of a car is almost sufficient indication of its approach, but where corners are frequent and traffic is thick, the use of some other noise becomes imperative. In fact, we would urge upon all motorists, when rounding sharp corners, to toot pretty freely before approaching the bend. As motor-cars become universal this injunction will become more and more necessary. For the consequences of two cars approaching from opposite directions, and each driving as near the centre of the roadway as legally possible, meeting at a bend, is too terrible to contemplate. Hence the suggestion that motorists should give little heed to those newspaper correspondents who seem to delight in raising scares and making suggestions simply so that they may write letters to the papers.

Numbers on Cars.

ACCORDING to one of the police inspectors of Dublin, the shifting of automobile numbers from one machine to another is becoming an intolerable and frequent nuisance. A case has just come before the courts in which the identification mark of a motor-cycle had evidently been duplicated by someone who had no claim to its use. The owner of the alleged number was discharged, and the jury handed a document to the Recorder to the effect that "In giving the prisoner a wide benefit of the doubt we wish to draw public attention to the defect in the laws regulating the numbering of motors and registration of same, and suggest the numbers be encased in or enamelled on the metal portion of the machine." This is a suggestion that the Irish Local Government Board may bear in mind should new legislation be proposed, and we would appeal to motorists on both sides of the Irish Sea to do all they can to put down such practices.

◆ ◆ ◆

The Motor and the Fruit Trade.

AN epoch in the history of the Clydesdale fruit trade has been inaugurated by the commencement of a new method of conveying the fruit to Glasgow market by motor-lorry. The other afternoon the first motor-vehicle arrived in Crossford, and several of the leading growers inspected it in the evening. Opinions are fairly well divided on the merits of the new service, though it is generally conceded that the motor-lorry is a step in the right direction. The great Clyde Valley is peculiarly situated, having no railway connection, and the methods at present in vogue for transit are felt to be slow and somewhat costly. Many growers take their fruit into Glasgow by horse-drawn vans—a distance of twenty miles—which necessitates early pulling of the berries. Others drive their fruit to the nearest railway station—one or two miles distant—for despatch by rail, but this necessitates a deal of handling of the baskets and consequent shaking and wasting of the fruit. The steam-motor is built to carry a load of seven tons, and will, of course, be speedier and cheaper.

◆ ◆ ◆

Successful Appeals.

ACCORDING to a return just compiled by the Motor Union, there have been eight appeals to Quarter Sessions since the passing of the Motor Car Act, and only in two cases have the convictions been upheld, both occurring in the county of Hampshire. It is rather remarkable that all these appeals have been in the south, and we would congratulate the solicitors engaged, Messrs. Frith, Vulliamy and Rushforth, as well as the counsel concerned, on the uniform success which has attended their efforts. It would appear that motorists appealing against the decisions of the magistrates have every reason to hope for success; hence the added inducement for contesting such convictions wherever possible. In only two cases, however, in which the conviction was quashed did Quarter Sessions give costs against the magistrates, with the result that four unfortunate automobilists have had to pay sums varying from £60 to £150 to disprove charges of which they were ultimately found to be innocent.

Digitized by Google

General Booth's Motor-car Trip.

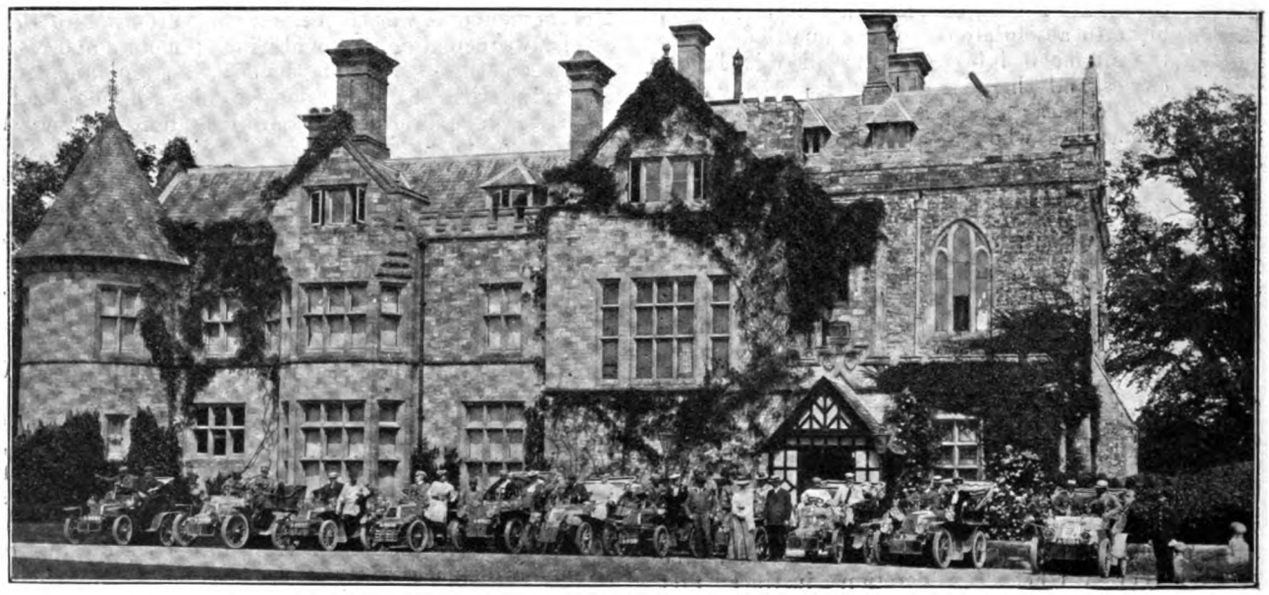
AFTER the recent interchange of courtesies between His Majesty and General Booth, of the Salvation Army, no surprise will be felt at the conversion of the latter to automobilism. Early in August he is to start on a "motor-car campaign" from Land's End to Aberdeen. It is to be a record "stop" run, for sixty-two towns and villages will be included in the preaching plan and an average of three meetings a day will be addressed from the vehicle. Many people in the country have expressed a desire to hear the General. They cannot get to the meetings in London. So Mahomet is going to the mountain—by motor-car.

◆ ◆ ◆

Shooting at the Tyres.

AT a resort on Long Island, in the United States, a police officer has fired a revolver at the tyres of an automobile which exceeded the speed limit. The bullet struck the body of the car and went between the legs of John Foley, the owner of the vehicle. The owner declares that he failed to hear the policeman's warning to slacken pace. Great indignation has been caused by this action amongst chauffeurs, who declare that it is unpardonable. The police, however, justify themselves on the ground of Magistrate Cornell's advice to shoot at cars driving at a dangerous speed. Lawyers and automobilists are unanimous in condemning the opinion expressed by Mr. Cornell as deplorable, and likely to incite the ignorant to deeds of violence under the belief that they will be afforded immunity. According to the New York correspondent of the "Daily Telegraph," in some quarters of the city automobiles are unable to penetrate owing to the hostility of parents, who declare that the streets are no longer a safe playground for children.

◆ ◆ ◆



The Folly of the Child.

THIS idea of the roadway as a playground for children is one that will have to be dispelled in this country as well as in America. In the rural districts children are beginning to recognise the danger of such foolhardiness, but in some of our towns the youngsters are too reckless for their safety, and a few serious accidents may be anticipated ere they learn wisdom. Often have we seen them rushing across the road in front of cars, or standing in the centre of the thoroughfare as long as they think they can do so with impunity. This folly will end in disaster, and we would invite our readers to send letters to local journals urging parents to seriously warn their families as to the risks they run in playing such games of bravado in the public streets.

◆ ◆ ◆

Cars and Commissions.

THE letter we publish this week from a firm in the automobile trade calling attention to the "journalistic" methods of a contemporary, opens a wide question of interest to both the trade and the public alike. Doubtless the journal concerned will make known to its readers the fact that its replies to their queries are likely, should business result, to enrich its coffers by a certain percentage. Otherwise Sir Edward Fry and those who have brought the subject of secret commissions to the front will find in the automobile press an instance with which to startle the country. Writing for ourselves, we deplore any such close association between advice to readers and commission from advertisers as is indicated in the correspondence referred to. The value of the correspondence columns is vitiated at once, and a blow struck at the regard in which the automobile press is held which will be regretted by all who have watched the progress of the motor-car papers with pride and goodwill.

The French Motor Tour in England.—The party at Lord Montagu of Beaulieu's Hampshire seat.

The Badminton Book.

THE third edition of the Badminton volume on Motors and Motor-driving comes to hand this week. This book, written by experts and edited by Sir Alfred Harmsworth, has been thoroughly revised, while the new legislation enforced since the publication of the original pages is fully referred to. Many books on motoring have lately made their appearance, but this maintains its place in the first rank—a place which the editor evidently intends it should retain.

◆ ◆ ◆

Accidents in the Streets.

FOR the year ended May 31st there were reported in the Metropolitan area no fewer than 22,113 accidents to persons and property in which horse-drawn vehicles were involved. No less than 7,327 persons were injured more or less seriously, so that there is much room for improvement if any effectual attempt is to be made to increase the safety of our streets. Fortunately the great proportion of the accidents thus recorded were only slight, but nevertheless some real effort to deal with the problem should be made ere the matter becomes more complicated by the introduction of new vehicles which will

Digitized by Google

probably confuse some old drivers who have not yet learned the secret of rapid movement. As we pointed out last week, however, there can be no adequate idea of the proportion of horse-drawn and motor-car accidents, seeing that no figures are available as regards the number of vehicles of the former class in use.

◆ ◆ ◆

Self-Propelled Traffic Problems.

SIR HERBERT JEKYLL, Assistant Secretary to the Board of Trade, has received, at the offices of the board, a deputation from the Roads Improvement Association. Mr. Worby Beaumont suggested that the Board should no longer sanction the erection of posts along the middle of roads. Such standards enormously reduced the usefulness of the thoroughfares and hindered the maintenance of the pavement in a uniform condition. Colonel Crompton urged the adoption of recommendation 50 of the Departmental Committee appointed last year, namely, that except in very special cases no tramway or light railway should in future be laid on any road which has not a minimum width of 33 feet, if a double line is contemplated, or of 27ft. if a single line is to be constructed. Mr. Rees Jeffreys argued in favour of a central authority specially charged with the duty of protecting the rights of general vehicular traffic. Mr. Howard Humphreys, referring to the growing importance of heavy motor traffic, pleaded that railway and canal companies should be compelled to keep their highway-bearing bridges up to the original strength, and should not be allowed to close them wholesale against self-propelled vehicles, as was being done in Staffordshire and Monmouthshire. Mr. Robert Todd, chairman of the Association, Mr. R. Noble and Mr. R. J. Smith also took part in the proceedings. Sir Herbert Jekyll promised to lay the representations of the deputation before the Board.

◆ ◆ ◆

The Dust Question.

THERE is no doubt that ere long the authorities will have to give heed to the representations of those who have given the subject of road making their attention. In connection with this there is no denying the seriousness of the dust nuisance, and blame should not entirely attach to the motorists. Cannot something tangible and systematic be done by our highway authorities throughout the country? Mr. Shrapnell Smith, who is to address the twenty-second congress of the Sanitary Institute at Glasgow on Tuesday next, will submit a resolution on this urgent question to the conference of municipal and county engineers. We shall be interested to see the form in which it will emerge, and trust that the conference will give full consideration to the matter.

◆ ◆ ◆

The Municipal View.

THE matter was referred to by Mr. A. T. Davis, the County Surveyor of Shropshire, in his presidential address to the Association of Municipal Engineers. He pointed out that fourteen or fifteen years ago it was a rare thing to see a steam-roller in the country districts. The introduction of such implements had rendered it possible for india-rubber tyred vehicles to use the roads without being unduly injured by loose sharp stones. At the same time Mr. Davis pointed out that the coming of the automobile had been followed by the dust nuisance. His view was that the real remedy must be founded on the principle "that prevention is better than cure," and the chief roads, at least, will have to be coated with an impervious material which will resist the sucking action of pneumatic tyres, and, at the same time, be strong enough, together with the foundation coat, to bear the heavy traction traffic. Of course there would still be wear and tear caused by iron-shod wheels and horses' feet, but the detritus produced from these and other causes would be reduced to a minimum. If this change is to be brought about without friction it must be done without adding materially to the present cost of maintenance, and Mr. Davis cannot think of any better or more economical material for the purpose than tar-macadam. There is nothing new in the principle of mixing tar with road metal, but many must be interested in the experiments of a member of the Association in the use of selected furnace slag for the purpose, which while yet warm from the furnace is made to absorb the tar, which it is alleged thoroughly saturates it and renders it waterproof throughout. If this material is found in actual practice to be sufficiently tough to resist the wear and tear of heavy traffic the fact that it can be produced at a reasonable cost will lead to its extended use.

The King leaving Hinton Admiral Station for Highcliffe Castle.

◆ ◆ ◆

The Police and Motorists.

"THE police in some parts of the country," writes Mr. Staplee Firth, "are simply taking the number of a motor-car, enquiring the name of the registered owner at the different County Councils, and then writing a formal letter to demand the name and address of the driver, under the pretence that they are making such demand under Section 1, Sub-section

Digitized by Google

3, of the Act of Parliament. Several motorists have assumed that the police are within their powers in doing this, and they have meekly given the name and address of the driver, the driver, in many cases, being themselves. Where they have had summonses issued against them, they have not had an opportunity of defending themselves, or procuring evidence for their defence, from the simple fact that there was no warning when the alleged offence was committed, nor had they any notion of it when subsequently charged with committing such offence. It cannot be too widely known that the police have no right to resort to these underhanded methods of trumping up cases against motorists. There are only two instances where it is necessary for the registered driver to give information. These two instances are, where the driver, on being stopped, refuses to give his name and address, or gives a false name and address, and the police are not empowered under any other circumstances to resort to this section of the Act. If a motorist sees a police constable hold up his hand to stop and he refuses to do so, even this circumstance is not one under which the police have any right to demand from the registered owner under the section above referred to his name and address."

◆ ◆ ◆

The French Motorists in England.

FOLLOWING the reference to the De Dion excursion in last issue we would add that the visit to Sir David Salomons was greatly enjoyed. From Maidstone the French motorists went to Brighton, and then, by way of Worthing, Arundel, and Chichester, they journeyed to Havant and Portsmouth. A day was spent at Southsea, some of the visitors taking advantage of the opportunity to cross to the Isle of Wight. At the seat of Lord Montagu our photograph was taken and then the tour was continued to Weymouth. On Saturday they reached Torquay and in the evening went to Paignton, where they were entertained to dinner at the new Hotel Redcliffe by Mr. Paris Singer. The English and French flags were arranged side by side, and immediately underneath was suspended a banner on which were inscribed the names of King Edward VII. and President Loubet. Mr. P. Singer presided, and the guests also included Dr. J. Alexander, Dr. T. H. Ward, and Mr. J. H. Cooper, the last-named occupying the vice-chair. The menu holders were in the form of miniature cardboard motor-cars. On Sunday a trip was made to Newquay, Monday and Tuesday being spent in Cornwall. The return journey was commenced on Wednesday, and the party is due in London to-day (Saturday).

Touring and Photography.

TOURING is now the order of the day among motorists, and in addition to well-filled luncheon baskets the presence of a reliable camera will add materially to the pleasures of a trip. Of course there is disappointment with photography, but it offers a means of recording incidents and scenes for reminiscence when days are short and nights are long. Among motorists are many amateurs of real talent, and we shall be glad to receive photographs of wayside scenes in which the automobile figures, as well as of historic places visited by our readers. There is an art in grouping cars with monuments and before notable buildings that is worth all the trouble, and the results of which we should like to see.

◆ ◆ ◆

Motor-Boat Racing at Southampton.

THE British International Cup Race for Motor-boats is to take place in the Solent on Saturday, the 30th inst. Challenges have been received from France and America for the cup. Altogether there are six classes—for boats not exceeding 15 ft., 20 ft., 25 ft., and 30 ft. respectively, launches of over 30 ft., and an unrestricted class for boats under 40 ft. Altogether there are twenty-six entries, the largest number being in the "under 25 feet" section. An eliminating contest is to be held on Friday. The start and finish of the race is to take place off Ryde Pier. So much interest is being taken in the event that the A.C.G.B.I. has chartered the steamer "Princess Helena" to enable members and friends to follow the race.

◆ ◆ ◆

The Motor Union.

AN extraordinary general meeting of the Motor Union was held in the Inns of Court Hotel, Lincoln's Inn Fields, on Monday. Colonel Holden presided over a large attendance, which included Earl Russell, Messrs. E. H. Cozens-Hardy, R. J. Smith (Glasgow), Arthur Dale (Gloucester), C. H. Dodd, and Dr. J. Hopkins Walters (Reading). The draft rules, which were deferred from the meeting held at the time of the Exhibition at the Agricultural Hall in March, were considered, and, after considerable debate, passed. A General Purposes Committee was also appointed to advise the General Committee as to any steps which may advantageously be taken to increase the membership and usefulness of the Union.

◆ ◆ ◆

A Motor Disease.

MOTORPATHIA cerebralis is not to be found in the official nomenclature of diseases issued by the College of Physicians, and yet there are a good many patients who have suffered from it during the last few years. Every innovation that appears in our midst, says the "Medical Press and Circular," brings its own drawbacks with it, and since motoring came into fashion a number of its devotees have found out that even the joy of spinning through the air at 20 or 30 miles an hour has to be paid for in some shape or form. The yachtsman suffers from mal-de-mer, the mountaineer from mal-de-montagne, and automobilists from motorpathia cerebralis. The vibration of the car, especially at high rates of speed, produces in some the same temporary disorganisation of function in the semi-circular canals, and their nervous supplies, that the motion of the ship does in the sea-sick passenger, and nausea, giddiness, and headache are the result of a fast journey over a rough road. Fortunately, the art of the car-builder is able to reduce this disadvantage to a great extent by providing large and powerful springs, but some people, especially ladies, suffer considerably from the jolting and swinging of the car. The frequent use of the car in every-day practice in a district in which the roads are bad seems to tend to upset the normal equilibrium of the nervous system, and unsteadiness of gait and shakiness of the hand result.

THE Midland Hotel at Manchester has just been made the headquarters of the Manchester Automobile Club.

DEPEND upon the policeman to exaggerate your speed and the owner of a different make than yours to doubt it.

A GARAGE has been opened at High Street, Theale, Berks, by Mr. H. G. Sweetman, of Reading. Petrol is stocked, and all classes of repairs can be undertaken.

LAST Saturday the Eastern Counties Automobile Club held a gymkhana at Stutton Lodge, Ipswich, by invitation of Mr. and Mrs. Godolphin Milbank. Seventeen cars took part in the event, Dr. Moseley acting as judge and general superintendent of the race, Mr. Milbank as starter, and Mr. Ching as timekeeper.

AN exhibition of motor cars, motor-cycles, accessories, etc., will be held in the Corn Exchange, Oxford, on Wednesday next and the two following days. It will be under the management of the Oxford Cycle and Motor Car Company, and will be in connection with the meeting of the British Medical Association in the University town.

IN the House of Commons Mr. Scott Montagu has proposed the exemption from duty of alcohol required for motive power, lighting, heating, and manufacturing purposes. The Chancellor of the Exchequer said that, though he could not accept the proposal as it stood, he would accept the suggestion that they should have a committee to look into the matter.

THE arrangements for the haulage of coal on the Huddersfield Corporation tramways from Hillhouse railway siding to the works of Messrs. Marten, Sons and Company, Limited, Wellington Mills, Lindley, are nearing completion. The coal will be conveyed in motor-driven wagons, for each of which two men will be required. The distance covered will be about three miles.

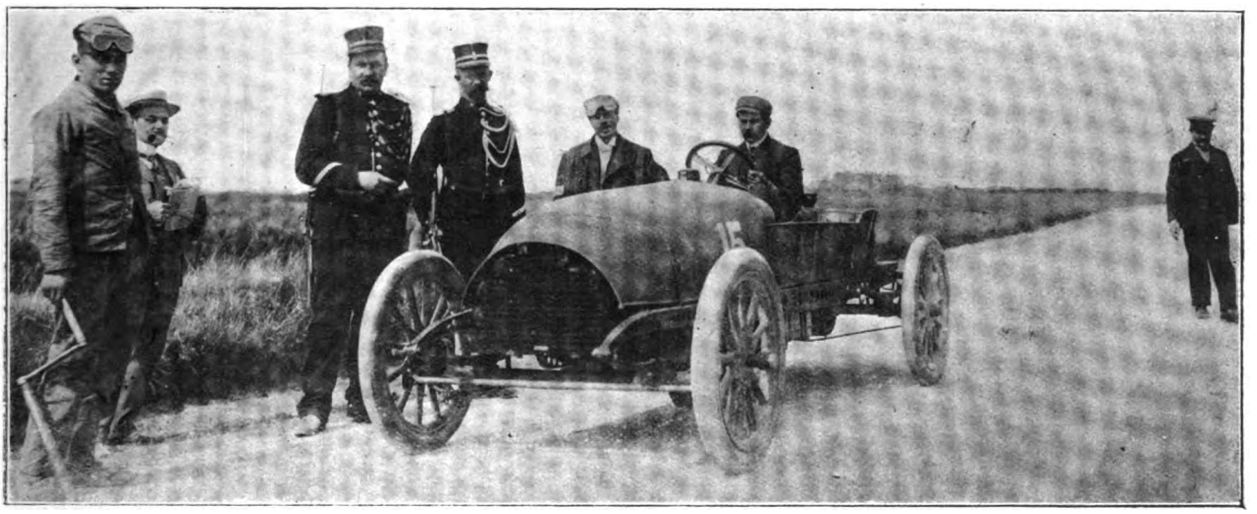
SPEED TRIALS AT OSTEND.



THE automobile race meeting at Ostend, organised by the Automobile Clubs of Antwerp and Flanders, was commenced on Thursday of last week, the day being devoted to the five-kilometre speed trials for tourists on the Nieuport-Snaeskerke road. No accident marred the day's sport, which was witnessed, among others, by Prince and Princess Albert of Belgium. The whole length of the course was sprinkled with Westrumite. The first event was for *chassis* costing less than £160, which proved a victory for Gachet on a Boyer (time 6 min. 18 sec.). The class for cars under £240 brought out four entries—three Vivinus and a Boyer—the winner being Count de Liedekerke on one of the first-named vehicles (5 min. 24 sec.). Eight entries were received for the section for cars costing less than £400, the competitors including Pipe, Vivinus, Darracq, Serpollet, Belgian Gobron, Clement-Bayard, and Corre. The best time was made by Elskamp on a Gobron (4 min. 32 sec.), Joostens (Clement-Bayard) being second in 6 min. 8 sec. A large entry list was received for the class for cars costing under £600, the first three places being secured by Rochet-Schneider cars. Kinet proved the winner in 3 min. 47 secs., La Minne taking 5 secs. longer. The category for cars under £800 brought out a Fiat, a Serpollet, two Mors, and two Automotrice cars, the event proving a victory for Deville on the steamer, his time being 4 min. 17 secs. Only two cars competed in the class for cars under £1,200. Hautvast, one of the Belgian Gordon Bennett team, on a Pipe easily beat Delesalle on a C.G.V., the former covering the five kilometres in 3 mins. 14 secs., as against 4 mins. 40 secs. taken by the latter. The section for cars over £1,200 brought out two Mercedes, one driven by Baron de Caters and the other by Baron Jochems. The event was won by De Caters, whose five kilometres in 2 mins. 52 secs. was the best time of the day.

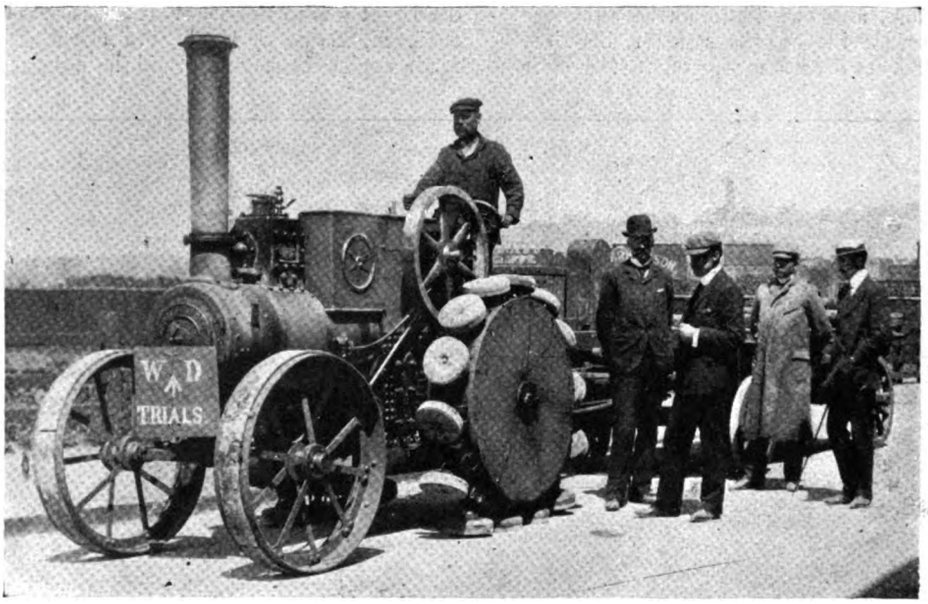
Friday, the 15th inst., was devoted to the racing section, the programme consisting of a ten-kilometre speed trial on the Nieuport-Snaeskerke road, parallel with the canal. It was in good condition, but comprised two sharp turns, one near the start and the other about midway. The weather was splendid, and some exceedingly fast speeding was enjoyed by the spectators. The first event was for motor-bicycles under fifty kilos., and brought out half a dozen competitors. The best time was made by Renè on a Red Star (7 min. 28 sec.). Pilette on a De Dion won the class for motor-cycles, under 250 kilos, in 7 min. 29 secs., and Edmond on a Darracq the voiturette section, in 6 min. 14 sec. The category for light cars was a battle between Clement-Bayard and Darracq, Hanriot on the former beating Hemery (time 4 min. 52 sec.). The heavy car class brought out Rigolly (Gobron-Brillié), Baras (Darracq), Coppee (Panhard), Gabriel (De Dietrich), and Le Blon, who has hitherto driven Serpollet steam cars, on a Hotchkiss. Rigolly proved the victor, he doing the ten kilometres in 4 min. 39 sec., equal to a speed of nearly 81 miles an hour. Baras was second in 4 min. 43 sec., while the slowest man did the distance at the rate of 75 miles an hour.

Saturday was devoted to a fifty-mile tour from Ostend to Bruges and back *via* Blankenbergh. About thirty competitors took part in the run, including the Baron de Caters, Messrs. Serpollet, Baras, Gabriel, Rigolly, Le Blon, Edmond, and Deville. On Sunday a banquet was held, and in the evening the visitors were received by Baron de Caters at the Hotel de la Fontaine, where a cinematograph display of the Gordon Bennett race was given.

Some very high speeds were attained in the standing mile trials, which were held on the Snaeskerke road on Monday, the Darracq cars, after a spell of bad luck, retrieving their position by securing several world's records. In the racing section the motor-bicycles led off. Olieslagers, on a Minerva, was first, and created a new record, viz, 59 2-5 sec., Seguy, on a Griffon, being second in 1 min. 6 2-5 sec. In the heavy motor-cycle class Rigal, on a Buchet tricyle, beat Pilette on a De Dion; time, 1 min, 16 1-5 sec. In the voiturette category Edmond, on a Darracq, established a new world's record, covering the mile in 1 min. 1 4 5 secs A new record for light cars was also established by Hanriot, who, on his Clement-Bayard, did the mile in 56 sec. dead. It was in the heavy car class that the fastest speeds were achieved. Baras, who had had a new engine fitted to his Darracq, made a splendid start, and did the mile in the marvellous time of 48 3-5 secs., equal to over 74 miles an hour, Rigolly (Gobron-Brillié) being second in 50 1-5 sec., and Le Blon (Hotchkiss) third in 1 min. 25 secs. The times for the kilometre from a standing start and for a flying 609 metres were also taken. Baras covered the former in 35 secs., and Rigolly in 36 3 5 secs.; while the 609 metres were done by both in 13 3-5 secs., or a rate of nearly 105 miles per hour.

In the tourist section, Landrin on a Serpollet was first in the under £400 class (time 1 min. 30 sec.). La Minne, on a Rochet-Schneider won the under £600 class in 1 min. 18 sec., while in the under £1,200 class Baron de Caters' 90-h.p. Mercedes, with four persons up, covered the mile in 1 min. ¾ sec. The day was beautifully fine, with a slight wind in favour of the motorists. A kilometre of the course had been sprinkled with a tar solution to keep down the dust, which it did most effectively.

Hanriot on the Clement-Bayard on which he established a new World's Record for Light Car



THE Duryea carriages are the subject of a new pamphlet published by the Duryea Company, of Coventry, in which the history of the car, its development from early types to the present excellence and its construction, form the subject of chapters supplemented by useful hints on the management and care of this vehicle, extending to upwards of sixty pages. The book will be of general interest to motorists and of particular value to users of this type of car.

THE PEDRAIL TRACTOR.

THE exhibition of Mr. Diplock's latest design of Pedrail engine, which he calls the Pedrail Tractor, 1904 type, at the Royal Agricultural Show last month, attracted great public attention. On the 30th ult. an interesting preliminary trial of this tractor took place at Lincoln, in the presence of three officers of the Mechanical Transport Committee of the War Office. After showing the movements of the Pedrail on rough ground, turning a quick circle, etc., it was attached to a lorry loaded with pig iron, the total weight of the tractor and lorry being 9½ tons gross. This load was hauled for a distance of about four miles, in the neighbourhood of Lincoln, including a long hill with an average gradient of 1 in 12, and in parts 1 in 8. The Pedrails throughout this trial worked with remarkable ease and certainty, and it was quite evident in mounting the hill that the adhesion of the Pedrails was sufficient for a much heavier load. This conclusion was verified in a striking manner on the return to Messrs. Fosters' works at Lincoln, where the machine was built.

The tractor was attached to a traction engine weighing 11½ tons, with the driving pin left in, so that in hauling the engine it was necessary to turn the gear wheels of the 11½-tons

The Pedrail Steam Tractor.

engine backwards, thereby adding very considerably to the resistance of the load. A dynamometer was placed between the tractor and load, and the average draw-bar pull registered was over one ton. The brake on the 11½ ton engine was then screwed down until the resistance on the draw-bar registered an average of just over two tons, at which point the resistance of the load proved sufficient to pull up the tractor. It may be mentioned, for the benefit of the uninitiated, that on a first-class, hard, level road (taking road resistance at 60 lbs. per ton) a draw-bar pull of two tons is equivalent to pulling a load of about 75 tons.

The interesting feature of this trial lies in the fact that the tractor was pulled up by want of sufficient cylinder power in the engine, and not by want of adhesion. Throughout the trials the Pedrails never skidded or slipped, and this notwithstanding that the heaviest trial took place on ground with a loosened upper surface about two inches thick in dust.

Our illustration shows the Pedrail tractor and lorry on its return journey, with Mr. Diplock, Major Lindsay Lloyd, Major Donohue, and Major McNalty (reading from left to right) standing in the foreground. Mr. Diplock is now fitting this same tractor with double cylinders to increase the power, and as soon as this is done further War Office trials will take place —probably in the Long Valley, Aldershot.

CONTINENTAL NOTES.

The Liedekerke Cup.

Count J. de Liedekerke has just offered a cup to the Belgian Automobile Club for an International touring competition. The Count proposes that the trial shall take place in Belgium annually, and extend over a distance of at least 250 miles without any neutralisations. The contest, which is open to touring cars with engines of a maximum capacity of 3·75 litres, and of which the stroke must not be less than the bore, will be restricted to manufacturers, who may enter a maximum of three vehicles each. The cars must be in touring trim, and the one which covers the course in the best time will be declared the winner. The first competition is to be held next year.

◆ ◆ ◆

A German Speed Indicator Competition.

The German Government has decided to organise, in conjunction with the Mid-European Motor-Car Club, an international competition for the best speed control and indicator apparatus. A Commission has been appointed to draw up the necessary conditions, having regard to the following points:—Every motorist knows the difficulty of fixing the travelling speed of a car, particularly on open roads where objects for comparison are not easily found, while the police cannot always guess or measure the speed correctly, even with the best stop watches. At present a driver is often fined although innocent, the police not acting from malice, but owing to incorrect information. The Government authorities intend to lay down regulations to prevent furious driving and police persecution to protect both the public and the motorists, since the latter represent an important movement. It shall be made possible to fix the speed approximately to enable police and judge to punish the offender, but not to fine the motorist who is the victim of malice or ignorance. The Commission is aware of the difficulties in the way of designing a reliable apparatus, also with regard to laying down the conditions as to how the speed indicator shall register the results. The inventor's scope must not be limited to a great extent, but a few main points must be laid down beyond which the construction must not deviate. The rules are being drawn up by a sub-committee.

◆ ◆ ◆

Motor-Car Regulations in Austria.

The Provincial Government of Lower Austria has issued a decree empowering the local authorities to prohibit the passage

Digitized by Google

of automobiles over any roads or parts of roads where, in their judgment, the traffic of such vehicles would endanger the safety and comfort of pedestrians and others using the roads. This is the first action taken in Austria for the regulation of motor traffic, and is meeting with the greatest opposition from automobilists. They declare it will have a most injurious effect upon the industry.

◆ ◆ ◆

The Calais-Dover Motor-Boat Race.

The great race for motor-boats from Calais to Dover which has been arranged by the French Automobile Club will take place on August 8, provided the conditions are at all favourable. According to the official programme the competing vessels will be in three classes—racers, cruisers, and motor fishing-boats—and in the first two classes there will be a further subdivision to ensure that vessels of the same size and power shall be in competition. There are said to be already over eighty entries, including Panhard, Hotchkiss, De Dietrich, Serpollet, Napier, Wolseley, and Herald.

◆ ◆ ◆

Another Hill-Climbing Competition.

The Automobile Club Bourguignon will hold a hill-climbing competition on Sunday next on the Val-Suzon hill, near Dijon.

The Circuit des Ardennes.

Considerable interest is being shown in the Circuit des Ardennes races, which are to be held on Sunday and Monday next, and already all the available sleeping accommodation in the immediate neighbourhood of the starting point is reported to have been secured. Sunday will be devoted to the race for voiturettes and motor-cycles. The circuit is not the same as that chosen for the cars, having a different starting-point, and is only thirty miles round, so that the competing machines will have to traverse the course five times to make up the total distance of 240 kms. (149 miles). The itinerary is as follows :—Arlon, Attert, Habay-la-Neuve, Ettale, Vance, Stockem, Arlon. There are no level crossings, and there will be no stops for controls. The start will be at 7 a.m., the machines being despatched at intervals of one minute. The race for the heavy and light cars will be run over a different course on Monday, the route being Bastogne, Ourthenville, Champlon, St. Hubert, Recogne, Neufchateau, Habay-la-Neuve, Martelange, Bastogne. As the total distance to be covered is 600 kms. (376 miles), the circuit will have to be traversed five times, the start and finish being at Bastogne. The same as Sunday's run, there are no level crossings, and there will be no stops for controls. Some exciting racing is expected, as all the leading firms are competing, while England will be represented by the Wolseleys and the Napiers. It is reported that Jarrott has decided not to run, and that his mechanician, Bianchi, will take his place. The German Daimler Company is not competing officially, but Mr. Andrew Fletcher has entered a 90-h.p. Mercedes. Duray, who has hitherto driven a Gobron-Brillié, will make his appearance at the wheel of a Darracq.

The Ventoux Hill Climb.

The meeting at Ventoux, organised by the Vaucluse an Automobile Club, will take place on the 27th and 28th August. The first day will be devoted to a tour to the summit of the hill, while on the second there will be a timed contest for both racing and touring cars. There is a difference in height above sea level of 5,000 ft. between the starting and finishing points, the average gradient being 13 per cent.

◆ ◆ ◆

More Alpine Climbs.

On Thursday, last week, M. René Nagelmachers succeeded in driving his 60-h.p. car over the Col du Glandon, which separates the French department of Isère from Savoy. The highest point is 6,560 ft. above the sea level.

◆ ◆ ◆

The Dust Nuisance.

The French Automobile Club has just voted small sums ranging from £12 to £20 to the local authorities of Trouville, Deauville, and Beuzeval-Houlgate towards the cost of dust-laying experiments.

MESSRS. A. DEACON AND SON have opened a garage in Llandudno capable of accommodating 30 cars, fitted with every convenience, including inspection pit with electric light and plenty of room for washing cars.

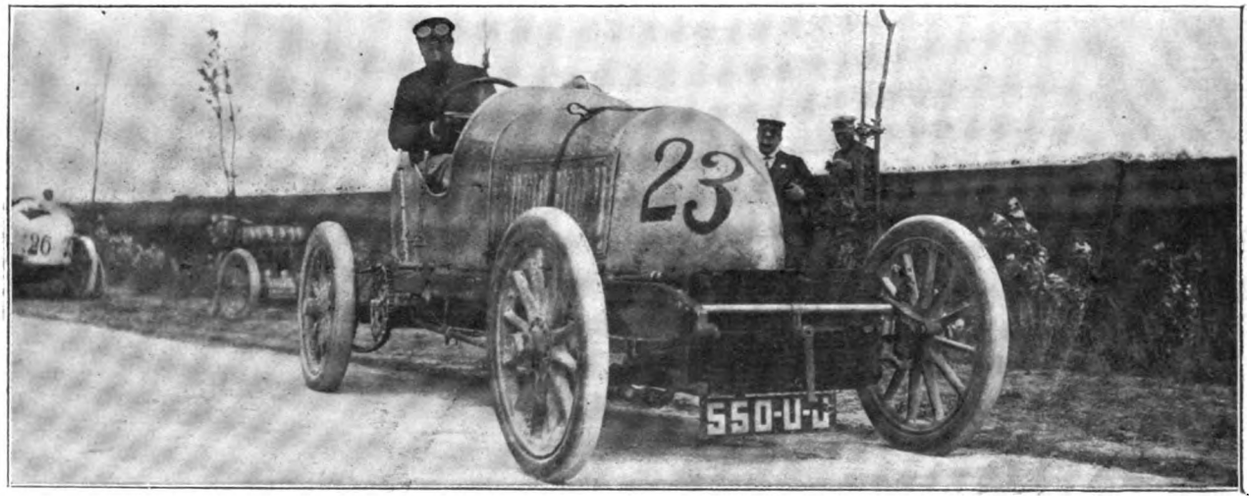
IN the annual report of the British Electric Traction Company, Limited, the directors state that they have given much attention to the question of motor haulage and motor-omnibuses, and have entered upon several experimental enterprises, but, so far, without obtaining satisfactory results, and all the expenses incurred have been written off. Experience, however, has been gained in connection with the new industry which is likely to be of value in future.

Digitized by Google

PREPARATIONS FOR DRIVING.

(*Concluded from page* 434).

A YEAR'S hard service will usually develop in the steering mechanism of a car a noticeable amount of lost motion, unless all moving parts are perfectly dustproof and exceptionally well lubricated. Where serious backlash is found to exist it will probably be partly in the irreversible device at the base of the steering column, and partly in the ball joints or pivots between the steering column. The newer worm and worm wheel steering gears have means for throwing the wheel into deeper engagement with the worm and for thus approximately correcting the wear, which is minimised by packing the gear in lubricant within a perfectly tight case and by hardening the worm surfaces. The older ones, however, are many of them without means for adjustment, and, since the worm is usually fast to the column or integral with it, the elimination of the backlash is well nigh impossible. Multiple-threaded screw irreersible devices are now made adjustable by the use of a split nut with its halves capable of being drawn together, or by some equivalent device, and wear may be corrected, but the sector and gear devices which were formerly much used were generally made unadjustable and were frequently entirely unprotected from road dirt.



A review of the past year's experience with the tyres of the machine may call to mind one or more which required unduly frequent pumping, and these, or their inner tubes, should be removed and carefully inspected for leaks, which, if found, should be repaired. It may be that the valves were the only source of loss of air, and the cost of putting in new ones is very trivial. If any of the tyres exhibit weakness, new ones should be ordered in anticipation of their failure. In case any presumption may have arisen in the past that the size of tyres used on the machine was too small, a good opportunity may be afforded at this time for the changing of the wheel rims to admit of the heavier tyres.

It is not unlikely that a season's use may have had its effect upon the wheel and axle bearings. Cups or cones may have begun to cut, or a ball or two may have broken, and the adjustments may be in need of attention. At any rate, it is well to be assured of the condition of these important bearings. The adjustment of ball bearings is very easily accomplished, but roller bearings usually depend upon the removal of thin washers to counteract the wear, and a little more more skill is required. An examination of the change-speed gear may bring to light the fact that the bushings of the gear shafts are worn so that perceptible looseness is apparent. The gear faces which engage on the sliding system may have become battered by constant use and may require re-beveling. If anything is found badly worn its lubrication should fall under suspicion.

Owners of machines who note the great improvement in lubrication methods which have been embodied in the latest cars may become dissatisfied with their own oiling arrangements, which, while effective enough, may lack convenience. It is perfectly possible to apply magazine oilers to vehicles originally unsupplied with these conveniences, as there is on the market a variety of such devices provided with as many feeds as required. They may be obtained of the gravity type, of the power-driven pump variety, or of the kind in which the oil is forced positively by means of the exhaust pressure.

One of the necessary preliminaries of the season's running is a thorough cleaning out of all oil passages, lubricators, and cases containing oil for splash lubrication. The use of paraffin is most effective in this. It should be allowed to run rapidly through oil cups until all dirt and gum is removed, and it should be forced through magazine oilers and their tubes, and through all oil passages and oil pockets. Gear and crank cases should be liberally supplied with paraffin and the liquid then rapidly drawn off, when it will carry with it the minute metal chips and dust which frequently accumulate, as well as, in solution, the gummy portions of the oil. When all internal parts are clean, and all oilways clear, one may expect lubrication to be effective.

After all necessary mechanical work has been accomplished, and not until then, the painting of the body may be undertaken. Unless the colour is to be changed or some new woodwork has been added, a slight amount of "touching up" with the colour may be all that is necessary before applying the varnish. If any additions of lamps or horns, golf baskets or hampers are contemplated, it is well to have them in mind before the finishing touches are applied by the painter.

Speed Trials at Ostend. Le Blon on the Hotchkiss. (*See page* 445.)

THE Automobile Club of Argentina has just been formed in Buenos Ayres.

WE understand that the Gamage issue was more than doubly applied for.

THE Corporation of Hythe has determined to put a stop to motoring through the Mayor's Avenue, which is to be exclusively utilised for promenading.

MESSRS. DEAN AND BURDEN BROTHERS, LIMITED, have been registered with a capital of £3,800, to acquire the business of motor manufacturers and engineers carried on at Friary Lane, Salisbury, as Burden Brothers, and to carry on the business of engineers, manufacturers of motors of all kinds and dealers in motor-cars, etc.

Digitized by Google

THE 20-H.P. HUTTON CAR.

THE 20-h.p. Hutton car, which formed one of the great attractions at the Motor-Car Show at the Agricultural Hall, was briefly dealt with in the *Journal* for the 26th March last. It comprises so many novel features, however, that we have taken the first opportunity of

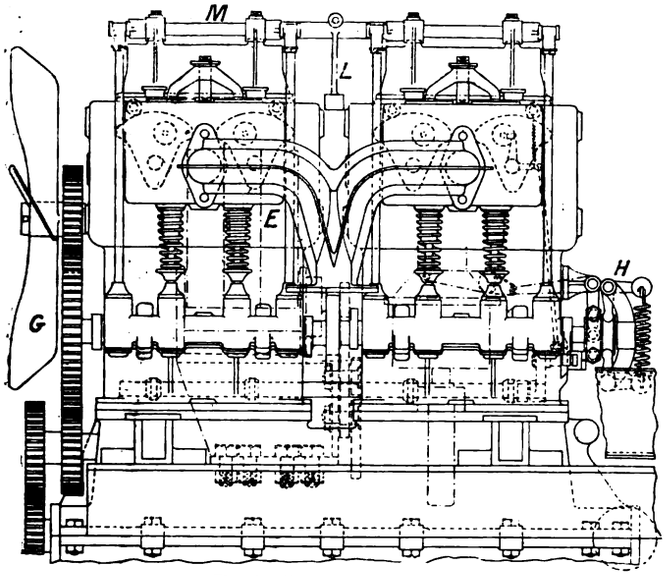


Fig. 1.—Elevation of Motor.

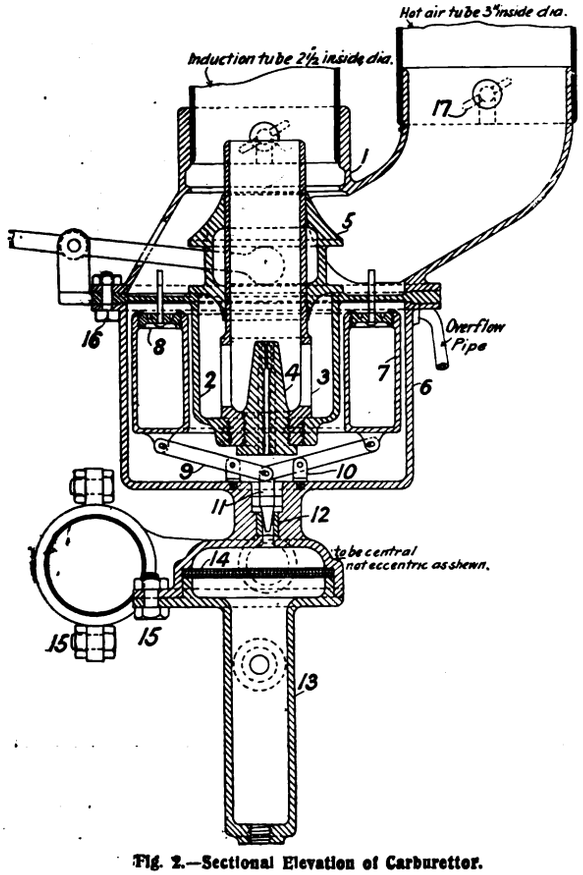

Fig. 2.—Sectional Elevation of Carburettor.

referring to it at greater length. The car, which is constructed in accordance with a number of patents granted to Mr. T. W. Barber, M.I.M.E., has been designed with a view to provide simpler methods of control for the mechanism and less expenditure of physical effort on the part of the driver. Now that cars of 20 and 30-h.p. are generally used for touring purposes, it calls for a good deal of nerve and muscular power to keep such vehicles under control. Of course, nerve cannot be supplied mechanically, but, as will be seen by the subsequent description, it is possible to supply mechanical devices which will enable a person deficient in physical resource to vary the speed of the car—for instance, put on the brakes, etc., with little more than the movement of a finger. The concentration of all the means of control on the steering wheel is also a central feature of the new vehicle.

The frame is constructed of nickel steel members, hydraulically pressed to shape, and riveted together at the cross junctions with gusset-plates. The springs for the steering axle are provided with elastic dumb irons, which add considerably to the light running of the car. Cross members are placed where the twisting strains, due to the attachments of the springs, are transmitted to the frame, enabling the latter to be constructed of a very light section, and at the same time increasing its rigidity. The engine (Fig. 1), which is nominally rated at 20-h.p., has four-cylinders, 90 mm. dia. by 124 mm. stroke, cast in pairs. The inlet valves are mechanically operated, and are placed on the top of the cylinders, the exhaust valves being in the usual position at the side. All the movements for the valves and sparking are obtained from one cam shaft, at one end of which the governor is placed, and at the other end gear

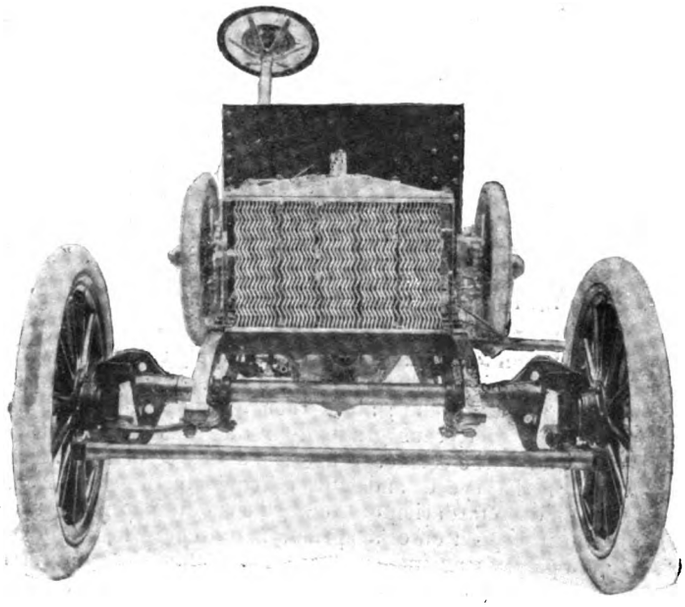

Fig. 3.—Front View of 20-h.p. Chassis, showing Radiator.

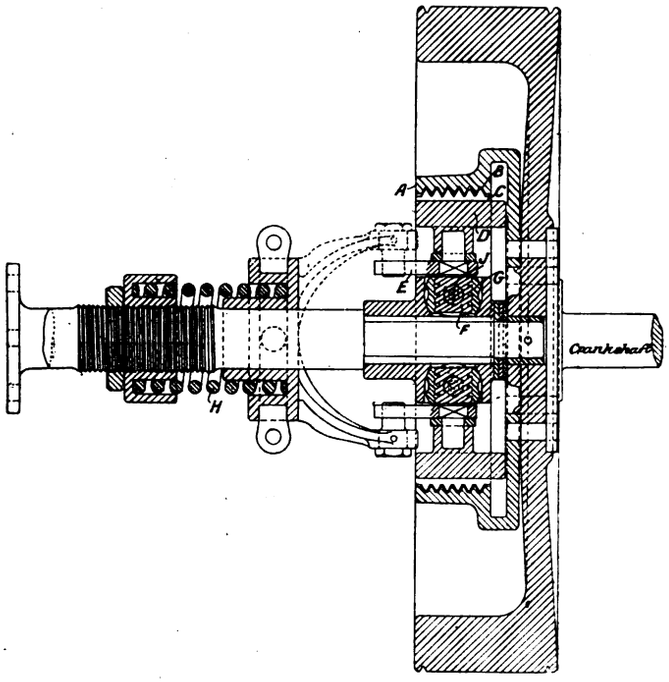
wheels for obtaining motion from the crank shaft, and also for conveying movement to the gear-driven fan G. The inlet valves are provided with a variable lift adjustment by means of eccentrics, operated from a rocking arm L, on a shaft M, and controlled from the steering wheel. Means are also provided to advance and retard the time of sparking. The engine and its entire accessory mechanism is carried elastically on the frame of the car by four spiral springs which fit into sockets. By this means the engine is freed from the stresses due to distortion of the frame of the car, and the necessity for a flexible connection between the clutch and gear-box is eliminated. The normal speed of the engine is 900 revs. per minute, the maximum being about 1,500 revs.

Figure 2 shows a sectional elevation of the carburettor, which is controlled direct by the governor in such a manner that the richness of the mixture is varied automatically, according to the speed of the engine and the power required. This is accomplished in the following manner:—The body of the carburettor (6) contains an annular float (7), surrounding the jet (4), which is in the centre of an induction tube (3). The latter which is perforated in the end adjacent to the jet, projects into the main induction pipe of the engine. Sliding on the induction tube is a throttle-collar (5) operated by means of a rocking

Digitized by Google

lever, which is coupled to the governor. As shown in the drawing, this collar has shut off all access to the induction tube (3); at the same time leaving a full passage for air up the main induction pipe. This is the position which the collar would assume when the engine tended to race or was set by hand to run at the minimum speed. When starting the engine, the governor raises the collar to its highest position and it will then prevent air passing direct into the main induction pipe; all the air will, there-



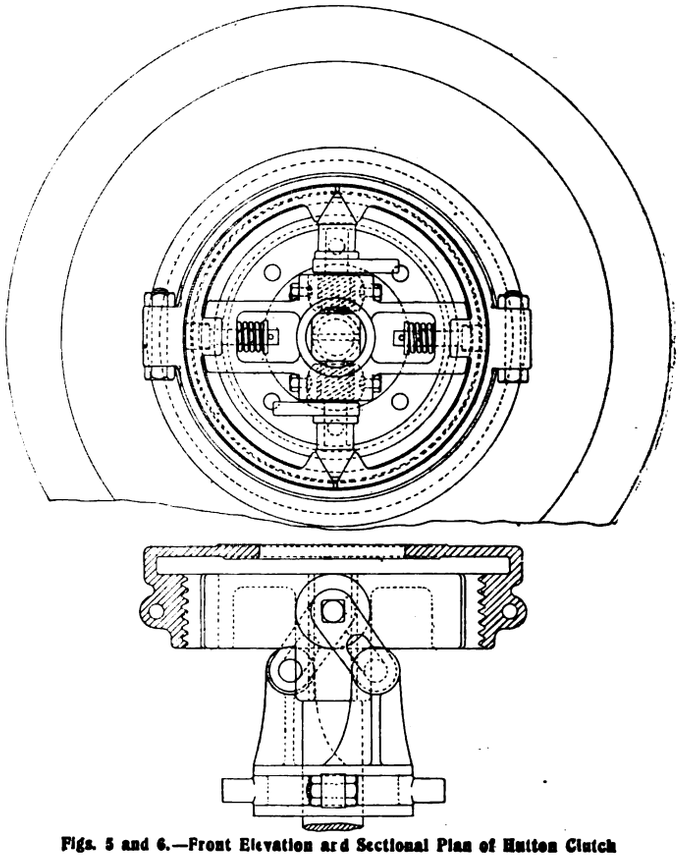


Fig. 4.—Sectional Elevation of Hutton Clutch.

fore, pass through the induction tube and supply the engine with a rich explosive mixture for starting. As the engine speeds up the governor lowers the collar; air is then admitted direct into the main induction pipe, thus gradually reducing the strength of the mixture until the correct proportions of petrol and air are obtained for the speed and power required of the engine. Acceleration or retardation of the engine is obtained in the usual way by the interposition of a spring, actuated from the dashboard and operating against the governor. Below the carburettor a water-separator (13) is attached. The petrol is admitted near the top of this separator and passes upward through the gauze filter into the carburettor; particles of water and dirt are intercepted by this gauze and gravitate to the bottom of the separator, from which they can be drawn off at any convenient time. Hot air is supplied to the carburettor through the orifice (17). This is obtained in the usual manner by surrounding a portion of the exhaust pipe of the engine with a tube leading to the carburettor.

Ignition is by low-tension magneto, driven by a chain, passing across between the cylinder castings, from a sprocket wheel on the centre of the cam-shaft. The engine is started from a shaft which projects out from the frame on the near side, instead of being arranged in front. This shaft lies beneath the mudguard and its inner end carries a bevel wheel that meshes with a larger bevel just behind the fly-wheel. Normally, the starting shaft remains stationary as usual, freeing itself as soon as the engine is set in motion. The radiator (Fig. 3) forming the front of the bonnet is exceedingly light, it being made entirely of aluminium. The upper and lower water spaces are each formed by two castings, which are bolted together, and these containers are connected to one another by a large number of small tubes, bent into zigzag shape and expanded into the plates at each end. It is very light, weighing only 30 lbs., and is claimed to be extremely efficient and to afford a free passage to the circulation of the water. The exhaust-box of the Hutton car is of exceedingly novel design. It consists of a taper pipe, the outer end having the largest diameter. The pipe itself has a series of holes pierced in it, through which air is drawn in and mingled with the exhaust gases, which have a straight outlet from the motor, without meeting any baffle plates on their way to the atmosphere.

Figs. 4, 5 and 6 illustrate the pedal-controlled metal-to-metal clutch which transmits the power from the engine to the gear shaft. A is a cast iron ring attached to the flywheel; it is provided with grooves at B, similar to those formed in the split rings C, which form the expanding portion of the clutch. The wedges D are advanced and retreated from the position shown by means of levers E and screws F, the latter working in spherical nuts G. The levers are moved backwards and forwards by means of a sleeve on the shaft, operated in the usual manner by a forked arm. The adjusting spring is shown at H. The adjustment for wear is easily and quietly accomplished by means of the set screws J which project into cavities formed in the sides of the nuts G. All that is necessary to take up the wear of the clutch is to slacken back these set-screws and rotate the nuts until the next cavities register with the set screws, which are then tightened up again. Sixteen of these cavities are drilled in the periphery of the nuts. An angular chamber is provided to carry a quantity of oil, which is supplied constantly to the clutch, and the effect of the grooves at B is to keep the whole of the working surfaces constantly lubricated. This

Figs. 5 and 6.—Front Elevation and Sectional Plan of Hutton Clutch

causes the clutch to have a very sweet action, and relieves the car from shock, even if the clutch be let in suddenly. It will be seen that no end thrust is created by the clutch.

(To be continued.)

MESSRS. JARROTT AND LETTS, LIMITED, have issued a souvenir pamphlet illustrative and descriptive of the recent ascent of Snowdon by Mr. W. M. Letts, a copy of which they will be pleased to send to any inquiring readers.

Digitized by Google

SOME USEFUL NOTES.

BOTH brakes and steering gears are now generally well and safely constructed, but they, like all other mechanisms, warrant the closest scrutiny. Every motorist should assure himself that each nut, bolt, pin, or other device upon which their integrity depends is properly in place, and that nothing is weak or loose. Each brake on the car should frequently be tested upon the steepest available incline to see that it is capable of promptly bringing the machine to rest and holding it from motion in either direction, and merely because one of the two brakes is little used, it should not be neglected, but kept in perfect adjustment for use in the emergency which its name denotes that it is intended to meet. Attention to brakes and steering gear upon the part of motorists, and the acquirement of a readiness to use them, will prevent all accidents not obviously attributable to recklessness, and dispel the general but erroneous idea that motor-cars are dangerous.

◆ ◆ ◆

A RATHER peculiar short-circuit is liable to occur in the Panhard cars. When the starting chain is a little slack, it may, wing to vibration, touch one of the little brass tubes of the commutator and consequently "short" that particular cylinder.

◆ ◆ ◆

THERE is sometimes a doubt, in the case of a new car, as to which is early or late firing. It should always be remembered that when the contact-breaker is moving in the direction the cam-shaft turns it is moving to "late-firing."

◆ ◆ ◆

THOSE who have not put on a new tyre-cover before should note that it is far easier to do so if they put the clips in the rim first, and also put the tube in by the valve. The operation will be more difficult, and necessarily longer, if the cover is first put on and the clips inserted afterwards.

◆ ◆ ◆

BECAUSE a bearing has been equipped with balls does not mean that it is therefore for ever and a day made almost frictionless without further thought or attention on the part of the motorist. Ball bearings are only superior to plain ones when they are given an opportunity to properly perform their functions as friction decreases. To be sure that this exists the balls should be carefully examined every 2,000 or 3,000 miles the car travels, and the balls might advantageously be renewed at least every 5,000 or 6,000 miles. This is not only a policy of wisdom but one of economy as well, since steel balls are a far cheaper commodity than the cups and cones on which they run. The amount of damage a broken ball may do, or, still worse, a ball worn sharp, as well as rough, is, remarks a writer in the "Automobile Magazine," not easily appreciated by those who have no experience.

◆ ◆ ◆

WHEN in doubt as to the number of balls, one less should be put in than the total possible number which can be squeezed into the cup. When jacked up and screwed tight, the wheel should revolve quite freely; in fact, as freely as possible, provided there is no lateral "play." If a cone shows a tendency to work loose, it is best to provide a stout iron washer fitting up to the pin; this should be the strongest that can be used.

◆ ◆ ◆

WHEN replacing a broken ball, it is better to renew the whole set, unless the new ball can be carefully gauged to be of the same size as the others. If this is not attended to, the new ball, having to bear more than its share of the weight, quickly succumbs. The greatest care should be taken, of course, to use grease free from grit, and to clean the balls and bearings before they are replaced.

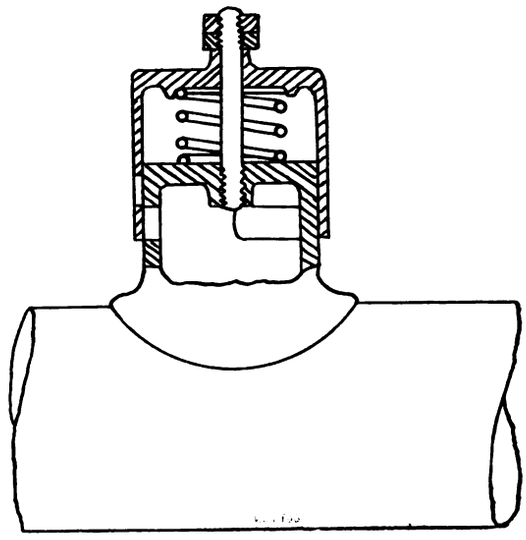
◆ ◆ ◆

HOW few novices use the clutch of a car properly! They obtain their new car, start off on it, change the gears, letting in the clutch "bang" each time, and wonder that the car does not get away. A delicate use of the clutch is essential for good driving, as the engine should always be allowed to "get away" before the clutch is fully engaged.

MOTOR CYCLING NEWS.

COMMENCING with 1905, the Automobile Club of France has decided to make a weight allowance in motor-cycle races and competitions of 3 kilogs. for motor-cycles using magnetos for ignition.

◆ ◆ ◆



SHOULD any English firm be desirous of competing in the Dutch motor-bicycle reliability trial which is to be held on the Maestricht-Nymegen road on the 14th and 15th August, an entry form can be obtained at the office of the *Motor-Car Journal*.

◆ ◆ ◆

SIGNOR TOSCANO, who recently made an attempt to establish a record on a Werner motor-bicycle from London to Rome, had unfortunately to give up at Modane, owing to sudden indisposition. He proposes to make another attempt shortly.

◆ ◆ ◆

Mr. W. STARLEY, manufacturer of the Starley worm-drive motor-cycle, is now fitting a device to all his machines which does away with the air-lever on the handle-bar. As will be seen from the accompanying illustration, the device is an attachment to the ordinary carburettor and consists of two short tubes which telescope into each other. Both tubes are provided with slots which serve as air passages, the outer tube being actuated by the

intake sliding backwards and forwards. The faster the engine works the larger becomes the opening for the admittance of air.

◆ ◆ ◆

A NUMBER of motor-cycle races throughout the country are being arranged for August Bank Holiday. Amongst those for which permits have already been granted by the Auto-Cycle Club are:—At Guildford, a three and a fivemi les handicap; Brighton, a three miles handicap; Tunbridge Wells, a three miles scratch race and a five miles handicap race; and New Brighton, a five miles scratch race.

◆ ◆ ◆

THE 1,000 miles reliability trial for motor-cycles organised by the Auto Cycle Club will commence on the 15th prox., the routes for the six days being as follows:—

		miles.
August 15th.	—To Great Yarmouth with a stop at Colchester for lunch	154½
„ 16th.	—Yarmouth to Stamford, lunch at Ely	204¾
„ 17th.	—Stamford to Scarboro', lunch at Doncaster... ...	146
„ 18th.	—Scarboro' to Doncaster, lunch at Thirsk	164½
„ 19th.	—Doncaster to Oxford, lunch at Warwick	185
„ 20th.	—Oxford to London, lunch at Marlborough... ...	146
		1,000¾

◆ ◆ ◆

LOCAL cyclists and others who may be willing to act as hon. officials in districts through which the competitors will pass are invited to communicate with the secretary, Mr. F. Straight, at 119, Piccadilly, W., as early as possible.

A SWISS ELECTRIC TIMING ARRANGEMENT.

MOST people have heard of the celebrated "Cresta" toboggan run at St. Moritz, Switzerland, and many have seen it, but not so many are familiar with the electric arrangement by which the racing is timed accurately to the tenth of a second. Having regard to the unique character of this little installation and to its possible use in timing mile and kilometre motor trials, a description of the apparatus may be of interest. St. Moritz is one of the highest villages in the Engadine, having an altitude of about 6,000 feet, and is a great centre of winter sports; it is consequently much frequented by English and other nationalities who enjoy the sports of skating, curling, tobogganing, ski-ing, &c., which can here be obtained under the best conditions. Good tobogganing may be had in other places, but at St. Moritz it is carried to a fine art, and only an expert can expect to compete successfully on the renowned "Cresta" toboggan run, with its wonderful curves and banks. The course is a

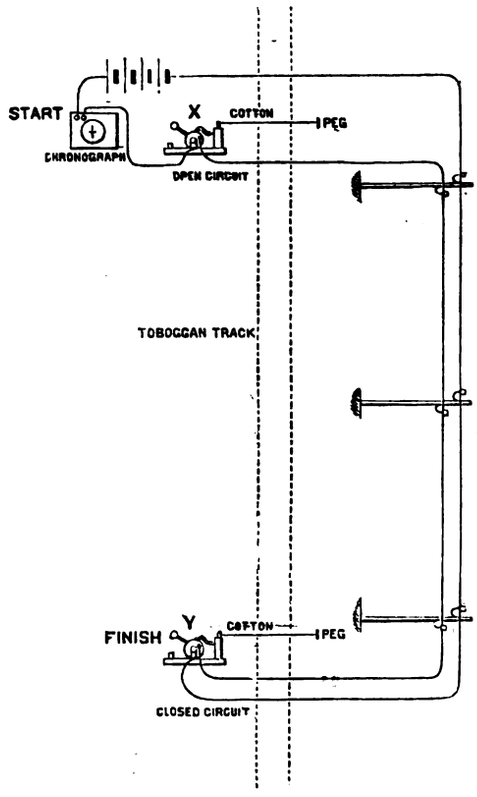

Fig. 1.

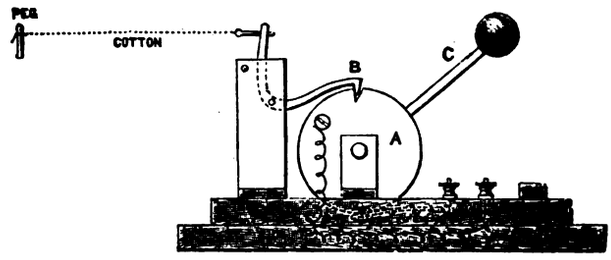
little over three-quarters of a mile in length, with a difference of elevation from the start to finish of about 600 ft. As only one toboggan can occupy the track at a time, the races are all decided by the time taken to complete the course. The record time from the start to the finish is at present 61 6-10 seconds, this entailing a speed of sixty miles an hour or more on the fastest parts. The curves of frozen snow are built up with high banks accurately shaped to allow the tobogganer to go round them at the greatest speed, the highest bank being about 25 ft. in height. The whole track is practically of ice, and after passing the finish it has for a short distance a steep upward gradient, the great momentum obtained carrying the toboganner up hill.

At the side of the course there are poles carrying four overhead wires on ordinary porcelain insulators; the two upper wires are connected to a telephone at each end to allow of communication between the officials in charge of the starting and finishing points. The two lower wires are connected to the timing apparatus, which is arranged as in Fig. 1. At the starting point, one overhead wire is, states the "Electrical Review," connected through a battery of ten cells to one terminal of the chronograph, the other terminal being connected through the trigger switch X to the other overhead wire. The further ends of the overhead lines are connected at the finishing points to another trigger switch Y. Both switches, X and Y, are firmly fixed at the side of the course, and have each a strong cotton line attached, with one end to the trigger of the switch; the line is stretched across the track about 2½ in. from the ground, and the other end is tied to a peg driven into the ground on the further side. The switches X and Y are nearly identical and are represented in Fig 2. A circular wheel of brass,



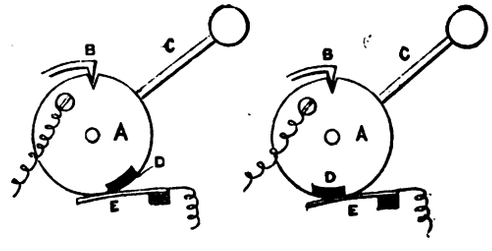


Fig. 2.—Switch with Trigger Set and Attached to Cotton

A, is mounted on bearings, and has a notch in its periphery in which the pawl B is placed when the trigger is set. To the wheel is fixed a radial arm, C, with heavy brass knob, which falls by gravity when the pawl is disengaged by the cotton being pulled. At the lower edge of the wheel, A, a piece of ebonite, D, is inserted in slightly different positions in the two switches (Fig. 3); also a metallic spring contact, E, is pressed against the under side of the edge of A. As will be seen in Fig. 3, when the pawl is set in the notch in the two switches, the spring E in switch X will be pressing against the ebonite D and in switch Y, the spring E is making contact with the wheel A. Before the tobogganer starts, both switches are set with the pawls B in the notches of the wheel A and the cotton stretched from the trigger across the track at start and finishing points. The signal is given and the tobogganer starts from a few yards behind the cotton; his toboggan striking the cotton pulls and breaks it, disengaging the pawl; the arm C drops at switch X, closing the circuit, which allows the current to flow through the electro-magnet of the chronograph, the armature releasing the clock-work, which immediately starts and continues until the cotton attached to switch Y is pulled and broken by the toboggan at the finish of the course, when the arm

Switch y Circuit closed. Switch x Circuit open.

Fig. 3.

of switch Y falling breaks the circuit and stops the chronograph; the time is then noted, and the apparatus re-set for the next tobogganer. The chronograph has a stop for resetting the hand at zero, one complete revolution of the hand representing thirty seconds, and these being sub-divided into tenths. It may be mentioned that with the switch at the starting point, the pawl B can be arranged so that a comparatively hard pull is required to disengage it, but at the finishing point, owing to the very great speed of the toboggan, the pawl must be arranged so that a light pull will disengage it, or otherwise the cotton will break without releasing it.

HERE AND THERE.

THE membership of the Auckland (New Zealand) Automobile Club now numbers 45.

THE Court Circular has announced the King's motor-car trip from Buckingham Palace to Newmarket.

THE Durham County Motor Transit Company, Limited, has been registered with a capital of £4,000.

A REWARD of £10 for the apprehension of missile throwers has been offered by the Automobile Club of Pittsburg, U.S.A.

IT is estimated that there will be 370 cars in the tour to St. Louis which is being organised by the Automobile Club of America.

AT Littlehampton Mr. S. A. Jones has a garage from which he lets cars on hire and supplies the wants of motorists passing that way.

THE Colville Motor Garage has been opened at 21, Powis Terrace, Talbot Road, Bayswater, S.W. A feature of the establishment is the provision of private lock-ups for cars.

THE preliminary arrangements have been completed at Montreal for organising the Automobile Club of Canada. A general meeting is shortly to be held, when permanent officers will be elected.

THE County Garage Company, Limited, has been registered with a capital of £1,650 to acquire the business carried on at 14, Botchergate, Carlisle, by Mr. J. Hodgson, as the County Garage Company.

THE Prime Minister left town on Saturday afternoon in his motor-car for Beaconsfield, where he spent the week-end with Mr. Henry White, of the United States Embassy. He returned to Downing-street on Tuesday.

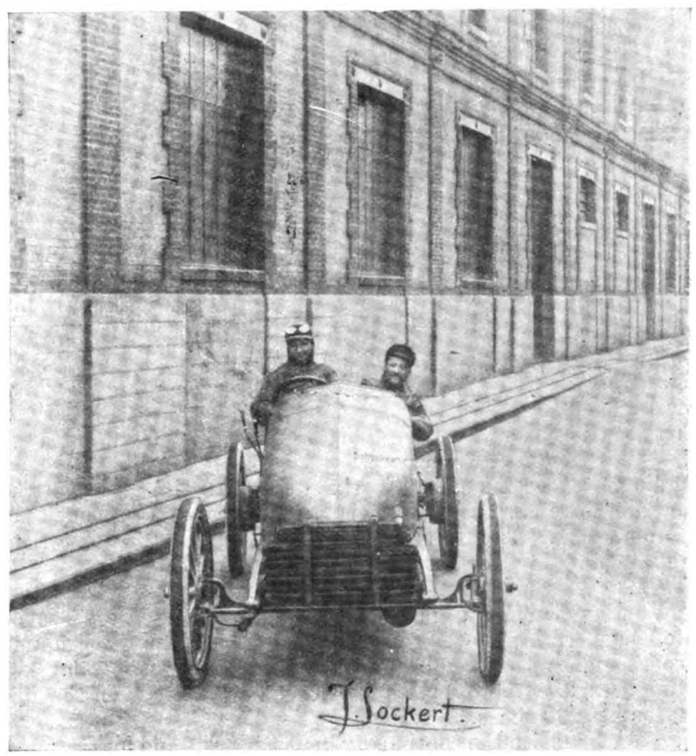
THE office staff of Messrs. Armstrong, Stevens and Son, Birmingham, held their annual outing on Saturday last. About twenty-two journeyed to Stratford-on-Avon, where the usual recreations of boating, motoring, and walking were indulged in.

PLANS are now being prepared for the White racing steam car which will represent the White Company in the Vanderbilt cup race, in October next. The car when completed will weigh from 1,800 to 2,000 pounds, and the engines will have a capacity of 80-h.p.

THE Comte and Comtesse Louis de Gontaut, whose marriage fetes caused so much interest in Paris lately, have arrived at the Royal Palace Hotel, Ostend, in their motor-car. They will continue their automobile journey to The Hague, Amsterdam and Aix-la-Chapelle, and will go finally to Lucerne.

AN automobile hospital, consisting of a motor ambulance ready to bear nurses and physicians post haste to the scene of an accident, is to be built and equipped by the Medical College Alumni Association of Harvey, Ill., and made part of the Iroquois Memorial Hospital at Chicago.

MESSRS. J. E. HUTTON, LIMITED, have received delivery of a new 1904 Mercedes model—the 40-45-h.p. The bore and stroke of the engine are 120 and 150 mm. respectively, as against 110 and 140 mm. on the 28-32-h.p. model. In other respects the two types are very similar.



A NOVELTY in the foreign automobile section at the St. Louis Exhibition is a large Panhard bank wagon. This vehicle is of a general type, useful, with slight modifications, as a police patrol wagon in city work, or a money or securities transport for banks and trust companies. It is very strongly built, and has a powerful searchlight on the roof in front.

MOTORISTS who have visited California say that no State in America offers as many enjoyable tours. The great expanse of territory in California affords a greater variety of scenery than is offered in any section of the country, and automobilists are beginning to appreciate the fact that there are many country roads that will compare favourably with any in the United States.

THE Aero Club balloon No. 1, with a capacity of 45,000 ft., recently carried Mr. Frank H. Butler, Mr. Spencer, and Professor Huntingdon to a height of 9,000 ft. The velocity of the wind was 25 miles per hour, and they landed at Saffron Walden in two hours. On the same occasion No. 2 balloon carried Mr. C. F. Pollock, Hon. C. S. Rolls, and Mr. Ivor de la Rue from the Crystal Palace.

MESSRS. WOLSTENCROFT AND COMPANY, LIMITED, has been registered with the capital of £1,800, to carry on the business of manufacturers of and dealers in motors, motor-cars, motor-cycles, locomotives, trucks, wagons, traction engines and other machines, engineers, machinists, fitters, &c., and to adopt an agreement with the Hon. E. R. Thesiger.

MR. W. G. JAMES, who has acquired the right to use the word "Crypto" in relation to cycles, motor-cycles and motor-cars, from the Crypto Works Company, has acquired the premises at 14, Mortimer Street, London, W., until recently occupied by the Weston Motor Company. Mr. James' business will consist of two distinct departments, one carried on as the Crypto Car and Cycle Company, which will deal with all complete cars and motor-cycles sold under the name of "Crypto." In the second department, which he will conduct in his own name, he is pushing the *chassis* made by M. P. Dupressoir, of Maubeuge, France, for whom he is the exclusive agent for Great Britain, Ireland and the Colonies. The speciality of the Dupressoir firm is high class armoured wood *chassis* and automobile components ranging from 6 to 14-h.p.

M. A. Clement, jun., on the Clement-Bayard Racer with which he competed in the French Eliminating Trials. [*Le Chauffeur.*

THE Mint authorities at Bangkok, Siam, are in the market for a motor-van for the transfer of ingots, coin, etc., up to one ton. The specification states that the van must have a speed up to ten miles per hour, and have a hood for the driver and the accompanying official, also a step in the rear for another official. Behind the driver's seat a box is required for the accommodation of the "transfers." The box, which may be three feet square and 18 inches deep, should have a lid lifting vertically, and a "tail board or falling side." The van must be capable of taking a load of one ton up an incline of one in five at a speed of eight miles per hour, and may be propelled either by steam engine or internal combustion motor. In stating the price at which such a van can be supplied, the makers must give full particulars of the motor, transmission, frame, wheels, tyres, radiators, etc. The amount of fuel used per ton mile must also be stated. Communications should be addressed to Mr. J. W. Hinchley, H.S.M. Royal Mint, Bangkok.

THE Earl of Londesborough and Mr. A. Ure, K.C., M.P., have been elected members of the A.C.G.B.I.

A CORRESPONDENT writes that the other Sunday morning 125 motor-cars and cycles passed the Red Deer Inn, Croydon, in two hours.

THE Cadillac Automobile Company, of Detroit, has so fully recovered from its recent fire that its shipments of cars averaged 200 a week during the month of June.

MESSRS. DUNHILL have just brought out an umbrella dust screen; it is arranged to be fitted to the door of the tonneau or

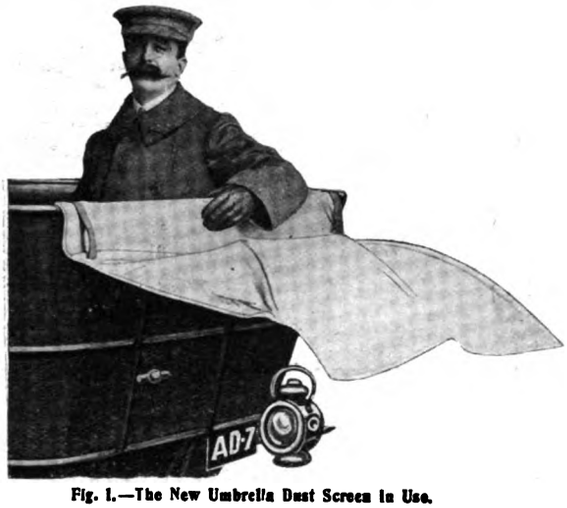

Fig. 1.—The New Umbrella Dust Screen in Use.

the back of the car. The frame folds compactly and opens and shuts as easily as an umbrella. When not required it can be easily detached, the only fixing required upon the car being three small studs. The frame is extremely light, being of aluminium, and is covered with a strong thin material.

FROM the H. H. Franklin Manufacturing Company, of Syracuse, N.Y., U.S.A., comes a catalogue of the Franklin petrol cars. These are of 10-h.p. and 24-h.p., and are noteworthy in that both are fitted with air-cooled four-cylinder engines.

THE Weymouth Corporation Guide, which will be sent on application, accompanied by six stamps, to the Town Clerk, contains some attractive photographs of places in and about that seaside resort. The roads in the district are good, and motorists are becoming familiar features in the locality.

THE Warwickshire County Council has issued a notice cautioning manufacturers against a continuance of the use of Stoneleigh Hill, near Coventry, as a testing ground for motor-cycles and cars. It is pointed out that during five days in June over fifty motor-cycles were taken up and down the hill altogether 232 times.

To cope with the continually increasing demand for their cars the Wolseley Company have found it again necessary to considerably extend their premises at Adderley Park, Birmingham, and building operations have been commenced on ground facing the present works, where a large factory will be erected covering no less than 116,640 square feet. The first bay, which will be utilised as a repair shop, has been already completed. The shop measures 240 feet by 30 feet, and is provided with two pits running the whole length of the building on either side. The latest pattern machine tools and all necessary appliances for dealing with this class of work in the most expeditious manner are provided. At one end a large space has been fitted with a number of lock up cupboards in which customers can store all articles, such as rugs, lamps, etc., while their cars are under repair. Above this a store-room has been built for keeping finished cars whilst awaiting delivery instructions. These new works will be used mainly to develope the industrial side of the motor industry, and special plant will be installed for dealing with launch motors, public service vehicles, heavy tractors, lorries, etc., and other branches of engineering which the capacity of the present works does not permit of being undertaken in large quantities.

THE Earl of Carnarvon has acquired a Hotchkiss car, for which the British Automobile Commercial Syndicate, Limited, are sole agents in Great Britain.

A SERVICE of motor-'buses will shortly commence running between Lowestoft and Southwold, and at Torquay two such vehicles have just been placed on the road to Paignton by the Great Western Railway Company.

IN the annual report of Messrs. Greenwood and Batley, Limited, Leeds, it is stated that the manufacture of chassis for electrically-propelled motor-cars had given good employment, and that about 100 of these carriages had been made during the year.

THE Brighton and Sussex Motor and Carriage Works, Limited, has been registered with a capital of £15,000 to acquire the undertaking known as the Brighton and Sussex Motor and Carriage Works, carried on at 123, Gloucester Road, and 29, King's Road, Brighton, and 99, Conway Street, Hove, to acquire a site in Brighton, behind the Grand Hotel, and to erect thereon shops and motor works.

MR. JAMES MILES has opened a garage in Providence Place, Ann Street, London Road, Brighton, where he has accommodation for twenty cars, and two inspection pits, as well as facilities for the charging of accumulators and for general repairs. Mr. Miles has every convenience for lady motorists as well as for gentlemen, and is evidently going fully into the automobile business.

FROM the Scottish Cyclists' Union comes their official handbook for the current season, giving a list of hotels, consuls, and repairers in the various towns and villages throughout the northern part of Great Britain. This is done with completeness and accuracy, reference being facilitated by a useful alphabetical index. Although primarily intended for cyclists, the little book will prove of great value to motorists touring in Scotland.

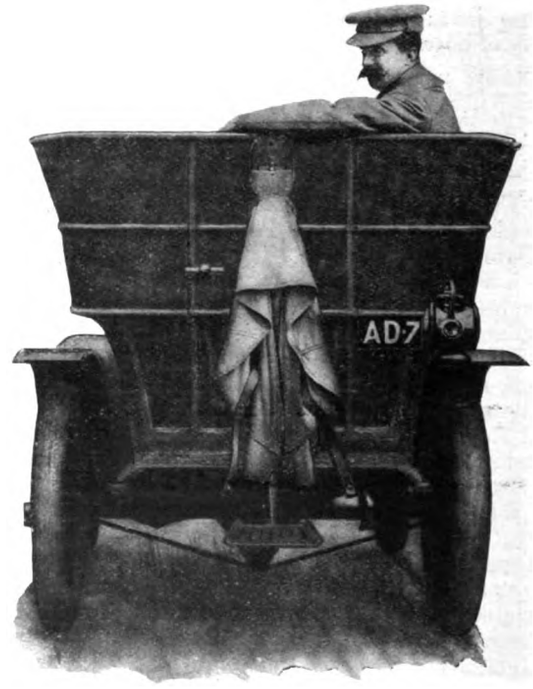

Fig. 2.—The Screen Folded Ready for Opening the Tonneau Door.

LAST week the foremen from the Beeston Works of Humber, Limited, held holiday, the directors placing at the disposal of the party a fleet of motors. The arrangements were in the hands of Mr. Belcher, and the tour was made through some of the loveliest scenery in Derbyshire. Getting away from the beaten tracks the roads in places were mere bridle paths, and notwithstanding the severe tests the cars were subjected to, each one arrived home without any adjustment having to be made. If a breakdown had occurred, there were 30 or 40 expert mechanics in the party available to rectify any mishap.

CORRESPONDENCE.

THE LIFE OF MOTOR-CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—There is one thing about motoring that is not always taken sufficiently into account by the average user. I mean the life of the vehicle, or rather the period during which it will continue to meet the owner's requirements. It is, of course, certain that the man who pays £600 or £700 for a vehicle does not expect to get full value for his money in actual service, unless he is a business or professional man, to whom economy of time is a great consideration. Except in such cases the car can only pay for itself on condition of its doing service for a specified time, which time is to be calculated according to the class of work it has to perform—that is to say, whether it is in constant or occasional use or is employed for business or pleasure purposes or both—and, in any event, it will take a number of years before the purchase value will be wiped out by the economies which the owner is able to make by its use.

It is difficult to say how long a motor-car should be in actual service, because this varies with different requirements. The question of general interest, therefore, is the time during which the vehicle is capable of doing efficient work. Everything is limited by the durability of the car, because the owner cannot work out his economies beyond that period. What, then, is the life of a motor-car? Not so very long ago it was generally estimated that the motor-vehicle would do excellent service for six years. Now, if we were limited to this time it is evident that the majority of users would not find it to their interest to purchase cars. They would scarcely be able to cover the purchase money in such a short period. Formerly no one ever thought of buying motor-cars with the idea of using them until they fell to pieces, but it was the usual practice to invest in cars either by making an immediate profit on their resale or by disposing of them at the end of a year or so, so that the owner always had up-to-date cars and usually made a good profit on the transaction. With the increasing production of cars there are much fewer opportunities for engaging in this form of investment, and the sale of second-hand cars or of new vehicles with premiums—except in a very few cases—has practically died out.

The motorist must therefore buy his car with a special view to its durability, because he may have no chance of making anything out of it by speculative transactions, and, fortunately for the future of the car, its life is found to be much longer than was supposed in the earlier days of the industry, when six years were fixed as the limit of its actual service. As a matter of fact, it is a common thing to see cars running—old Daimlers, for example—dating from 1897 and 1898. These cars were, moreover, built at a time when the industry was far less advanced than it is at present, and it should reasonably be supposed that the new vehicles, constructed on scientific lines with special material and designed to resist the maximum strains, will last for a much longer time. There seems to be nothing unreasonable in putting this life at ten years at least, and it will probably be found that there are few, if any, users where a ten years' economy will not pay back the purchase money with interest, leaving the owner with a vehicle which can be reconstructed at comparatively small cost for another long period of service. Of course, there is still the question of a car getting out of date; but this is of no importance to the ordinary user, who is quite satisfied with a vehicle that will meet all his requirements as regards comfort and reliability, whether it be the fashionable type or not.—Yours truly,

F. J. Dixon.

A GROWING NUISANCE.

To the Editor of *The Motor-Car Journal.*

Sir,—May I be allowed to suggest that instead of the police wasting their time in endeavouring to trap motorists, they should devote a little of their energies to the young rascals who, not now content with throwing their caps in the road as a car goes by, are beginning to pelt motorists with small sticks and stones? The other day, as we ran through a Surrey village, a stone was thrown at me, and by the closest shave just missed giving me a nasty blow in the face.—Yours truly,

Mazagran.

SECOND-HAND CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—Surrounded with difficulties as is the task of selecting a new car, it shrinks visibly when compared with that which confronts the prospective motorist desiring to make his introduction to the pastime through the medium of a second-hand vehicle. In the first case there are numberless signs and indications which, if intelligently studied, frequently enable one to avoid the pitfalls that mark the purchaser's path. The live makers those who, instead of either going backwards or standing still, have progressed and are still progressing, are not hard to perceive. Values are determined, in the main, by considerations which even the uninitiated can understand. The weight, the power, the speed, the carrying capacity—all form items in the inventory of value, and a very little study furnishes the would-be motorist with his cue. In addition, and most important of all, the reputation and standing of the maker go a long way in finally determining the matter.

But with second-hand vehicles these considerations have much less weight. The decadent cars naturally come to the front in great numbers and are offered at tempting prices. Obsolete patterns are frequently in the majority. The anxiety of their owners to dispose of them is in obverse ratio to their sale value, the latter being sometimes practically nil. If this be true of cars of dubious, or more than dubious, ancestry, it is scarcely less so where cars of reputation are concerned. These seem safe purchases. For that reason buyers who know a little about makes are the easier thrown off their guard. The purchase of a standard vehicle at a reduction of from one-half to two-thirds of its list price seems a perfectly safe one, and as a rule it is. But there is the question of condition to be taken into very serious consideration. The car may have been recklessly abused and be in such condition that only the expenditure of much money and time will avail to put it in good running order. The assumption is, when the purchase is made from a regular dealer, that this has been done. But assumptions are sometimes ill-based, and no buyer can safely do otherwise than go beyond such assumption and satisfy himself that it has something behind it. If repairs have to be made they should, as a matter of course, be added to the purchase price, and it is necessary, if a true estimate of the value of a

The Meet of the Lincolnshire Automobile Club at Riseholme Hall, Lincoln. (*See page* 457).

Digitized by Google

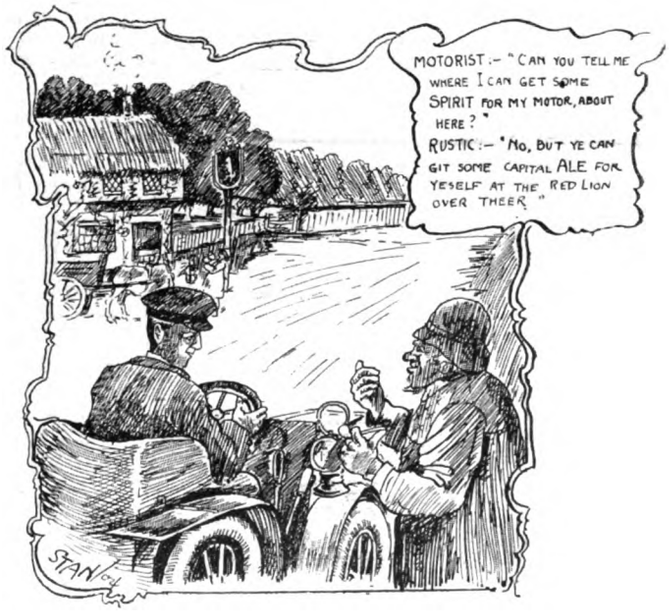
car is to be obtained, to see that the repairs are exhaustive and that they leave the car in good running order.

When such a course as this is adopted the purchaser knows exactly where he stands. But it is seldom done. The buyer does not know enough to perceive the advantage of such a plan; and the seller, whether dealer or user, is almost equally opposed to it. Price cuts an important figure, and the greater it is the more difficult it becomes to sell the car to the average purchaser.—Yours truly,

B. W. J.

KNOCKING IN THE ENGINE.

To the Editor of *The Motor-Car Journal*.



Sir,—It seems to me very probable that the knocking of which "Puzzled Novocastrian" complains in the *Journal* of the 9th inst. is due to the regulation of spirit. This is frequently the case with two-stroke engines; in fact, at times the noise is so pronounced as to cause one to think that the engine is being struck with a sledge-hammer.—Yours truly,

T. Delver Sanders.

PATENTS IN AUSTRALIA.

To the Editor of *The Motor-Car Journal*.

Sir,—The Australian Commonwealth Patent Act is now proclaimed. By it one application under the new Statute covers Victoria, New South Wales, Queensland, South Australia, Tasmania, and Western Australia. After June 1st (the day of proclamation) no more patents can be applied

or separately in the States above mentioned. The Commonwealth Act absorbs each State Act, and all documents, whether for the completion of the old State patents or for the new Commonwealth applications, have finally to be lodged in Melbourne, where the examination of all applications is conducted. Seven copies of the specification on white paper (not thinner than 250 to 300 sheets per inch) are called for. Also three sheets of drawings all measuring 8 in. by 13 in., two being on white Imperial paper, the third on tracing cloth. An opportunity which should not be missed is presented to manufacturers and inventors by this new Act.—Yours faithfully,

Phillips, Ormonde and Co.

OVERHEATING OF INDUCTION COIL.

To the Editor of *The Motor-Car Journal*.

Sir,—I am using an induction coil of good make on my car, but it gets so hot that the paraffin has melted and run out to some extent. I do not know how coils are constructed, and consequently do not know what to do to stop it. Will it do any harm? It does not seem to make any difference with the sparking as yet, but shall be glad if you or any reader of the *Journal* can tell me how to prevent the heating.—Yours truly,

W. J. T.

[The trouble caused by heating in the induction coil may be due to "W. J. T." using a battery of higher voltage than is suitable, or that the induction coil is placed too near some part of the car which gets heated. It is also possible that there is a short circuit in part of the primary winding, causing too much current to pass through it. It will not do any harm until the paraffin has melted completely off some part of the condenser or secondary winding, so that moisture can get to it, which would eventually happen. If one end of the coil is unscrewed and lifted so that the connecting wires to the terminals do not break off, a further supply of hot paraffin wax could be run into it. The main point is to keep all the parts of the coil thoroughly protected from moisture, which it is the function if the paraffin wax to do.]

TOURING IN IRELAND.

To the Editor of *The Motor-Car Journal*.

Sir,—Might I be permitted to reply to the letter of Mr. H. Douglas *re* touring in Ireland? No such hotel exists in Malahide as the Royal, and no such price as 1s. 6d. per dinner exists—a chop costs 2s. 6d. Bray is a little over twelve English miles from Dublin. I have been all over Ireland and am a Irishman having large interests in the country, and I quite agree with what he says regarding the Irish people, as my former letter stated; but I still maintain, and can prove what I state, that the greatest difficulty the disinterested parties who took up the question of developing Ireland as a touring resort some years back met with was the hotels, and the varied charges for very indifferent accommodation. I admit Ireland can be done at 10s. per day, but one would have to know the country well, and it would be very poor living, but it could not be done by anyone touring on a motor of any description. As an American friend of mine, who spent last July, after the Gordon Bennett race, on a motor-car tour in Ireland, said to me when leaving, "I guess you should be a rich people; they got all I had but the car, and they could hardly take that, they knew it was not my own!" A story I once heard in America of a visitor leaving a house, and found all the servants in a line in the hall, one holding his bag, another his hat, and so on, and after tipping half a sovereign and so on down the line arrived at the man who held his gloves, said to him, "Keep them, my good man, its cheaper!"—Yours truly,

K. 125.

JOURNALISTIC COMMISSION.

To the Editor of *The Motor-Car Journal*.

Sir,—We have received the following circular letter from a well-known motor-car paper published in London:—"Since this journal was started we have made a special feature of advising and assisting those of our readers who wished it in the choice, and often in the actual purchase, of their motor-vehicles. As the net result of the work of this department of the "—" we are in a position to verify the fact that orders to the value of upwards of £30,000 have been placed with manufacturers and agents by our readers, and directly due to the recommendation of the various cars represented by the above sum. So far, we have carried on this work gratuitously, but now, owing to the greatly increased circulation and influence of the "—," and to the absolute satisfaction of our clientele with which this has been carried on, we are consulted so frequently, and by such a large number of people, that the time and expense we are called upon to afford has become a serious item of our expenditure.

We therefore ask you whether you will agree, from this date, to credit the "—" with a nominal introductory commission of 2½ per cent. upon the sale of any new or second-hand motor-vehicles bought from you by persons coming to you upon our recommendation?"

We have always been of the opinion that the function of the Press was to give unbiased advice on these matters, and that their profits arise from the advertisements they print, and from the sale of their paper. We hardly think it fair that a journal should attempt to put a tax on the trade by demanding a commission for the recommendation of certain makes of cars, but we should like to have the opinion of the trade on the subject, as we think the question is one of vital importance.—Yours truly,

Motor Dealers.

AN APPEAL TO MOTORISTS.

To the Editor of *The Motor-Car Journal*.

Sir,—Your readers are well acquainted with the unfortunate narrow road passing High Barnet Parish Church. The authorities of this church are fully sensible of the fact that many motorists and cyclists restrain their pace, their horns, and their bells in passing. There are, however, some who forget the distraction which an unnecessary noise is to those in church during the hours of Divine service. May I, through your columns, plead for their courtesy and consideration, and request them to pass as quietly as possible?—Yours truly,

Rector of Barnet.

The Orient Buckboard.—Replying to R. H. Gordon, the British agents for the Orient buckboard are the Remington Automobile Agency, of 11, Tothill Street, Westminster.

The Fleetwood Motor Passenger Carrying Company, Ltd., has been registered with a capital of £5,000.

We learn that Mr. G. E. Culley has been appointed managing director of the American Motor-Car Agency, at whose depot at 117, Long Acre, W.C., examples of the Ford car may be inspected.

CLUBS AND ASSOCIATIONS.

BERKSHIRE.

BY invitation of Captain E. F. Rhodes, the fourth summer meet of the Berkshire Automobile Club was held on Wednesday of last week at Holme Park, Sonning. The gathering took the form of a garden party, and there was an attendance of some thirty motor-cars, besides a few motor-bicycles and "trailers." Captain and Mrs. Rhodes welcomed their guests, who included, besides a number of members of the Berkshire Automobile Club, a contingent from the Ladies' Automobile Club and some of the principal residents in the neighbourhood, among them the vicar of Sonning (Canon Holmes) and Major Lloyd, R.E. The band of the 3rd Batt. Royal Berkshire Regiment, under Bandmaster Courtenay, played a choice selection of music during the afternoon, and tea, fruit and ices were served in the dining-room and from a tent on the lawn. Most of the guests left between six and seven o'clock, and enjoyed in the cool of the evening the run back over the Berkshire roads to their several destinations.

Owing to the King having signified his intention of being present at the motor-boat races at Southampton on July 30th, which many of the Club members desire to attend, the next Club meet has been postponed for a week, and will be held on the first Saturday in August at St. Ann's Hill, Chertsey.

LINCOLNSHIRE.

MOTOR meets nowadays are of many kinds, but on Saturday Mr. and Mrs. C. A. Moreing, of Riseholme Hall, near Lincoln, managed to provide a distinct novelty in combining a water fete and battle of flowers in connection with the meet of the Lincolnshire A.C. Well over sixty cars were drawn from all parts of the country, and the line of vehicles was very imposing. Lunch was provided in a marquee on the lawn. Afterwards the visitors went down to the cars and inspected the several new vehicles, and most of those present took trial runs in each other's cars, the roads in and around the park presenting quite a busy scene.

The large lake was then visited, and some of the motorists boarded the boats, the ladies, ashore and in the boats, being supplied with baskets of flowers, and at the word they indulged in a right merry battle of flowers, going into it with real zest, and every one making merry. Some of the blooms that had fallen into the water were used as ammunition, which added to the merriment, and the scene was both animated and pretty.

"Cease fire" sounded by the trumpeters brought hostilities to a close, and the "dinner call" drew the heated combatants to the lawn again, where refreshing tea was served. Those present included Col. J. S. Ruston, Lincoln, and Capt. J. A. Cole, J.P. (Chairman of the Club), Dr. de Beauvais, Mr. E. Cragg, M.D. (hon. sec.), Dr. Benson, and Capt. Mitchell-Innes (chief constable of the county), Rev. R. H. Simpson, Dr. Gilpin, Mr. F. Richardson, Dr. Sharpley, Rev. T. Nelson, Mr. H. Belcher Rev. S. W. Skeene, Rev. Mr. Stoodley, Mr. G. E. Sandars, Dr. Sharp, Col. J. M. Warrener, and Capt. H. E. Newsum.

THE LADIES' CLUB.

THE following ladies have been elected to membership of the Ladies' Automobile Club :—Lady Clementina Walsh, Miss Isa Keyser, and Mrs. W. Portal. The following members of the Club were present at the inter-club meet which was held by invitation of Mrs. Rhodes at Holme Park, Sonning, near Reading, on the 13th inst. :—Mrs. Ainslie, Mrs. Buttemer, Miss C. Browne, Mrs. Edmunds, Mrs. Hartung, Miss Hartung, Miss Honeyman, Mrs. Herbert Lloyd, Mrs. Biddulph Martin, Mrs. Carpenter Rowe, Mrs. Turnor, and Miss Woodhull.

DERBY.

IN beautiful weather, the Derby and District Automobile Club held a meeting in Allestree Park on Saturday. The gymkhana event was won by the hon. secretary, Mr. C. J. Allin, who drove an 8-h.p. Rex. The kilometre sprint went to Mr. G. F. Reading on a 10-h.p. Wolseley.

PETERBOROUGH.

BY invitation of the Marquis of Exeter (the club president) the members of the Peterborough and District M.C. recently visited Burghley and spent a most enjoyable afternoon. The motorists, many of whom came from the Bourne district, first met at the New Inn, Market Deeping, and afterwards went in a body to Burghley. Here they were met by Lord Exeter, who personally conducted the party over the house. The following took part in the run :—Messrs. F. T. Heighton (Peterborough), S. Ireland, P. R. Heighton, Gibson (Bourne), Percy (Bourne),

Digitized by Google

B. C. Holmes, Bulkmore, T. A. Morris (Bourne), T. Pearson, J. Whattoff (Boston), Rev. S. W. Skene (Deeping St. James), W. E. Wadsley (Bourne), S. Heighton (Peterborough), P. Smith, and W. Clarke.

HEREFORDSHIRE.

A LUNCHEON was given to the members of the above club at Sufton Court by Mr. J. T. Hereford (president of the club) last week. Speeches were made after the luncheon by the host and Colonel Scudamore, who proposed the health of the members of the club, also the health of Mr. J. T. Hereford. They then adjourned to Dinmore, where the reliability trials for motor-cycles took place. Amongst those present at the trials were Mr. J. T. Hereford and party in a 18-h.p. Daimler car; Mr. Graystone, of The Moor, Hay, in a 15-h.p. Panhard; Mr. J. H. Hall, of Ross, in a 8-h.p. M.M.C.; Mr. A. W. Marriott and party in his 5-h.p. International Benz; Mr. Llewellyn and party, Ross, in a 16-h.p. Brush; Mr. E. B. Howell and party in a Humberette; and Mr. W. Pritchard, of Hereford, on his 2-h.p. Quadrant cycle. Messrs. W. Margrett and A. Townsend acted as timekeepers, Mr. Margrett very kindly supplying the stop watches. Mr. Wilfred Groom (secretary) was present as starter. There were two classes of cycles, viz., No. 1 class for motors of and over 2¾-h.p.; No 2 class for motors of and under 2¼-h.p. The names of the competitors and results are given below:—

CLASS 1.

1. H. Minton, 3¼-h.p. Zedel, 2 min. 8 3-5 secs.
2. F. Marriott, 2¾-h.p. Griffon, 2 min. 39 4-5 secs.
3. J. H. Hall (Ross), 2¾-h.p. Quadrant, 2 min. 42 1-5 secs.
4. C. L. Llewellyn, jun. (Ross), 2¾-h.p. Excelsior, 2 min. 49 2-5 secs.
5. T. Godwin, 3-h.p. Bat, 2 min. 59 4-5 secs.
6. C. L. Llewellyn, sen. (Ross), 2¾-h.p. Excelsior, 3 min. 10 4-6 secs.
7. E. J. Smith (Bromyard), 2¾-h.p. Griffon, 3 min. 20 secs.

CLASS 2.

1. H. Minton, 2-h.p. Minerva, 2 min. 52 1-5 secs.
2. J. Wheel (Ross), 2-h.p. Minerva, 2 min. 57 2-5 secs.
3. F. Marriott, 2¼-h.p. Royal-Albert, 3 min. 22 3-5 secs.
4. C. W. T. Simpson, 2-h.p. Imperial Triumph, 3 min. 37 1-5 secs.

The winning times in both classes were excellent, considering the gradient and the state of the roads.

READING AND GLOUCESTERSHIRE.

ON Saturday last the Reading and Gloucestershire Clubs ran from Reading and Cheltenham respectively and met at Farringdon. The meeting was postponed some weeks ago on account of the bad weather, but the postponement was a happy one, inasmuch as the run on Saturday was favoured with the most perfect summer weather, and the roads, with the exception of the thick layer of dust, were in good running order. The Reading cars started from the club's headquarters and proceeded to Farringdon *via* Streatley and Wantage and the return journey *via* Abingdon and Wallingford. The run was also one of the six-monthly club runs in connection with the Reading Automobile Club's reliability trials for which a silver challenge cup is awarded and a medal to the holder.

The cars assembled in the Market-place at Farringdon, and after they had been examined and inter-club courtesies exchanged the party took tea at the Bell Hotel. Mr. A. Arthur Dale made an after-tea speech, welcoming the Reading Club in felicitous terms, to which Dr. Walters replied on behalf of the Reading Club. Among those present were Messrs. A. Arthur Dale, 3½-h.p. Ormonde; H. Callas and Mr. J. Harris on 7-h.p. Swift; A. C. Brewerton and C. H. Smith, 10-h.p. Georges Richard; Skurray, 12-h.p. Darracq; Dr. Walters, 8-h.p. M.M.C.; J. Montgomerie, 5-h p. Napier; Sandars and Wood, 11-12 h.p. Argyll; Dr. A. C. Major and A. E. Newton (Hon. Sec. Reading A.C.), Renault; C. H. Dodd and W. H. Phelps, 8-h.p. Renault; J. V. Moinet, 3-h.p. Excelsior; Neville Bennett, 3-h.p. Excelsior tricycle; J. H. Hewitt and Mrs. Moon, De Dietrich; T. H. Hewitt, 10-h.p. Gladiator.

BLACKHEATH.

THIRTY-ONE members and friends of the Blackheath Automobile Club had a most enjoyable run on Saturday last to Botley Hill, Surrey. The members and cars taking part comprised Fleet Paymaster W. O. Bedford, R.N. (Swift); Messrs. H. A. Cunis, (Horley); Alex. Duckham, (Germain); E. Fraser (Humber tricar); L. Lambert (Talbot); H. Norfolk (Renault); T. Norfolk (De Dion Spider), T. Prestige (Clement); S. Prestige (Panhard); W. S. Toynbee (tricar); W. Whiteway (Regal). Some of the members took advantage of the favourable weather and had an *al fresco* lunch on the way. Tea was taken in picnic fashion on the brow of the hill, and a start made for home at 7·15. p.m. In the unavoidable absence of the hon. sec., Mr. Alfred Roberts, Mr. H. A. Cunis kindly officiated.

MIDLAND.

THE Midland Automobile Club have purchased a complete telephone service for use on the occasion of the president's hill climb at Sunrising Hill to-day (Saturday). This service they will be pleased to hire out to kindred clubs. After the event a dinner will be held at the Shakespeare Hotel, Stratford-on-Avon.

A COMMISSION CASE.

A. W. GAMAGE, LIMITED, Holborn, sued Krupkar, Limited, motor manufacturers, 13, Basinghall Street, for £29 1s. 9d., being 10 per cent. commission on the purchase price of a motor-car sold by the plaintiffs for the defendants to one Dicken. Mr. P. Rose-Innes, who appeared for the plaintiffs, said that in the early part of the year there was an exhibition of motor-cars at the Crystal Palace. The plaintiffs and the defendants had stands. Mr. Dicken was introduced to Mr. Vincent, a director of the plaintiff company, who was in charge of their stall. Mr. Dicken saw several cars, and on the second day inspected one of the defendants' cars, the price being 277 guineas. Mr. Vincent asked the defendants what they would allow to his firm if he could sell one of their cars, and Morrison, who represented the defendants, replied that 10 per cent. would be paid. Mr. Vincent brought off the sale, and the plaintiffs now wanted to be paid. In his evidence Mr. Vincent said it was not true that the 10 per cent. arrangement was in reference to future business. As a fact Mr. Dicken knew that they were to have 10 per cent. Mr. Dicken was called, and bore this out. Mr. Morrison, for the defendants, said that he sold the car to Mr. Dicken, who simply employed Mr. Vincent to act as an expert. Witness added that he had sent the plaintiffs a cheque for five guineas, the usual expert's fee, although that was generally paid by the purchaser. He did that feeling that he would like to act magnanimously. He told Mr. Dicken that he would not sell the car if he had to pay a commission. The Judge said he was not satisfied that the 10 per cent. arrangement was confined to future business. He thought it included the lot, and, therefore, he found for the plaintiffs, with costs.

PRISON FOR "MOTORISTS."

ON Whit-Monday Horace Melville took Alexander McSwade out in a motor-car which he had borrowed without permission and also without having a licence to drive. He drove at a furious pace, and in swerving to avoid running down a boy crashed into an omnibus, smashing its stairs and damaging the car to the amount of £50 or £60. McSwade was thrown so heavily that he had since been paralysed down his left side, and remembered nothing of the affair. At Clerkenwell Sessions, Melville, who had been a month in custody, has been sent to prison for two months in the second division.

JUSTICE DARLING was engaged all day at Guildford Assizes on Friday hearing a case in which a French motor-car driver named Emile Richard was charged with the manslaughter of Frederick Parkinson Job at Banstead on April 4th. It was alleged that prisoner was driving the car at from twenty-five to thirty miles an hour, and in order to pass a motor-cycle he so swerved that he crashed into Job, who with his cycle was hurled into the air. His injuries included a fractured skull, and he died in Sutton Cottage Hospital four days later. Prisoner was sentenced to six months' hard labour.

CASES DISMISSED.

AT Chertsey, Earl Cairns was summoned for driving a motor-car recklessly and negligently near Egham Causeway whilst on the way to Ascot on June 14th. Mr. Staplee Firth, at the opening, raised an objection against the form of the summons, and the word "negligently" was deleted. Mr. Firth said it was absolutely impossible for Earl Cairns, expert driver though he was, to negotiate Staines Bridge at thirty miles an hour. Lord Cairns and Lord Anerley, who was in the car at the time, entered the witness-box and denied the reckless driving. Both said the car was under perfect control. The magistrate dismissed the case.

MR. W. L. M'BRIDE was summoned at Kingston-on-Thames County Police Court for driving his motor-car at a speed which was alleged to be dangerous to the public, at Portsmouth Road, Surbiton. The constable in his evidence said that as the car bore a manufacturer's number, he asked defendant if he was out with the car on trial with the object of selling it. The defendant replied: "No, I am only doing it for pleasure." The Chairman intimated that as the speed was so near the limit allowed to motorists—20 miles an hour—the summons would be dismissed.

MR. LEE, of Coventry, was summoned at Warwick for "driving to the common danger" under circumstances reported last week. The adjourned case was heard on Monday, when his counsel, Mr. Maddocks, of Birmingham, raised a novel defence. After one witness for the police had sworn to "thirty-five to forty miles an hour" and two others to "furious" driving, and all three had testified under cross-examination to from 150 to 200 yards having been covered in from two to five minutes, and Mr. Maddocks had ascertained from the Chief Constable that his case was complete, he submitted that he had no case to answer as no offence had been proved, Mr. Maddocks' contention being that there is no such offence in the 1896 Act of Parliament as "driving to the common danger," which offence only appears in the Local Government Board's regulations, and he contended that as L.G.B. regulations are subject to alteration at any time, it was necessary for the prosecution to put in a copy of the existing regulations before it could prove that an offence had been committed at all. The Superintendent wished to send for a copy, but Mr. Maddocks held that, even if he were willing to permit the case to be reopened, which he was not, that a printed copy was not sufficient, but that it was necessary to produce a written copy, sealed and signed by the Secretary of State, and in the end this contention was held to be a valid one and the case was dismissed.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, JULY 30, 1904. [No. 282.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AN experiment was carried out on Saturday under the auspices of the Aero Club, when two balloons left the Crystal Palace, one manned by Mr. C. F. Pollock, Mr. D. Lloyd, and Mr. C. Moore, while in the second there travelled Mr. C. S. Rolls, Professor Huntingdon, and Mr. Frank Butler. A race involving the capture of one balloon by the other had been arranged, and both started close together. The "Norfolk," of which Mr. Pollock had charge, however, quickly got ahead of "Aero Club No. 1," which was under the care of Mr. Rolls. The advantage of the start was lost to the "Norfolk" by an easterly drift, and "trailing" had to be given up when the balloon had to "jump" a village which lay in its path. Near Cambridge the wind dropped so much that the capture of the "Norfolk" by "No. 1" was seen to be impossible, and soon the balloonists found themselves over Newmarket at a height of 7,000 feet. The air was intensely cold, and this caused the gas in the balloons to condense, with the result that the occupants of both were given an unexpected shower bath. The "Norfolk" made a safe descent near Ely; but its companion balloon came down between Newmarket and Cambridge, where it was captured by a motor-car that had been giving it chase all the way.

◆ ◆ ◆

The Trials in Hereford.

ALREADY the people of Hereford are beginning to be interested in the light car trials to be held in that city. The Hereford Automobile Club is raising £100 towards the expenses, the subscription list being headed by the Mayor, Mr. H. C. Beddoe. The daily runs will probably be to Worcester, *via* Bromyard; to Ludlow; to Ledbury, *via* Leominster; to Staunton; to Kington; and, lastly, in the Ross district. The competitors will arrive at Hereford on the 27th prox., and an interesting time is in store for the motorists, who will doubtless welcome the change from the south of England.

◆ ◆ ◆

Visit of Scottish Road Surveyors to France.

FOLLOWING up the interest created by the Special Commission appointed last year to enquire into the working, maintenance, and administration of the roads in England, and the mention of the superior system obtaining in France, the Road Surveyors' Association of Scotland, through the Foreign Office, approached the French Government for leave to inspect the roads in France, and to make personal observation of the system there. The proposal was cordially received by the French Government, who extended a hearty invitation to the Association to send representatives. Accordingly, a party of surveyors visited the country ten days ago, and were shown over some of the most important roads, also the various methods of quarrying and preparing material, bridge building, paving, road rolling, and the use of tar as a dust preventative. By the free and generous use of motor-car, rail and steamer, every facility was given for moving about, and all felt that the visit, which was in all respects a most pleasant one, would, in consequence of the information obtained, prove most profitable and instructive.

◆ ◆ ◆

The Motor Boat Race.

THE British International Cup Race for Motor Boats will be raced for at Ryde to-day (Saturday), in the presence of their Majesties the King and Queen. This will add greatly to the importance of the event, and indicates that the sport and industry of motor boating is assuming very important dimensions. This Cup is at present held by this country, and is competed for on practically the same lines as the Gordon Bennett Cup for motor-cars. Five boats are entered to represent Great Britain, and France and the United States are challenging; the race should therefore produce a very keen contest. The event is being organised by the Automobile Club of Great Britain and Ireland, as the trustees for the Cup, the management being in the hands of the Marine Motor Committee of the Club.

◆ ◆ ◆

Motor-Cycle and Small Car.

THE future of the motor-cycle seems an undetermined point, and even makers of this form of automobile are not wholly convinced as to the prospect. Speaking on the subject to a leading northern maker the other day we learned that while the sale of the motor-cycle is great, the buyers of the same are not always prepared to take as great a care of the vehicle as are owners of small cars. In short, the ranks of motor-cyclists are filled by a proportionately larger number of unmechanical persons. The fall in the price of the car and the additional cost of the fore-car, trailer, or side car are bringing the outlay on the two more nearly together. This is a factor in the situation which leads many to feel that the present boom in motor-cycles—they outnumber the cars that have been registered—is not to be perpetual. The time may come when the figures are reversed and there will be a great disparity between the census of motor-cars and motor-cycles.

◆ ◆ ◆

A Census of Automobiles.

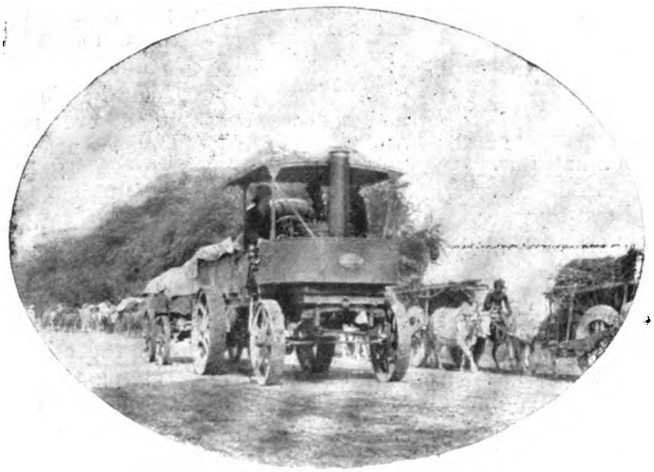
IN the paper which Mr. Shrapnell Smith read at the Conference of Municipal and County Engineers in connection with the congress of the Sanitary Institute at Glasgow, some interesting tables were given, showing the number of motor-cars, motor-cycles, and driving licences which had been issued up to Midsummer of the present year. These showed a total of 18,340 cars and 21,521 motor-cycles, excluding the county of Essex, from which no return had been received. In order to bring the estimate up to date, Mr. Smith computed that there are now 20,076 cars and 22,916 motor-cycles in the United Kingdom, making a total of, roughly, 58,000. Of these 15,616 cars and 18,116 motor-cycles are in use for private purposes. Business uses account for 2,380 cars and 3,370 motor-cycles. Nearly 1,000 cars are in use for the haulage of heavy goods, and not quite half that number for public passenger service. These figures are interesting as showing the great advance that has taken place since registration began. A comparison of the

Digitized by Google

figures for various counties reveals the fact that London and the south of England have a very considerable lead, Birmingham and the Midlands also showing up well in this connection.

◆ ◆ ◆

In the River.



A MOTORIST had an exciting adventure during the Molesey Regatta. He was driving on the towpath, and in turning round the car glided into the river. Fortunately the passengers were quickly rescued from the Thames, and, with the help of a rope fixed to the two brackets at the end of the front springs, the crowd on the bank towed the car along the bed of the river to shallow water, and then, with a strenuous effort, pulled the vehicle back to land. Not often does the riverside crowd have such fun, but the owner saw little humour in the situation.

◆ ◆ ◆

No Taxes on Alcohol used in Industry.

SEVERAL M.P.'s, including the Hon. J. Scott Montagu, Sir W. H. Holland, Colonel Sadler, Messrs. T. Lough, G. Harwood, and Lloyd George, have been urging upon the Chancellor of the Exchequer the wisdom of exempting alcohol used for motive and manufacturing purposes from taxation. Mr. Austen Chamberlain admitted the justice of the plea, and although not immediately responsive to the wishes of those who wanted to see new industries stimulated, promised a departmental committee to inquire into the matter with a view to action. We welcome the committee and hope that its deliberations will quickly result in a change which, while not materially affecting the Treasury, will undoubtedly benefit the industries of the country.

Motor-Car Construction at Guildford.

FEW of the many motorists who pass through Guildford look upon the old town as a motor-car building centre. Even we were surprised when, the other day, we had an opportunity of inspecting the works of Messrs. Dennis Bros., Ltd., at the extension which had taken place since our previous visit. The new addition, at the back of the old premises, comprises three large floors with internal staircase communication and an external iron staircase as an emergency in case of fire. On the ground floor is located the power plant, this comprising a 75-h.p. gas engine, the gas for which is produced on the premises. In addition to driving the shafting on the various floors, the gas engine operates a large dynamo for lighting the premises by electricity. In turn we passed through the smiths' shop, the hardening, plating and enamelling departments, the heavy machine tool-shop, and the fitters, and erecting department. In due order we came to the body-building section, in conjunction with which we were able to inspect the operations of painting, varnishing and upholstering. Indeed, we have to confess that we were astonished at the completeness of the Dennis factory, which covers an area of no less than 150 feet by 175 feet, the total floor space available being 95,275 sq. ft. With the exception of the engines and the pressed steel frames and certain special accessories, all parts of the Dennis cars, even to the carriage bodies, are now turned out on the premises. What we were particularly interested in was the stores department. This is in two sections, one part being devoted to what may be termed raw material and the other to finished parts. By a carefully-worked-out system of books and cards track is kept of the various parts, and at the same time a record is made of the time spent on the part, the workman's name and other useful data. Another department, too, which forms one of the features of the works is that in which the costs are worked out. Mr. Raymond Dennis, who acted as our guide, informed us that he had found this department an invaluable help, as by its means they were able to ascertain the exact cost of every car they turn out. Pressure of space prevents us referring at greater length to the Dennis works, but we may add that there were evident signs of activity at the time of our visit. As proof of this we may mention that they give employment to over 170 men, and that we saw fully fifty cars in various stages of construction.

◆ ◆ ◆

The French Motorists in England.

NOTHING marred the visit of the De Dion excursionists to England, and following their visit to the West a most enjoyable journey to London was taken, *via* Oxford and Windsor. Under the guidance of the Hon. A. Graham Murray, the Secretary for Scotland, an ardent motorist, to whose practical knowledge his confreres north of the Tweed owe the freedom of the roads, the party explored the State apartments at Windsor Castle, and saw many interesting treasures a sight of which is not often granted to public eyes. Everyone was delighted, and the hearty welcome extended on behalf of the King was further proof of the cordial relationship existing between the two countries that face each other across the Straits.

◆ ◆ ◆

At Taunton.

ON hearing that the party were to visit Taunton, the newly-formed Somerset Automobile Club invited them to a complimentary luncheon, which was held at the London Hotel, Taunton, on Thursday of last week. The motorists, who had journeyed from Barnstaple with no more serious mishap than a few punctures *en route*, arrived about two o'clock and sat down to the excellent repast provided by Mr. E. H. Claridge, whose hotel has just been officially appointed as the headquarters of the Automobile Club, for the benefit of its members when in the West of England. After justice had been done to the good fare provided, Sir Wroth Lethbridge, Bart., who presided, proposed the toast "His Majesty the King" which was enthusiastically received by all present. Mr. A. Armitage, in a humorous speech, proposed the health of the visitors, which was in turn ably acknowledged by one of the guests, who, in the course of his remarks, stated the pleasure they had all derived by the tour through southern England, and thanked their hosts for the very kind reception that day; he wished to convey from his confreres their best wishes for the success of the Somerset Club. Mr. J. Hargreaves, who had journeyed to Taunton on his Napier racer, in responding, thanked the visitors for their very kind remarks, saying he hoped that that was only one of the many visits they would pay to this part of the country. On the termination of the proceedings the cars were photographed by Mr. Montague Cooper, of Taunton, a reproduction from which appears on page 461.

◆ ◆ ◆

Reunion in London.

THE official tour at an end, a delightful reunion took place on Monday evening at the Hotel Cecil, when the Marquis De Dion invited the French excursionists and a score of English guests to dine with him. The French and British flags were intertwined at one end of the room, and Mr. J. W. Stocks had arranged the guests with a view to extending international

Digitized by Google

acquaintance. The Marquis presided, and in felicitous phrases welcomed his guests and gave the toasts of the King and the Royal Family. The King, he said, was the first automobilist in the world, and they appreciated highly their visit to Wind or Castle.

◆ ◆ ◆

Toasts and Responses.

THE Baron de Zuylen, president of the Automobile Club de France, proposed "Automobilism," and Sir David Salomons, Bart., responded. In proposing "Our Guests,' the Marquis De Dion referred to the way in which, twenty years ago, his friends thought he was mad and laughed at the automobile as a little "puff, puff." But he worked on, and now the motor-car was recognised as a possibility. The English were a practical people, and would, doubtless, make much of the idea in the future. There was no reason why the two nations should not work together for the universal triumph of industry and mechanics. Responses were made by the Hon. A. Graham Murray, K.C., Sir David Salomons, and the Hon. J. Scott Montagu, M.P., the latter pointing out how motoring had enlarged the view of national life, enabling those who owned cars to see how the people of various countries lived in a way that was hitherto impossible.

◆ ◆ ◆

Next Year's Excursion.

FOLLOWING these excellent speeches the chairman cordially toasted the "Press," the reply reminding those present of the good work it had done in fostering a spirit of amity between France and England. The ladies who were on tour and the chairman were next toasted, and the atter wound up a delightful evening with a hearty invitation to an excursion in France next year. He suggested that a special train might await the English motorists on arrival at Calais to convey themselves and their cars to the central point of the excursion. Thus time would be economised and comfort secured. From the glowing account that he gave of the idea all present became as enthusiastic as the chairman, to whose *bonhomie* and geniality so much of the pleasure of the evening was due.

◆ ◆ ◆

At St. Neots.

A FAIR example of the procedure adopted at a so-called Court of Summary Jurisdiction took place at the Court House at St. Neots, Huntingdon, on Thursday last week, when a bench of countrymen sat in solemn judgment upon three automobilists who made a striking comparison with the Bench.

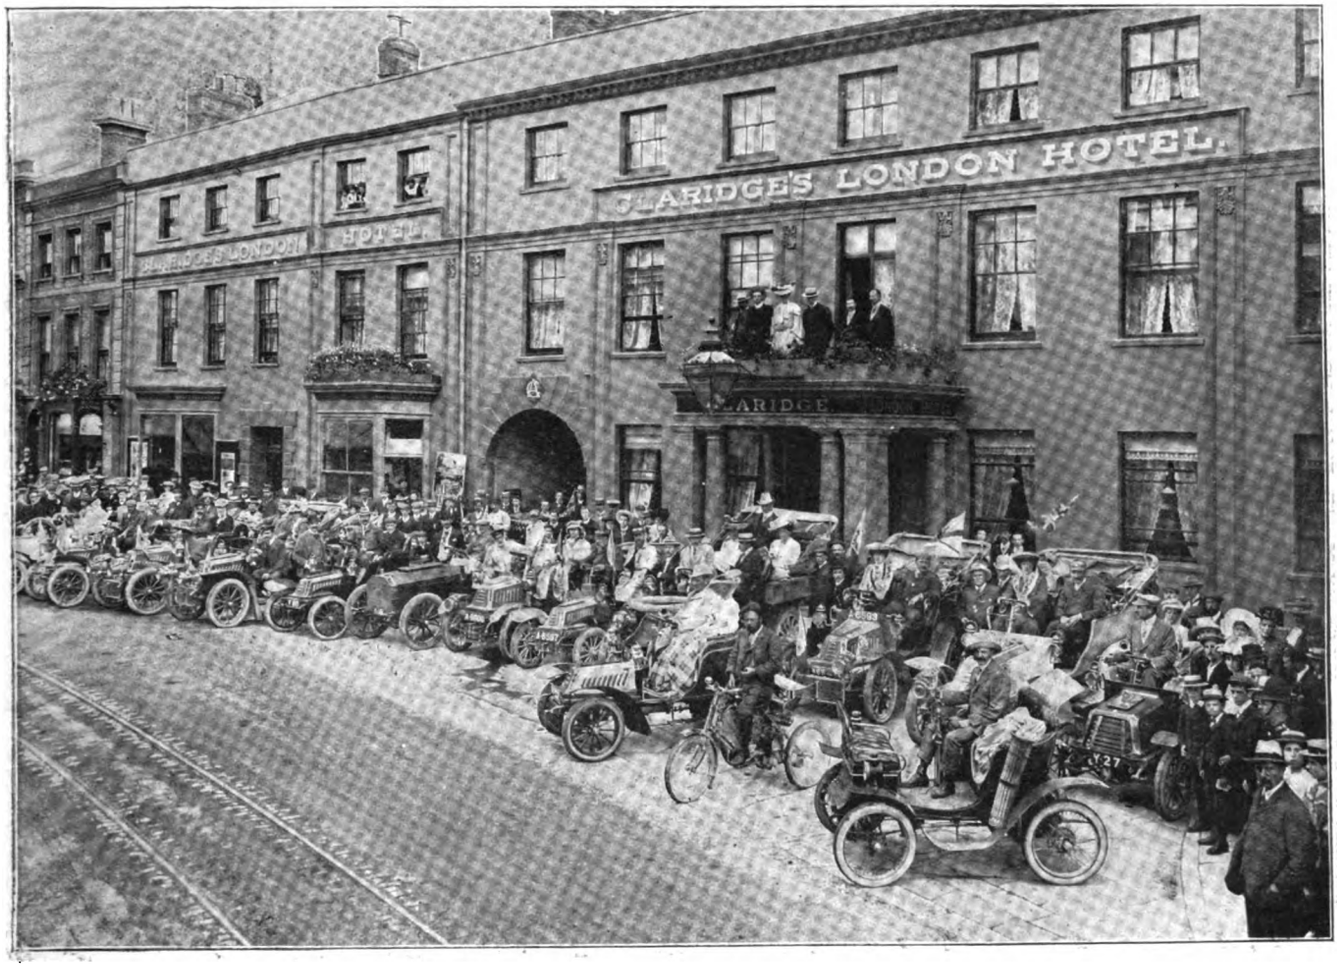

Photo by] The De Dion-Bouton Excursion—French Motorists at Taunton. *[Montague Cooper.*

Each automobilist was brought in turn before "their Worships" and charged with the most serious offence under the Motor Car Act of 1903, viz., of driving to the danger of the public. It has now become fairly established law, upheld by several appeals to Quarter Sessions, that before a Bench can convict of such a serious offence, evidence must be forthcoming, and strong proof shown that somebody was actually endangered, and that speed is no evidence in itself of danger. No such evidence was given in any of these three cases; in fact, every evidence was given, both by the prosecution and by the automobilist in each case, that the car was driven carefully, and in each case it was proved that the car was pulled up in its own length, or very little more; indeed, this fact was admitted by the prosecution. Three or four points of law were raised by counsel for the defence, Mr. A. Moresby White (instructed by Mr. Staplee Firth), and although each case was upheld by decided cases and

Digitized by Google

quotations, the Bench in their wisdom over-ruled them, and convicted in each case.

◆ ◆ ◆

A Motor Wagon Mishap.

A RATHER extraordinary accident happened to Messrs. F. Skurray and Son's Coulthard motor wagon at Swindon a few days ago. It was running under a narrow railway bridge when some timber supports, which had been put in to make up the road, suddenly gave way, tipping the wagon completely over on its right side, and throwing most of the load on to the road. The extraordinary part of the accident is that, after jacking up the machine and reloading, she started off on her journey and completed it without any difficulty. When it arrived at the mills everything was carefully examined, and the only damage done was to the brake rods, which were bent.

◆ ◆ ◆

A Crisis.

THE automobile industry and sport is undoubtedly passing through a crisis which threatens hardship to all concerned unless it is grappled with by a firm hand, and unrelenting vigour and perseverance are shown by the individual in fighting the action taken by many of the county Benches of magistrates throughout England. The merciless treatment meted out to automobilists is apparent from the perusal of the press. The Motor Car Act was championed by those who little knew what power they were putting into the hands of these men, and by their folly and short-sighted policy has this crisis been brought about. The methods adopted by the men who sit in judgment upon their "betters" in some hole and corner village are simple, and so well known to all that it is unnecessary to reiterate them.

◆ ◆ ◆

The Cost of Appeal.

MR. ARCHIBALD FORD is to be congratulated on his success in securing a reduction of his fine of £20 and costs to the smaller sum of 40s. at Liverpool. He came in conflict with the police on the landing stage at that port, with the result that in the Stipendiary's Court he was fined £20. The Recorder, however, has reduced the fine to the smaller amount, but Mr. Ford has probably spent another £20 in paying fees, witnesses, etc., so that financially he is further out of pocket than when he commenced the appeal. This we feel is one of the weaknesses in connection with the Act. Experience has shown that in four cases out of five the appeals have been eminently justified, but that the individuals who thus resist the police methods should have to pay all their considerable expenses is an unfair position which should call for review at the termination of the operation of the present Act.

◆ ◆ ◆

Put a Stop to Motors.

A FEW days ago the writer rode to town with two members of a well-known "Anti-Motorist" Bench in the south and overheard a most interesting conversation. One of the gentlemen had that morning been sitting on the Bench trying a "very bad motor case." "And what did you do with him?" asked his companion. "The same as usual," replied the other, "we fined him £10 and endorsed his licence." And he followed up his remark by saying "We have got used to bicycles, but the motors we shall never get used to, we must therefore put a stop to them." This expression sums up the whole case. "We must put a stop to them" is the watchword of many of the county benches, and the motorist must individually, and as a body, fight against this sentiment, and, remembering the victories at Horsham, Winchester, and Kingston, should strive with renewed energy. Then the reward of their toil will be manifest, both to the industry and sport, and the wish of every fair-minded man will undoubtedly be brought about sooner or later. The county benches, some of which are a disgrace to the country, should be reorganised after proper enquiry, a suggestion that should be borne in mind in influential quarters.

A Peculiar Accident and its Moral.

A PECULIAR automobile accident, which resulted in the death of Mr. D. Healy, a prominent business man, is reported from Auburn, N.Y. Mr. Healy was found under his car in the motor-house with his skull crushed and his arm broken. He left home saying he was going to repair his machine, which had been damaged some time previous. The front wheels had been removed, and the body was supported on two blocks of wood and a crate. When the deceased was found the blocks were lying lengthwise on the floor, while his head was on the crate, the full weight of the car pinning his body down in that position, in which he was found some hours later by his wife. It was evident that Mr. Healy had accidentally knocked out the blocks of wood while engaged at work on the car. Our object in referring to the gruesome accident is to show that too much care cannot be exercised when working on or about a car. Should it be ne essary to get under a vehicle that is jacked up off the ground, steps should be taken to prevent the car moving ever so little by blocking the road wheels.

◆ ◆ ◆

Decrease in Horse Traffic.

THE displacement of horse-drawn vehicles by motor-cars is affecting the railway companies in a peculiar way. At the annual meeting of the Great Eastern Railway Company on Wednesday, Lord Claude Hamilton said in the past wealthy people going out of town had sent their carriages and horses on before them by railway. Motor-cars, however, had taken the place of the carriages, and it was found more convenient to send these on by road in charge of the chauffeur. Receipts for the carriage of horses and carriages had, therefore, fallen off. In addition to this loss there had also been a slight loss on the parcels traffic, due to the use of motor-vans. Similarly at the half-yearly meeting of the London, Brighton, and South Coast Railway, Lord Cottesloe attributed the decrease in the horse and carriage traffic to the greater use of motor-cars and the consequent displacement of horses and horse-drawn traffic. Probably facts like these will do something to educate the companies in the direction of economy by the adoption of motor-vans for some classes of goods traffic, and of motor-'buses for passengers.

◆ ◆ ◆

Dust Prevention.

WE are glad to learn that the conference of engineers and surveyors to county and other sanitary authorities has expressed the opinion, "that the advent and increase of motor-vehicles on public highways renders it imperative, in the interests of public health, that municipal, urban, and county authorities should adopt methods for the prevention of dust on macadamised roads; and this meeting recommends the Council of the Sanitary Institute to make known these views as widely as practicable." This was adopted unanimously on the proposition of the President, Mr. W. Weaver, M.I.C.E, seconded by Mr. E. George Mawbey, M.I.C.E., whose article on motor-cars for municipal officers in our columns recently has attracted much attention.

THE entries received for the Bexhill meeting on Monday next promise excellent sport. On Tuesday an illuminated procession of cars will take place, and a battle of flowers on Wednesday.

MESSRS. FRISWELL, LTD., inform us that they have sold the lease of the premises at 48, Holborn Viaduct, E.C., to the Winton Motor Carriage Company, of Cleveland, U.S.A., which is opening up in England. Messrs. Friswell's only address now is 1, Albany Street, N.W.

THE second day (Wednesday), of the motor-boat reliability trials in Southampton Water showed excellent results, all the fifteen boats which started completing the 20 hours' trial without mishap. The best performance was done by the Napier Minor boat. Scolopendra II., Durendal, and Baby Brooke also kept up a smart pace.

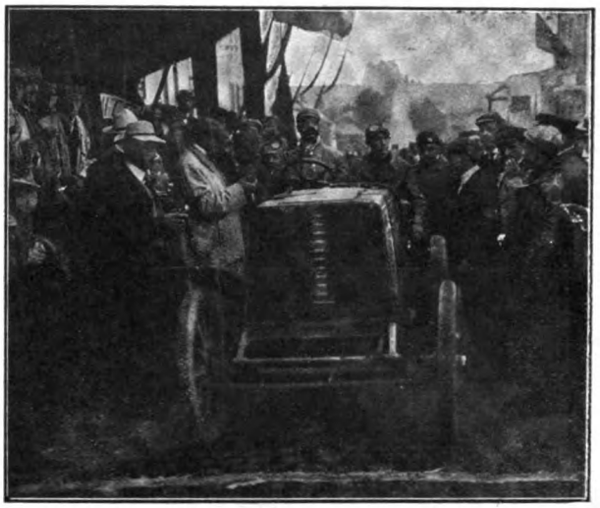
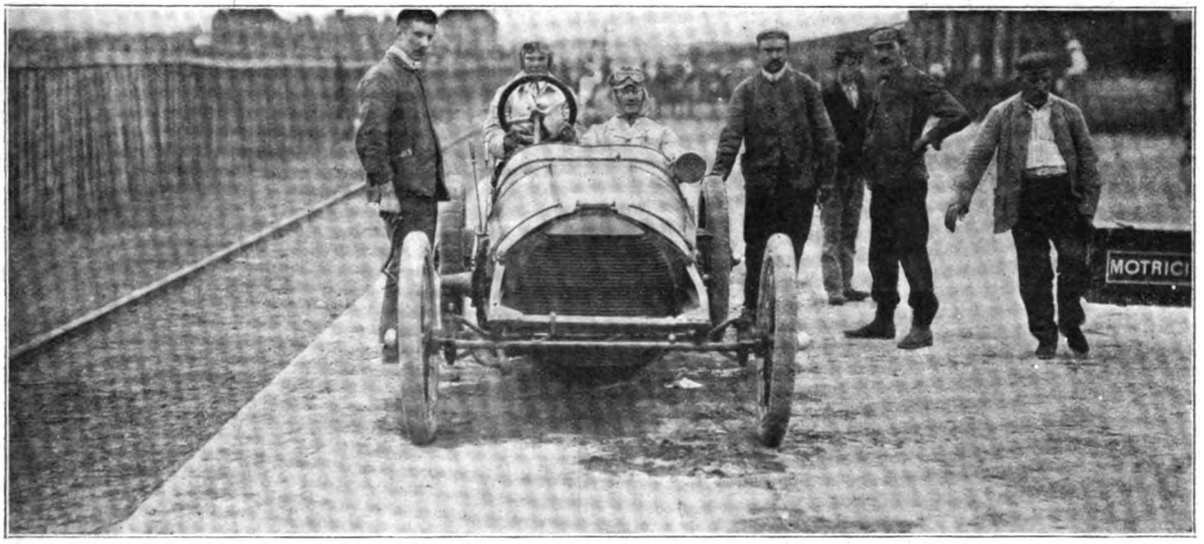
THE CIRCUIT DES ARDENNES.

ARLON, Sunday.



AFTER the record speeds attained at Ostend on Wednesday of last week, the scene of automobile operations in Belgium shifted to Bastogne, where the weighing-in operations in connection with the Circuit des Ardennes took place yesterday (Saturday). The racing commenced this morning, the day being devoted to the voiturettes and motor-cycles. The circuit was not the same as that chosen for the cars, having a different starting-point, and was only thirty miles round, so that the competing machines had to traverse the course five times to make up the total distance of 240 kms. (150 miles). The itinerary was as follows:—Arlon, Attert, Habay-la-Neuve, Ettale, Vance, Stockem, Arlon. There were no level crossings, and there were no stops for controls. Owing to the relatively few voiturettes entered, interest was principally centred in the motor-cyclists, particularly in the struggle between Kuhling on a Minerva and Griet on a Alcyon. Eventually the former won in 3 hours 46 min. 6 sec., his average speed being equal to close upon forty miles an hour. Griet (Alcyon) was second, and Hamand (Minerva) third. In the heavy motor-cycle class Tavenaux on a Gregoire, with Griffon engine, was first in 3 hours 50 min. The voiturette class was a struggle between A. Clement on a Clement-Bayard and Edmond on a Darracq. The latter, who led at the end of the first round, met with puncture and other troubles, and eventually abandoned at the end of the third circuit, leaving Clement to finish alone in 4 hours 26 min. 52 sec.

BASTOGNE, Monday.



The great race of heavy and light cars was run off to-day. At the last moment there were several changes in the drivers, Baron de Caters giving place to Jenatzy on a Pipe. The English competitors comprised Mr. Andrew Fletcher on a 90-h.p. Mercedes, Mr. Mark Mayhew on his Napier, and Girling and Bianchi, Jarrott's mechanician, on Wolseleys. It was evident from the beginning that the Panhard Company were making a big bid to retrieve their position in the racing world, in which, as events proved, they were most successful. The course to-day was Bastogne, Ourthenville, Champlon, St. Hubert, Recogne, Neufchateau, Habay-la-Neuve, Martelange, Bastogne. As the total distance to be covered was 600 kms. (375 miles), the circuit had to be traversed five times, the start and finish being at Bastogne. Altogether there were thirty-three competitors in two classes, they being despatched at 2 min. intervals, the first man, Heath, being despatched at 5 2 a.m. Rain had fallen in the night and had done much to reduce the dust danger.

Gabriel, on De Dietrich, Starting.

Heath, the Winner of the Race, at the Starting Point.

Bianchi on the Wolseley at the Weighing-in.

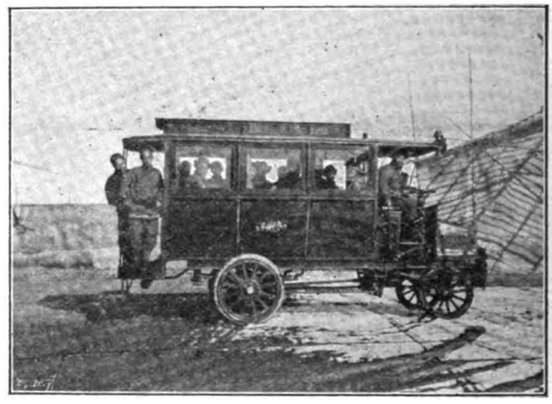
Digitized by Google

All the competitors finished the first lap except Terry (Mercedes). The best time in this round was made by Duray, who made his debut on a Darracq, Rigolly on his Gobron-Brillié, being close behind him. The second round knocked out Hautvast (Pipe), owing to ignition troubles, Tart (Panhard), Weyler (Gobron-Brillié), Baras (Darracq), Lavergne (Mors), and Amblard (Hotchkiss). Jenatzy gave up in the third lap owing to a leaky tank. Girling (Wolseley) also retired in this round, as did also Rougier (De Dietrich), and A. Fournier (Hotchkiss). The fourth lap saw the retiral of Guders (Clement-Bayard), Maurice (Hotchkiss), and Buirette (Darracq), while in the last round Hanriot (Clement-Bayard) retired owing to overheating troubles. Complaints were rife as to nails on the road, and most of the competitors suffered from tyre troubles. Rigolly was particularly unfortunate in this respect, while Teste finished with one tyre down, a minute behind the winner. The fastest lap in the whole race was made by Le Blon, who covered the 120 kilometres in 1 hour 9 min. 44 sec., or at the rate of about 65 miles per hour. Only seventeen of the competitors were classified as finishing. This was due to the spectators blocking the road, the local authorities, as a consequence, putting an end to the race. The results of the event are shown in the appended table :—

A Chinese Mechanician.

HEAVY CARS.

	Driver.	Car.	Time. h.	m.	s.
1.	Heath	Panhard	6	30	49
2.	Teste	Panhard	6	31	44
3.	A. Clement... ...	Clement-Bayard... ...	6	34	43
4.	Rigolly	Gobron-Brillié	6	42	4
5.	Le Blon	Hotchkiss...	6	54	5
6.	Duray	Darracq	6	55	34
7.	Farman	Panhard	6	57	29
8.	Gabriel	De Dietrich	6	58	51
9.	Mayhew	Napier	7	27	42
10.	Leger	Mors	7	45	15
11.	Fletcher	Mercedes...	7	53	0
12.	Bianchi	Wolseley	7	54	10
13.	Lancia	Fiat	7	45	25
14.	Salleron	Mors	7	55	34



LIGHT CARS.

			h.	m.	s.
1.	De la Touloubre ...	Darracq	7	48	59
2.	Hemery	Darracq	8	9	35
3.	Edmond	Darracq	9	58	0

The first two places in the car section were thus secured by Panhards, a Clement being a good third. Of the English competitors Mayhew was ninth and Bianchi twelfth. As will be seen, in the light-car class all the first three places were secured by Darracqs. Heath's average speed works out at nearly fifty-eight miles an hour. The meeting was well organised there being no serious accident reported.

AUTOMOBILES FOR THE CHINESE IMPERIAL COURT.

SEVERAL months ago it was announced that a German firm had secured an order for fifteen automobiles for the use of China's imperial court. We learn that these vehicles have now been delivered and are in regular use; they were built by the Berliner Motorenfabrik at Tempelhof, near Berlin, and were taken to China and placed in service there by Herr E. Valentin, an engineer of the company, who has lately returned from his trip. Three of the vehicles ordered are for the use, respectively, of the Empress, the Emperor and the princes, and are luxuriously furnished, and finished in the Imperial yellow, with the Chinese insignia, the dragon and sun, affixed in all possible places. These vehicles are each fitted with a rotatable cushion seat. The other twelve are for the use of the court servants, etc., and are built as fourteen-passenger omnibuses, and painted a deep red. The cars were disassembled and sent by rail securely packed in very strongly-made cases. The trip from Berlin to Tientsien took twenty days, of which fourteen were spent on the Siberian express train. The cases were transported to Tientsin from the terminal of the Trans-Siberian line by steamer,

One of the Empress of China's Motor Omnibuses.
[*Allgemeine Automobil Zeitung.*

and even before their arrival Herr Valentin had erected shed for assembling the vehicles, which served later as garages for the cars and residence for the drivers. The next thing to receive attention was the instruction of the Chinese workmen. When the cases finally arrived the ship captain declared that with his small cranes he could only undertake to unload them at the risk of the owners, to which Herr Valentin was obliged to consent. Next the coolies refused to move the cases, claiming that they were too heavy to handle, but promise of a handsome allowance made the impossible possible, and 150 men, with their primitive appliances, successfully accomplished the transport of the cases to the garage. The unpacking of the cases was also a matter of some difficulty; but now began the assembling of the vehicles, a task of no small difficulty. The work was yet far from completion when one day Viceroy Yuatutchikai sent word to Herr Valentin that he intended to make a trial trip the next morning at 10 o'clock. There was only an interval of eighteen hours left, and as non-compliance with the vice-regal demand might have led to serious consequences, the work of assembling was forced with all possible haste, and by 9 o'clock the vehicle was in running order. The Viceroy was fully satisfied with his trip, though at first he had a horse-drawn vehicle following the motor-car until he had convinced himself of its reliability. The training of the men who are to drive and take care of the cars was carried out very successfully, and the final delivery of the vehicles in Peking passed off without a hitch.

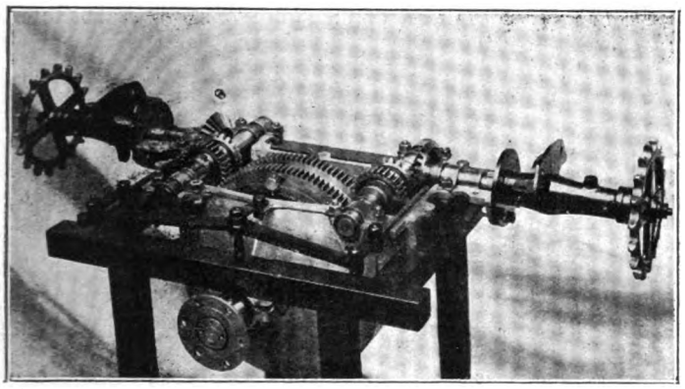
THE 20-H.P. HUTTON CAR.

(*Concluded from page* 450).

FIGS. 7, 8, and 9 show various views of the infinitely variable speed gear, which is perhaps the most important characteristic of the Hutton car. The operation of this mechanism may perhaps best be described in the following manner. Fig. 9 shows a section through the shaft, eccentric sheave and strap. A cross section of these parts is shown in Fig. 8. In Fig. 9 the sheave is shown central with the shaft, and in Fig. 8 it is at its maximum stroke.

The variation in stroke of the eccentric is obtained by hydraulic pressure. The pressure fluid is admitted through the centre of the shaft, under the ram (17), which forces the sheave and strap outwards, according to the fluid admitted to the cylinder. The cylinder is formed on the body of the shaft—is, in fact, bored out of the cross head, which rotates the sheave and upon which the sheave slides. In Fig. 9 the eccentric strap is shown with links (1) attached to the lugs. The other ends of the links are attached to toggles (2), which form a connection between shoes (3 and 4) operating on either side of rings, provided on the rotating portion of the gear. The effect of this toggle movement is that a species of free wheel construction is obtained, such that when the links move in one direction the shoes are caused to grip the rings on the periphery of the gear and the whole rotates, while when they move in the other direction the shoes are disengaged and slide back freely on the rings



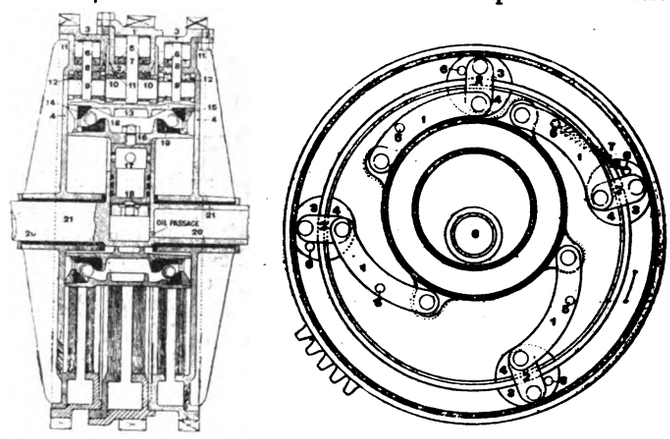


Fig. 7.—The Hutton Variable Gear.

When the eccentric is quite central, no movement is conveyed to the strap, but as soon as a small amount of eccentricity is given to the sheave, the strap gyrates and each of the lugs on the strap describes a circular movement equal to that of the eccentricity of the sheave. The greater the eccentricity of the sheave, the greater the circular movement of the lugs, and consequently the more reciprocating movement is communicated to the links, and through them to the periphery of the gear.

The provision of large ball bearings between the sheave and the strap reduces the friction in the gear to a minimum, and the provision of large wearing surface on the shoes (3 and 4) and large diameter pins reduces the wear and tear to negligible amount. The control of the gear is effected through a small lever on the steering wheel, which operates inlet and exhaust valves. The inlet valve is supplied with oil from an accumulator on the dashboard in such a manner that the opening of the valve admits pressure fluid to the ram (17) in the gear, and thus increases the movement of the gear and the speed of the car. The opening of the exhaust valve allows the pressure fluid to escape, thus decreasing the movement of the gear and reducing the speed of the car. It will, of course, be understood that when the eccentric is at the centre the gear is motionless and may be used practically as a clutch. It is therefore practicable to eliminate the clutch on a car provided with this gear. This will eventually be done in the Hutton car; but, in view of the fact that so many drivers are accustomed to control their cars largely by means of the clutch, it is thought desirable, in the first instance, to retain the clutch, and only to eliminate it when the new method of control becomes more familiar. This gear also takes the place of the differential, and a very simple reverse is obtained in practice without the addition of any further mechanism save the reversing levers. It may therefore be said that in this gear the motorist has clutch, differential, reverse, and all speeds in both directions in one compact combination.

Figs. 8 and 9.—Details of Hutton Variable Speed Gear.

The whole mechanism operates in an enclosed gear case, which is kept half full of lubricant. The accumulator, which forms the central feature of the hydraulic control apparatus, is placed on the dashboard; it consists of a chamber in which a spring is confined between two pistons. One end of this chamber forms a storage for oil, under pressure, which is distributed to those portions of the gear operated by its means, and the other end forms an elastic device for eliminating shock when starting up the speed gear. This end of the chamber, in fact, is placed in series with the cylinder contained in the speed gear shaft, so that the strap and links are actually operated by an elastic medium instead of by an incompressible element, such as oil or water, under pressure, would be without this arrangement. The accumulator is charged constantly by means of a slow-moving pump, operated by the second speed shaft of the motor.

With regard to the transmission of the power to the rear road wheels, the periphery of the two discs of the variable gear, which travel in opposite directions, is provided with spur teeth, each disc meshing with its own pinion on a side shaft (Fig. 7). On the rear ends of the latter are bevel pinions

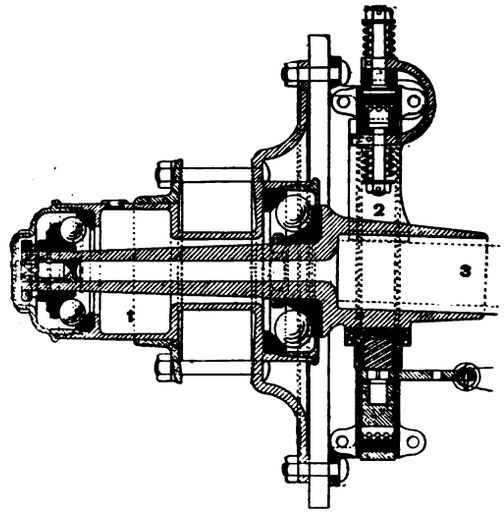

Fig. 10.—Section of Rear Hub and Expanding Brake on Hutton Car.

gearing with bevel wheels on the cross shaft. On the ends of the latter are sprocket wheels, which convey the power to the rear road wheels by side chains in the usual way. To obtain the reverse motion, the spur pinions, which are free to slide on their shafts, are each disengaged from their discs and brought into mesh with the other.

Digitized by Google

Fig. 10 is a sectional elevation, through the end of the axle and the hub of one of the rear road wheels. The external and internal brakes are coupled direct to a flange on the hub of the wheel, to which also the driving sprocket is attached. The chief feature of the hub is the large diameter (1¼ in.) of the balls adopted for the anti-friction bearings. The axle is a nickel steel tube, and the axle-end carrying the ball races is a nickel steel drop forging. The double rear brakes are applied by hand and by oil pressure, the first being expanded within the brake ring in a manner entirely similar to the clutch, except for the manual application, and the second by hydraulic pressure through an oil ram attached to the two free ends of the half brake bands, the oil under pressure being admitted to the ram by means of a lever on the steering wheel.

The success of "metal to metal" brakes, as is the case with "metal to metal" clutches, depends entirely upon a successful and reliable system of lubrication. The brakes on the Hutton car, both internal and external, are supplied constantly with oil, under pressure, from a special lubricator. Consequently the action of the brake, like that of the clutch, is a sweet and gradual one, and the firing or seizing up of the parts need not be feared.

Fig. 11 shows the general arrangement of the steering apparatus. The steering screw is carried between ball thrust bearings, and a spring device is inserted in the horizontal steering arm, which eliminates shock to the steering apparatus, and thus makes it unnecessary to provide complicated devices for the taking up of undue wear of these parts. Nickel steel tubes of large diameter are used for the steering rods and the steering arms, as well as for the tubes of the steering pillar. The valves

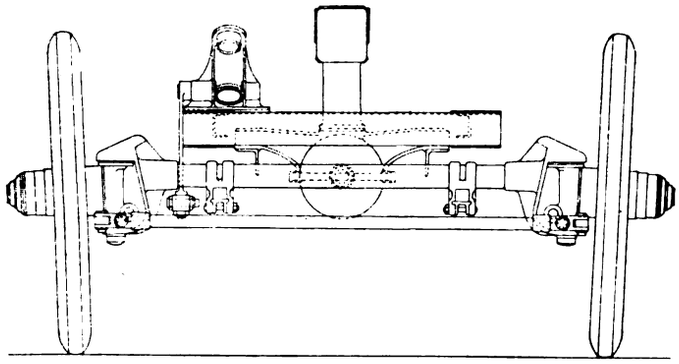

Fig. 11.—The Hutton Front Axle and Steering Gear.

for the hydraulic control are manipulated by means of rods attached to the lower end of these tubes, which are controlled by three levers at the top of the steering column—one for the sparking, one for the brake, and one for the variation of speed. The segment over which these levers work is clearly marked: brake, on—off; speed, increase—decrease; spark, advance—retard. The steering axle head is of special cast steel; the swivelling axle is a nickel steel drop forging, and the hub, as is also the case with the rear wheels, is of cast steel. It will be seen that the weight of the fore-end of the car is transmitted to the wheels through a ball race in the head, while at the same time all side stresses, which would be liable to interfere with the perfect movement of this race, are eliminated by means of the central pin, upon which the swivelling axle turns. This ball-bearing makes the steering of the car very easy. The central pin is hollow and will contain sufficient lubricant to keep the hub ball races in good condition for many months. Inch balls are used, and the ball races are of equally ample dimensions. It will also be apparent from the construction of these hubs, that although they are very large in diameter, they are light in weight; the construction, in fact, is tubular, similar to that of many other portions of the car. From the illustrations and description which we have given, it will be seen that much thought and ingenuity have been bestowed in the design and construction of the Hutton car.

MESSRS. STIRLINGS, LIMITED, have constructed a tramway-car, driven by petrol, for the Corporation of Perth.

IMPROVEMENTS IN CHANGE-SPEED GEARS.

A GENERAL improvement is noticeable in change speed gears of the sliding type and their containing cases, and the objections which have been urged against them in the past are now practically without foundation. The use of gears of large pitch, with properly beveled tooth faces, has minimised the difficulty of securing instant and noiseless engagement; the employment of an appropriate grade of metal for the gears, which combines great toughness with full susceptibility to the hardening process, secures a high measure of durability, while the employment of the jaw clutch to secure a direct drive upon the most used speed has placed the sliding gear system—with all its other advantages—on a full parity with the planetary system in the important respect of directness of application of the power and the absence of intermediary mechanism. Not content with securing a direct drive with gears turning idly, some manufacturers have arranged so that even the idly revolving gears are thrown out of mesh and the ideal of "gearlessness" is fully attained. How much actual mechanical advantage is secured by throwing these idle gears out of action is, considers an American writer, problematical, and the advantage attained may be nearly balanced by the complication entailed. Considering the existing prejudice against idle gears, it is at least a valuable "talking point."

Important refinements have been introduced in the lubrication of sliding gear systems, and the splash method, which is universally employed for the oiling of the gear faces, is now generally entirely distinct from the oil supply of the shaft bearings, it being recognised that a certain amount of metal chips is likely to be cut from the opposing gear faces after extended use, which, if allowed to enter the bearings, may work havoc upon the shafts and their bushings. The bearings are consequently in many instances protected against the entrance of oil from the splash, and fed by separate tubes from a magazine oiler or from grease cups. The employment of non-fluid lubricant for this purpose secures the incidental advantage of greater cleanliness, as there is less escape of lubricant to the external portions of the case.

All the smaller gears of the train are now usually cut upon the blank which forms the gear shaft, and if all gears could be so formed it would be highly advantageous in some respects, although it is hardly to be expected. The gears which are not formed integrally with the shaft are usually mounted upon flanges which are parts of the shafts themselves. Frequently the gears are held by means of bolts passing through the gear web and the flange, these bolts being depended upon to withstand the torque. If the bolt holes are accurately spaced so that each bolt receives its fair proportion of the turning moment, and the bolts are well secured, this arrangement may be all right, especially if the gear is splined to the shaft as well; but if the bolts do not accurately centre their holes one of them may be sheared off, drop into the gear case and cause serious trouble. It would seem that the flange and the gear might readily be provided with engaging jaws which would assume the torque and relieve the bolts of all responsibility save of holding together the two parts.

THE Governor of Upper Austria has ordered the official purchase of a 12-14-h.p. Peugeot car for certain tours of inspection in his domain, and will make use of the vehicle in districts where the railway connections are few and far between.

EVERY automobile speaks a language that can be understood by the exercise of a little patient effort. Then when a car signals that its carburettor is not working right, that a sparking plug needs attention, or that the lubrication is faulty, the understanding hearer knows precisely what to do and can remedy the trouble at once, thus saving himself both annoyance and expense.

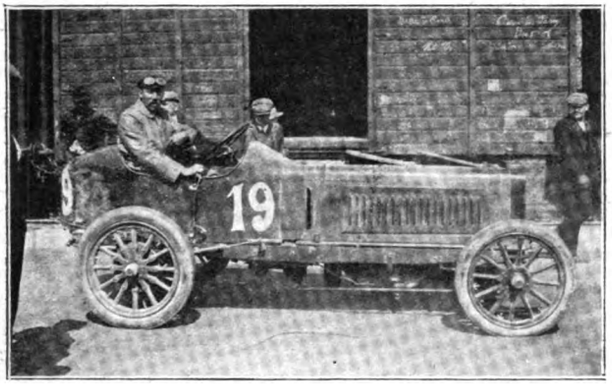
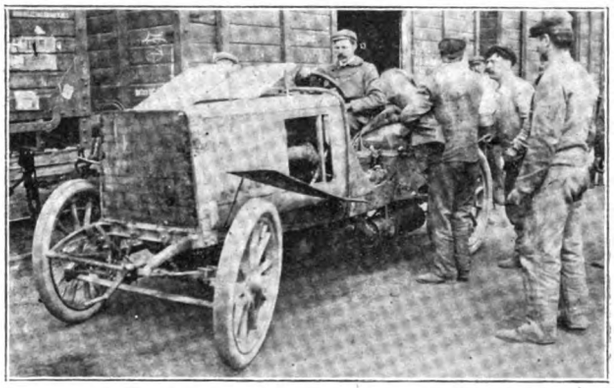
CONTINENTAL NOTES.



Record Breaking at Ostend.

Marvellous as were the speeds attained on Monday of last week at the trials in connection with the Ostend automobile week, they were eclipsed on the occasion of the flying kilometre speed trials on the Snaeskerke road on the 20th inst. Dealing first with the racing section, Seguy on a Gri on secured the first place, among the motor-bicycles his time, being 36 2-5 sec., Coppin on a Red Star being second in 40 4-5 sec.; Rigal's machine in the heavy motor-cycle class broke down and was pushed home in 12 min. 35 2-5 sec. In the voiturette class, Edmond on a Darracq established a new record — 30 2-5 sec., equal to seventy miles an hour. In the light car class Hanriot again demonstrated the speed of his Clement-place on a C.G.V. in 50 sec., while in the over £1,200 class Baron De Caters was first on his Mercedes in 30 secs. After the trials Rigolly, Baras and Le Blon each endeavoured to set up new times for the flying kilometre, but the best speed attained was 22 1-5 sec. by the first-named.



◆ ◆ ◆

The Dauphine Automobile Week.

The programme of the automobile week which the Automobile Club Dauphinois, of Grenoble, is organising for the week ending August 7th has now been issued. The meeting will open on the 3rd by the reception and weighing in of the competitors. On the 4th there will be a run for touring cars of 308 kilometres, from Grenoble to La Mure, La Salle, the Col Bayard, Saymes, Briancon and back to Grenoble, *en route* the times over a six kilometre stretch on the Laffrey Hill will be timed. On Friday, August 5th, there will be another run

Baras on his Darracq.

H. Farman on the Panhard Racer.

The Scene at the Weighing-in at Bastogne.

THE CIRCUIT DES ARDENNES. (*See page* 463.)

Bayard. He was allowed a second trial, as on the first, owing to mistaking the signals, he stopped his engine before completing the kilometre. On the second attempt he got away smartly and covered the kilometre in 26 4-5 sec., thus creating a new world's record for this class of car. It was, however, in the heavy car class that the fastest travelling was witnessed. And here again the speed of Gobron-Brillie racers was demonstrated in a striking fashion, Rigolly covering the kilometre in the new world's record time of 21 3-5 secs., equal to a speed of over 100 miles an hour. The Darracq racer driven by Baras is now in splendid condition, as is evidenced by the fact that his time was only 2 5 sec. longer than that of Rigolly. In the Tourist section, the honours of the day fell to Boyer cars in the under £160 and £240 classes, and to Serpollet steam cars in the under £400 and £600 and £800 categories. In the under £1,200 class Delesalle secured first of 190 kilometres, from Grenoble to Les Echelles, Montmelian, Gieres, and Uriage, the times being taken on the climb up the Col du Cucheron. Saturday, the 6th, will be spent at Uriage-les-Bains, the programme for the day comprising a 500-metre speed trial and a fete at the Casino. The meeting will close on the 7th with a gymkhana, a battle of flowers, and a banquet. The awards in the touring competition will be based on the points gained for regularity of running, speed on hills, average speed, fuel and water consumption, comfort and cost of car.

◆ ◆ ◆

Hill-Climbing in Austria.

Under the auspices of the Austrian Automobile Motor Club, a hill-climbing competition is to take place on August 21st, over the ten kilometre Schottwein-Semmering course. Competitors will be classified as follows:—(1) Motor-bicycles of maximum

Digitized by Google

weight of 50 kilos.; (2) motor-cycles between 50-65 kilos.; (3) cars between 250-400 kilos.; (4) cars between 400-650 kilos.; (5) cars between 650-1,000 kilos.; (6) touring cars with body having at least four seats and carrying two persons and 140 kilos. of luggage. In groups 1-5 the first receives a prize of honour, the second a silver medal, and the third a bronze medal of the Austrian Club. In group 6, five prizes of honour will be distributed. A trophy is put up for the machine making the best time; this has to be won in three successive years before becoming the property of the winner. Mr. Clarence Gray Dinsmore, who won it for the second time in September of last year, is defending the cup. Entries will be received until the 10th August at the Generalsekretariat des Oesterreichischen Automobilklubs, Karntnerring 10, Vienna.

◆ ◆ ◆

The Calais-Dover Motor-Boat Race.

Great interest is being shown in the forthcoming motor-boat race from Calais to Dover, and quite an extensive list of prizes will be offered for competition, including one for boats using heavy oil as fuel and one for vessels using denaturated alcohol. All competitors will be required to obtain from the naval authorities a *permis de navigation*. It will be seen from the appended list of entries that there will be a large number of English competitors in the race.

CRUISERS.

◆ ◆ ◆

An Automobile Week in the Vosges.

The Syndicat Initiative des Vosges et de Nancy is organising an automobile week to be held from the 7th to the 13th August. On the first day there will be a run from Nancy to Strasburg, a distance of 143 kilometres, via Luneville, Raon, Le Dona, and Schirmeck. On the 8th the run will be continued to Saint Dié, 147 kilometres; on the 9th Colmar, 81 kilometres, will be visited; on the 10th the tour will be extended to Epinal, 95 kilometres, the day's run including a trip up the Col de la Schlucht. On the 11th Bussang, 90 kilometres, will be reached; on the 12th Belfort, 46 kilometres, the tour finishing at Contrexeville-Vittel, 134 kilometres, on the 13th August.

◆ ◆ ◆

A German Automobile Congress.

An automobile congress is to be held at Breslau from the 18th to the 21st August, under the auspices of the German Automobile Union and the Silesian Automobile Club. The meeting will open with a reception on the 18th, while on the 20th there will be a run to the Furstenstein Castle, where the visitors will be entertained to lunch by the Prince of Pless.

◆ ◆ ◆

A Five-Cylinder Motor.

The Société Decauville, of Paris, having given the matter of multi-cylinder motors long attention, are of opinion that five is the number to be employed where more than four are desired, and a five-cylinder Decauville will therefore probably be a feature of the next Salon.

◆ ◆ ◆

The 1905 Gordon Bennett Race.

Baron Henri de Rothschild is reported to be interesting himself in a proposed course for next year's Gordon Bennett race in the Aix-les-Bains district. The suggested course—Aix-les Bains, Chambery, Albertville, Annecy, Aix-les-Bains—is said to be most suitable for the race from every point of view.

◆ ◆ ◆

Another French Public Service.

The company which is running the public motor-car service between Havre and Etretat now proposes to establish similar facilities between Havre and Caudebec-en-Caux. The route will be along the valley of the Seine, stopping-places being provided for at all the principal villages passed through

◆ ◆ ◆

A Danish Motor-Cycle Reliability Trial.

In a recent motor-cycle endurance trial in Denmark, held under the auspices of the Dansk Motor-cycle Club, twenty of the starters completed the journey. Fourteen of the machines which finished the trip were of German construction. The first prize was won on a Westfalen machine, of which there were four among those that classified, while the next four machines were Adlers, of which there were eight in the competition.

◆ ◆ ◆

The Swiss Automobile Club.

The annual meeting of the Automobile Club of Switzerland took place recently in Zurich. M. Aloys Naville was elected president, M. Charles L. Empeyta first vice-president, and M. Camille Rochette second vice-president. In speaking of the past year the president stated that motoring had become one of the most popular sports in the Swiss republic and that the few national manufacturers of motor-cars and cycles were doing well and becoming prominent in the European market.

◆ ◆ ◆

Public Services in Germany.

Slowly but surely the motor-car is being adopted for public service work in Germany. One is about to be started between Hexenthal and Freiburg (Breisgau), while in the Duchy of Brunswick a service is projected between Brunswick, Salder and Hallendorf and a number of other villages not served by the railways. A public service between Emmerich and Cleve is also under consideration.

◆ ◆ ◆

A Military Motor Service in Bosnia.

The military authorities in Bosnia propose to establish a motor military post service between places not served by railways. The first vehicle is now at work; it was built by the Austrian Daimler Company, and is designed to carry between 13 cwt. and 14 cwt. of mails and five passengers. The motor is designed to use either petrol or alcohol as fuel, while the road wheels are shod with solid rubber tyres.

THE Winton Company has just brought out a four-cylinder car. The engine is of the horizontal type with the four cylinders each 4 3-8 in. bore by 5 in. stroke) set transversely across and on one side of the frame. Only two speeds forward and a reverse are provided, the power being transmitted through a universally-jointed shaft and bevel gear to a rear live axle.

MOTOR CYCLING NEWS.

FOR every time a motor-cycle goes wrong—even in the most insignificant detail—there may be a score of occasions when it is beyond criticism. Nevertheless, the one troublesome occasion will vastly outweigh the twenty enjoyable ones in the mind of the rider. The latter are rarely thought of, scarcely ever dwelt upon. The owner of a machine may ride fifty or one hundred miles without a hitch, and think nothing of it; but let one thing go wrong and he will frequently remember only it, and wonder why he ever had anything to do with such an unreliable "contraption."

◆ ◆ ◆

THIS state of chronic fault-finding is inseparable from all new things. When the safety bicycle became popular, when the pneumatic tyre put in an appearance, and so on down the scale, the same disposition to find fault on all occasions was observable. But as every improvement connected with the bicycle had to run the same gauntlet of criticism, so each and all of them finally outlived it. It will be so with the motor-cycle. The disposition to throw up one's hands in mingled horror and resignation every time the mixture is wrong, the sparking is not regular, or the belt slips, will ultimately disappear.

◆ ◆ ◆

THE more a rider uses a motor-cycle the better he will understand it, and know how to use it and take care of it, that is, provided he has some glimmering of mechanical knowledge. If he is without this, however, it were far better that he never crossed the saddle of a mechanically-propelled bicycle. For it is a fact, and it might as well be understood at the outset, that the rider who would not know how to screw up a nut if he attacked it spanner in hand—and there are not a few of this type of person still about—has no business with a motor-cycle.

◆ ◆ ◆

IT may be said for the motor-cycle, however, that even at this early stage of the movement there is a very marked lessening in the number of troubles encountered. If only ordinary care is taken it is not necessary to start out on a motor-cycle run with the fear constantly in one's mind that the return journey will be made by train or on foot. It is quite possible, as recent trials have conclusively proved, to come through a run without a mishap of any kind, and the chances of immunity from trouble will become greater as the months go by.

◆ ◆ ◆

ON Saturday last the Irish Motor Cycle Union carried out their third series of speed trials at the Silver Strand at Portmarnock. This series of competitions have become very popular and Saturday's trials attracted the entry of Bert Yates, of Coventry, who won two of the four competitions on the card. The events in which Yates was successful were the classes for single motor-cycles weighing under 120 lbs. and 150 lbs. respectively. He was second in the class for motor-cycles carrying two, A. Summers winning. The sands were not in quite as good order as usual, the high winds of the week making them very "wavy" in parts, and consequently the times were not remarkable, the best performance being that of C. "Arburettor," who did 52 1-5 secs. for the flying kilometre in winning the open class.

CLASS A (for machines weighing 120 lbs. or under, without petrol or accumulators). One mile, from standing start. First heat: F. A. Wallen, 2½-h.p. Triumph; 2. J. G. Drury, 2-h.p. Triumph. Time, 1 min. 50 secs. Second heat: B. Yates, Coventry, Humber, 1; R. W. Stevens, Dublin, 2¾-h.p. Griffon, 2. Time, 1 min. 41 secs.

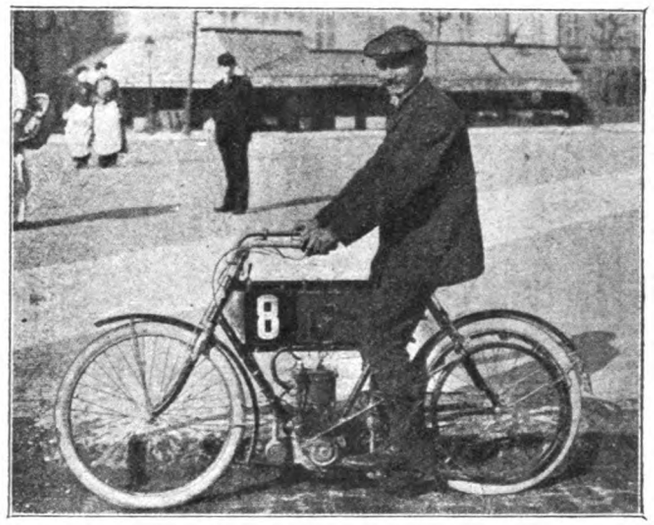
Final:—B. Yates, Coventry, 1; F. A. Wallen, Dublin, 2. Time, 1 min. 41 secs.

CLASS B (for machines weighing 150 lbs. or under, without petrol or accumulators). One mile, from standing start. First heat:—C. B. Franklin, 2¾-h.p. F.N., 1; R. F. Franklin, 2¾-h.p. F.N., 2; A. Summers, 3-h.p. Triumph, fell. Won easily. Time, 1 min. 51 secs. Second heat: B. Yates, Humber, 1; F. A. Wallen, 2½-h.p. Triumph, 0; J. G. Drury, 2-h.p. Triumph, 0. Won easily. Time, 1 min. 36 secs.

Final:—B. Yates, Coventry, 1; C. B. Franklin, Dublin, 2. Time, 1 min. 37 secs.

CLASS D (for motor-cars built for and carrying two, driver and passenger to be of an aggregate weight of twenty stones). One mile standing start.

Final: A. Summers, 3-h.p. Triumph bicycle with trailer, 1; B. Yates, Humber Olympia fore-car, 2. Time, 2 min. 4 2-5 secs.



CLASS C (for single motor-cycles unrestricted as to weight). One kilometre, flying start:—C. "Arburettor," 3-h.p. Excelsior, 52 2-5 secs., 1; A. Summers, 3-h.p. Triumph, 54 1 5 secs., 2; C. B. Franklin, 2¾-h.p. F.N., 55 3-5 secs., 3.

◆ ◆ ◆

THE last date for entries for the "Albert Brown" trophy competition is September 5th. The trial is being organised by the Motor Cycling Club and will be one of reliability. The hon. sec. is Mr. C. W. Brown, Hollyville, North Finchley, N.

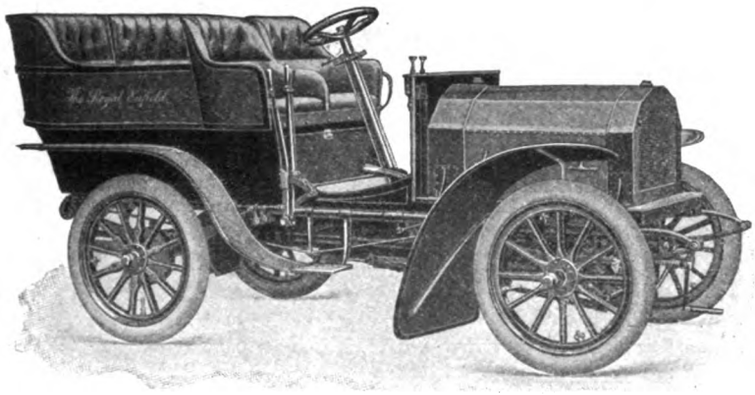
◆ ◆ ◆

ONE of the most successful motor-cycle clubs in the North of England is the Manchester Motor-Cycle Club, which has now seventy-five members. The club have held their first non-stop reliability trials over a 100 mile course. The first round extended over two days and has been most successfully carried out. There were twenty-three competitors. The first day's run was over a

Bonnard, a well-known French Motor Cyclist, on his Werner.

triangular course of 16½ miles lying between Knutsford, Holmes Chapel and Northwich, which had to be traversed nearly six times. Nothing of note transpired except that the Knutsford police interfered and stopped three of the men on the first day. The course for the second day was altered to an out-and-home route of fifty miles, starting between Knutsford and Holmes Chapel to Shrewsbury and back. In the two days' run no less than nineteen competitors out of the twenty-three completed the run within the time limit, and ten made practically non-stop runs as follows:—Messrs. Maitland, Andrews, Hall, Reece, Wilkinson, Clift, Boden, Bullock, Varden, and Withecombe, and thus qualify for the second trial. It has not yet been decided what form this will take.

◆ ◆ ◆



MONDAY next is the last day for entries for the Motor Cycle Challenge Cup competition which is being organised by the Motor Cycling Club. The competition will take place on the 27th prox.

THE Car and General Insurance Corporation, Limited, has opened a sub-office at 23, Bucklersbury, E.C., and new branch offices at the Standard Life Buildings, City Square, Leeds, and 29, Princess Street, Manchester.

Digitized by Google

THE ROYAL ENFIELD 10-H.P. CAR.

IN addition to the 6-h.p. two-seated car illustrated in the *Journal* of April 2nd last, the Enfield Cycle Company Limited, are now turning out a 10-h.p. vehicle, of which a general view is given herewith. Like the smaller car, the frame is of tubular construction, in the fore part of which is set a two-cylinder engine of their own construction. The cylinders are 4 in. in diameter by 5 in. in stroke, with inlet and exhaust valves operated mechanically off one cam shaft, Longuemare carburettor and centrifugal governor. The two cylinders and water-jacket are cast in one piece; the valve chambers are also an integral part of the cylinder, this construction ensuring reliability of running. The crank shaft gives large and ample wearing surface for the thrust bearings, and also for the connecting rod bearings. The fly-wheel is of large proportions, ensuring regularity in the running of the engine. The latter is cooled by a gear-driven pump and honeycomb radiator. We may add that the normal speed of the engine is 850 revs. per min.; a pedal accelerator is, however, provided, by means of which the governor can be cut out. The tubular frame is carried on four springs slung so that they will give a comfortable suspension under the most trying conditions. The change speed gear gives three speeds forward and one reverse, controlled by one lever, the drive on the top speed being direct. Both foot and hand brakes are provided, the former acting directly on the transmission shaft from the change-speed gear. Several excellent arrangements have also been

devised in other parts, while the comfortable tonneau should make the vehicle a popular one. We may add that the Enfield Company are building a special factory for the motor-car branch of their business, which will, when completed, rank as one of the largest in the Midlands.

THERE are about 200 cars registered in Leeds and an equal number of motor-cycles.

AT the annual show of the Cardiff Horticultural Society, a class for decorated motor-cars was an attractive feature.

IN Norfolk, Mr. F. Garner, of Watton, and Mr. T. N. Elvin, of East Dereham, are undertaking the manufacture and repair of motor-car bodies.

ON Saturday last Mr. W. L. Duck drove a 20-h.p. Winton touring car from London to Brighton and back on the top gear, both traffic and hills being negotiated successfully without change.

MR. E. A. GOLBY, of Batley, sends word of the help recently rendered him by Mr. W. Corbett, motor agent, of North Road, St. Helen's, whom he recommends as a friend to motorists in distress.

THE Finchley Road Motor Garage has been opened by the Artillery Wheel Works, Limited, at Lymington Road, Hampstead, N.W. This is to be open night and day, Sundays included. A neat tariff card has been issued by the proprietors.

SOME USEFUL NOTES.

IN the majority of petrol cars the speed of the engine may be controlled either by the throttle or by the ignition, or by both, and it is a matter of some difficulty for the novice to understand why two different devices should be provided for the same purpose, when apparently one would accomplish the object. The logical conclusion to be drawn is that by using the two devices in combination more efficient control may be secured, but how the two controlling means are operated to always secure the most efficient control is generally quite a puzzle to beginners. The engine, preferably, should always be so controlled that the power necessary to drive the car at the required speed is generated with the least consumption of fuel. This is desirable not only because of the saving in fuel, but because an excess of fuel burnt simply results in greater wear of the bearing surfaces, more heating of the cooling water, and in a higher temperature of, and consequently more noisy exhaust.

◆ ◆ ◆

CONTROLLING the speed of the engine by the ignition alone is very wasteful, as the engine at a given speed always consumes the maximum amount of fuel for that speed, regardless of the load. The engine takes in a full charge at each suction stroke, and the speed can only be reduced by wasting the greater proportion of the energy contained in the charge. With a throttle, on the other hand, the charge per suction stroke is reduced when the speed of the motor is reduced, and with the throttle control the fuel consumption may be very closely proportional to the load on the engine.

◆ ◆ ◆

WHILE control by throttle alone is therefore inherently more economical than control by ignition alone, the highest economy can only be secured by controlling simultaneously both the throttle and the ignition. Practically speaking, there is, states the "Horseless Age," for each speed of the engine a definite ignition lever position which gives the best results. This is not absolutely correct, as the speed of combustion depends upon the richness and purity of the charge, and consequently when the engine is throttled and runs at light load, at a certain speed, the best period of ignition is slightly earlier than when running at full load on a purer charge at the same speed. The difference is slight, however, and to simplify matters may be neglected here.

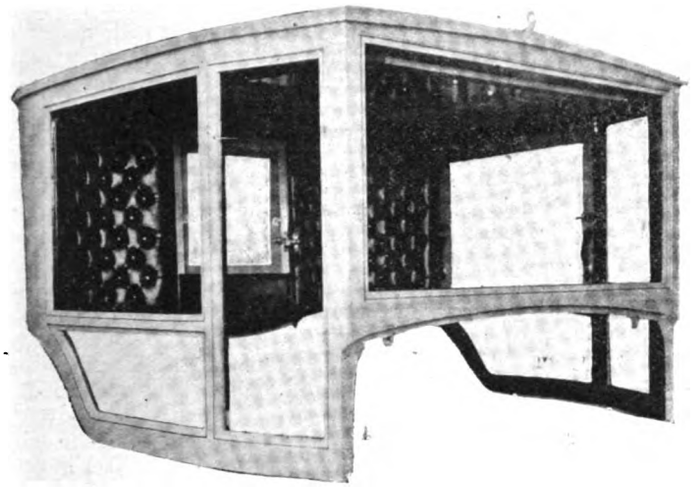
◆ ◆ ◆

THERE is, then, for each engine speed a most advantageous position of the ignition lever found in practice by trial. Retarding the ignition from this position will cause the engine to slow down, and advancing it beyond this point will cause the motor to produce a pounding noise readily distinguished by the trained ear. When the motor pounds or knocks in this manner it is a sign of great strain on the moving parts, and advancing the ignition lever too far should therefore be carefully avoided.

◆ ◆ ◆

DURING periods of adjustment, when it is impossible to have the spark occur at just the right moment, it is always better to have it occur late rather than early. Consequently, when the car is running slowly with the ignition lever set to conform to the particular speed, the throttle should first be opened, which will cause the engine to speed up, and then the ignition lever should be adjusted to the new conditions. On the contrary, if is desired to decrease the engine speed, the ignition lever should first be set back, and the throttle then closed. Also, when the car is changed from a lower to a higher gear the engine will be pulled down in speed considerably immediately the high gear is engaged, and the spark should therefore be retarded just before or at the moment the clutch is thrown in.

◆ ◆ ◆



STUDY your car, whether you have a chauffeur or not. You will be well repaid. The man who gets the best service is the one who knows his servant, understands its little kinks and is ready in emergencies to apply his knowledge. Half the repair bills of motoring can be saved by a little thinking.

HERE AND THERE.

LORD ARMSTRONG has just been supplied with a 18–28-h.p. Mercedes by the Northern Counties Motor Garages, Limited.

THE accompanying illustration shows one of the special brougham tops recently introduced by the Lacre Motor-Car Company, Limited. One of the chief features of the top is that

it is easily fitted to any open car. The front and side windows slide up under the roof and are secured with special fasteners, which do away with any noises that are so objectionable in many such contrivances.

COL. R. E. CROMPTON is shortly going to the United States as one of the delegates of the Institution of Electrical Engineers to the International Electrical Congress which is to be held in connection with the St. Louis Exhibition in September.

MESSRS. THOMAS SHAW, LIMITED, have recently added to their premises in Dundee a well-equipped motor garage. Storage space is available for some twenty or thirty cars, while an inspection pit capable of accommodating three cars is one of the features.

THE educational committee of the Y.M.C.A., Detroit, U.S.A., has appointed a number of leading local automobile constructors as members of an advisory committee for its motor school, feeling that to properly care for the needs of the school it is necessary to have a committee of practical automobile and gas engine manufacturers with whom the instructors may take counsel on questions that may arise.

THE formal opening of the club rooms of the Toronto Automobile Club of Toronto, Canada, took place on the 4th inst. Delegations from Cleveland, Buffalo and a number of important Canadian towns gathered at the King Edward Hotel, where a banquet was given. After dinner several speeches were made, in which one of the principal subjects was the good feeling between motorists in both Canada and the United States and the urging that all should work in favour of the common cause.

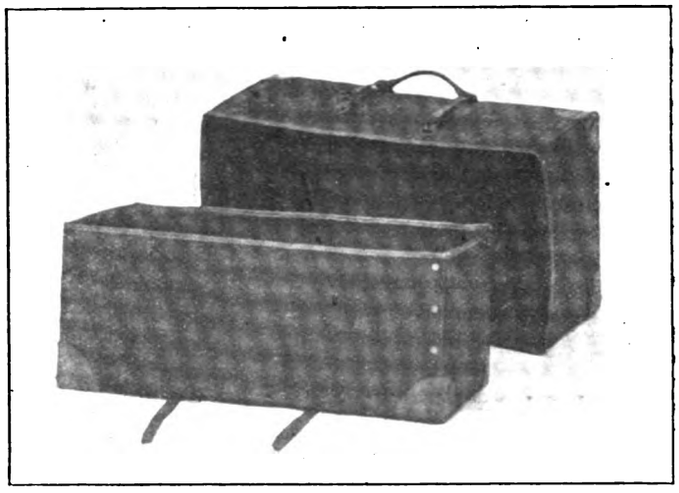
THE United Motor Industries, Ltd., have lately introduced a new series of electric lamps for motor-cars, to take the place of acetylene and oil lamps. Fitted with a 12-volt bulb—which is the one recommended—they give, owing to their construction, a most remarkably good light, as has been shown by actual test on a very dark night. The U.M.I. inform us that they find it is quite safe to drive a car at a good speed by the aid of these lamps only, on a pitch dark night, and of course they get over all the trouble of cleaning and save much weight. Another advantage is that they are materially cheaper than gas head lamps. The lamp consists of a metal body formed into a correctly-shaped reflecting surface, through the centre of which a fixture for a small incandescent lamp projects. From the back of this fixture the leads run to the battery. The front of the body of the lamp is closed with a hinged door carrying a double convex lens, which collects and distributes the light of the lamp to the best advantage.

AN automobile club has just been formed at Chaux-de-Fonds, Switzerland.

THE new city hospital at Cincinnati, U.S.A., is to be provided with motor-ambulances.

MESSRS. S. HOLMES AND COMPANY, of Bradford, have taken out a licence for the sale of motor spirit, and motorists passing through the town can be assured of a supply at any hour.

A 2,255-MILE trip across the United States from south to north was completed last month for the first time by Mr. C. L. Joy on a Winton car. He started from Lia Juana, in Mexico, and drove northward through mountainous and level country in California to Seattle.



IN consequence of a rumour to the effect that the dynamo is no longer fitted upon Decauville cars, the Motor Car Company, Limited, ask us to mention that this method of keeping the batteries charged has been found to be perfectly satisfactory, and consequently the dynamo is supplied in every case where desired by the purchaser.

WITH the permission of the first district committee of the Renfrew County Council, the Western Section of the Scottish Automobile Club have treated two portions of roadway with "Westrumite," and one portion with crude oil. So far, the results are satisfactory and a special note is being kept by the surveyor as to the utility and durability of the operations.

DURING the two weeks ended July 16 the number of motor-cars registered in London was 136 and the number of motor-cycles 36, making the total number registered up to that date 3,904 and 2,773, respectively. During the same period 360 licences were issued and general identification marks for motor-cars were assigned to four manufacturers or dealers, the total number of licences and general identification marks issued being 9,664 and 274 respectively.

THE Anglo-American Oil Company have just published a revised edition of the list of agents from whom automobilists may obtain their supply of the well-known Pratt's Motor Spirit. Besides giving the names and addresses of nearly 3,500 agents in districts of London and provinces, Scotland, Ireland and Wales, it contains the regulations regarding motor spirit under the Locomotives and Highways Act, 1896; index marks of the County and County Borough Councils in Great Britain; railway receiving days, and information regarding the rates of carriage for motor spirit.

MR. EDWARD KENNARD, whose enthusiasm for motoring is unbounded, sends the accompanying photograph of a valise which he had made for him, and which he found perfect when on tour.

Mrs. Kennard possesses a duplicate, and Messrs. Dunhills are now making the handy little wallet. It is to be known as the Kennard valise.

AMONG the visits to be paid by the Institute of Journalists during their Conference at Glasgow is one to the Hozier Company's Engineering Works.

Digitized by Google

As mentioned in a recent issue, Mr. Thos. Shaw, of Dundee, driving a 15-h.p. Napier with four people up, has succeeded in covering the 676½ miles which lie between London and Inverness in 31 hours 35 minutes. The route taken was *via* Doncaster, Durham, Berwick, Edinburgh, Glasgow, and Dundee. The run was a non-engine-stop achievement throughout, no trouble of any kind being experienced. The Palmer Cord tyres, with

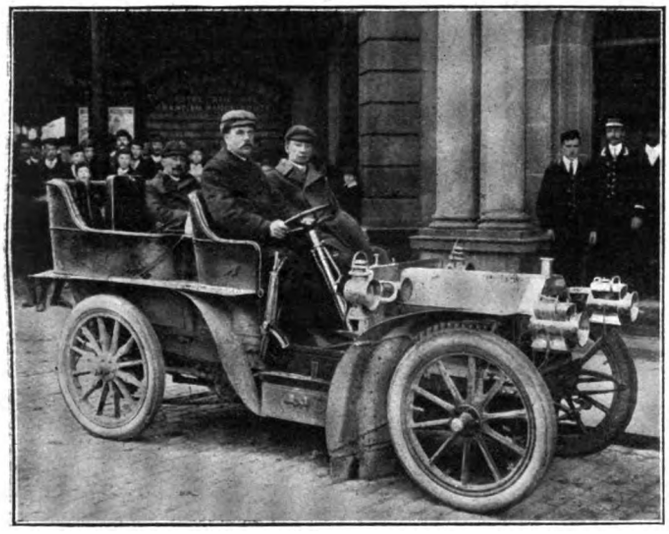


Photo by [*MacMahon.*

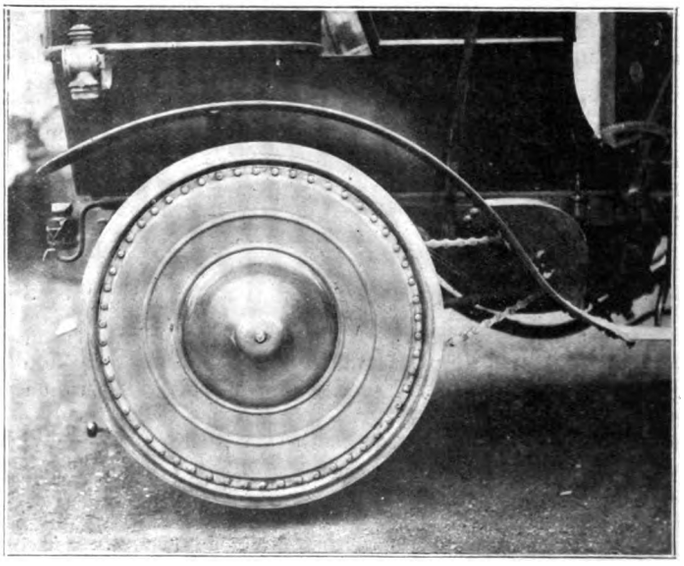
which the car was shod, stood up without the least sign of deflation, nor was there any delay in procuring petrol or oil *en route*. With the exception of a thunderstorm the journey was accomplished under most pleasant conditions, and the fact that the London to Glasgow and London to Inverness records were lowered by 1 hour 55 minutes and 5 hours 43 minutes respectively further increased the travellers' gratification. Our illustration shows the car on its arrival at Inverness.

"The Automobile Industry" is one of the volumes of Books on Business now being published by Messrs. Methuen and Company. It is written by Mr. Geoffrey de Holden-Stone, who has found other works on the motor-car "sketchy and circumambulatory" or possessed of other defects which left room in the literary firmament for the present work. The method of description has enabled the author to achieve the "well-nigh impossible task" of bringing the matter "actually up-to-date." More than that need not be said.



Messrs. W. Martin and Company, cycle and motor engineers, of West Ham, have sent us photographs of an invalid chair they have lately introduced. The chair is built up cycle-fashion with thin weldless steel tubing. The back rest can be tilted at any desired angle by the occupant, spring pegs fitting drilled holes in quadrants on either side securing it in the desired position. The side frame tubes are open throughout the entire length, so that a couple of sticks or crutches may be carried therein. Five springs are fitted which effectually break up all road vibration, so dangerous in some cases. The chair can be collapsed into a small space in 40 seconds by folding the back rest, with the arm rests flat on to seat, and by unscrewing three screws the front wheels and steering wheel are detached from the frame and pack under the seat. For persons suffering from the more acute forms of paralysis, etc., the chair should be invaluable, more especially as it is so portable, when folded, that it can be taken in an ordinary motor-car or railway carriage. The large wheels are fitted with Dunlop tyres, and the small rear-steering wheel with solid rubber tyres. The weight of the chair complete varies from 35 lbs. to 45 lbs., according to the strength necessary to carry the invalid's weight. It may interest motorists generally to know that a chair such as described is in use by a gentleman owning a Lanchester car, who, when visiting or touring, carries the chair folded up on the "deck" of the car.

Mr. Andre A. Godin, the British agent for the Ducellier motor lamps, is at present in the United States for the purpose of fixing up an American depot for these well-known light-givers.

Smokers on cars have always found it difficult to light either a pipe or a cigar, and to overcome this difficulty Messrs. L. A. Beckett, Limited, have brought out a cigar and pipe lighter. The device is simply connected up to one of the 4-volt accumulators used for ignition purposes on petrol cars, and by simply pressing a button in the handle a coil at the end instantly glows with a red heat. We have tried one of the lighters and find it most effective and convenient. It can also be used as a tester for accumulators, and, further, will light up acetylene lamps and even paraffin lamps if good oil is used. Needless to say it is wind and rain proof and is always ready.

Price's Patent Candle Company, Limited, have sent us a sample of a new lubricant they have lately introduced for treating the chains of motor-cars and cycles. The compound, which is known as "Cirogene," and is the result of two years' experiment, combines the tenacity of wax with the valuable lubricating properties of the finest tallow and graphite. It has been prepared to meet the repeated demands of motorists for a material which should perform the functions of a lubricant, should not be expressed from the links by the action of the chain, should prevent the admission of dirt to the links, and, while free from injurious action itself, should protect metal from the corrosive action of the air and moisture. To apply "Cirogene" to a chain, a small quantity of the former must be put in a metal vessel and melted by heat, while the chain must be removed from the car and thoroughly washed in paraffin oil. In the case of smaller chains it may be possible to find a shallow vessel of sufficient capacity to permit of the immersion, in the liquid "Cirogene," of the whole chain, at once, when coiled up. In the case of larger chains, the chain, after washing, is to be suspended on a pin, or preferably on a small spare sprocket running free on a bearing on the wall, directly over the vessel containing the liquid. The chain is then to be immersed in sections, a few links at a time, in the melted material, each section being permitted to remain in the bath till it attains the temperature of the liquid, in order to ensure the complete permeation of each link by the lubricant.

We are able to give an illustration of the Arthur Robinson patent compensated spring wheel which Messrs. J. W. Brooke and Company, Limited, have lately constructed for Mr. Arthur

Robinson, of Beccles. The illustration shows the wheels jacked up ready for the removal of the cover plate to obtain a view of the interior. The time occupied in removing the plate is only three minutes.

The Farrington Motor Works, of South Street, Chichester, have every facility for the repair of cars—a fact of interest to motorists attending Goodwood.

CORRESPONDENCE.

A MOTORIST'S PETROL EXPERIENCES.

To the Editor of *The Motor-Car Journal.*

Sir,—There are certain precautions, in connection with car management, which become a matter of habitude, and yet which may well strike the casual onlooker as superfluous. Possibly the motorist himself at times is tempted to relax his vigilance, but at a heavy cost. For instance, there is the matter of filling up one's tank with petrol. The usual thing, of course, is to use a gauze funnel, handkerchief, or a piece of linen, to filter the liquid as it flows into the tank; but when one has poured out scores and scores of gallons without observing any sediment it is easy to think lightly of the precaution, and possibly abandon it occasionally if in a hurry, and a tundish is not handy. But it does not pay! It is easy enough to suppose that the petrol manufacturers are scrupulously careful, and that the presence of grit within their cans is rendered practically impossible. But mistakes will happen, as I was forcibly reminded the other day, for after emptying a two gallon tin into my tank I was horrified to find quite a number of particles of dirt remaining on the gauze membrane of my tundish. Some were as large as good sized pellets, while there were plenty more which would have worked sad havoc with my carburettor but for the fineness of the gauze.

For the benefit of fellow motorists I may point out here what, of course, no experienced hand needs to be reminded of, namely, that nothing is more aggravating to a driver than interruption of the petrol flow through the presence of minute particles of sediment. They return again and again to the charge like hungry flies, and are more baffling even than troubles with the ignition. "Filter your petrol" is a maxim which cannot be too seriously laid to heart at the outset of every automobilist's career.

In another direction, too, I have lately had an illustration of the fact that one must not regard the petrol-can as necessarily without flaw. Before starting on a journey I had placed a couple of tins in my tonneau, after the plan adopted by many others of carrying a reserve, and keeping it as such by buying on the road whenever feasible; you thus make it worth people's while, to stock petrol in various parts of the country, and are always sure of having some at hand in case you do not come across an agent. At the end of the journey I found the floor of the car quite wet, and on examination discovered that petrol had been oozing out of one of the cans—in minute quantities, of course, but it was escaping all the same. Now one is accustomed to believe that one could build a fire round a tin of petrol, and that unless the heat were sufficient to melt the joints there would be no conflagration. But that a leaky tin is a possible, if uncommon, factor to be reckoned with is shown by the circumstance above described.—Yours truly,

J. W. Macpherson.

MOTOR UTILITY.

To the Editor of *The Motor-Car Journal.*

Sir,—Although the value of the motor-vehicle is naturally most appreciated in connection with the conveyance of passengers and the transportation of goods, there are adaptations of which it is capable which should—when fully understood—increase its popularity with manufacturing and commercial firms. In every motor-vehicle we have a portable engine, whose power can be utilised for a large variety of work by simply providing a short length of flexible shafting which can be connected up to the engine shaft, or to one of the countershafts. Take the case of a builder or contractor engaged in the erection of a large building, and using a motor-wagon for the transport of his materials. The vehicle might be fitted with a winding drum, and after it had been placed into a suitable position a rope or chain from the lifting tackle might be led to the drum through a snatch block, and the power of the motor utilised not only to discharge the load, but also to hoist it up to the necessary elevation at once. For girders and other heavy goods the low speed would be used, and for quick, light lifts one of the higher gears. When not required for transport purposes, the motor, by means of a flexible shaft, might operate a circular saw on the site of the building, and thus save a large amount of hand labour.

Similar conditions obtain in many other cases. The farmer, for instance, frequently has to engage a portable engine for his work. The heavy motor-wagon could not only enable him to transport his produce to markets which were formerly inaccessible, but the motor itself could also be used for operating the various machines which are often worked by hand, or in a clumsy fashion by horses.

Turning now to pleasure vehicles, the well-equipped country house of the future will have its motor-vehicle for station work, and it is quite easy to conceive that a car provided with a length of flexible shafting might extend its field of usefulness very widely under such conditions. It might be used for pumping water from a well to an overhead tank for supplying the house, and also for operating a churn, chaff-cutter, and other similar machines. These few instances will serve to indicate some of the directions in which the usefulness of the motor-vehicle can be increased, and by a little careful thought the list might be largely amplified, and manufacturers will see that by the addition of simple attachments, the cost of which would be comparatively small, they might largely increase the selling power of their vehicles.—Yours truly,

Tintagel.

CONVERTING FROM TUBE IGNITION.

To the Editor of *The Motor-Car Journal.*

Sir,—I should be much obliged if any reader of the *Journal* could inform me if it is possible to satisfactorily convert a tube ignition car to electric, say wipe contact and trembler coil? The car I am thinking of altering is an old 6½-h.p. Daimler, with tube ignition; speed on level, good surface road about twenty miles per hour. The engine has two cylinders, and governs on the exhaust with a governor of the hit and miss pattern. Would the increased acceleration of the engine and consequent vibration (solid tyres) prove too much for the old car, and cause very much increased wear on engine bearings, etc.?—Yours truly,

E. F. L.

[The change can be done with good results, the increased acceleration having no appreciable effect on the car. The wipe contact and trembler coil would be most suitable. The governor would have no effect on the firing, this practically remaining the same as at present. The wear on the engine bearings would not be any greater than before.]

A Motor Meet at Saint Tropez, near Nice.

EXPERIENCES WANTED.

To the Editor of *The Motor-Car-Journal.*

Sir,—As a regular reader of the *Journal* I am somewhat disappointed that other subscribers do not more frequently contribute a warning note as to the cause of their breakdowns. It is a truism that we learn more from our mistakes than from our successes, although doubtless the cynically-minded might say that we learn still more from the misfortunes of our friends. I do not yet own a car, but hope to do so before August is out. Are these all "yarns" that I hear of the frequency of breakdowns? A friend tells me that he was visited at his place in the country last Sunday by two parties on cars. One took half an hour to restart his motor; the other could not start it at all, and had to leave it there till a mechanic from London came down next day. Another acquaintance is in the surgeon's hands with a dislocated shoulder, from being thrown out of a car. So far as I can follow the account, he was coming home with a loose chain when it jumped the sprocket and the car overturned. It is needless to add to the list of breakdowns. I only give the latest which have reached my ears.

Digitized by Google

and from reliable sources. It seems to me a great pity that those who have such accidents do not contribute to your pages an account of what happened, why it happened, and how it was put right. Must we all buy our experience in the bitter market of affliction? Doubtless to many motorists these breakdowns bring their own lessons, so that they never occur a second time, but they would be promoting the sport, removing prejudice, and encouraging beginners like myself by publishing a kindly note of warning and advice. They can do it under a *nom de plume* if they feel that their exploits have been too ridiculous. As I have every intention of making known my own failures when I start on them, will no one tell us how he has been "hung up"?—Yours truly,

RUSTICIAN.

[We are always ready to welcome letters on the lines suggested by our correspondent, and there is no doubt that those who can supply useful hints as to how to obviate difficulties are rendering good service to the movement.]

HITCHON'S PATENT TRANSMISSION GEAR.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In answer to your correspondent in the *Journal* of the 9th instant, I may state that I drive two cars—one heavy and one light—which have the above gear fitted to them. I will not trespass on your space in enumerating all the advantages of this gear, but for the benefit of your correspondent I will state briefly a few. In the first place, the ease of manipulation is a source of astonishment after one has been accustomed to the ordinary sliding gear, and I find in the handling of these gears that the claims made for them are fully borne out in practice.

The change, whether to a higher or lower speed, is made so quickly that the driving is continuous, and consequently no sudden impulse of the car occurs at the period of change. The required gear, cushioning on the roller clutches, permits of a silent change, and makes the fouling of the teeth an impossibility. The adaptability of this gear for hill-climbing is beyond dispute; by the non-release of the clutch and the rapidity of change to a lower gear the momentum of the engine is maintained, and the ascent of steep gradients is accomplished with scarcely any perceptible loss of speed. The advantage here gained is that cars may be built with less engine power; consequently there may be fewer working parts, which means less depreciation, and economy of fuel and lubricant.

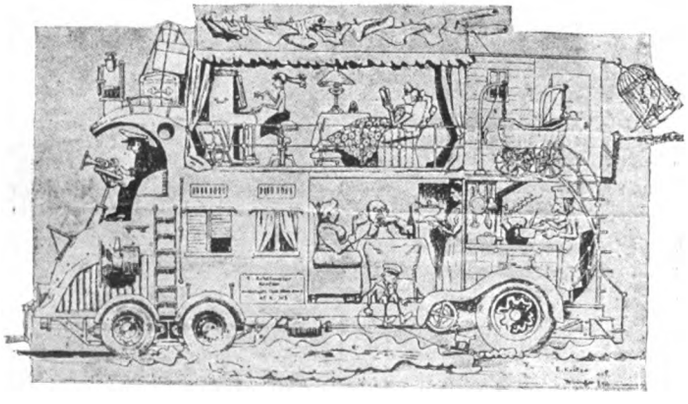
The durability of the gear becomes conclusive when I state that after two and a half years' wear the gear wheels are apparently as good as when first fitted to the car. The use of these gears has removed the fear of indirect stripping, and renewals through such, and eliminates from motoring the annoyance of breakdowns *en route*, and the laying by of the car in the hands of a repairer, ofttimes for an indefinite period. To my mind, an outstanding feature of these gears is the rapidity of change, and their application in all cases of emergency.—Yours truly,

E. W. ADAMS.

HORSE v. MOTOR.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I should be glad to learn from your readers the respective merits of horse and trap *versus* motor-car, from the point of view of convenience and also expense, the latter to be exclusive of first cost. Can anyone give me the cost of a motor-car to go to and from the station (two miles each way) twice daily, and occasional drives with four passengers? The above information will be of service.—Yours truly,



PRACTITIONER.

KNOCKING IN THE ENGINE.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I would advise "Puzzled Novocastrian" to make sure that the flywheel of his engine is keyed absolutely tight on the crankshaft. If it is ever so slightly loose it will set up an appalling knock.—Yours truly,

AD SUM.

A Motor Caravan. Reproduced from a Russian Sketch furnished by Mr. C. Friswell.

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—Regarding the paragraph in your *Journal* of the 16th inst., notifying that 3,768 cars and 2,697 cycles have been registered in London up to July 2nd (and goodness knows how many licences and general identification marks for dealers have been granted), and bearing in mind that this returns applies to London only, it occurs to the ordinary motorist to inquire in what manner he, or the public in general, has benefited from this large addition to the income of the County Council. Have the roads been improved in any way? Where are the caution boards that were to be erected? And to what extent have these funds been utilised towards mitigating the nuisance from dust, so troublesome to all users of the roads? Surely the expense of collecting the money cannot have been very heavy, as the onus of registering and obtaining a licence rests on the motorist.—Yours truly,

INQUISITIVE.

QUERIES RE IGNITION.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I have a 4½-h.p. Pieper car fitted with a make and break ignition, and I do not think the engine pulls as well as it ought to on hills, although it runs at a very high speed on the level. I would like to know if an Auto-trembler would be a improvement, as I believe it gives a better spark at low speeds, or would a trembler coil be superior?—Yours truly,

M. BROWN.

We would strongly advise a trembler coil instead of Auto-trembler, although the latter is very good. A reliable trembler coil can be purchased for about £2 from any of the leading electrical accessory concerns.]

THE BLACKHEATH CLUB.—We shall be glad to have the address of the Secretary of the Blackheath Automobile Club, several readers in the district being desirous of communicating with that gentleman.

MOTORING IN THE ISLE OF WIGHT.—"Toura" writes asking for information from any reader of the *Journal* as to the best way of taking a car over to the Isle of Wight.

MOTOR-CAR CRADLE AND TURNTABLE.—Replying to "J. F. L.," the address of the makers of the motor-car cradle and turntable illustrated in a recent issue is Webb's Patent Motor Carriage Cradle, 12, Shaftesbury Road, Hornsey Rise, London, N.

MOTORING vistors to the Lake District will be interested in learning that Mr. J. Braithwaite, cycle and motor agent, Windermere, keeps a stock of motor spirit, also cylinder oils, grease, etc.

THE Sussex Hotel, St. Leonards, keeps a supply of petrol, grease, oil, etc., and has garage accommodation for automobiles. The hotel is only three miles from the Bexhill track.

AN effective show card, with portraits of "the men at the wheel" for England in the Gordon Bennett race, has been issued by the makers of the E.I.C. plugs which were used by the three British competitors.

THE Derwent Engineering Company, who have a large garage at Central Square, Workington, Cumberland, inform us that not only are motor repairs carried out, but a stock is kept of petrol, cylinder oils, grease, etc.

MESSRS. HARVEY FROST AND COMPANY, the makers of the "H. F." Vulcaniser, are moving into larger premises at 39, Great Eastern Street, E.C. A repairs department is being established, and all kinds of tyre repairs will be executed.

MESSRS. J. C. MEREDITH, LIMITED, have sent us a copy of the latest section of their price list, in which are full particulars of the G.O.M. system of converting the various contact breakers to wipe pattern One or two new patterns of sparking plugs are illustrated, and we may also, while on this subject, mention that the firm are now supplying a mica tube which will fit the De Dion plugs, all ready to go into the plug.

FROM the Civil Service Motor and Cycle Agency, Limited, comes a price list of cars, motor-cycles, and various accessories for which this company are agents. One good feature of the catalogue is a comparative statement showing the principal features of different makes of motor-cycles, which should be of real value to those about to go in for that form of automobilism. Another useful list comprises some of the best known cars, classified according to cost. Lamps, sparking plugs, motor horns, batteries, etc., all find mention in this comprehensive list.

CLUBS AND ASSOCIATIONS.

THE MIDLAND HILL CLIMB.

THE Midland Automobile Club's President's—Mr. J. Broughton Dugdale—Cup was competed for last Saturday at Sun Rising Hill, midway between Stratford-on-Avon and Banbury. Out of an entry of thirty-eight only three failed to put in an appearance. The weather at the start was everything that could be desired, but later on rain came down heavily, and somewhat marred the proceedings, making the ascent a difficult task to the majority of cars. A large gathering was present, and the hon. sec., Mr. T. C. Aveling, is to be congratulated for the excellent way in which everything was carried out. The following are the official times:—

Name of Driver.	Make of Car.	h.p.	m.	s.
J. A. Holder ...	Mercedes ...	40 ...	5	18⅘
J. B. Jarvis ...	Jarvis & Weekes...	7 ...	12	1⅗
J. Spencer ...	Ariel ...	15 ...	6	56
E. M. C. Instone ...	Daimler ...	28 ...	4	49⅗
P. Martin ...	Daimler ...	28 ...	4	49⅘
E. W. Lewis ...	Rover ...	8 ...	6	45
A. Farnell ...	Daimler ...	28 ...	4	50⅖
J. H. Deykin ...	Wolseley ...	6 ...	7	26⅖
E. F. Baker ...	Duryea ...	12 ...	5	36⅗
T. Thornycroft ...	Thornycroft ...	20 ...	5	12⅘
E. Manville ...	Daimler ...	28 ...	4	58⅖
A. Bush ...	Daimler ...	28 ...	5	26⅘
W. H. Cook ...	Argyll ...	10 ...	7	40⅗
Cecil Edge ...	Gladiator ...	14 ...	6	39⅖
J. W. H. Dew ...	Speedwell ...	9 ...	7	39
A. J. Dew ...	Léon Bollée ...	24 ...	5	20⅕
E. T. Meadich ...	Léon Bollée ...	24 ...	6	9⅗
C. E. Forman ...	Forman ...	14 ...	8	41⅕
S. F. Edge ...	Napier ...	20 ...	4	51⅕

Profile of Sun Rising Hill.

G. F. Reading ...	Wolseley ...	10 ...	6	27⅘
Major Lloyd ...	Wolseley ...	6 ...	7	0
C. S. Baynton ...	Wolseley ...	10 ...	7	42
L. de Rothschild ...	Mercedes ..	60 ...	5	1
G. Baxendale ...	Thornycroft ...	20 ...	6	23⅖
F. S. Bennett ...	Cadillac ...	6½ ...	7	34⅕
R. A. Cobb ...	Star ...	12 ...	6	29⅗
J. Lisle ...	Star ...	7 ...	7	9⅕
G. H. Lanchester ...	Lanchester ...	12 ...	7	19⅕
C. G. Garrard ...	Garrard ...	6½ ...	10	35
A. A. Remington ...	Wolseley ...	6 ...	8	4⅘
A. E. Crowdy	Wolseley ...	28 ...	5	10⅘

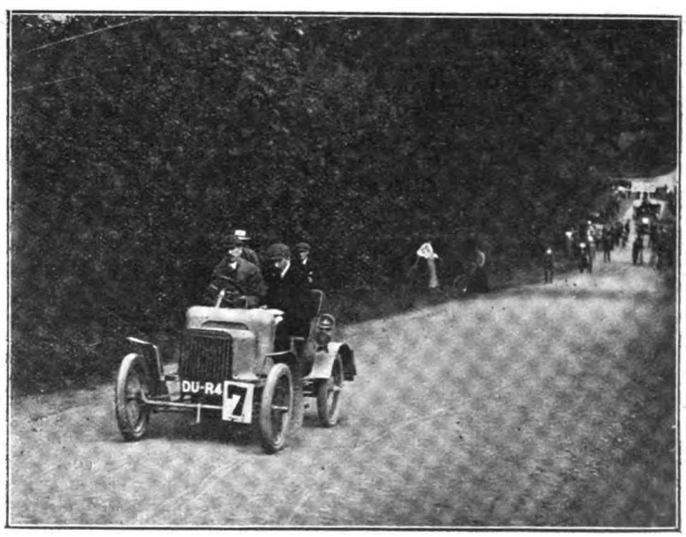
Owing to the muddy condition of the surface at the second control, C. G. Garrard had considerable difficulty in getting his 6½-h.p. tri-car away. There was ample power in the engine, but the driving wheel slipped on the greasy surface. C. E. Forman also had trouble at the second control. He allowed his car to be deluged with rain, which worked its way into the clutch and caused it to slip. A. E. Crowdy, on a 28-h.p. Wolseley, which, by the way, looked like one of the 1903 G.B. racers, had a bad side slip, but recovered, although it must have cost him a little distress of mind, and apparently worried him for the rest of the journey.

A farmer in the neighbourhood who is a county councillor and objected to the competition being held at Sun Rising Hill, showed his protest by employing all his farm hands to march up and down the hill during the progress of the climb with a number of horses and carts, and this was going on all the time, much to the amusement of some spectators and to the indignation of others.

At the conclusion of the competition the members, officials, and friends dined at the Shakespeare Hotel, Stratford-on-Avon.

SCOTTISH.

ON the invitation of Mr. W. Strang Steel, of Philiphaugh, a meet of the club took place at Philiphaugh on Saturday last. A large number availed themselves of Mr. Steel's kind invitation and about 150 members and their friends put in an appearance before half past one o'clock. The Edinburgh cars travelled by Eskbank, Stow and Galashiels, while the members from Glasgow and the West drove *via* Clyde Valley, Lanark, Biggar and Peebles, and, in addition, members came from other and more distant parts, as Ayr, Moffat, Dumfries, Crieff and Dumbarton. After lunch, which was served in Mr. Steel's magnificent dining hall and in a marquee on the lawn, the health of the host was cordially pledged and his hospitality fittingly acknowledged. The house party,



The Sun Rising Hill Climb.—Motorists at Ann Hathaway's Cottage at Stratford-on-Avon

which included Lord Napier and Ettrick and Lady Napier, Sir Charles Hartley, and others, were most attentive to the guests, who inspected the magnificent gardens and policies outside and the art and ornamental treasures in the mansion house with interest. After an unpromising early morning in some parts of the country, the day turned out fine, and the well-made Border roads and the magnificent scenery in the valleys of the Tweed, the Ettrick, and the Yarrow made the run a most enjoyable one.

LINCOLNSHIRE.

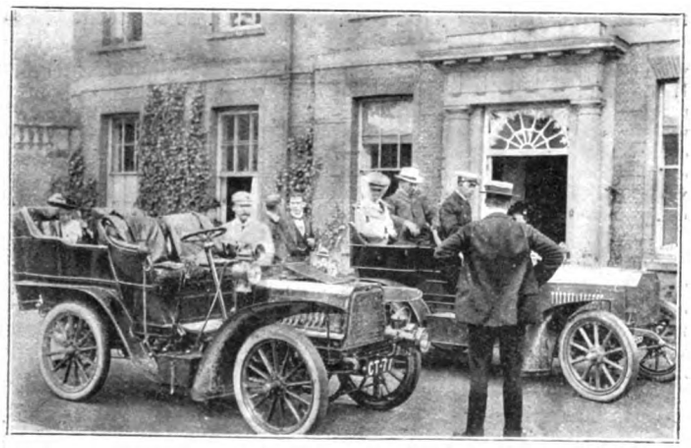
THE meet of the Lincolnshire Automobile Club on Saturday was to Sherwood Lodge, Sir Charles Seely's place, near Nottingham, and twenty cars, with about seventy passengers, attended. The invitation was first conveyed to the members by Mr. C. H. Seely, M.P. for Lincoln, when speaking at the annual dinner of the club in the winter. The route to be taken was by way of Southwell, but the roads were so bad

The Sun Rising Hill Climb.—Mr. E. W. Lewis on the new Rover Car making the ascent

beyond that a letter was sent to each of those who had accepted, suggesting coming into Nottingham, thence by the Mansfield road. This was taken by many, though some of the Lincoln motorists went from Newark to Mansfield, thence to Sherwood Lodge. Several cars had bad punctures, and that and the very unfavourable weather caused several to be unable to fulfil their acceptances. On arrival, the cars were driven up to the house and the occupants were received by Sir Charles and Miss Seely, and by Mr. and Mrs. C. H. Seely and Mr. F. E. Seely,

Digitized by Google

with Major and Mrs. Leach. After the reception, lunch was served in a marquee on the lawn, a string band playing selections. Before the repast was finished a very heavy thunderstorm came on, and prevented anyone getting away to more substantial cover. The time, however, passed pleasantly, for there was plenty to talk about. When the storm had temporarily subsided the unique treasures of the house were inspected, and here again the time passed very pleasantly indeed. A halt was called till the rain had stopped, then, after tea had been handed round, the cars were driven up to the house and Sir Charles and his visitors bade each other good-bye. In every way it was a very pleasant and successful meet, and thoroughly enjoyed by all, although the weather was so unfavourable.



Among those present were Sir Hickman Bacon, Bart., president, 12 h.p. Panhard; Mr. C. A. Moreing, 15-h.p. Limousine Panhard; Capt. H. C. Newsum, Mr. J. R. Richardson, Col. M. Warrener and Dr. G. M. Long, Lincoln, 18-h.p. Richardson: Rev. and Mrs. Stoodley, Dowsby, 4½-h.p. De Dion; Dr. and Mrs. Sharp, Brant Broughton, 12-h.p. Richardson; Mr. and Mrs. Tomlinson, Sleaford, 5-h.p. Bardon; Mr. and Mrs. T. W. May and Dr. Gilpin, Bourne, 12-h.p. Wolseley.

MANCHESTER.

On Saturday last the Manchester Automobile Club had a week-end run to Ellesmere, Salop, which is between sixty and seventy miles from Manchester. In the morning some rain fell and the weather was generally threatening, so only eight cars turned up at the Bridgewater Arms (the Club's headquarters at Ellesmere). Sunday, however, was a bright day with plenty of sunshine and no dust, making the run for those who joined it highly successful.

THE LADIES' CLUB.

On Saturday last the members of the Ladies' Automobile Club and their friends were entertained to afternoon tea at Hanworth Park by Mrs. Ainslie. Tea was taken under the trees, after which the members either

The Meet of the Lincolnshire Club at Sherwood Lodge.

strolled through the grounds, listening to the bands of the 2nd Royal Derbyshire Regiment and 21st Lancers, or played in ten minute croquet and tennis tournaments. There were about fifty friends present, among them being the following members of the club:—Baroness Campbell von Laurentz, Mrs. Daniels, Mrs. Herbert Lloyd, Mrs. Morrison, Mrs. Bruce Porter, Miss Honeyman, Miss G. Honeyman, Miss Pilcher, the Misses Dorothy and Maud Pilcher, Mrs. Turnor and Miss d'Esterre-Hughes (Secretary).

WEST SURREY.

The club gymkhana was held at Eashing, Godalming, on Saturday last, over 100 members and friends being present. Twelve cars were entered for the competitions, of which ten came to the scratch, the events including a "garage" race, in which the cars had to manœuvre into a 20-ft. square enclosure with a narrow right-angled entrance; tilting at the ring, bending race forwards and backwards; ladies' bending race, the ladies, however, competing in the other events as well as that allotted to them alone, with much success; starting race, in which the competitors had to run 100 yards, start their car, and drive back; passenger race, where the cars had to drive 150 yards to a table on which were envelopes containing coloured ribbons, take one, drive a similar distance to where the ladies acting as passengers were sitting, pick out the one wearing corresponding coloured rosette, hand her into tonneau, and drive to finish, the confusion inevitable at the second stop causing much amusement; and puncture race, drive 300 yards, change inner tube, and drive another 300 yards, which latter event only brought out a field of three. The winners were:—Garage race, Mr. R. W. Buttemer (Decauville); second, Miss Crothers (9-h.p. Argyll). Tilting, Miss Crothers; second, Colonel Fairtlough (12-h.p. Darracq). Bending race, Mr. R. Crothers; second, Mr. Buttemer. Ladies' bending race, Miss Crothers; second, Mrs. Pullman (5-h.p Peugeot). Starting race, Mr. Buttemer; second, Mr. Sichel (7-h.p. Daimler). Passenger race, Mr. R. Crothers; second, Mr. Buttemer. Bending race backwards, Mr. Buttemer; second, Mr. R. Crothers. Puncture race, Mr. Ponsford (8-h.p. Clement); second, Mr. Buttemer; third, Dr. Fennings (Ader). Times of winners: 14 and 14½ minutes. The programme, which commenced at 3 p.m., was not completed till 7 o'clock, all the races but the last bringing out a full field. The prizes (supplied by the United Motor Industries and Messrs. Dunhill) consisted of clocks, tool rolls, voltmeters, horns, and the like. The attendance was good, and would have been larger but for a few showers, which kept several intending visitors away.

YORKSHIRE.

The Yorkshire Automobile Club had a most successful motor parade and gymkhana on Saturday last at Harrogate, and it is anticipated that there will be a good surplus to hand over to the Lifeboat Fund. In all forty or fifty cars took part, and the result of the judging was as follows:—

Motor Parade.

Class 1—
1st.—Mrs. S. Dixon, Bradford (Spyker).
2nd.—Mr. Penrose Green, Leeds (De Dion).

Class 2—
1st.—Mrs. Peglar, Leeds (Darracq).
2nd.—Mr. Gordon Learoyd, Huddersfield (De Dion).

Gymkhana.

	min.	sec.
Bending Race—		
1st.—Mr. Walter Booth, Clayton, 6-h.p. Prunel ...		59⅘
2nd.—Mr. Walter Jackson, Baildon, 24-h.p. Brush ...	1	3⅘
Coach-house Handicap—		
1st.—Mr. Symonds, Harrogate, 14-h.p. Talbot	2	3
2nd.—Mr. Thos. Whitaker, Horsforth, 10-h.p. Lanchester	2	24⅘

Tug-of-War—
Lifeboat Crew *versus* Fire Brigade.
Lifeboat Crew *versus* Motorists.
Lifeboat Crew winners.

Motor-Cycle Obstacle and Bending Race—		
1st.—Mr. F. Greenwood, Leeds, 2¾-h.p. Bradbury ...	1	11
2nd.—Mr. G. E. Martin, Leeds, 1½-h.p. Bicycle ...	1	20⅘

Legal Limit Race—
1st.—Mr. E. Broadbent, Bradford, 6-h.p. Rochet.
2nd.—Mr. Mitchell, Harrogate, 10-h.p. Lanchester.

The judges were:—The Mayor and Mayoress of Harrogate, Mr. and Mrs. Penrose Green, of Leeds, Councillor Holgate, of Harrogate. At the conclusion the prizes were distributed by the Mayoress. The time-keeping was in the hands of Messrs. F. J. Borland, of Leeds, and J. Chippendale, of Harrogate. The members of the Committee of the Yorkshire Club officiated as stewards, and the Harrogate Football Club kindly placed the ground at the disposal of the Y.A.C. Altogether a splendid afternoon was spent, and the rain kept off until the prizes were distributed, after which it poured down.

CLAIM AGAINST A MOTORIST.

A motor-car running down case has been heard at the Herefordshire Assizes. The plaintiff was Thomas Morgan Jones, farmer, Glewstone, and the defendant Dr. Gerald Edwards, of the Sports Club, London. The defendant and his friend Dr. Bush were motoring through Glewstone, near Ross, and it was alleged that on going down a hill at an excessive speed they ran into the plaintiff, who was riding a pony in the opposite direction. The plaintiff was thrown to the ground with his pony, both having been struck by the front of the car. The defendant, it was stated, did not stop, but about a hundred yards further on the car stopped owing to something going wrong with it. The plaintiff sustained serious injuries and was confined to his bed for six months. For the defence it was denied that the car was on the wrong side of the road and that the defendant went on after the accident. The defendant said he pulled up thirty yards further on. A verdict was given for the plaintiff with £250 damages.

POLICE TRAPS.

Surbiton is the scene of some well-devised police traps, and motorists should exercise care in driving through the town.

In Portsmouth Road, Putney, is a measured distance of 220 yards.

The trap between Lancaster Gate and the Queens Road Station of the Central London Railway is becoming notorious.

In the village of Moortown, on the Leeds and Harrogate road, is a carefully devised trap.

The traps at Buckden and Water Newton, to which we recently made reference, are still in active operation.

Between the fourth and fifth milestone on the road out of Grantham to London motorists should be wary.

The police in the Washington district on the Worthing road have started their old game. On Saturday they had a trap set on this road about a mile on the London side of the hill, and although the road then was like a sea beach, they stopped a motorist and told him that he was travelling at 28 miles per hour—an exaggerated view that should make other drivers careful.

MOTOR-CARS IN THE UNITED KINGDOM.

As an appendix to his paper at the Sanitary Congress on Tuesday, Mr. E. Shrapnell Smith gave the following return of the number of motor-cars, motor-cycles and driving licences at Midsummer Day, 1904.

Swansea	" "	£5, etc.
Shoreham	Beyond legal limit	£5.*
Otley	No rear light	20s., etc.
Yarmouth	Driving at dangerous speed	£1, etc.

* Notice of appeal given.

CASES DISMISSED.

ON Saturday, before the Woking Bench, summonses were brought against two motorists "for unlawfully driving a motor-car at a speed which was dangerous to the public having regard to all the circumstances of the case." One summons was issued against Captain Benett Stanford for an offence which was alleged to have been committed on the 1st July at Ripley Street, and the other was against Mr. Mendelssohn for an offence alleged to have been committed at the same place on the 17th July. Mr. Staplee Firth defended in both cases. Evidence was given by Sergeant Jarrett, supported, in Captain Benett Stanford's case, by a farm assistant, and in Mr. Mendelssohn's case by P.C. Pink. Mr. Firth submitted that there was no real evidence of actual danger in the first case, and that it was becoming a fact well established in law by the result of appeals to Quarter Sessions that there must be some substantial evidence of danger before the Court before Section 1 of the Motor Car Act could be put into force. The Bench said there was not sufficient evidence before the Court to justify a conviction against Captain Benett Stanford, and this summons was dismissed. In Mr. Mendelssohn's case the police swore that the car was driven at a speed of twenty-six miles an hour along a roadway half of which was dug up, leaving a passage way of seven feet wide for vehicles to pass along. The case was, however, dismissed.

AT Warwick, on Monday, H. J. Lee, of Coventry, was summoned by Superintendent Ravenhall for driving a motor-car in a manner dangerous to the public. Last week defendant was summoned under the regulations of the Local Government Board for driving to the common danger, and the case was dismissed on the legal objection raised by Mr. Maddocks that these regulations had not been put in by the prosecution. In the present instance defendant was summoned for the same offence under the first section of the statute, and after the evidence had been repeated Mr. Maddocks took the further objection that the case, having already been heard and determined, was *res judicata*. It was a fundamental principle of English law that a person could not be tried twice for the same offence. He quoted various authorities in support of his objection, which was allowed by the Bench.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, AUGUST 6, 1904. [No. 283.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AN important trial of motor transport took place one day last week, when the 20th Middlesex (Artists) used this means of sending their regimental stores and camp equipment down by road to Newhaven. They employed one of the Cadogan Garage and Motor Company's petrol lorries, which carried successfully over 5½ tons of stores at an average rate of seven miles per hour from London to Newhaven. This is a development of the automobile for military service that should go quickly forward, effecting, as it does, economy in time, money and labour.

◆ ◆ ◆

Motor Ambulances.

DURING the Motor-Car Exhibition at the Agricultural Hall, in March last, several of the members of the Metropolitan Asylums Board attended the display and conversed with makers as to the possibility of having a motor ambulance. Now we learn that at a recent meeting of the Board the Ambulance Committee reported that, in their opinion, the time had arrived when the question of adopting motor-cars for the general conveyance of patients to the managers' hospitals and elsewhere should be considered. The question of what was the most suitable form of motor was, in their opinion, one which could only be answered satisfactorily by an expert in motor-construction. They, therefore, recommended "that the Ambulance Committee be authorised to employ an expert to advise them on the question of the employment of motor traction for the Board's ambulance at a fee not exceeding twenty guineas." This was agreed to, and we hope something practical will result.

◆ ◆ ◆

Police Interest in the Trials.

VERY gratifying is the reception that the police of the Midlands and West are giving the light car trials to be organised by the A.C.G.B.I. Lieut.-Col. H. S. Walker, the Chief Constable of Worcestershire, has written to Mr. Basil Joy, saying that he will be "glad to do anything in my power to assist your Club in these trials, as it is by the improvement of small cars that the general public will derive the greatest benefit." If this view were generally entertained by the police authorities there would be less of the prosecution that almost amounts to persecution in many parts of the country. Evidently the pleasure of the forthcoming event will not be marred by a repetition of the ridiculous police performances on the occasion of the run to Winchester in last year's trials of the A.C.G.B.I.

◆ ◆ ◆

The Small Car Trials.

IT has now been decided that the motor-cars in this trial will start from Hereford on the morning of Monday, the 29th inst., and go over route 1, viz., to Worcester and back *via* Bromyard. They will also go over the same route in the evening. On Tuesday route 2 will be taken, as marked on the map and on page 493, and so on throughout the week, the last run being to Kington and on through Walton and Titley on the Saturday. There will be three hill climbs, one on Monday on the way to Worcester, viz., Frome's Hill; one on the Tuesday on the way to Ludlow, viz., Dinmore Hill, and one on the Wednesday on the return from Leominster, viz., the north side of Dinmore Hill. Each of these routes are approximately fifty miles, and the cars will have to do each journey without a stop, the award being given to the car in each class which makes the most non-stop runs.

◆ ◆ ◆

A Display at Cardiff.

IN connection with a horticultural show at Cardiff, an interesting motor-car display has been held. Several competitions were included in the event. Mrs. Gibbon-Brookes won the cup presented by the South Wales Motor Company for the best decorated car. The silver cup offered by the South Wales Automobile Club for the most expert driver was awarded to Mr. C. E. Evans, Mr. Graham winning the second prize, this being the gift of the Cardiff club. A locally-built motor-car was adjudged the smartest turnout on the ground, and Mr. H. M. Gregory was heralded as the most expert amateur driver, Mr. A. E. Reynolds being second. The event was a great success, and should prove a factor in popularising the motor-car in the locality.

◆ ◆ ◆

In Essex.

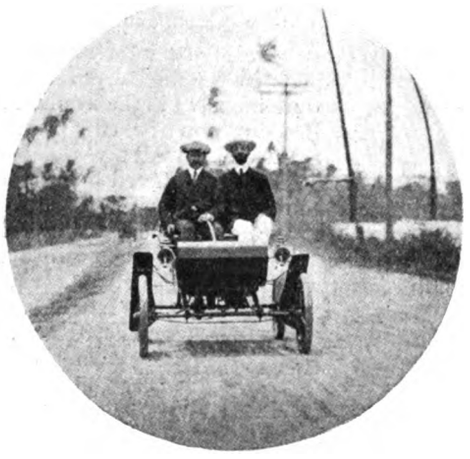
MUCH indignation has been aroused among Essex motorists by the revived activity of the police, which has found vent in the preparation of "motor traps" at Dunmow and other places through which many motor-cars pass daily. Nearer town, at Romford and some of the suburbs, unusual antipathy seems to find expression against motorists, and we would suggest that if the police of the county and those of the Metropolitan division who do duty in the district want to enforce the law they will be better engaged in looking to the drivers of market wagons and of hay carts that come lumbering along the roads at midnight. Lights are rarely carried, and in seven cases out of ten drivers are sleeping on the top of the load, the foremost horse in the slow procession being responsible as guide. Motorists out late at night in the eastern suburbs find these not only a nuisance but also a menace to their safety; and the sooner the police attend to their legitimate duties the better will it be for all concerned.

◆ ◆ ◆

Motor-Cars on the Roadside.

AT Ambleside, the Rev. Arthur Leigh, vicar of Rydal, was charged with obstructing the highway at Rydal by leaving a motor-car thereon for a long and unnecessary period—to wit, thirty-five minutes—on the 22nd ult. P.S. Langhorn stated the case, and said he saw the car some distance from Rydal Vicarage, by the roadside, unattended. He sounded the horn, but no one appeared. A passing gentleman said he thought the car belonged to Mr. Leigh, and he went towards the vicarage and saw Mr. Leigh, who said he had left it there while he went to lunch. The road was 22 feet wide, and the car was

Digitized by Google



5 ft. wide. He only took the measurements by striding. The defendant said he had been accustomed to leave his car there and had not received any complaints. The car was by the road-side, on the grass part. The road was 24 ft. 8 in. wide, and there was 5 ft. 9 in. of grass part on which the car stood. There was a clear roadway of 21 ft. The Bench dismissed the case, but said the police were right in bringing the charge, one of those queer qualifications that are becoming the rule in motor-car cases.

◆ ◆ ◆

The Bank Holiday Traffic.

THOUSANDS of automobiles, from huge touring cars to the little motor-cycle, have been upon the roads during the last few days. Attracted by the glorious weather of the bank holiday season, their owners have come out upon the roads, and it is a remarkable fact that accidents—so freely reported and exaggerated—have been so few that even the usual crop of letters against motorists that follows a holiday has failed to appear. The distribution of wealth that is associated with motor touring must be a great factor in the prosperity of the countryside, as is indicated by the refurbishing of hotels, the establishment of repair shops, and the general revival that one sees in rural districts.

◆ ◆ ◆

An Oldsmobile in Hawaii.

◆ ◆ ◆

3s. for Knocking Down a Policeman.

OUR list of convictions against motorists every week affords material for some interesting comparisons, and a correspondent at Carlisle sends particulars of a case at Bradford where a driver was fined 3s. and costs for "endangering a policeman." The defendant was driving a horse and cart, and knocked down a policeman, who subsequently informed the magistrates that the cart was being driven at a furious rate. The defendant, instead of pulling up, drove quickly away. Had a motorist knocked a policeman down the incident would have been reported in all the papers, and a severe fine imposed. A fine of 3s. is worth contrasting with some of the fines for less harmful offences on the part of motorists.

◆ ◆ ◆

The Census of Cars.

DOUBTLESS some surprise will be expressed on reading the census of motor-cars which we were able to publish in the *Journal* of last week, to see that in some cases, in both Ireland and Scotland, the number of motor-cars registered exceeded the number of licences granted. These, however, need not alarm even the most nervous Parliamentary representative of some of these distant parts. In the Isle of Shetland, for instance, only one driving licence has been granted while fifteen cars have been registered, and in Donegal and Leitrim the number of cars exceeds the number of licences. In the early days of 1904, when folks were less used to Lot No. So and So, than they now are, many London motorists sent to those districts where low numbers were likely to prevail, in order to the avoid the four—it will probably soon be five—figures that new motorists will have to place upon their cars. By the way, it was rather curious to read in the Parliamentary proceedings of the day on which we went to press last week that the Local Government Board were preparing a list of the number of cars registered, and licences granted up to April 1st last for the enlightenment of legislators. Why April 1st should have been selected as the date on which to draw the line only a Government official can explain. Evidently it is the intention to keep three months behind the Press.

◆ ◆ ◆

Wimbledon and Motor-Cars.

WE wonder that two hundred residents in such a district as Wimbledon should have been found to sign a petition to the local council, not only complaining of motor-cars, but also asking that they should be stopped from going on the road altogether. At the last meeting of the London County Council, Mr. W. Sanders, a newly-elected alderman, tried to raise a laugh by suggesting that, owing to their perfume, motor-cars should be prohibited from the London parks, a course which the chairman of the committee that looks after the Open Spaces pointed out as impossible. Now that these wise Wimbledon residents are urging that the smell of motor-cars along their roads at nights is an evil state of things which they do not deserve leads to the reflection that it is impossible to please some people. Even if transplanted to the island of Juan Fernandez they would not be any happier than was Alexander Selkirk.

◆ ◆ ◆

Educating the Doctors.

IN connection with the visit of the British Medical Association to Oxford, the Oxford Cycle and Motor Car Company organised an exhibition of motor-cars, motor-cycles and accessories in the Corn Exchange and a large marquee adjoining. Several of the vehicles shown had been driven direct to the University town from the works where they were made, thus giving the medical men, who showed their interest in the display, an opportunity of judging of their reliability. Many well-known types of cars were on view, and it was made clear to the medical profession that there is no lack of choice for those who would adopt the modern means of locomotion.

◆ ◆ ◆

The Regulation of Motor-Wagon Traffic.

THE Main Roads Committee of the Lancashire County Council report that the recommendations of the Departmental Committee appointed to collect evidence and report upon the motor-wagon traffic include :—The gross weight and the weight unladen to be painted on the wagon; the compulsory weighing of wagons on registration in the presence of an official; the compulsory weighing of wagons when required if wagon within quarter of a mile of a weighing machine; the width of tyres to be in proportion to gross load; the speed to be in proportion to weight and not to exceed eight miles an hour; with india-rubber tyres the speed not to exceed twelve miles an hour; every motor-car and trailer above three tons to have springs. The Main Roads Committee, having in view the great amount of damage still being caused to the main roads in the county by heavily-laden motor-wagons, have urged upon the Local Government Board the desirability of issuing the proposed new regulations at the earliest possible moment, and hope that the Board will publish them before the Parliamentary recess.

◆ ◆ ◆

Speed in Cumberland.

THE Highways Committee of the Cumberland County Council have had before them an application from the Keswick and Millom Urban District Councils and the Cockermouth Rural District Council asking the County Council to schedule roads within their districts against motor

Digitized by Google

traffic, and applications from the Bootle and Whitehaven Rural District Councils and the Millom Rural Parish Council requesting the County Council to establish a speed limit for motor traffic within their districts. The Committee have resolved "(a) that the applications for speed limits be adjourned for the present, pending a further trial of the provisions of the Act; (*b*) that application be made to the Local Government Board to close against motor traffic the road from the Old Toll Bar to the gate leading to Castle Hill on the Ambleside and Keswick road, and about half a mile in length; (*c*) that the application from the Cockermouth Rural District Council be deferred, pending receipt of plans, sections, and particulars."

◆ ◆ ◆

Some Return for Fees.

In view of the large number of automobiles which have been registered throughout the country, it would seem desirable that motorists should use their local influence in securing some return in the way of improvements in the roads for the increased revenue they have brought the county exchequers. Surrey, for instance, has received no less than £1,600 in the way of registration and licensing fees, and motorists in that county have a right to ask whether anything for their benefit has been done with the money. At the same meeting of the Surrey County Council at which these receipts were reported, it was mentioned by some opponents of the new movement that the rateable value of property along the main roads was seriously depreciating in consequence of the dust nuisance which had been created by motor-cars; but, on the other hand, some very representative house agents have declared that whilst perhaps the value of houses on the main roads may not have gone up, there has been a great rise in the value of business premises on main roads.

◆ ◆ ◆

Raising the Value.

In fact, the tendency of the motor-car is rather to change the character of the property on roads to some extent, and it is interesting to learn that the value of the many mansions on side avenues has gone up in consequence of the increased competition owing to people leaving main roads where business premises have become increasingly valuable, due largely to the motor-car. We have often remarked upon the revival of prosperity which has come over the great arteries of traffic, so that it is rather unfair of county councillors to urge that the motor-car has a retrograde tendency, whereas impartial investigation will prove that it is really re-acting on the general welfare.

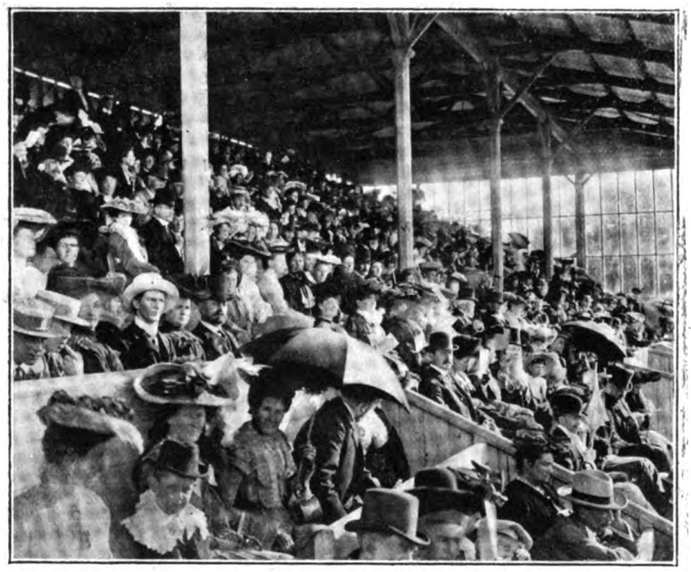
◆ ◆ ◆

Motor Omnibus for Bromley.

Another development of the motor-car in the public service may shortly be expected at Bromley, in Kent, where the Borough Council has decided, on the report of a specially-formed Motor Traffic Committee, to obtain statutory powers to enable them to provide and run motor-omnibuses and other general powers in connection therewith. The outskirts of the borough are being developed for residential purposes, and the early inauguration of a motor-omnibus service should do much for the prosperity of the place. Councillor Weeks, who has been a leading advocate of the innovation, estimates that a sum of between five and six thousand pounds will be sufficient to commence the service, which can then be extended as circumstances demand.

◆ ◆ ◆

Motor-Car v. Railway.



Two railway chairmen have just declared that the motor-car has had an adverse influence on their receipts from horse traffic, and now comes the news that it is doing something to lessen fares in the interest of the public. High Wycombe, which a few years ago displayed a marked hostility to automobilists, is served by the Great Western Railway, which has enjoyed such a monopoly that a return fare of 5s. 8d. from London to the chairmaking centre nas been stoutly maintained. But the Uxbridge and Harrow Railway Company had arranged, on the completion of their line as far as the former place, to run a motor-car to High Wycombe, charging a through fare of four shillings. The G.W.R. have responded by dropping their fare to three shillings, a figure which will probably destroy the motor-car's chance of success, thus killing the bird that brought the reduction, a variant of the old adage quite in keeping with this commercial age.

◆ ◆ ◆

Motors and Manslaughter.

Making use of two motor-car cases involving accidents which came before the courts last month as a test, the editor of the current "Monthly Review" has a sermonette with the striking title of Motors and Manslaughter. The article is more sympathetic than would appear from the title—more fit for a halfpenny horrible daily paper than a sedate half-crown magazine. The main point seems to be a recognition of the fact that the automobile is unveiling a new condition of things; that the coming of the car is altering the circumstances of life. This is a fact which must be accepted by all men. And having been accepted there remains only to construct special motor tracks whereon fast moving cars can disport themselves "all out." The idea is not new, but it is one that should not be overlooked, and although we express our displeasure with the title of the article we would endorse the conclusion at which the editor arrives.

◆ ◆ ◆

The Crowd at an Australian Motor Gymkhana.

◆ ◆ ◆

A Speed-limit Granted.

The fact that the Local Government Board have conceded to the wishes of the people of Beverley, in granting their application for the five-mile speed limit through certain streets of the town, will doubtless do something to stiffen the opposition which the automobilists of Leeds are organising to the application of the Corporation of that town for permission to limit the speed of motor-cars within a radius of two miles from the junction of Briggate and Commercial Street to ten miles an hour. We can quite understand the desire of the Corporation to bring motor-cars to a crawling pace at the point named, but to insist upon that for a two miles radius is, to those who are acquainted with the district, really absurd. We would remind the Yorkshire Club, who are taking the leading part in opposing the proposed restriction, that no such regulation has been found necessary in the City of London, where the common sense of motorists and police has been sufficient to prevent accidents without the interference of opponents whose prejudice often gets the better of their wisdom.

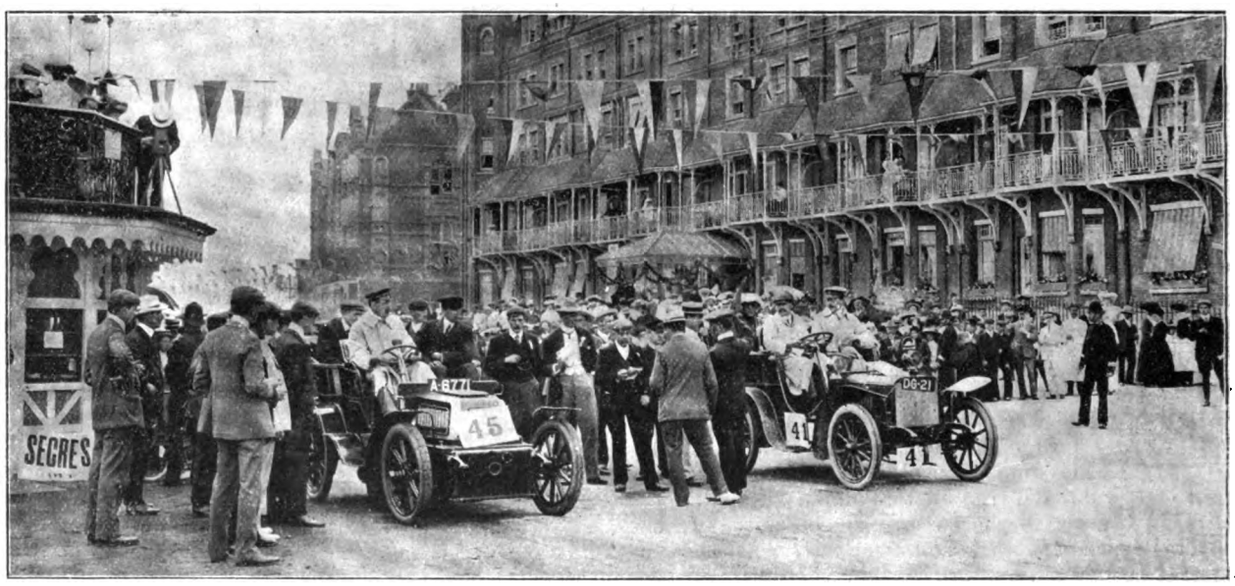
THE BEXHILL MEET.

HEARTY was the welcome that the townspeople of Bexhill-on-Sea gave the motorists who entered the place at the end of last week to be in readiness for the Bank Holiday festival. The town is the only one in this country that has a motor track, which would have been more freely used but for the opposition of one of the residents some time ago. That incident can, however, be forgotten, in view of this week's reception, and of the splendid success that has characterised the Meet.



The Marine Parade was gay with bunting on Monday morning when the programme was begun, and all the hotels seemed filled with motorists. The first event was a contest of "the best-appointed motor-cars in procession, suitable costume of driver and passengers being taken into account." About sixty cars participated in this competition, assembling near the Town Hall and taking a route leading through the main streets of the town and in front of the Hotel Metropole, where the judges—the Countess de la Warr, Lady Mary Sackville, Lady Frances Hope, Mrs. Mary Bathurst, and Mrs. Stratton—reduced the number to ten. A subsequent review of this selected few resulted as follows:—

1. Mr. Walker Munro (Brockenhurst), 25-h.p. Napier.
2. Mr. Gurney Preston (Beckenham), 28-h.p. Mercedes.
3. Mr. S. F. Edge (London), 20-h.p. Napier.

After luncheon the races were held from a standing start near the Sackville Hotel, and along the kilometre course terminating in a gradient of one in ten and a-half on Galley Hill. The first race was for cars costing £200 or under, Mr. H. Sturmey's 10-h.p. Duryea, driven by Mr. E. Baker, making the best time of 1 min. 12 secs. in its heat. The competitors were divided into seven heats, and the spectacle of two cars running side by side added zest to the proceedings.

Mr. J. Lisle's 12-h.p. Star v. Mr. C. Johnson's 12-h.p. New Orleans.

Mr. H. Du Cros's 15-h.p. Ariel v. Mr. H. Hall's 15-h.p. Darracq.

Photo by] PREPARING TO START. *[Argent Archer.*

In the class for vehicles costing over £200, but not more than £400, the 14–18-h.p. Hallamshire, driven by Mr. F Churchill, proved the fastest, covering the kilometre in 1 min. 20 3-5 sec., beating a 12-h.p. light Star by one-fifth of a second, this heat proving the fastest and most exciting of the seven that were run in the class.

Class E—for cars costing over £400 and not more than £500—produced seven heats and some good times, two 15-h.p.

Digitized by Google

Darracqs—one driven by Mr. D. S. Graves, in 1 min. 9 1-5 sec., and another by Mr. H. Hall in 1 min. 10 sec., being notable, while two others of this type also won their heats.

The largest entry came forward in the next class, for touring cars costing more than £550 and not more than £750, in which ten heats were run off, Mr. H. A. Walker on a 30-h.p. Darracq being the fastest in 1 min. 1 1-5 sec.

Then came the section for cars costing more than £750, but not more than £1,000, and here Mr. Percy Martin's 26-h.p. Daimler covered the distance in 53 4-5 sec., Mr. S. F. Edge's 20-h.p. Napier being second in 55 1-5 sec.

Six heats were necessary for the last class, this being for touring cars irrespective of price, and carrying five passengers. Here some of the times were remarkably close, the best being on Mr. A. L. Guinness's 60-h.p. Mercedes, which travelled the kilometre in 50 3-5 sec.; Mr. S. F. Edge's 20-h.p. Napier took 52 sec., beating Mr. Charles Cordingley's 60-h.p. Mercedes by 4-5 sec. Mr. S. Girling also made a good run on a 28-h.p. Wolseley.

On Tuesday morning the second and third heats were run off in glorious weather, some variety being imparted to the racing by a motor-cycle handicap, the machines being started off in quintettes. Mr. W. W. Genn was first on an Eland motor-bicycle fitted with a Minerva engine, Mr. T. H. Tessier on a Bat being second.

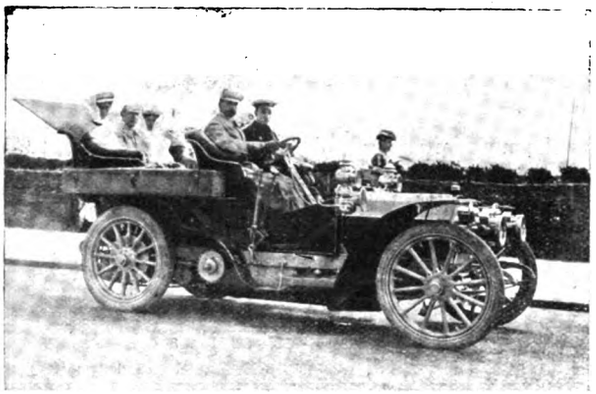
Considerable interest was taken in the semi-finals and finals of the various events, the ultimate results being as follows:—

Class C.—Mr. H. Sturmey's 10-h.p. Duryea (1 min. 14 1-5 sec.), 1; Mr. E. W. Lewis's 8-h.p. Rover (1 min. 40 sec.), 2.

Class D.—Mr. W. Whiteway's 14-h.p. Regal (1 min. 20 2-5 sec.), 1; Mr. J. D. Lyons' 10-h.p. Vinot-Deguingand (1 min. 27 2-5 sec.), 2.

Class E.—Mr. Hall's 15-h.p. Darracq (1 min. 11 sec.), 1; Mr. A. H. Walker's 15-h.p. Darracq (1 min. 11 1-5 sec.), 2.

Class F.—Mr. A. H. Walker's 30-h.p. Darracq (1 min. 1 3-5 sec.), 1; Earl de la Warr's 18-h.p. Daimler (1 min. 7 3-5 sec.), 2; Mr. G. Baxendale's 20-h.p. Thornycroft (1 min. 9 1-5 sec.), 3.

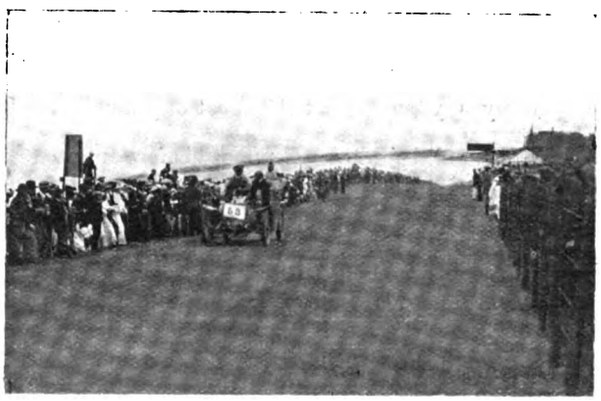


Class G.—Mr. S. F. Edge's 20-h.p. Napier (51 3-5 sec.), 1; Mr. P. Martin's 26-h.p. Daimler (52 sec.), 2; Mr. U. Stratton's 28-h.p. Daimler (53 2-5 sec.), 3.

Class H.—Mr. A. L. Guinness's 60-h.p. Mercedes (46 4-5 sec.), 1; Mr. A. Dews, 24-h.p. Bollée (59 3-5 sec.), 2.

It will be seen that the fastest time of the day was that of Mr. Guinness on his 60-h.p. Mercedes, this being equivalent to 48 miles per hour. Nearly two and a-half years ago M. Serpollet travelled over the same course, with a flying start, at the rate of fifty-two miles per hour, a speed that excited amazement. The fact that forty-eight miles was accomplished on Tuesday from a standing start occasioned far less comment than did M. Serpollet's performance—a fact which must be regarded as a tribute to the progress made by the industry in less than three years.

Mr. W. Munro's Napier.—Winner of the Competition for the Best Appointed Car.



Mr. Gurney Preston on his 28-h.p. Mercedes, which took Second Prize in the Competition for the Best Appointed Car.

Mr. Culley on his 10-h.p. Ford Car.

Photos by]

Mr. A. H. Walker on his 30-h.p. Darracq.

[Mr. E. Kenealy.

On Wednesday the programme included a procession of florally decorated cars, a battle of flowers and a gymkhana, the latter bringing the series of interesting events to a successful conclusion. The proceedings were largely of a social character, preserving to the end the harmony of the week.

The organisers may be heartily congratulated on the way in which the Meet was carried through, and not only was the safety and convenience of the public adequately considered, but attention was also given to the needs of the Press. During the progress of the event several protests were made, but all were disallowed. Everything worked smoothly—starters, stewards and marshals attending closely to their duties, while the members of the various local committees were ubiquitous in their desire to make the event a success. This it certainly was, and already conversation has turned on the possibility of holding two Meets at Bexhill next year—one for touring, the other for racing cars.

SOME USEFUL NOTES.

COMPARATIVELY few owners of motor-cars, whether they look after their vehicles personally or not, know how to keep the paint on the body in proper condition, and it is frequently, and often unnecessarily, the case that a car that has been in use only a few months acquires a dull, lustreless appearance, without any of the brilliancy which is so conspicuous and attractive on a new vehicle. This does not arise from hard usage, in a majority of instances, but simply from a lack of knowledge of the proper treatment it should receive. A really fine piece of carriage painting cannot be accomplished under several weeks, and from twelve to sixteen successive coats of fillers, colours, surfacers and varnishes are put on and rubbed down by hand and the most painstaking care exercised, especially in applying the last coats of varnish, when perfect atmospheric conditions and a certain temperature are required in order that the best results may be attained. While it is hardly to be expected that a moderate-priced car will be finished in this expensive manner, still the painting is done with considerable care and is a delicate piece of work, easily losing its beauty if not correctly treated, but retaining its brightness for a long time if it is.

ONE of the most important points to be observed is that no water should be allowed to remain on the varnish for any length of time. Wherever water has rested the varnish will be found dull and cloudy, and a spattering of water, if not removed, will leave behind it a spotted appearance. Of course the same is true of oil, only to a greater extent, and it cannot be removed too quickly.

WHEN the car is to be washed, use cold water. A hose is very convenient for this work, but avoid using too much force in the stream. The hose may be used for the rougher part of the cleaning. After this go over the varnish with a sponge and clean cold water. Avoid warm water, for it will in a very short time take all the life out of the varnish, leaving a dull, dead surface that is anything but handsome. Keep the water clean and keep the sponge constantly rinsed out, so that you will not be rubbing particles of grit over the smooth surface. Even the finest dust will do great execution if well rubbed into the varnish, and it is not necessary to say anything about the effect of grains of sand.

LUMPS of dried mud should be well soaked before an attempt is made to remove them. Though soap is sometimes used in cleaning carriage painting, painters usually regard it as injurious as well as unnecessary, and the finest carriages are as a rule simply washed with cold water. After the rough washing with the hose and the subsequent thorough removal of grit and dirt with the sponge, the water should be removed and the body rubbed with a chamois leather. The importance of getting rid of every particle of dirt in the sponging will now be appreciated, as it would attach itself to the chamois and leave its mark in the varnish. The final rubbing should be done with a clean, dry and soft chamois. Try this and you will, remarks the "Automobile," be surprised, if you have never tried it before, at the fine appearance of the paint—that is, if it has not been injured by neglect or otherwise.

EVEN with the most careful washing the varnish will, in time, lose a certain amount of its original gloss, and it then requires treatment of another sort. Get from some reliable concern what is known as varnish renovator, made especially for brightening up carriage painting, and also lay in a stock of cheesecloth. Apply a small quantity of the stuff on a piece of cheesecloth, and then take a clean piece and rub it off. The secret of this business is the rubbing. After you have rubbed for a while and the cloth gets dirty, take a clean piece and rub some more. Keep on rubbing with clean pieces of the cheesecloth until they do not become discoloured. Great care must be observed, however, in using this renovator that none of it is permitted to remain on the paint, as it will destroy it in short order. Do not attempt to polish too great an area at one time, but take it in comparatively small sections, say a panel at a time, and do it thoroughly before going to another portion. This process will improve the varnish, to some extent at least, no matter how bad it may be, but, of course, it cannot be expected to restore to its original condition a surface that has been badly injured through hard usage or neglect.

THE RELIABILITY TRIALS FOR MOTOR BOATS.

THE judges of the Reliability Trials for motor-boats, Major Lindsay Lloyd, Lt. Mansfield Cumming, and Capt. R. E. T. Dixon, with commendable promptitude have prepared their report, in which, after dealing with the number of competitors and general arrangements of the trials, they express their satisfaction at the results of the trials and at the proved reliability of the boats taking part. Only two of the sixteen starters failed to complete the twenty hours' run, five boats making complete non-stop runs.

The report proceeds with an appreciation of the good performance of the Seal and the Vosper boats using ordinary paraffin, and of the good general condition of all the boats at the termination of the twenty hours.

One of the most important recommendations of the report is dealt with at some length, viz., that of the safety of boats fitted with internal combustion engines, and the effects of this recommendation should be evident in next year's Trials.

The question of convenience of general arrangement of details is also treated of, the Napier Minor and the Maudslay boat being taken as examples of excellence in this direction.

After expressing approval of the general lines of the present trials, suggestions are made as to further points for marking in future trials, with a recommendation that further trials should be held. The report concludes by recommending the following awards:—

Class I.	—	—
Class II.	Seal Motor Company, 2½-h.p. 18ft. launch.	Gold medal.
Class III.	Vosper and Company, 12-h.p. 22 ft. launch.	Gold medal.
	Mitcham Motor Company, 6-h.p. 22 ft. launch.	Silver medal.
Class IV.	Maudslay Motor Company, 20-h.p. 25 ft. launch.	Gold medal.
	Woodnutt and Company, 10-h.p. 30 ft. launch.	Silver medal.
Class V	Mr. S. F. Edge, 55-h.p., 35 ft. launch.	Gold Medal.
Class VI.	J. I. Thornycroft and Co., 20-h.p., 30 ft. launch.	Silver medal.

The judges express their satisfaction with the admirable fashion in which Mr. Basil Joy, the Secretary, organised the Trials.

AT Westerham Hill, on Wednesday, A. A. Chase and A. E. Lowe decided a motor-bicycle hill-climbing match for £25 a side. The conditions were that each man should ascend the hill three times at half-hour intervals. Lowe, who had met with an accident a few days previously, rode with both legs bandaged. Nevertheless he made a very plucky effort, and, on the aggregate, was only beaten by 4 2-5sec.

THE Automobile Club wishes to direct the attention of the public to the worthlessness of records of non-stop runs which are not officially certified. The Club has a stringent code of rules for properly carrying out such trials, and regulations have been provided for the protection of the public. It is formulating further regulations to prevent irregular trials by unauthorised persons in the future.

GREAT interest is being taken in the cross-Channel motor-boat race from Calais, to Dover which will take place on Monday next. The final list of entries was issued officially on Wednesday. Thirty-two vessels will compete, of which seven are English, three Belgian, and the remainder French. The competing craft will be exhibited in dock at Calais on Sunday, and at half-past one on Monday will start in the race. The French Government is providing a flotilla of torpedo craft to accompany the boats to Dover, and the French Automobile Club is running one of the fast Channel steamers from Calais to Dover.

THE RAVEL "INTENSIVE" MOTOR.

IN his new motor, M. J. Ravel, of Paris, has endeavoured to obtain a higher power within a definite bulk and weight; and hence the name "Intensive" applied to his latest production. Petrol motors of what is called the four-cycle type are, as well known, almost exclusively adopted at present. Such motors comprise, in principle, a cylinder in which moves a piston which actuates the driving-shaft, and above the upper dead-point of which is situated a chamber that contains the distributing parts and the ignition device. The operation of such a motor is as follows:—The piston being supposed to be at the end of its up-stroke, when the flywheel causes the piston to descend, a partial vacuum is formed in the rear of the latter, the admission-valve opens automatically under the action of the vacuum, and a certain quantity of explosive mixture enters the cylinder. At the end of the down-stroke, the piston again rising under the impulsion of the flywheel, the admission-valve closes, and the explosive mixture admitted is compressed into the chamber above. As the volume of the latter is less than that

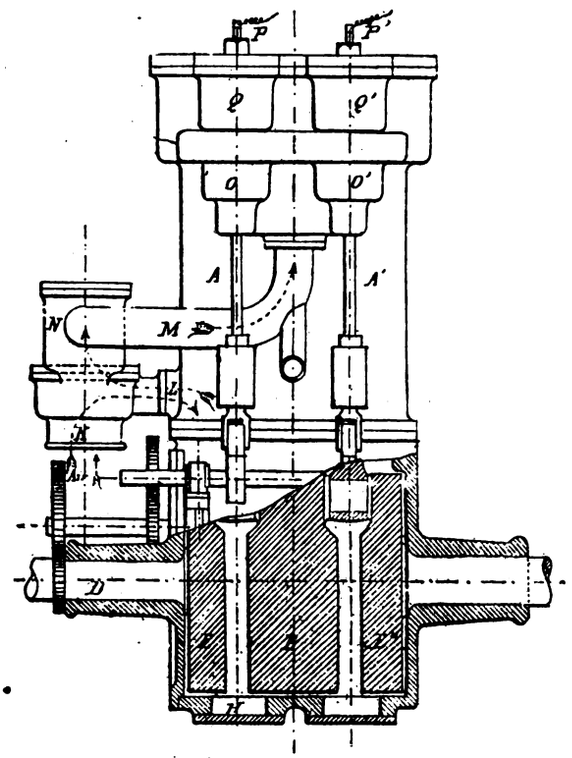

Fig. 1.—Part Sectional Elevation.

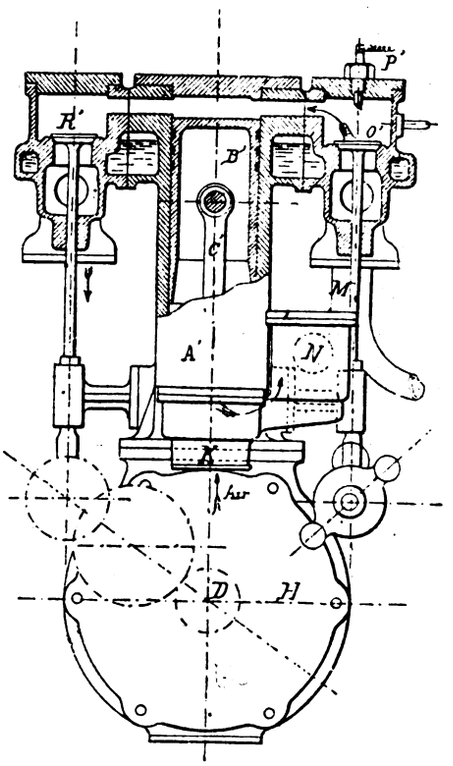

Fig. 2.—Cross Section.

of the space in the cylinder unoccupied by the piston, there results a compression of the mixture varying in degree with the ratio between the two volumes just mentioned. When the mixture is ignited in an appropriate manner in the vicinity of the upper dead-point, there ensues an explosion which develops a pressure of from 175 to 220 pounds to the square inch. The piston, upon being driven downward through such pressure, gives the flywheel a sufficiently strong impulsion to permit it to effect the other strokes, while the products of combustion expand; that is to say, lose their temperature and pressure. Just before the end of the down-stroke, a communication with the exterior being established, while the pressure is still in the vicinity of 45 pounds to the square inch, the exhaust begins, and the piston, in rising, forces to the exterior, as far as to the end of its up-stroke, the products of the combustion that has just taken place. A new admission then occurs, and so on.

It will thus be seen that if we have a free cylinder space of a definite volume, and force the mixture into a chamber of another definite volume, we shall obtain a compression of, say, from 35 to 45 pounds that will produce an explosive pressure of from 175 to 220 pounds, the expansion bringing the pressure to the neighbourhood of 45 pounds and the exhaust to that of the atmosphere. The mean pressure during the motive stroke will be practically from 65 to 75 pounds per square inch of piston surface, corresponding to a definite power for a definite velocity. Upon the whole, under fixed conditions of velocity and piston surface, of richness of the explosive mixture, and of ratio between the volume of the cylinder space and that of the compression chamber, we shall have for a given cylinder charge expanded in one cylinder a definite mean pressure corresponding to a likewise definite power.

If, then, through some arrangement or other, we succeed in having two cylinder charges instead of one, of the same explosive mixture, and compress both in one double chamber, we shall finally have a double mass of an identical explosive mixture, at the same degree of compression, giving the same explosive power; but if, instead of expanding this double mass in two cylinders, we expand it in but one, the products of combustion will begin to escape at a pressure much higher than the preceding, and the mean pressure will be increased in definite proportions, and be, practically, nearly doubled. We shall thus succeed in obtaining a power that is sensibly double, within a volume and weight that remain sensibly the same.

This is what M. Ravel claims to have succeeded in doing in his "Intensive" motor (Figs 1, 2, & 3), which consists of two vertical cylinders, *A A'*, placed side by side, and the pistons of which move at the same time. These pistons, through the connecting-rods, actuate the driving-shaft, *D*, which carries crank-discs, *E E' E''*, that act as flywheels. The whole is placed in a casing, *H*, the free space in which is reduced as much as possible by the bulk of the pieces which it contains. This casing is capable of communicating with the exterior through a butterfly-valve placed at *K*, and a conduit, *L*; and, with the compression chamber of the two cylinders, through the same conduit, *L*, and another conduit, *M*, between which is interposed a carburettor, *N*. The conduit, *M*, terminates beneath the admission-valves, *O O'*, above which are located the sparking plugs, *P P'*. The exhaust-valves are on the other side, at *R R'*. A circulation of water assures the

Digitized by Google

cooling of the valves and cylinders, and a governor keeps the velocity within definite limits. The admission and exhaust-valves are all mechanically controlled. Let us now see how the motor operates :—One of the pistons, say B', for example, being at the end of its up-stroke during the working period, the other one, B, will be likewise at the upper dead-point; but, at the time of the admission-period, the piston, B', forced downward, will carry B along with it, and both will drive before them the air that fills the lower part of the two cylinders. At this moment, the admission-valve, O, being open, this air, passing through L and M, will enter the cylinder, A, after becoming carburetted by traversing N in part. At the lower dead-point, the exhaust will be continued in A', while the admission will cease in A. The pistons, then returning in an opposite direction, will form a vacuum; and pure air, entering through the valve, K, will flow into the casing, H, and fill the lower part of the cylinders, while the exhaust that follows an admission will finish in A', and the compression that follows an explosion will take place in A. We thus see the four cycles completed in each of the cylinders alternately, the bottom charging the top. It should be noted that the two cylinders that suck the air admit at the same time two charges of explosive mixture, which are forced into a single compression chamber of

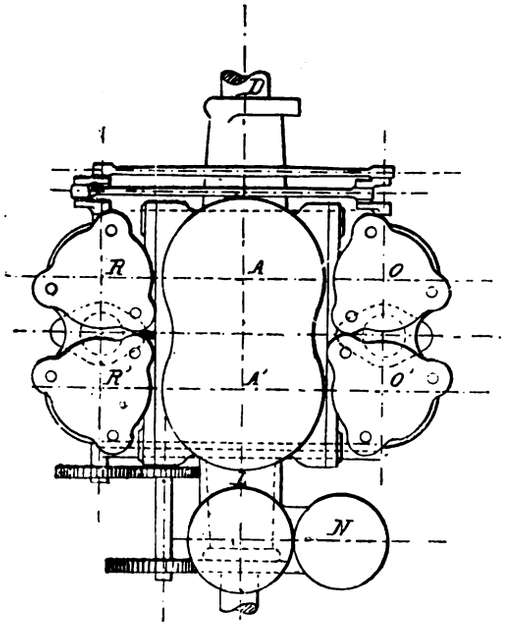

Fig. 3.—Plan.

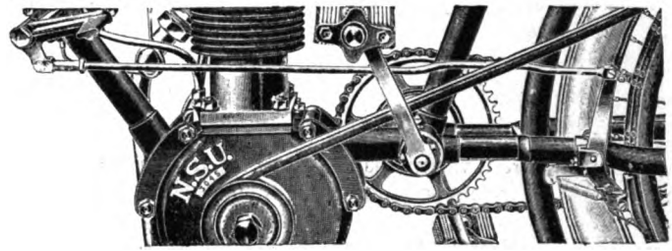
double the volume of an ordinary one. Since the governor closes the admission-valve when the velocity becomes too great, there is less admission, and, consequently, a feebler compression, explosion and mean pressure, which re-establish the equilibrium.



FROM Mr. D. M. Weigel, who is spending his honeymoon on a 20-h.p. Talbot car in Switzerland and Italy, comes a picture postcard from the top of St. Bernard.

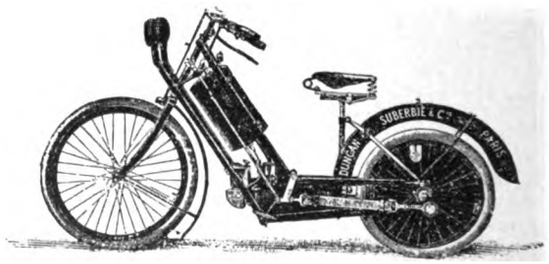
MESSRS. J. W. BROOKE AND COMPANY, LIMITED, Lowestoft, in addition to building motor-cars, are now devoting considerable attention to motor-boats, and have just issued a very complete catalogue, in which full particulars are given of the Brooke craft and of the engines of the same.

THAT Messrs. Brown Brothers, Limited, have gone very deeply into the motor business is evidenced by the bulky catalogue of motor vehicles, parts and accessories, etc., which they have lately issued, and of which a copy lies before us. The list is fulla illustrated and is one of the most comprehensive works of its kind so far issued, the firm having endeavoured to include everything that is in every-day use by the trader who deals in motor materials. A number is alloted to every article, so that no difficulty is experienced in ascertaining the prices, which are given in a separate list.

MOTOR CYCLING NEWS.

FOLLOWING the example of British motor-cycle builders, the Neckarsulmer Fahrradfabrik are now devoting attention to the construction of tricars. Their latest production in this class of vehicle is provided with a powerful foot brake acting on the

outer surface of the belt pulley attached to the rear wheel. The brake is applied by the driver's left foot, and is extremely powerful; in addition, band brakes are provided in connection with the hubs of the front wheels.



ALREADY about fifty entries have been received for the Auto-Cycle Club's reliability trials, which start on the 15th inst.

HAROLD WILLIAMSON, of Coventry, on a 3¼-h.p. Rex motor-bicycle, last week accomplished the journey from Land's End to John o' Groat's in 48 hrs. 36 min., thus beating Mill's recently-made record by two hours. Mr. J. Urry was the official timekeeper.

AT the sports meeting at Preston Park, Brighton, on Monday, as there were no entries for the three miles open motor-cycle handicap, Mr. Le Courtier made an attempt to establish a five mile motor-cycle track record. His time was 11 min. 55 secs.

INCLUDED in the sports meeting held by the St. John's Athletic Club at Tunbridge Wells on Monday was a three miles scratch open motor-cycle race. The permit granted by the Automobile Club for the event was for machines with engines not exceeding 76 in. bore by 76 in. stroke, or the equivalent volume swept out. The following were the winners. Heat 1: W. W. Genn, Wimbledon, 6 min. 14 secs. Heat 2: C. E. Bennett, Canning Town, 5 min. 58 2-5th secs. Heat 3: H. Boghurst, St. John's, 6 min. 9 4-5th secs. Heat 4: J. Perkins, jun., Leyton, 6 min. 19 2-5th secs. Final: 1, Bennett; 2, Genn; 3, Perkins. Time, 4 min. 54 2-5th secs.

THE rules of the Auto Cycle Club to be submitted at the special general meeting on the 5th inst. define its objects as (1) to administer the rules and regulations of the Automobile Club of G.B.&I. for the government of motor-cycle racing; (2) to encourage and foster the pastime of motor-cycling; (3) to provide a social club and a centre of information on motor-cycling matters; (4) to safeguard the rights and privileges of members and affiliated clubs, and to take action, where advisable, in cases where

A Motor Bicycle of 1896.

general principles affecting the rights of motor-cyclists, as a whole, are involved. Another rule provides that it shall be under the supreme control of the Automobile Club of G.B.&I., which shall have the power of veto upon any decision considered by the Committee of that Club to be detrimental to the interests of the Automobile Club or of the sport or pastime of motoring.

MOTOR-BOAT RACING AT RYDE.

THE British International Cup for motor-boats was competed for in the Solent on Saturday last. The cup was presented for a competition among boats using any form of power, by Sir Alfred Harmsworth, in 1903, and was raced for in that year in Queenstown Harbour. There were no foreign entries which complied with the rule that the competing vessel shall be constructed wholly in every particular in the country which it represents. The race was therefore confined to English boats—one entered by Messrs. S. F. Edge, Limited, one by Messrs. Thornycroft, and one by Messrs. Wort and Beadle, and was won by Messrs. Edge. This year greater interest has been evoked in motor-boat racing, and the entries were as follows :—

Country.	Name of Competitor.	Maker of Engine.	H.P.	Length.
England	S. F. Edge, Ltd.	D. Napier & Son	55	35ft.
„	„ „	„ „	90	40ft.
„	J. E. Hutton, Ltd.	J. E. Hutton, Ltd.	150	39·95ft
„	Thornycroft & Co.	Thornycroft & Co.	120	40ft.
„	Lord Howard de Walden	——	150	40ft.
France	M. A. Clement	Clement	180	40ft.
„	M. H. Legru	Gardner-Serpollet	100	39·3ft.
„	Richard-Brasier	Richard-Brasier	82	30ft. 2¼in.
U.S.A.	Smith and Mabley	Smith & Mabley	150	39ft. 10⅞in.

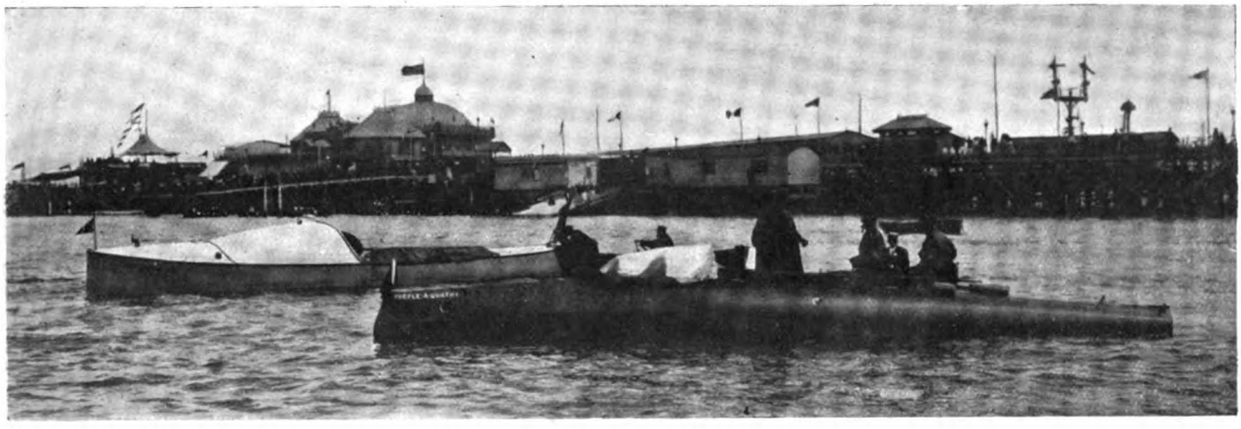

Photo by] Napier Minor and Trefle à Quatre Ready to Start for the Final. *[Stephen Crabb.*

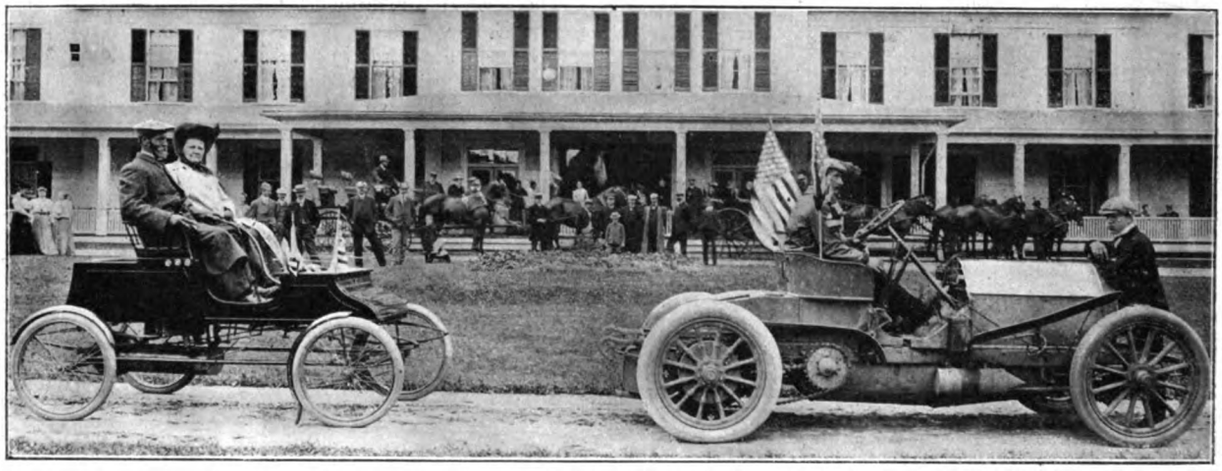
On Friday a series of eliminating races were held to select three out of the five English competitors to represent this country in the International event. The course was from the starting line off Ryde pier, round three mark boats off Osborne and back to the pier, a total of about 7·7 knots. Owing, however, to absentees the preliminary contest cannot be described as an exciting event. The first boat to appear on the scene on Friday and to pass to the committee enclosure at the end of Ryde Pier was Mr. Edge's new boat Napier II. She came up with a fine dash, throwing spray out from her bows on each side. The first heat was to be a race between this boat and Thornycroft's, but the latter failed to put in an appearance owing to the inability to get her into racing form in time. Thus it came about that Napier II. started alone over the course. Immediately the starting gun was fired, and simultaneously with the lowering of the Blue Peter, Edge got away, and in a short time he could scarcely be distinguished owing to the spray and foam around him. As he was having a walk-over, a pace at the rate of 12 knots would have been sufficient to qualify him for taking part in the cup race, but he apparently wished to give the spectators an idea of the speed capabilities of his boat and completed the round in 27 minutes 26 seconds.

The second heat was also a walk-over, and another of Mr. Edge's boats, the Napier Minor, had it all her own way. She got round the course in 27 minutes 14 seconds. The third heat also proved a disappointment. This was to have been between the second boats (if any) in the previous races and that of Mr. J. E. Hutton. The latter did not come in at the outset, but subsequently went over the course alone. However, she did not complete the round, for after covering some 50 yards or so she came to a sudden stop and was towed back home. This left the two boats Napier Minor and Napier II., to contest the cup on behalf of Great Britain.

The international contest took place on Saturday, the competitors being favoured with magnificent weather until just before the final heat, which, at the express wish of the King, who was present on the Royal yacht, had been postponed until four o'clock, when the rain came down in torrents, and for a time almost completely obscured all but the nearest objects. The heats were brought off prompt to time, and the first one bid fair to be full of interest, the competitors being fully representative of the three countries interested. Messrs. Smith and Mabley's American boat, with its 150-h.p. engines, occupied the inside berth, Mr. Edge's Napier II. the centre, and the third was reserved for the Clement boat with engines of no less than 180-h.p. The first two boats were early in position, but the Clement only drew up on first gun-fire, and then instead of staying there went off on a little tour of its own. On getting into position again, its propeller fouled a mooring-chain. At gun-fire the Yankee boat shot away with the lead, the English boat starting slowly and going off on a course to starboard. Mr. Edge had some trouble with one of his engines, and it was three minutes before he got them both going, by which time the American boat was a mile to the good. Just before rounding the mark-boats for the return journey, however, the front engine of the American boat failed through the sparking contacts fouling, with the result that she fell back and Edge overhauled her, passed, and won by about 44 sec., in 24 min. 19 sec.

For the second heat the Serpollet steam launch failed to appear, and the English Napier Minor drove over in 23 min. 21 sec. The third heat was also a drive over, this time for the French Richard-Brasier boat Trefle-à-Quatre, which covered the course, after a false start, in 25 min. 20 sec.



For the fourth heat the two Napier boats—the winners of the first two heats—contested together, and after a fine race Mr. Edge's boat won by 17sec., although it got away very badly. The time was 24min. 7sec. Unfortunately in the course of the race, Napier II. struck some floating obstacle, and started one of her forward plates so badly that she leaked too fast to make it safe to run her again, so Mr. Edge took the helm of Napier Minor for the final, in which he had to meet the Trefle-à-Quatre.

Shortly before four the King arrived in his yacht, and took up a position outside the other shipping and in line with the pier and mark boat, and it was arranged that the boats should finish under the bows of the Royal yacht. On the firing of the gun Napier Minor was under weigh instantly, quite two seconds before the French boat, and started with a good forty yards' lead. Hopes ran high, not to be disappointed, for when the

Digitized by Google

competitors once more came in sight the English boat still led. She was fully a minute in advance when the Royal yacht was passed, and secured the cup for England. The Napier Minor's time was 23 min. 4 sec., as against 24 min. 27 sec. of Trefle-à-Quatre. On passing the line the two boats circled the Royal yacht, and Mr. Edge performed some striking evolutions to show the King the great control he had over her.

A protest has been entered against the winner by the owner of the Tréfle, on the ground that, having been beaten, Napier Minor was not eligible to run. The point will have to be settled by the committee, but it is not expected that the result will be upset. The contests were conducted by the Marine Motor Committee of the Automobile Club, assisted by a sub-committee appointed by the Royal Victoria Yacht Club, the judges being Major F. Lindsay Lloyd, R.E., Captain R. T. Dixon, R.E., and Lieutenant Mansfield Smith-Cumming, R.N.

The Mount Washington Hill Climb.—Mr. F. E. Stanley on his Steam Car and Mr. H. Harkness on his 60-h.p. Mercedes.

MOUNTAIN CLIMBING IN AMERICA.

[From our own Correspondent.]

SINCE annihilating time on the sands of the now world-renowned Ormond-Daytona Beach and vainly seeking new fields for glory, the motor-car has fearlessly challenged and boldly conquered Mount Washington, the "Monarch of New England," whose summit reaches an altitude of 6,292 feet.

That this feat has been accomplished by more than twenty automobiles of various types is one of the best possible proofs of the practical development and reliability of the motor-car over all kinds of roads, and under the most adverse conditions.

Where the event was held, a narrow carriage road climbs continuously 4,659 feet in a distance of eight miles—an average grade of 582 feet to the mile, or about 12 per cent., but in several places reaching 20 per cent.—where, with the many curves and sharp turns, the slightest divergence from the beaten track would hurl both driver and car over steep cliffs and precipices, hundreds of feet below. With a surface rough and uneven, broken by three hundred and fifty "water-bars," and rendered still more dangerous by the loose, rolling rocks, all the records made are remarkable, and especially those of the winners, Mr. H. Harkness, in his 60-h.p. Mercedes, in 24 min. 37 3-5 sec., and Mr. F. E. Stanley, in his 8-h.p. Stanley steam car, in 28 min. 19 3-5 sec.

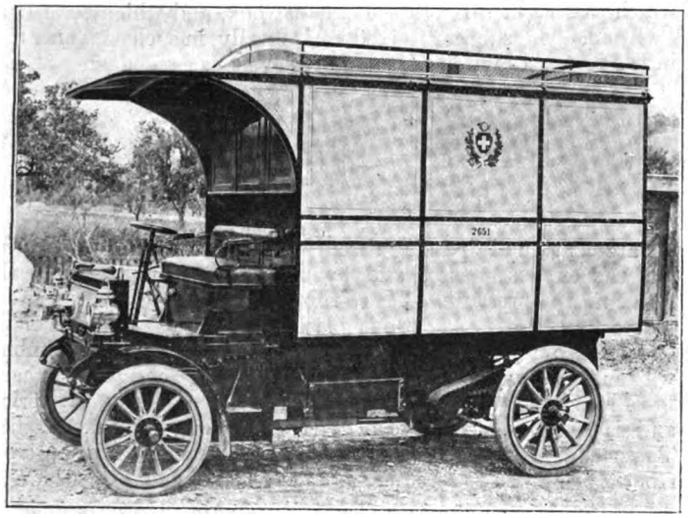
Some comparisons of the time consumed in ascending by different modes of travel are interesting in this connection. On the other side of the mountain, over a route of only three miles, the famous cog-wheel railroad, the first of its kind in the world, ascends in the schedule time of 1 hour and 20 minutes, and descends in 1 hour and 15 minutes; while over the carriage road used by the motor-cars, horse-drawn vehicles average three hours and a-half in making the ascent. The first record breaking trial with horses, which established a record of 1 hour and 17 minutes, was made by Mr. Jacob Vanderbilt, brother of Commodore Vanderbilt, and Mr. Wm. Turnbull, of New York, in August, 1883. The next attempt was in September, 1884, when Mr. E. V. R. Thayer, of Boston, made a new record of 1 hour 9½ min., which has not yet been broken, although in September, 1887, it came within 17 sec. of being equalled by Dr. W. Seward Webb, a son-in-law of Mr. W. H. Vanderbilt, and Major and Mrs. W. Boelum Wetmore. Dr. Webb's horses suffered severely, one of them dying soon after reaching the summit, which caused legal measures to be taken preventing any further attempts. All these trials were made with six horses attached to a light vehicle.

Now that it has been thoroughly demonstrated that motor-cars can make the ascent at a high rate of speed, under apparently insurmountable obstacles, with improved conditions of the road any reliable machine will soon be able to drive from base to summit in 45 min., with comfort and safety, so opening up a field not only for touring through some of the most beautiful scenery imaginable, but leaving the fair valleys and passing up to an altitude where forests of spruce and fir gradually become dwarfed, until vegetation entirely cesses, save for a few hardy grasses and Alpine flowers, till, amid a desert of great loose boulders, one reaches the summit of the "Crown of the White Mountains," with its wonderful panoramic view of the hills and vales, rivers, lakes and villages, stretching from Canada far to the south, and from the Atlantic to the Adirondacks.

During the rest of the year motor-cars will not be allowed on the road, the managers desiring to limit it to the exclusive use of carriages, as coaching tours to the summit have for many years been one of the most interesting features of this part of the United States.

In case of petrol becoming accidentally ignited, it is useless to try to extinguish the flame by means of water, as the spirit will float on it and continue to burn. Dry sand is very effective as an extinguisher, and a supply should be kept constantly on hand where petrol is stored or used.

◆ ◆ ◆



Some motorists are not sure as to the best method of effecting a good speed change. There can be no definite laying down of the law on this point, as no one car is exactly the same as another in this respect, but it may safely be said that in reducing one's speed, *i.e.*, in changing from a high gear to a lower, a better change is effected if the clutch is not completely withdrawn; just a gentle pressure on the pedal is all that is required. Care must be taken that the order of things is not reversed, as omitting to withdraw the clutch when changing from a low speed to a higher one will probably result in a broken gear.

HERE AND THERE.

ACCORDING to the police returns there are now 294 motor-cars in Budapest.

THE "Orion" motor vehicles, for which Messrs. Moss and Woodd are British agents, are now being used by the Swiss

postal authorities. The accompanying illustration depicts one of the vans lately put in service in Zurich; it is designed to carry loads of 30 cwt.

A GARAGE to accommodate fifty motor-cars has been opened at Auckland, N.Z.

THE election of Mr. Allan H. Bright to the House of Commons adds another enthusiastic motorist to the ranks of legislators.

DURING the renovation of 119, Piccadilly, W., the Devonshire Club will extend hospitality to the members of the A.C.G.B.I.

THE Earl of Dalhousie, Viscount Baring, Viscount Enfield, Major Jameson, M.P., and Mr. Louis Sinclair, M.P., are among the last batch of candidates for election to the A.C.G.B.I.

AT the last meeting of the Cardiff Health Committee it was stated that the motor-wagons in use by the Corporation had effected a saving of £100 as compared with horse haulage.

MESSRS. LAMB BROS. AND GARNETT have issued an instructive and interesting little pamphlet entitled "Electric Ignition for Motor Cars," a copy of which they will be pleased to send to any reader of the *Journal* applying for the same.

WE regret to learn of the death of Mr. Julius Harvey, the principal of the firm of Messrs. J. Harvey and Co., which occurred on Thursday last week. The business will be transferred to Messrs. Price and Belsham, 52, Queen Victoria Street, E.C.

AMONGST the monthly journals of interest to motorists is the "Home Counties Magazine," edited by Mr. W. J. Hardy. Rambles in Surrey, historical notes on Whetstone and Reigate, and some interesting notes and queries on places in the Home Counties generally, make up a very readable current number.

A WINTON tonneau car carrying five persons, with luggage, has recently made the journey from the city of Mexico to Guadalajara. The distance is between five and six hundred miles, and in many places there is no road whatever. The car arrived in good condition and was the object of curiosity to all the natives *en route*, most of whom had never seen a motor-car before.

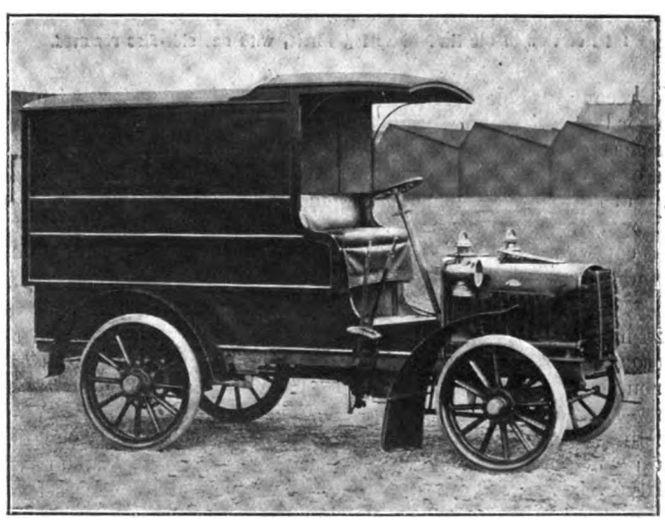
MR. C. L. GLIDDEN, of Boston, has offered to the American Automobile Association a cup valued at £200, which is to be known as the Glidden trophy, and to be open to the world for competition. The cup is to be awarded for the best efficiency shown by any car in an annual tour, the cars to be driven by their owners, and under such restrictions and conditions that motorists rather than manufacturers will be inclined to compete. The competition is to be in the nature of a thousand miles endurance contest, the vehicles to run one hundred miles a day for ten days.

AN application has been made to the Bridlington Town Council for a motor-car licence for street service.

MESSRS. WHITE AND POPPE, who hitherto have made a speciality of motor-cycle engines, are introducing a 7-h.p. two-cylinder motor for cars.

THE Lacre Motor Company send us a copy of a special pamphlet they have issued giving full particulars of the Lacre electric cars. It shows the cost of upkeep of these vehicles to be £175 per annum.

THE Municipal Association of Victoria are inviting representatives from each municipality to meet in conference to consider the advisability of establishing a bye-law for general adoption by the various municipal bodies concerning motor traffic.



THE Dustless Roads Company, Limited, has been registered with a capital of £5,000 to carry on the business of manufacturers of and dealers in dust laying, cleansing, and disinfecting preparations, materials for binding together broken stone, gravel, sand, and the like, dealers in slag and furnace refuse, &c.

BOWEN'S ELECTRIC AND MOTOR BOATS, LIMITED, is the title of a company registered with a capital of £20,000 to acquire the freehold yacht building and electric works on Eel Pie Island, Twickenham; to adopt an agreement with Mr. K. Bowen; to construct and establish, on Eel Pie Island or elsewhere, a dock, workshops, etc., and to carry on the business of builders of and dealers in motor-boats, etc.

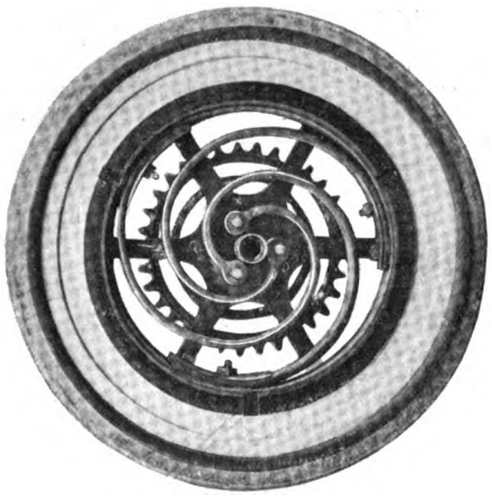
AT the recent Ardennes Race, Lieut.-Col. Mark Mayhew on his Napier finished in 7 hours 27 mins. 42 secs., and Mr. Andrew Fletcher, on a Mercedes in 7 hours 53 mins. These gentlemen were the first of the team representing England in the recent race, and it is worthy of note that, although many tyre troubles were recorded, neither of these gentlemen lost a single second during the whole of the race from this cause. We may add that both cars were fitted with Continentals.

IT is estimated that there are at the present time about 125 owners of motor-cars in Montreal, of whom more than half are members of the Automobile Club of Canada, formed last month. American automobiles are in great favour, but English cars are sold in a large proportion, while a few of the best known French vehicles have also been imported. The motor-cycle is not yet in great favour, but among those in use there are several of American make.

THE Ryknield Engine Company, Limited, which is now devoting attention to commercial as well as pleasure motor-vehicles, has lately completed the delivery van illustrated herewith. The

motor power is supplied by a 10-h.p. double-cylinder engine having mechanically-operated inlet valves; two forward speeds of respectively twelve and six miles per hour and a reverse are provided. The vehicle, which is fitted with a roomy van body with wide doors at the back, is designed to carry loads up to fifteen cwt.

Digitized by Google



AT Teignmouth a motor-boat is proving a popular attraction to visitors.

THE man who is fearful that his car is going to give him trouble is seldom disappointed.

A NEW motor garage and repair shop has been opened at 2, Murray Street, Perth, by Mr. Buchanan Shiell. Accommodation is available for about thirty cars.

"CANN, LIMITED," is the name of a firm that has recently been formed with Mr. C. E. Cann as managing director. The company has established a new and complete plant for the construction of all kinds of motor bodies at 12 and 13, Miller Street, Camden Town, London, N.W. The premises selected are especially suitable to this business, as they are within a few minutes of the West End via Regent's Park. Mr. Cann is well known to the motor trade and to motor-car owners, as he was connected for over sixteen years with Messrs. Thrupp and Maberly, and during the last two and a half years has had control of the work of that firm.

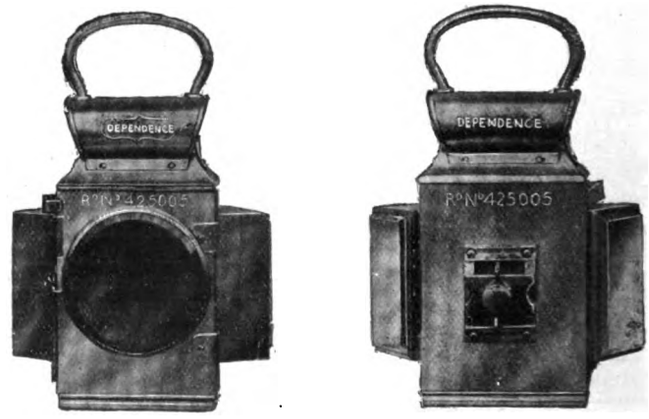
MR. H. HALFORD has introduced a new spring wheel, the construction of which is apparent from the accompanying illustration. Three strong springs are the central feature of the invention, which is entirely free from loose parts or joints likely to cause complication. The wheels will be placed on the market by the Halford Spring Wheel Syndicate, Limited, 2, Gresham Buildings, Basinghall Street, E.C., for any make of car, whether chain or gear driven.

Interior view of the Halford Spring Wheel, with one side-disc removed.

We recently took a trip on a 7-h.p. Panhard fitted with the Halford spring wheel, and went over some very rough road surfaces with a remarkable absence of vibration. The spring drive prevented the car from jumping when the clutch was let in, and it was evident that all shock is avoided by the use of this wheel. Thus the easy riding of pneumatic tyres is imparted to a car with solid tyres, while the absence of worry on account of punctures is a substantial advantage.

MR. C. G. WRIDGWAY lately made a second attempt to run a 24-h.p. Peerless touring car 1,000 miles without stopping the motor, and again was forced to capitulate, this time because his carburettor became clogged with a bit of waste. The start from New York was made early on the 12th ult. and the New York-Boston route followed. On returning to New York on the first round it was necessary to replace the radiator, which was badly damaged, with a new one. This was done successfully, the motor running all the time, and the car was again started for Boston only forty-five minutes behind time. After running 650 miles the carburettor began to work badly and finally failed entirely, stopping the motor. The clogging was attributed to the fact that petrol had to be poured into the tank without straining, the funnel having been lost. After removing the obstruction Mr. Wridgway continued the run, finishing 1,040 miles in a total elapsed time of 66 hours 45 minutes.

THE "Lester" is the name given to a new silencer or exhaust box for petrol motors which has recently been introduced by the Lester Exhaust Box Company of Birmingham. It has been designed to obtain silent running with the minimum of back pressure. As will be seen from the illustrations, the gases enter the box without obstruction from baffle plates or internal chambers; they then issue through a number of holes in a series of tubes which pass right through the exhaust box, and which are open at each end. The silencer is fixed horizontally, in such a manner that in the forward motion of the motor-cycle or car currents of cold



air are continually passing through the tubes, effectively clearing out the exhaust gases, and by their cooling effect materially reducing the pressure. These tubes also serve to secure the end plates together. A cut-out plate is fitted to the end of the silencer, so that free exhaust may be available for hill climbing without the noise resulting from cutting out the exhaust box altogether. This plate is kept closed by a spring, and is opened by stranded wire and ring, or thumb slide. The silencer is made in a variety of sizes and can be obtained from Messrs. J. C. Meredith, Limited, Birmingham.

THE Motor Volunteer Corps have a busy programme for the present month, duties being arranged in Essex, Hampshire, Berkshire, Suffolk, Worcestershire, and County Cork.

THE Ascot Motor Works, Limited, has been registered with a capital of £2,000 and registered offices at Windsor-road, Ascot, Berkshire.

MR. REGINALD EGERTON'S appeal case in Ipswich, which the Motor Union did not support, owing to the action of the Eastern Counties Automobile Club, which voted against giving aid, has, after all, had considerable assistance. Mr. Burton, a member of the committee of the Eastern Counties Club, got up a subscription among the members, and no less than £31 18s. 6d. was collected towards the costs of the appeal.

WE have given the "Dependence" tail lamp manufactured by Messrs. J. and R. Oldfield, Birmingham, a short trial, and find that the two side lights are a distinct advantage in allowing one to see by a turn of the head whether the lamp is alight, and also

Front and Rear Views of "Dependence" Lamp.

as a guide when backing the car. The lamp can be supplied to burn either paraffin or oil. We consider the latter gives a much more reliable light, as, owing to either excessive vibration from an old car or an inferior quality of paraffin, the light is apt to jolt out over a rough road.

MESSRS. S. BOWLEY AND SON call attention to the fact that other firms have made use of the distinguishing bright red-coloured cans as used by them since the introduction of the patent rectangular 2-gallon cans. They ask that motorists should see that every can is wired, sealed, and bears their name.

CONTINENTAL NOTES.

More Motor Postal Services in France.

Motor-car services for the transport of the mails between Auxy-Beaune and Boiscommun-Nebelle (Loire) and between Saint Amant and Thenemille (Cher) are about to be inaugurated. Similar services are also projected between St. Leonard and Bourganeuf and between Grenade and Jeaune.

◆ ◆ ◆

The 1905 Gordon Bennett Race.

Following the example of the A.C.G.B.I., the Italian Automobile Club has now formally sent in a challenge for the Gordon Bennett Cup, so that there are already nine competitors for next year's event.

◆ ◆ ◆

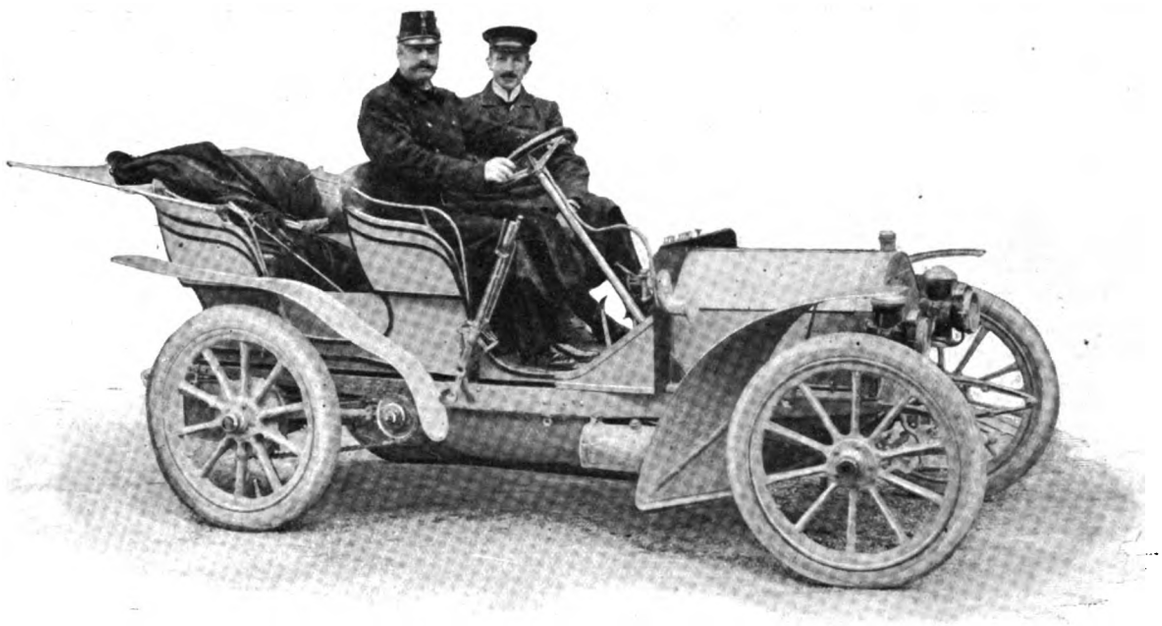
Hill-Climbing at Dijon.

The hill-climbing competition up the Val-Suzon Hill, near Dijon, organised by the Bourguignon Automobile Club, was held a few days ago. The road up the hill is 2½ kils. long, the gradient in some places being as much as 8½ per cent.; it also comprises some nasty turns. In the motor-bicycle class the best time was made by M. Herson-Macaiel on a 2¾-h.p. Griffon (2 min. 55 2-5 sec.). H. Cottereau was first in the voiturette class, he climbing the hill on a 7-h.p. Cottereau in 7 min. 16 sec. Dr. Morlot on an 18-h.p. Darracq secured the premier position in the double-cylinder car class in 6 min. 29 3-5 sec. The best time of the day (2 min. 40 sec.) was made by M. Serpollet on a 9-h.p. Serpollet steam car.

◆ ◆ ◆

The Spa Automobile Week.

The Circuit des Ardennes over, the motorists who are just now sojourning in Belgium transferred their attentions to Spa, where, however, the weather proved somewhat unkind. The meeting should have opened on Wednesday of last week with a hill-climbing competition from Spa to Malchamps, a distance of five and a-half kilometres, but, on account of the bad state of the roads, it was postponed. In the afternoon the mile hill-climb for the Spa Cup, held by Barbaroux (Benz Parsifal), was run off, but many of the competitors decided not to start owing to the "skiddy" nature of the course. The cup was eventually won by Tart, his time for the mile, on the Panhard racer, being 1 m. 10 sec., Hautvast (Pipe) being second, in 1 m. 17 1-5 sec., and Amblard (Hotchkiss) third, in 1 m. 51 3-5 sec.



Motor-Cycle Racing in the Rain.

Thursday brought with it no improvement in the weather, but nevertheless a 100 kilometre race for motor-cycles was run off. André, on a Sarolea, was first in the motor-bicycle class, in 2 h. 15 m. 8 sec.; and Meura, on a machine of the same make, made the best time, 2 h. 27 m. 58 sec., in the heavy motor-cycle class.

◆ ◆ ◆

The Spa-Malchamps Hill Climb.

The hill-climbing competition was run off in the afternoon, but the event lost a good deal of its interest owing to the fact that the Panhard and Darracq racers did not compete on account of the bad weather. Hautvast (Pipe) made the best climb in the heavy car class, his time for the 5½ kilometres being 3 min. 33⅘ sec. Guders, on a Clement-Bayard, secured the first place in the light-car category; time, 4 min. 12⅗ sec. In the voiturette section Grandjean, on a Renault, was first in 12 min. 9⅖ sec.; Verschaere, on a Sarolea, secured the premier position in the heavy motor-cycle class in 6 min. 45⅖ sec.; while in the motor-bicycle category Olieslagers again rode his Minerva to victory in 4 min. 33⅗ sec. Friday's event was a 120-kilometre touring competition, which was won by Hautvast on a 15-h.p Pipe car.

The Archduke Leopold Salvator of Austria on his 18-24-h.p. Austrian Mercedes. [*Allgemeine Automobil Zeitung.*

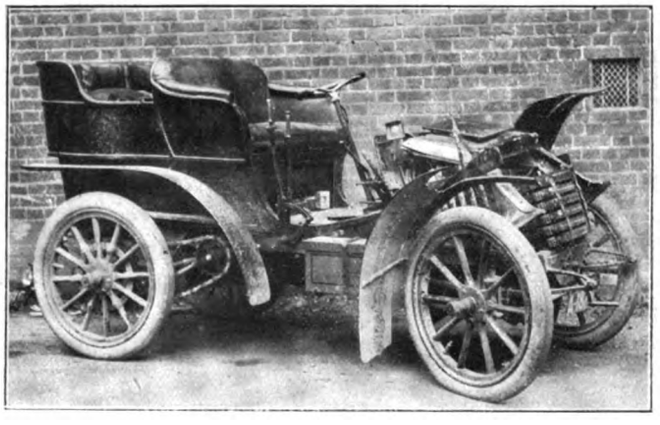
CORRESPONDENCE.

HORSES v. MOTOR-CARS.

To the Editor of *The Motor-Car Journal.*



Sir,—The comparison between horses and motor-cars is never one that can be dealt with in exact terms. Horses have been used, for example, for many branches of work for which they are very poorly adapted, and from these they may be ousted by automobiles, just as they were ousted from the mail service by the railways long before the railway service was as perfect as it is to-day. Automobilism will naturally attack its utility work first at the points where horse service is weakest. Then, by slow degrees, it will enlarge its sphere, growing gradually to greater perfection by adaptation to the more and more severe tasks imposed upon it. Understanding of automobile mechanism will spread at the same time among the public; men fitted to take care of motor-cars will become more numerous and less exacting; and after a decade or two it will be found that motor-cars may be substituted for horses without subsequent disappointment, even if no other factors are considered by the purchasers than reliability and economy of the machines as machines.—Yours truly,

Moderator.

UNIVERSAL REAR LIGHTS.

To the Editor of *The Motor-Car Journal.*

Sir,—We hope, in the interests of motorists in general, you will be able to reproduce the enclosed photograph of a wrecked Panhard which we have just brought from Hounslow to repair. It is a deplorable fact that slow-moving vehicles are not forced to show a rear-light, whereas a fast-moving motor-car has to suffer a legal penalty if the rear light even blows out unseen. The accident occurred last week at midnight, with drizzling rain, and was due to a market gardener's wagon crawling along

in the centre of the road, with the driver in charge asleep or nearly so. The wagon was not seen by our client till right upon it, and of course it crashed into back of same. Fortunately, although thrown out, no one was injured. We think it is high time these slow-moving vehicles should be forced to show a rear light, and the bringing of these accidents forward in your valuable journal will, we think, tend to bring about the much-needed reform.—Yours truly,

Letzer and Jordan.

A SUGGESTION TO HOUSE BUILDERS AND ARCHITECTS.

To the Editor of *The Motor-Car Journal.*

Sir,—A big revolution will have to come about ere long in the methods of the suburban house builder. Already he has had to consider the housing of the cycle, and now it is the storage of a motor-car that requires his attention. I am not suggesting that the builder should include a *garage* in his plans, though in due time that may be done in the case of mansions, for there is no need to plant a car as far away as possible, like a horse, lest the odour of the stable reek should be wafted through the windows.

The consideration I have in view is that of the approach to one's back garden. If one looks round "villadom" generally, one finds innumerable houses behind which there is room to keep a car, and from the appearance of the dwellings themselves it may also be assumed that the means exist to acquire and maintain a horseless vehicle; but of room to drive it in and out there is often none whatever. In many cases this is not unavoidable; houses, it is true, are often built too closely together to permit of a motor-car being driven between the intervening spaces, but in the numerous examples I have in mind there might have been left ample room for the purpose if the growth of automobilism had been foreseen.

Another difficulty which may frequently be found, even where there is just width enough to drive a car in and out, is the extreme awkwardness of the approach. I can recall several cases in which, to reach the motor-shed, the car has to be driven up a slope of one in eight! To get up it with a run the driver must needs slip through his garden gates at a fair speed, with only inches of clearance on either side. The ascent is thus difficult enough, but coming back is worse. The car has to be wheeled out, and allowed to drop by gravity, with a tight hand on the side brake; and steering a car backwards in a confined space, and graduating the power of the brake application at the same time, are not the simplest of operations.

This difficulty of manœuvring a car in and out of his own domain, though it vexes the soul of the suburban automobilist, serves at first one useful purpose. The one in eight gradient may be the exception, but the narrow space and awkward corners are probably the rule, and the result is that the owner, on acquiring his first car, soon of necessity learns how to use his reverse, and how to shave between gate-posts without a splitting of his splash-guards. These accomplishments being learned at home, and at the very outset of his driving career, reduce the possibility of trouble in actual traffic; but once he has become dexterous he will naturally continue to lament the inconvenience he suffer every time he takes the car out of its shed. And this brings me back to the point; the suburban builder, in his future operations, may reasonably be invited to consider the requirements of that rapidly-growing class, the owners of motor-cars, for they are by no means going to b merely the men who live in mansions, nor even those who keep a carriag —Yours truly,

Up-to-Date.

TYRE QUERIES.

To the Editor of *The Motor-Car Journal.*

Sir,—I should be obliged if you or some of your readers could inform me as to the way to determine the size of a tyre. I have a 3½-h.p. De Dion, and I want to get a new tyre for one of the wheels; the old tyres are Dunlop and are not marked save for a 3½ marked in a circle. The rims are 22 in. diam. (cycle type). When you talk of a 28 or 30 in. wheel or tyre, where are the measurements taken from, and what does a 28 x 3½ or 700 x 90 mean?

Frank W. S. Hodson.

GOGGLES.

To the Editor of *The Motor-Car Journal.*

Sir,—Much has been heard of late of the influence of automobilism on the eyesight, and alarmist reports have been freely circulated as to the bad effect of motoring on the eyes. Dr. Trousseau, a leading French eye specialist, declares that a person with sound eyes cannot suffer from a trip on a motor-car, unless, of course, some foreign substance, such as dust or grit, is admitted to irritate the eyelids. Hence he recommends the use of goggles when on dusty roads in windy weather. But there is now such a variety of styles of goggles that the choice is not an easy one. Dust will penetrate through the most minute aperture. It is therefore necessary that the lining of the goggles should fit the contour of the eye-sockets. After buying the goggles, the lining should be worked over, re-cut, and re-pressed, if necessary, to obtain a regular and close fit. Linings of very pliable skin are frequently used, as they absorb no moisture, and are less liable to deteriorate than those of taffeta. The rims of the goggles should be as light as possible, and should adapt themselves to the form of the face, especially to the curve of the nose. Many opticians are making goggles, but few are adequately studying the subject, and there is room for many new shapes and styles in addition to those already on the market.

T. J. Dickinson.

WEAK POINTS IN CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—Though we sometimes see descriptions of cars in which weak points are absent, such desirable vehicles are rarely to be met with in a material form, and the lines on which a large proportion of the advance made during the past few years has proceeded consist in the suitable and convenient location of such parts as must "go" under continuous wear or abnormal strain. The coming of the pneumatic tyre, the weak point *par excellence* of the modern car, is chiefly due to its being a preferable victim to road inequalities rather than that wheels, springs, or machinery should suffer, and its eminent suitability for roadside repair.

Two mishaps to a car which recently came under my notice are a good illustration of the advantage of having weak points in convenient places. The car was one in which the application of the foot-brake did not disconnect the engine, and a sudden stoppage to avoid a collision resulted in the shearing of a rather weak key connecting the engine shaft with the gear—no very troublesome repair, which was made apparently with a stronger key to avoid a repetition of the mishap. Shortly afterwards, similar circumstances, same neglect to ungear; result, a badly-stripped driving sprocket. Of course, neither need have occurred, and neither reflected on the car, but it is certainly preferable that the part to give way, even with careless driving, should be an easy one to replace. In another case, a pump firmly connected to the driving shaft broke one of its gear-cogs, and, of course, was jammed to destruction; while in another car I recently saw, the connection, also a direct one, avoiding the trouble of friction wheels, etc., was made by a simple wire

Digitized by Google

staple, which, though amply strong enough to drive, would certainly give way and save the pump in case of its jamming. The worst point about gear-driven live axles is that the bevel gear, usually the first part to "go," is an inconvenient and expensive replacement; one might almost suggest that weakness in the shaft or its universal joints would be preferable; while in such minor matters as studs, a weak centre that would avoid the necessity of drilling out if broken commends itself as a minor consideration in building a "fool-proof" car.

AMATEUR MECHANIC.

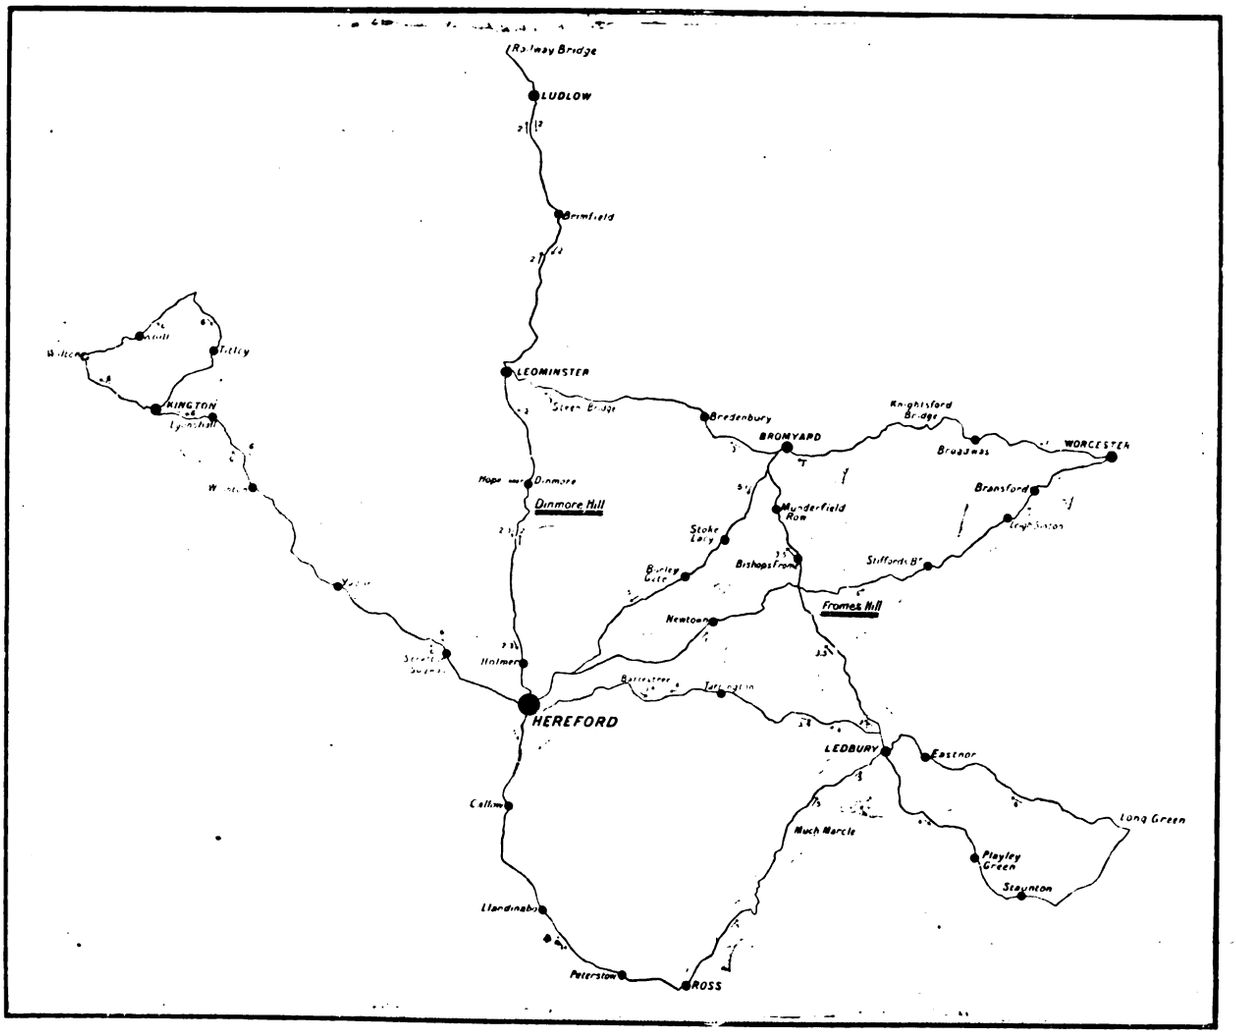
ELECTRIC CIGAR AND PIPE LIGHTER.—Replying to several correspondents, the electric cigar and pipe lighter referred to in our last issue can be obtained from Messrs. L. A. Beckett, Limited, 31-32, King William Street, E.C.

"HOLTITE."—A reader enquires as to where "Holtite" jointing material can be obtained.

THE BLACKHEATH CLUB.—The secretary of the Blackheath and District Automobile Club is Mr. A. Roberts, Madgelands, Beaconsfield Road, Blackheath, S.E.

THE SUN RISING HILL CLIMB.—The Garrard Manufacturing Company, Limited, write with reference to our report of this competition that the horse-power of their suspended tricar is 5 at 1,500 revolutions. The time of the Napier driven by Mr. S. F. Edge should have been given as 4 min. 48⅘ sec.

BEXHILL.—The Anglo-American Motor-Car Company write to say that the Cadillac car which was entered for the Bexhill speed trials did not compete, owing to the fact that it did not arrive from the States in time for the competition, and on this account the company's entry was withdrawn. The Cadillac car which did compete was one privately owned and entered.



MOTORING IN THE PARKS.

AT the Marylebone Police Court, Mr. Denman was called upon to decide a case of some importance. Henry Rose, of 10, Speedhurst Road, Chiswick, was summoned by the police for riding a motor-cycle in the Inner Circle, Regent's Park, contrary to the regulations of the Commissioners of Public Works and Buildings, and also for failing to produce his licence on demand while driving in the Inner Circle, a public place.

Mr. J. F. Mortimer, barrister, appeared for the defence at the instance of the Motor Union, and submitted that the Commissioners had no power to prohibit, but only to limit, the admission of "cycles mechanically propelled" to the Inner Circle, and that under the new Motor Car Act no power was reserved to them to make fresh regulations in regard to such cycles. He also submitted that since the defendant was prohibited from using the Inner Circle with his motor-cycle, it not being a public highway, he was not bound to produce his licence.

Mr. Denman, in giving his decision, said the regulations did not totally prohibit the use of motor-cycles in the park, but only in a certain portion known as the Inner Circle; and such a regulation was within the powers of the Commissioners. They were also empowered to regulate the park in the interest of the public, and he did not see, therefore, why they should not be allowed to prohibit cycles mechanically propelled from being used in any particular portion of the park. Finally, he found that the defendant ought to have produced his licence, as he was using a highway to which the public had access. In view, however, of the fact that these were the first summonses of the kind that had been taken out, and that this was practically a test case, he merely imposed a nominal penalty of 5s. with 2s. costs, on each summons, in the hope that the case would be taken as a sufficient guide for the future.

Mr. Mortimer intimated that he might have to ask for a case to be stated on the points raised.

Map of Routes for the Automobile Club's 1904 Reliability Trials. (See page 479.)

A SUMMONS AMENDED.

AT the Bristol Police Court, Percy Ogden was summoned for recklessly driving a motor-car. Mr. Wise (from the Town Clerk's office) appeared to prosecute, and Mr. F. E. Weatherly was for the defence. The latter pointed out that, according to the manner in which the summons was drawn up, three offences were alleged—viz., driving recklessly, driving at a speed dangerous to the public, and driving in a manner dangerous to the public. He contended, however, that there could only be one charge in one summons. Mr. Wise replied that he proposed to proceed on the charge of driving at a speed dangerous to the public, and the summons was amended accordingly.

CLUBS AND ASSOCIATIONS.

GLOUCESTERSHIRE.

On Saturday last, at the invitation of one of its members, Mr. J. H. Hewitt, the Gloucestershire club met at this gentleman's seat, Maugersbury Manor, near Stow-on-the-Wold. Several members had intimated their inability to be present owing to the commencement of the holidays and other engagements. A good attendance would, however, have been ensured had the weather been at all propitious. The previous day had been hopelessly wet, discouraging those with good intentions for the morrow, and Saturday morning broke with bursting clouds and a falling barometer. Soon after four o'clock the first car arrived, and the occupants were met at the entrance by their genial host and Miss Hewitt. The period before tea was occupied in pleasant conversation, while members admired the exterior of the picturesque old Cotswold mansion, and the well-kept lawns and arboricultural beauties. The house possesses some excellent old oak panelling and carving, which was noticed with much interest by some of the members. In the drawing-room members noticed pictures from the brush of the late Frederick Goodall, R.A., which were of added interest in that the morning papers had announced his death. At such meetings, when attended by either large or small numbers, examination of the cars is an important item on the programme. The host's most serviceable De Dietrich car came in for inspection, as did also a member's Trimo, which had developed locomotor ataxy owing to a broken exhaust valve mechanism. During the visit the Stow Rifle Band discoursed sweet music on the lawn in front of

Capt. Cole, J.P., winner of the Lincolnshire Club's Driving Competition at Asgarby. Dr. Cragg, the Hon. Sec. is sitting on his left. The lady and gentleman standing by the car are Mr. and Mrs. George Godson, who entertained the Club.

the house. After bidding adieu to their host and hostess, with many expressions of appreciation, the members commenced the homeward journey. Some six miles out of Stow-on-the-Wold a member's car, with a party of four, was found resting at a roadside inn, having been victims of side-slip, mud, and rain.

KENT.

At a committee meeting of the Kent Automobile Club held on the 20th ult., Mr. Granville M. Kenyon, of Wycliffe Lodge, Bromley Park, was appointed honorary secretary and treasurer of the club in the place of Dr. Dowding. Mr. Kenyon will be pleased to hear from gentlemen desirous to become members. The Kent Automobile Club is affiliated to the A.C.G.B.I.

LINCOLNSHIRE.

Driving Competition at Asgarby.

On Thursday afternoon of last week Mr. and Mrs. George Godson entertained the members of the Lincolnshire Automobile Club to a motor meet at their picturesque residence, Asgarby Hall. Upwards of a hundred motorists and their friends attended. Cars were present from all parts of the county, including the 15-h.p. Panhard Limousine belonging to Mrs. A. C. Moreing, of Riseholm Hall, Lincoln; Mr. C. W. Pennell's (Lincoln), 16-h.p. Martini; Mr. A. A. Padley's (Market Rasen), 10-h.p. De Dion; Mr. C. Linnell's (Market Deeping), 12-h.p. Wolseley; and Major Goddard's (Lincoln) 12-h.p. Richardson. Mr R. M. Wright (Lincoln) was on a 12-h.p. Richard-Brasier (1904 type). In connection with the event Mr. Godson arranged a driving competition, and this took place in the evening. The conditions of the contest were that the competitors should start from a motor-house on Mr. Godson's premises and make an outward run of about a quarter of a mile, negotiating four twists and a turn on the way, in addition to climbing a short hill—with a gradient of 1 in 6—just before reaching the turning-point. The chief difficulty of the competition was experienced on getting back to the starting place, where it was necessary to reverse and steer the car backwards into the motor-house. This was not easy of negotiation. The narrowness of the road and the stiff rise to the entrance occasioned trouble, and some of the cars lost a good deal of time by having to make several movements—forward and reverse—before getting their cars home, and fulfilling the conditions of the competition. The following times were recorded :—

	Min.	Sec.
Capt. J. A. Cole (Roxholm), 12-h.p. Durkopp	3	1½
Mr. R. M. Wright (Lincoln), 8-h.p. De Dion	3	5
Mr. C. W. Pennell (Lincoln), 16-h.p. Martini	3	30
Mr. Holland, Jun. (Boston), 8-h.p. Peugeot	3	32
Mr. W. A. Tomlinson (Sleaford) 5-h.p. Bardon	5	30

The times were taken by Mr. Casswell (Boston), and Dr. E. H. Cragg (Billingborough), the club secretary, officiated as starter.

TRACK RACING IN AMERICA.

The fourth automobile race meet on the Empire City track, at Yonkers, N.Y., on Saturday, the 16th ult., was interrupted by a heavy storm before half of the events on the programme had been run. The meet was well attended, both the grand stand and the clubhouse being crowded. The first event was a ten-mile open race for cars weighing from 881 to 1,432 lbs., of any motive power. Of the seven entries, five started and only three finished the ten miles. The starters were a 40-h.p. Decauville, a 10-h.p. Franklin, a 30-h.p. Renault, a 30-h.p. Christie, and a 20-h.p. Mercedes. This event was won by Mr. W. Gould Brokaw's Renault, driven by M. G. Bernin, the time, 10 min. 13 2-5 sec., being claimed as a new record for light cars. All the intermediate miles, from one up, were also made in record time.

In the fifteen-mile free-for-all race for cars of any motive power weighing from 1,432 to 2,204 lbs. only three cars lined up, viz., a 60-h.p. Mercedes belonging to Mr. A. G. Vanderbilt, and driven by Paul Sartori; a 40-h.p. Decauville belonging to and driven by Mr. G. Vaughn, and a 60-h.p. Mercedes belonging to Mr. Geo. Arents, jun., and driven by Carl Mensel. Sartori got away quickest, and continually increased his lead, completing the whole fifteen miles in 14 min. 40 sec.

At this point a heavy downpour converted the track into a river of mud, and it was decided that the other races should be postponed until the following Monday, when the unfinished events were duly run off. The first was the final heat of the fifteen-mile open race, which was won by Mr. A. G. Vanderbilt's 60-h.p. Mercedes, driven by Mr. Sartori. Time, 14 min. 44 2-5 sec. Sartori continued, after completing the fifteen miles, and established new records from sixteen to twenty miles, inclusive, the time for twenty miles being 19 min. 37 1-5 sec.

The next event was a handicap race, which furnished some interesting finishes. Vanderbilt's Mercedes started on scratch, and the greatest time allowance was accorded to Mr. A. E. Morrison's 24-h.p. Peerless, viz., 1 min. 40 sec., this car being the first in the final heat. In this race Vanderbilt's Mercedes was disabled and had to be towed off the track. It appears that the driver had neglected to fill the radiator, and the engine overheated to such a degree that the two forward cylinders burst.

TROUBLES OF A MOTORIST.

The Protector Lamp and Lighting Company, Limited, of Eccles, were sued at Birmingham Assizes on Saturday by Mr. Charles Kitchen, of Penns, for £98 12s., the price of a motor-car. In the alternative he claimed damages for breach of warranty. The plaintiff, it was stated, was attracted by the appearance of one of the defendants' cars, and on the assurance that it would carry himself and wife "uphill, downhill, or anywhere" he gave an order for one. He paid £20 on account, and visited Eccles while the car was awaiting the finishing touches. He was driven on it through the streets of Manchester, and there the first casualty occurred, a collision with a cart damaging the vehicle. The car was delivered in December, the balance of the purchase-price having been paid previously. One of the company's employees, who journeyed to Birmingham to instruct the plaintiff in driving, took him on a trial trip to Coventry, and on the way, according to the plaintiff's evidence, a delay of nearly two hours occurred through a cotter-pin coming out of the valve. Afterwards they went "jiggety-jogging" to Coventry. On the return journey a difficulty with the sparking plug brought them to a standstill, and altogether the trip was no enjoyable. After the instructor had left for Manchester the plaintiff's first experience of his new car was that it refused to carry him home, and he had to get out and push it. He complained to the defendants, and the car was taken back to the works. For the defence, evidence was given that the behaviour of the car had been misrepresented. The troubles which arose were only of a minor character, and such as were common on trial trips. On being returned to the works the car was found to be in good running order. The jury found a verdict for the plaintiff, and awarded him £50 damages.

MOTOR VEHICLES IN RELATION TO MUNICIPAL SERVICE.*

By E. Shrapnell Smith.

Evidence of the rapid growth of automobilism is to be found in the number of registrations under the provisions of the 1903 Act. There are 212 registering authorities for the United Kingdom, to whom, on June 18th, I sent a circular letter and form. It is interesting to observe that official records show the most sanguine calculations to be largely below the actual numbers, viz., 18,340 cars and 21,521 cycles, for the fourth week in June The figures for the county of Essex only, of the whole 212 registering authorities, are wanting. These figures do not include manufacturers or dealers, who use general identification marks, which cover more than one car each. In London alone, for example, there are 270 such registrations. The total number of driving licences is 53,169 to the same date. The interval of one month has, of course, allowed of all-round additions to these figures. I have made inquiry in certain cases and computed the actual position to-day at 20,076 cars, 22,916 cycles, and 58,000 driving licences.

The Dust Problem.

The dust problem is, admittedly, one for every user of the highway, but it should be the pre-eminent concern of the municipal or county surveyor. The country to-day looks for salvation to the Highway Authorities in this matter, and, above all, to their executive officers. The cure for this really intolerable disturbance of road detritus lies neither in the extermination of automobilists nor in the imposition of ridiculous speed limits. The remedy appears to lie in the gradual laying of metal that has been steeped in tar or other similar liquid, with proper consolidation and limited binding matter. The use of surface treatment can be urged as an adjunct or expedient only and not as the final solution *per se*. This aspect of highway maintenance—the reduction of the dust nuisance—affects the county and urban surveyor more than the municipal engineer. Prevention is better than cure, hence the growing conviction that the construction of dustless roads must form an important branch of work for the municipal, urban, or county engineer and surveyor.

Motors for use in municipal work, as distinct from the general use of motors by members of the public, will require consideration by more than one committee. Not a few authorities have seen a return for the outlay on the purchase of a light car for their surveyor or engineer. The motor provides a ready means of inspecting outside work, particularly in urban and county areas, and such freedom of locomotion saves both time and money by enabling the officer to supervise in person without curtailment of his indoor hours or administrative work. A number of public bodies are now alive to the wisdom of facilitating the work of their engineers by the provision of a motor. In several cases the bicycle has given way to the motor-bicycle, and that in turn place to the motor-car. A good two-cylinder car to seat four can be bought for £300, and the running cost, with a youth at £1 a week, should not exceed £150 a year for an average distance of 180 miles per week. The advantage of a four-seated car is that members of committee can make inspections, as is so often necessary, with the minimum loss of time, and the tonneau can be removed for other purposes if desired.

I shall pass over the application of motor-power wagons in tackling overhead electric equipment, likewise the use of motors in fire brigade work, and before taking the main subject shall refer to motor-omnibus services. The first consideration is that, compared with electric traction on rails by the trolley system, a service of motor-'buses necessitates one-sixth of the capital expenditure. Æsthetic views may also carry weight at times, for some towns resent the laying of rails and the use of overhead wires. The largest experience has been gained at Eastbourne. The greatest expense has invariably been in replacing rubber tyres, which are essential to comfort for passenger services. This item has reached 8d. per car mile—in some cases—but improvements in manufacture, and in the methods of securing the tyre to the rim, have now reduced this by three-fourths. The cost per car mile, inclusive of depot expenses, repairs, depreciation, driver, stores, sundries, and supervision, will vary from 8d. to 9d. for a sixteen-passenger 'bus, and will be under one shilling for a double-decker. where a sufficient number of 'buses are run to reduce the incidence of management. The increase in width to 7 ft. 6 in., and the higher speed of 12 miles an hour, which are permissible under the new regulations, render the prospects of the motor-omnibus particularly attractive both for complete services and for feeder purposes. Where the traffic stops are numerous, as in London, a hydraulic variable speed gear, with an infinity of ratios between the extremes instead of the usual three or four steps, is of value with the internal combustion engine, which is in greater vogue than steam for this work.

The majority of vehicles built since January 1st, 1900, have been above the tare of 3 tons unladen. Such vehicles have, in point of fact, been on the streets, as light locomotives, entirely on sufferance, though no action has been pressed on the score of weight, on account of the lack of clear definition in the Act. Separate returns furnished by 195 of the 212 registering authorities show a total of 843 motor-cars "above 2 tons unladen," all of which may be regarded as goods vehicles, and at least 90 per cent. as steam-propelled. There are, after making a careful estimate for the remaining seventeen authorities, about 950 heavy motor vehicles in the United Kingdom. The total number of public passenger service vehicles is returned at 332 by 190 authorities, which yields an approximate total of 470 in the United Kingdom after proportionate correction. These cars vary from six to thirty-six in seating capacity. Both sets of figures are computed to date, and this is a solid argument to advance in support of the purchase of motors for heavy transport, as soon as the new regulations appear, because it means that a buyer now places his feet on the heads of so many pioneers who have gone before.

I inquired of the borough engineers of 216 principal authorities, by circular letter and form dated June 15th, as to the use they are making of heavy motor vehicles. It is evident that the principal economies are found to be effected in the cartage of heavy materials, and in street watering, and that dust or refuse disposal is doubtful, unless there is a long lead to the tip or destructor. The general experience appears to confirm the accepted commercial figure of £7 10s. per week as the inclusive working cost of a motor wagon, when the mileage does not exceed 220 and single shifts are worked, It is for each authority to say whether they can replace present expenditure to that extent or more by the adoption of motor haulage. If not, they have nothing to gain by the change, The future of the heavier vehicles is assured now that we are to have a larger tare, which will enable constructors to build with sufficient power, strength and wheel dimensions. It is to be hoped that those who have been sacrificed in the earlier stages will find some recompense.

If Dick Turpin came to Life Again.

*From a paper read before the Conference of Municipal and County Engineers, in connection with the twenty-second Congress of the Sanitary Institute, on Tuesday, July 26th, 1904, at Glasgow.

REDUCTION OF A PENALTY.

At the Liverpool City Sessions, Archibald Ford appealed against a conviction and a fine of £20 inflicted by the stipendiary magistrate on June 29th on a charge of having driven a motor-car in a manner dangerous to the public. Mr. Morris, on behalf of the respondent justices, explained that the alleged offence was committed on June 5th, and the maximum penalty had been imposed under the Motor Car Act. P.C. Jones deposed that at 11.10 p.m. on Sunday, June 5th, the appellant, who was driving a motor-car, arrived at the Landing-stage from a Birkenhead ferryboat.

Digitized by Google

He drove away along the Landing-stage. Witness called upon him to stop, as he was proceeding at too high a speed, having regard to the traffic on the Stage. The appellant stopped his car opposite the offices midway between the Woodside berth and the floating bridge. Witness told him that he must not drive at more than a walking pace whilst on the Stage. The defendant started off again, and when he had covered a dozen yards he put on speed, and ran up the floating bridge at a speed of nine or ten miles an hour. The Stage was crowded at the time, and several people had to get out of the way. Evidence of the excessive speed was given in corroboration. The appellant said he had driven at five miles an hour whilst on the floating bridge. He could not, in fact, have exceeded that speed having regard to the gear of the machine just then. He denied having increased the speed after parting from the constable. The Recorder decided that the appellant had driven at too high a speed upon the Landing-stage, but that the penalty had been excessive. He reduced the penalty to 40s., and affirmed the conviction with costs.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Bristol	Reckless driving	£2, etc.
Aberdeen	Driving without licence	30s., etc.
Kidderminster	Driving a motor-cycle on foot-path	£1, etc.
York	Driving at dangerous speed	20s., etc.
Marlborough St, W.	Driving dangerously	21s., etc.
Sheffield	Not keeping record of car out with dealer's mark	10s., etc.
Birmingham	Reckless driving	40s., etc.
Northampton	Reckless driving	£5, etc.
Dublin	No number	10s., etc.
Co. Down	Not stopping when requested	40s., etc.
Leeds	Driving to public danger	£3, etc.
Marylebone	Beyond legal limit	£2, etc.
Croydon	,, ,,	£5, etc.
Manchester	,, ,,	£5, etc.
Bangor	,, ,,	£5, etc.
Birmingham	Reckless driving	10s., etc.
New Ross	Riding motor-bicycle without licence	2s. 6d., etc.
Carlisle	Unilluminated rear number	1s., etc.
Gorey (Ireland)	Failing to produce licence	10s., etc.
Wareham	Not stopping when requested	£2, etc.
Kingston	Excessive speed in Richmond Park	£3, etc.

CASES DISMISSED.

At the Leeds City Police Court, Joseph Higginson, jun., of Stockport, was summoned for committing a breach of the Motor Car Act. According to the evidence of two policemen, a motor-car registered in the defendant's name travelled over a measured distance at Moortown on the 9th ult. at the rate of 22 miles 888 yards an hour. In cross-examination, Mr. F. A. Reed, of Huddersfield, who defended, elicited that the officers did not stop the car. They did not know who the driver was, but they took the number of the car. Mr. Reed pointed out that there was no evidence to show that the defendant was the actual driver of the car, and he submitted that under these circumstances the prosecution must fail. The Bench sustained the objection, and the case was dismissed.

Capt. William Phayre Ryall, of Frome, at the Frome Petty Sessions, was summoned for having on the 17th July, in the parish of Frome, unlawfully driven a motor-car at North Parade at a speed which was dangerous to the public, having regard to all the circumstances of the case. After hearing the evidence, the Bench retired to consider their decision, and on returning said they thought the police were perfectly justified in bringing that case before the Court, but they had decided to dismiss it on payment of the costs, and they cautioned defendant to be careful in future of the speed at which he drove through the town.

In Dundee Sheriff Court, James Cox, Lochee, was charged with having driven a motor-car at the rate of 30 miles per hour on 10th June last on the public road between Dundee and Coupar-Angus. For the defence, Mr. Cox stated that the car was not travelling faster than 20 miles an hour, while further evidence went to show that it was impossible to take the correct speed of a motor-car by an ordinary watch. The correct time could only be obtained by stop watches. After further evidence Sheriff Campbell Smith found the charge not proven. He stated that what the law required in a case of that kind was evidence that left no room for reasonable doubt, and he did not think the charge had been proved by conclusive evidence.

At Kingston, A. E. Grottick, of Wandsworth, was summoned for negligently driving a motor-bicycle on the Portsmouth road, Surbiton, on July 3. William Watson, of the Black Horse public-house, Guildford, said that on the Sunday afternoon in question he was proceeding along the Portsmouth-road by the waterworks, pushing a truck in the direction of Windows' Bridge, when he was run into from behind by a motor-car and knocked down and rendered insensible. By Mr. R. F. Gibson (who defended): He did not identify defendant. Ernest Day, of East Molesey, also saw the accident, but he could not say that it was defendant who knocked Watson down. Mr. Gibson said the defendant admitted being on the road on a tricycle with a fore car, but denied touching anyone. He remembered passing the man Watson by about some six feet, and after going on about forty yards he heard a noise. Turning round, he saw there had been an accident, turned and took the man to the hospital. The case was dismissed.

John Stubbs was charged at Stafford with riding a motor-bicycle along Bridge Street, on the 8th inst., without having a licence. The defendant said the bicycle did not belong to him, and he was simply riding it on trial. He was ordered to pay the costs.

POLICE TRAPS.

It is said that at Bassett the police have covered a portion of the road with a dust-laying preparation and have set up a trap thereon.

The police have promised the city authorities of Birmingham to keep a sharp lookout on motorists travelling in the suburbs.

Loughborough must be added to the list of places where the police are unfriendly enough to lay traps.

A correspondent informs us that there is a trap on the main road from Bolton to Preston, starting nearly a mile short of Chorley Town Hall, and continuing to the top of the hill.

Mr. Brynmor-Jones, K.C., M.P., uses an electric landau or driving when in town.

Some experiments are being made in Paris with a new dust-laying preparation known as "Pulverante."

The road leading from Epsom to Ashstead Park past Ladas Inn and over the Common will be closed during the present month.

The United Motor Industries, Ltd., inform us that Castle accumulators were used by the winner of the International Cup for Motor Boats, and by Mr. H. Williamson on his Land's End to John o' Groat's motor-cycle record.

Dr. Marshall, the Crown Seneschal of the Isle of Man, is the first doctor in Manxland to join the ranks of motorists. He has purchased a Cadillac car, and his former coachman, having had a course of lessons in motor-driving, is now his chauffeur.

Mr. C. De Rouet, until recently with the Motor Manufacturing Company, Limited, has now joined the Metropolitan Engineering Association, 38, Deansgate, Manchester, which is establishing a depot for the sale of Thornycroft wagons and cars.

Motorists passing through the little town of Stone, Staffordshire, will find petrol and motor accessories at the depot of Messrs. Evans and Sons in the High Street. The firm are local agents for Wolseley and other cars, and report an increased interest in automobilism in the district.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to The Editorial Department. Motor-Car Journal, *39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

A Club for Hull.

ANOTHER automobile organisation has been formed in Yorkshire, and a strong committee has just been elected to organise the Hull and District Automobile Club. Mr. G. M. Heald is acting as hon. secretary, *pro tem*, the motorists convening the first meeting being Dr. W. H. Coates, Messrs. W. C. Dawson, A. Hagestadt, F. J. Hamlyn, A. E. Lowry, and G. M. Heald. The preliminary meeting was held at the Imperial Hotel, Hull, and great interest in the proposed club was shown by those present. Dr. Coates was in the chair, and urged the formation of such an organisation. A resolution was passed that a club be formed, and that it be entitled "The Hull and District Automobile Club."

◆ ◆ ◆

Motor Traction in Ireland.

IN the House of Commons, Mr. J. Delvin asked the Chief Secretary to the Lord Lieutenant of Ireland whether he was aware that Mr. Cowan, the chief engineering inspector to the Local Government Board of Ireland, had reported that it would cost over £12,000 sterling to prepare between nineteen and twenty miles of the existing public roads in the Derry No. 1 district for the running of motor vehicles, under the scheme of Lord Iveagh and the Right Hon. W. J. Pirrie, between Derry, Clandy, Park and Fermoy; and that, in consequence of the cost, the scheme had been rejected by the Derry County Council; if so, would he state how many motor vehicles had been placed on the Irish roads up to the present under the Iveagh-Pirrie scheme, and at what cost to the several districts; and whether, in view of the cost which the scheme was likely to involve to the local ratepayers, he would refuse to accord any further the support and co-operation of the Irish Administration. Mr. Wyndham, the Chief Secretary for Ireland, replied that Mr. Cowan's report was to the effect stated. The county surveyor also estimated the cost at over £12,000, and the county council declined to adopt his report on the ground that it "would effectually block any further consideration" of the motor-car scheme in the district. He understood that the county Antrim service would be opened at an early date.

◆ ◆ ◆

One Speedometer v. two Chronographs.

A NEW point in the police court proceedings against motorists was brought out last week by Lieutenant-Colonel Mark Mayhew, when summoned at Marlborough-street Police Court for exceeding the ten-mile speed limit with his motor-car in Hyde Park, on July 8th. The chronographs of Sergeant Filce and Constable Sullens indicated that the car, tested over a measured furlong, travelled at more than seventeen miles an hour. Lt.-Col. Mayhew, however, urged against that evidence the fact that he drove according to his "speedometer," which showed that he was going at only ten miles an hour, and stated that drivers desirous of travelling at the regulation speed, and being law-abiding persons, had adopted that instrument for the purpose. Mr. Denman expressed a desire to know more about the "speedometer," which was shown to indicate "zero" when the car stopped. It was pointed out that it only worked while the car was in motion. The magistrate, in giving his decision, had to rely on the evidence, as the "speedometer" could not be taken from the car and brought into court. There were, the magistrate said, two pieces of mechanism showing the same result, namely, more than seventeen miles, against one which indicated ten miles, and this method, so far, was the only one that could be adopted for speed tests. Consequently a fine of 20s. and costs was imposed.

◆ ◆ ◆

Motor Traffic Regulations in Australia.

THE conference of municipal delegates of the Melbourne area, which met to consider the advisability of framing regulations to control the speed of motor-cars in Australia, has decided to recommend that a Bill be introduced into Parliament, based on the English Act of 1903, limiting the speed of cars to ten miles an hour in the city and twenty miles in the suburbs. The conditions of that Act are also: Registration of all cars, the carrying of registered numbers, and that only licensed drivers should be allowed to drive the vehicles; registration fee for all cars to be £1 and 5s. for a cycle, while the driver's licensing fee would be 5s. per annum; the driver would also be held responsible for the careful and accurate handling of his car. From what we can gather, remarks "The Australian Cyclist," it is hardly likely that such stringent regulations will become law in Melbourne for many years at least, and if the municipal gentlemen responsible for such freakishness desire to kill the industry all at once, they are going the best way to do so. In fact, we do not regard their suggestions at all seriously. It is one thing to make recommendations, but quite another to carry them into law, when a strong body, such as the Automobile Club of Victoria, is in existence.

◆ ◆ ◆

Awaiting Experience.

AT the seventeenth annual meeting of the proprietors of Messrs. McNamara and Company, Limited, the well-known Post Office contractors, held on Tuesday, Alderman J. Pound, J.P., the chairman of the company, said the shareholders would remember that he stated last year that they had a motor-van on trial. The result of an extended trial, although not absolutely satisfactory, was of such a nature as to justify the directors in having two vans of regulation style and size, specially built for further experiments. These were now working regularly and doing good service; but it still required further time to ascertain if the cost of running, maintenance, and repairing came out cheaply, and was as reliable as horse traction. At any rate, it was the desire of the directors to keep well abreast of the times, and to be prepared to supply motor-vans, if demanded, for the purpose of the business, as soon as they can be economically worked and maintained.

Digitized by Google

After Beverley, Colchester.

ENCOURAGED by the concession made to the Beverley Town Council by the Local Government Board, the wiseacres of Colchester have been discussing the speed of motor-cars passing through that ancient and pleasant town, with a view to the adoption of a limit of speed. One alderman delighted his colleagues by the suggestion that a Local Government Board inquiry might secure the end in view, as it had done in the case of the Yorkshire town. Whereupon others became emboldened and openly advocated a limit of ten miles an hour. In the end no real harm was done, although it was said that a sub-committee of the Watch Committee would report on the subject, and also make proposals with regard to the provision of signs at dangerous corners. Evidently the motorists of the eastern counties must be vigilant.

◆ ◆ ◆

Width of Trunk Roads.

AT the instance of the Roads Improvement Association the Hon. Arthur Stanley, M.P., has placed the following notice of motion upon the agenda paper of the House of Commons :—"That, in view of the very large expenditure on street improvements by local authorities in setting back the frontages of existing buildings for the purpose of street widenings, it is desirable to place some limit on that expenditure by widening trunk roads, and particularly those passing through the suburban areas of large towns, before building operations commence, and that, in the opinion of this House, legislation should be introduced by the Government to provide that no new building shall be erected within fifty feet of the centre of a trunk road, the local authority paying suitable compensation for unoccupied land within the existing fences."

◆ ◆ ◆

The Limits of Journalism.

AT a meeting of the Council of the Society of Motor Manufacturers and Traders, held last week, the following resolution was adopted :—"It having been considered by the Society that the dealing with enquiries and recommending cars for purchase by some automobile papers, both in their columns and otherwise, is detrimental to the industry, resolved unanimously that this Council is of opinion that it is against the best interests both of the trade and the buying public for any automobile journal to take commissions or make any profit in connection with the sale of cars recommended in its columns or otherwise." With this resolution the *Journal* is quite in accord, since it endorses the view we recently expressed as to the desirability of the Press holding aloof from business of the kind.

◆ ◆ ◆

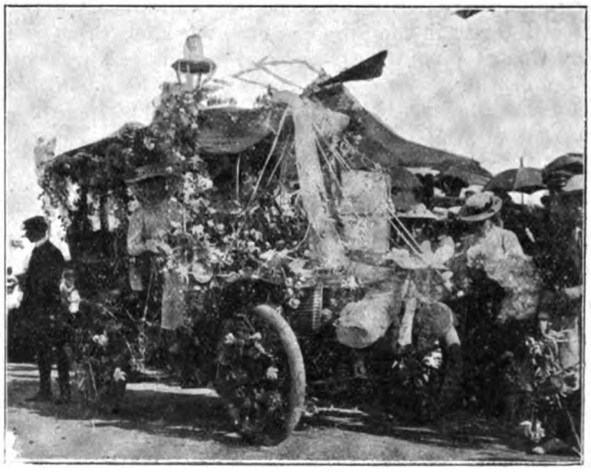
Modern Missionising.

THE great missionary tour upon which General Booth, of the Salvation Army, is now engaged suggests a contrast to the way in which John Wesley reached the people. Ambling along on a shaggy old nag, the earlier revivalist was greeted very differently to the reception accorded the General in the old Cornish towns on Tuesday. Wesley was stoned; General Booth has been received by mayors and people with enthusiasm. To the one locomotion was difficult; the motor-car has eased the way for the other, and we have the spectacle of an old man of seventy-four adapting himself to a new method of travel with a confidence that will not be misplaced.

◆ ◆ ◆

A Triumph of Organisation.

THE tour that has been mapped out for the four cars provided for the accommodation of the General and his staff officers will again prove the organising capacity of the Salvation Army. Halls have been booked, chairmen appointed, hotels secured, garage accommodation provided, petrol supplies ensured, and a score of other details have required attention. The failure in any one department will lessen the success of the whole trip; hence we may be justified in regarding the event as something in the nature of an automobile reliability trial as well as a great evangelical campaign. For here are the conditions of ordinary touring reproduced on a grand scale. After a glance at Land's End, the tour started with an address at St. Just, on Tuesday afternoon, and another at Penzance in the evening. Through Cornwall and Devon the motoring missionary has pursued his way, and on Monday next will lecture at Taunton, Bridgwater, and Wells, Tuesday's programme including Trowbridge, Chippenham, and Stroud.



◆ ◆ ◆

The Exhilaration of Motoring.

THIS is not General Booth's first automobile experience. He has had several motor trips and has always recognised the convenience of the car. More than that, its exhilarating effect has been useful to him in his work, and on this he is probably relying to get through the arduous trip upon which he is now engaged. Several gentlemen of advanced years and engaged in public affairs have recognised this result of motoring, and the Archbishop of Dublin has publicly testified to the bracing effect of a motor-car trip. The day is not far distant when the dignitaries of all religions and denominations are likely to do much of their pastoral work by means of the motor-car.

Ministers and Motors.

ALREADY the automobile is appreciated by scores of ministers throughout the country, who find it a useful convenience in their parish work, and whether their automobile is a car or a cycle matters not. The recognition of the new locomotion by all sections of the community is inevitable, and this fact should be appreciated by the motor trade even more, perhaps, than has been the case in the past.

◆ ◆ ◆

Manœuvres without Men.

LT.-GENERAL SIR JOHN FRENCH and the staff of the 1st Army Corps are in the Midlands for the purpose of studying the country from a strategical point of view, in the course of which imaginary bodies of troops are engaged in working out a scheme of military operations. The party numbers sixty-eight officers and forty servants, and twenty-six motor-cars are being employed in the work. British troops to the number of 70,000 were supposed to be located at various points in the West Midlands, and General French handed these troops over to different Generals present, and by the aid of large maps explained to them the duties they were expected to perform. The officers then left Droitwich in motor-cars and proceeded in different directions in order to ascertain the best positions to take up for defensive or aggressive purposes, where there were good supplies of fodder and water, and the best means of communication between the headquarters and different bodies of troops, for concentrating reserves, etc. A very wide field was to be covered by the officers, it being expected that some of them would proceed beyond Birmingham before returning to report at Worcester.

◆ ◆ ◆

Indeed it is Serious.

THE persecution which motorists have recently suffered has been of a particularly pernicious character. The chief cause, we believe, arises from the dust on the road. The recent dry weather has caused this to be abnormally obnoxious, but we would point out that the fault of the dust arising has not been entirely owing to motorists. Little dogs, little boys, cycles, horses, everything in the moving way has caused the dust to rise, but a mark has been made against motorists, and the various summonses issued have not been on account of excessive speed, but for driving to the common danger. Consequently many of our friends have had their licences endorsed, a disgraceful proceeding, and one for which we owe no thanks to those who were responsible for the measure under which such persecution is possible.

◆ ◆ ◆

Motor-Omnibuses for London.

COINCIDENT with the half-yearly meetings of the London Omnibus Companies, when the oft-repeated story of the good intentions of the directors to adopt motor-omnibuses in the "early future" has again been told, comes the news that the London Power Omnibus Company, whose experimental service in the north-west of London has been in operation for the past seven months, have completed their tests of over 160,000 miles. The results have been so satisfactory that last week arrangements were concluded for adding fifty motor-omnibuses to the service. These are being built by Stirlings Motor Construction Company, of Edinburgh, and will be constructed with certain modifications that have been found by actual experience desirable to fully meet the special requirements of London traffic. As the motor-omnibuses belonging to the company run over two and a half times the mileage per annum of the ordinary London 'bus, a service of 100 motor-omnibuses would be equivalent to an addition of 250 omnibuses so far as public convenience is concerned. The ascertained revenue per mile of the motor-omnibuses of the London Power Omnibus Company, with half the passenger capacity of the horse-'buses, is within a fraction of the revenue per car-mile as estimated in the published accounts of the London General and Road Car Companies. The new omnibuses of the London Power Omnibus Company will carry sixteen passengers and be speeded to twelve miles an hour.

Dust.

HE was a philosopher as well as a politician who described dirt as "matter in the wrong place." The same definition might also be given of dust; although it would be difficult to assign to the latter its proper place. In towns we are worried by the dust in our streets, and this is all the more deplorable having regard to its constituent elements, which must be a serious menace to the health of the community. When automobiles have supplanted the horse from our city thoroughfares we may hope to have one source of disease removed. But, it is also pointed out, the dust area is being removed from cities to country, and many a once verdant hedgerow is now sicklied o'er with the pale dust of the road—the result of a combination of bad road surfaces and good motor-cars. For, while it

Digitized by Google

must be acknowledged that some motor-cars throw up a great quantity of dust, it must also be recognised that there are others which are quite well behaved in that respect, and that the neglect of the problem of the construction of roads suitable for the new traffic is largely responsible for what people are pleased to call "the dust nuisance."

◆ ◆ ◆

After the Motor-Boat Race.

On Monday evening a banquet was given by Sir William Crundall at Dover, and was attended by nearly 200 guests, including a large number of ladies. There was a preponderance of Frenchmen, and the gathering was one of the most successful we have ever attended. Everything passed off with the utmost enthusiasm, and the international character of motoring and motor-boating was proved by the cordiality with which all fraternised. "God Save the King" and the "Marseillaise" were sung several times, and the speeches, individually and collectively, were of the most cordial description.

◆ ◆ ◆

Municipal Service.

The area of the municipal employment of motor wagons is wider than is generally imagined, ranging from Bournemouth and Folkestone to Newcastle and Glasgow. The universal experience is that the adoption of mechanical vehicles has resulted in considerable economies, and even at Folkestone, where the steam watering cart costs twice as much to maintain as did the old horse system, the fact is recorded that three times the work is done. At Chelsea, Hampstead, and Bournemouth greatest economy is effected in cartage work, and at Reading and Westminster in the rapid removal of big loads. At Cardiff and Blackburn there is considerable economy in dust and refuse collection and disposal. Unfortunately, the cost of repairs varies considerably; but there is a cheerful tendency towards a reduction on this account.

◆ ◆ ◆

Fees for Motor-Lorries.

In the report of the Highways, Bridges, and County Buildings Committee presented at the last meeting of Nottingham County Council it was stated that the Chairman and the County Surveyor had had an interview with the Local Government Board on the subject of the recent report of the Departmental Committee appointed to inquire as to the desirability of the Local Government Board issuing regulations increasing the maximum weights of motor-cars, with the view to the more general use of motor-lorries. As a result the committee had instructed the clerk of the Council to request that the Board would not proceed further with the regulations in question without further inquiries being made. In the opinion of the committee more evidence should have been taken by the Departmental Committee to show the effect of this new class of traffic on roads outside urban districts. The committee also considered that power should be given to County Councils to charge owners of the lorries an annual licence fee as in the case of ordinary locomotives, and that such lorries should be classed as locomotives. The fees would be some, though insufficient, compensation for the damage done to the roads.

◆ ◆ ◆

Dangers for Motorists.

An interesting point has been raised by Mr. S. H. Sparks, of Wellington, who has asked the Plympton (Devon) Rural District Council for damages for injuries sustained to a motor-car that was capsized through a heap of stones being left on the road within the area of the said council. This is a point of something more than local importance, and one to which county surveyors and others should give their closest attention. Not only in Devon, but in many other counties, the habit of leaving stones on the roadway unrolled is much too frequent, and it would be well if the Motor Union would look into the legal aspect of the matter with a view to compelling local authorities to keep the roads as free from danger as is possible.

◆ ◆ ◆

The International Motor-Boat Race.

The International Commission for the British International Cup for motor-boats has sat in London at the head-quarters of the Automobile Club to adjudicate on the protest lodged on behalf of the owners of the Trèfle-à-Quatre through the French Automobile Club against Mr. Edge's victory on Napier Minor in the final for the Harmsworth Cup on July 30. The commission, having carefully studied the rules under which the race was run, upheld the French protest and awarded the race to the Trèfle-à-Quatre. The ground for the protest was that although Napier II. had beaten Napier Minor in the fourth heat, Mr. Edge had run Napier Minor in the final heat, whereas the programme laid down that the winner of the fourth heat was the only boat qualified to compete in the final. There is no rule which provides what shall be done if two boats belonging to one country are eligible for the final, and the Commission based its judgment on the fact that the provision made in the official programme had been acquiesced in. The commission recommends that such additions to the rules be made as are necessary to provide against similar occurrences in the future.

The Dorset Automobile Club have held a successful meet at Eastbury Park, near Blandford, by invitation of Mr. Henry Farquharson.

Last Saturday Mr. and Mrs. Ochs were at home to their numerous friends at their beautiful place at St. Anne's Hill, Chertsey. Large numbers of guests assembled and enjoyed the delightful afternoon.

The cars employed on General Booth's tour were provided by Messrs. Bath and Sons. The dust coats, goggles, and other "Motorities" for General Booth's use have been supplied by Messrs. Alfred Dunhill, Limited.

As we go to press we learn by telegraph that Mr. J. Robertson, of Buenos Ayres, has just established a new record from John o' Groat's to Land's End on a 12-14-h.p. three-cylinder Argyll car, he having covered the distance in 42 hours 5 min., thus beating the previous record by 3 hours 20 min.

One of the surprises of the Bexhill meeting was the victory of the 10-h.p. Duryea in Class C. The vehicle, a three-wheeled one, and likewise three years old, not only made the best time in its class, but covered the kilometre at a rate of over 33 miles an hour, a speed not equalled by any of the higher-priced cars in Class D.

Mr. Wm. Glass, having joined the firm of Messrs. Ormiston and Glass, pen manufacturers, London, E.C., is giving up the Firefly Motor Company, which he has carried on for some time at Croydon. The business, together with the plant and stock, is as a consequence being offered for sale as a going concern.

Prince George Mourousy and Prince and Princess Paul Mourousy of Roumania have been motoring through the home counties of England, returning at frequent intervals to London, where they have been entertaining several distinguished guests. On Wednesday they left for Paris, but will return next month for a tour in the north.

The other afternoon Bexley Square, Salford, had an animated appearance, as a dozen motor-cars assembled to convey to Llandudno as a pleasure outing a party organised by Alderman Rudman and Mr. Newton, of the King's Street Garage, Salford. The party, which numbered about fifty, included the Mayor of Salford, the town clerk, the borough treasurer, and other officials, together with several councillors. The ex-Lord Mayor of Manchester was also one of the guests.

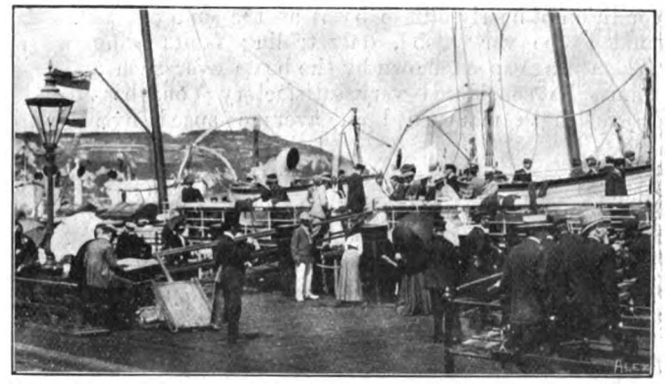
MOTOR-BOAT RACING.



MONDAY'S great international motor-boat race was a success in every way. Magnificent weather, a calm sea, universal good feeling and a fine race were factors that should leave only pleasant memories with those who were fortunate enough to follow the race from Calais to Dover, and also to enjoy participation in the international courtesies which followed at the generous instance of Sir William Crundall, the mayor of Dover.

Leaving Dover on the "Queen," a large party of English motorists set forth to Calais, where the quays and harbour presented a very effective sight. Thousands of spectators lined the former, and a score of little boats were manœuvring for position between a couple of mark boats off Calais pier head and the sands in front of the Casino. A goodly number of passengers were taken aboard, and interest was quickly centred in the start for the International Race organised by the Automobile Club of France for trophies presented by President Loubet and Count Recopè.

Mercedes IV., the Winner of the 8-12 metre Racer Section.

Spectators boarding the "Queen" at Dover.

The Clement-Bayard at Dover after the finish.

Mr. Beadle's Durendal at Dover.

Two minutes before a quarter to two o'clock the starting gun was fired and Henri Fournier's Hotchkiss made the most notable start, getting away in splendid style, but stopping within 500 yards of the pier owing to trouble with the sparking plugs. Interest was quickly transferred to the Mercedes IV., entered by M. A. Vedrine, and the Napier Minor with Mr. S. F. Edge at the wheel. These were leading, closely followed by Tréfle-à-Quatre, sailing for the first time with the British flag, Titan II., Le Nogentais, Marsouin II., Princess Elizabeth, Camelia, Admiral Bruix, and Triplex.

Originally the entries for the race numbered nearly forty, but only twenty-one got into position for the start at Calais, and all but one reached Dover, the official times being as follows:—

FISHING BOATS.

Maurice	3	13	5
Aurore	3	45	56

At first it appeared that Napier Minor would hold her own, but Mercedes IV. entered Dover Harbour two miles ahead of the English boat, thus winning the International award. The Belgian Princess Elisabeth, owned by M. A. Pirmez, was third. In the cruiser class M. A. Jean's Vas-y won the Sevres vase presented by President Loubet, while Count Recopè's cup for the first boat using paraffin for fuel was given to M. V. Caze's Marthe.

The race was followed with intense interest, and on one of the French destroyers following the boats was M. Pelletan, the French Minister of Marine, whose presence was a recognition of the important character of the event on behalf of the French Government.

THE MOTOR-BOAT RELIABILITY TRIALS.

LAST week we gave a summary of the report of the judges in the Reliability Trials for Motor-Boats organised by the A.C.G.B.I., together with a list of awards. The two features, says the full report of Major Lindsay Lloyd, Lieut. Mansfield-Cumming, and Captain R. T. Dixon, which have been considered the most important in making the awards have been :—Reliability, *i.e.*, non-stop runs and good general condition after the twenty hours, 100 marks out of 300 being given to each of these points; a smaller number of marks were awarded for speed, safety, and economy.

These are the first Trials of Reliability for motor-boats that have ever been organised, and as such have been a great success, the results proving more satisfactorily than could have been anticipated the complete reliability of the motor-boat. No less than fourteen boats out of sixteen starters completed the two days' run, the number of stoppages being comparatively few and unimportant; five boats made absolute non-stop runs on both days. The condition of nearly all the boats at the end of the trial was found to be very good, only trifling faults being noticeable. The average speed shown by the boats over such a long period must be considered very satisfactory; one boat of only 35ft. in length maintained an average speed over the whole twenty hours of nearly 14 knots, a performance that could probably not be equalled by any steam launch of her size under similar conditions. With regard to the comparative safety of boats fitted with internal combustion engines, it would appear that a large number of makers of the petrol engine do not seem to have sufficiently considered the details necessary for the perfectly safe use of this fuel. Although it would not appear to be difficult to protect the pipes and the fittings of the tanks from injury, and the consequent evil effects of leakage, yet except in one or two cases this has been overlooked. This may possibly be due to the apparent haste with which many of the boats had been finished, and it it hoped that in future trials sufficient time will be given from the announcement of the holding of the trials to the actual date of them for the manufacturers to equip their boats, not merely with the simple propelling machinery, but also with well thought out and finished arrangements for making the same perfectly safe and convenient as well as reliable. We would suggest, therefore, that marks should be given for these points.

With regard to future trials it appears that the general lines of the recent tests are very satisfactory, but we would suggest that the following points receive the consideration of the Committee with a view to marks being awarded if possible :—(1) Exhaust cooling and silencing. (2) Seaworthiness. (3) Ease of control and handling. (4) Wash (for river boats). (5) Arrangement and design. (6) Discontinuance of the use of aluminium for boats for sea work.

SOME USEFUL NOTES.

SOME motorists test the spark of a motor by removing the high-tension wire from the plug and holding it near the frame when contact is made. This method is all right so long as the wire is held quite close (about 5-16 in.) to the frame. If the wire is held some distance away a large spark may certainly be produced, but the coil may be injured, as the insulation can easily be broken down in this way.

◆ ◆ ◆

MESSRS. GROUVELLE AND ARQUEMBOURG, the makers of the well known G.A. radiators, have lately given their opinion as to the best method of cleaning out these devices. They write:—"In reality it is very rare that any incrustation forms in the pipes of radiators, as incrustation only takes place when the water is at boiling point, which ought not to take place in a radiator. When it does, it is an indication that the radiator is not large enough. The same remark does not, however, apply to the water-jackets of the motor, where the water often reaches a very high temperature. In cases where incrustation does happen to form in radiators, a small quantity of hydrochloric acid should be added to the water, and this caused to circulate for a time, making sure afterwards to thoroughly remove all traces of the acidulated water." Messrs. Grouvelle and Arquembourg point out that while incrustations are rare, deposits are frequently formed on the internal walls of the pipes, due to impurities in the water. These can, however, be removed by sudden injections of water by means of a pump.

◆ ◆ ◆

MANY motorists have been troubled by the refusal of chains to stretch equally on each side, an annoying state of affairs that is made worse by any attempt at adjustment that throws the countershaft and back axle out of parallelism with each other. It will generally be found that the right-hand chain stretches most, and some light on the subject may be given by the somewhat similar behaviour of springs. It has been our experience, corroborated by that of other drivers, that springs more frequently break on the right side than the left, and a simple and probable explanation offers itself: the real *fons et origo mali* is the hay-motor! The centre of a road is usually in a much worse state than the sides, owing to the destructive effect of horses' hoofs, and the rule of the road causes us to drive habitually somewhat towards the left; thus the right-hand chain is apt to get more dust and dirt thrown on it, while, owing to the greater roughness of the surface on that side, it is doing more work in pulling its wheel; the differential, though equalising the total effort, not compensating for the jolts and sudden strains. Moreover, when going over stones, the right wheels get the worst of it as a rule. Tyres also give some confirmatory evidence of this view, which, if correct, should hold good in the opposite sense on the Continent, where the rule of the road is reversed. Perhaps some who have had Continental experience could throw additional light on the matter.

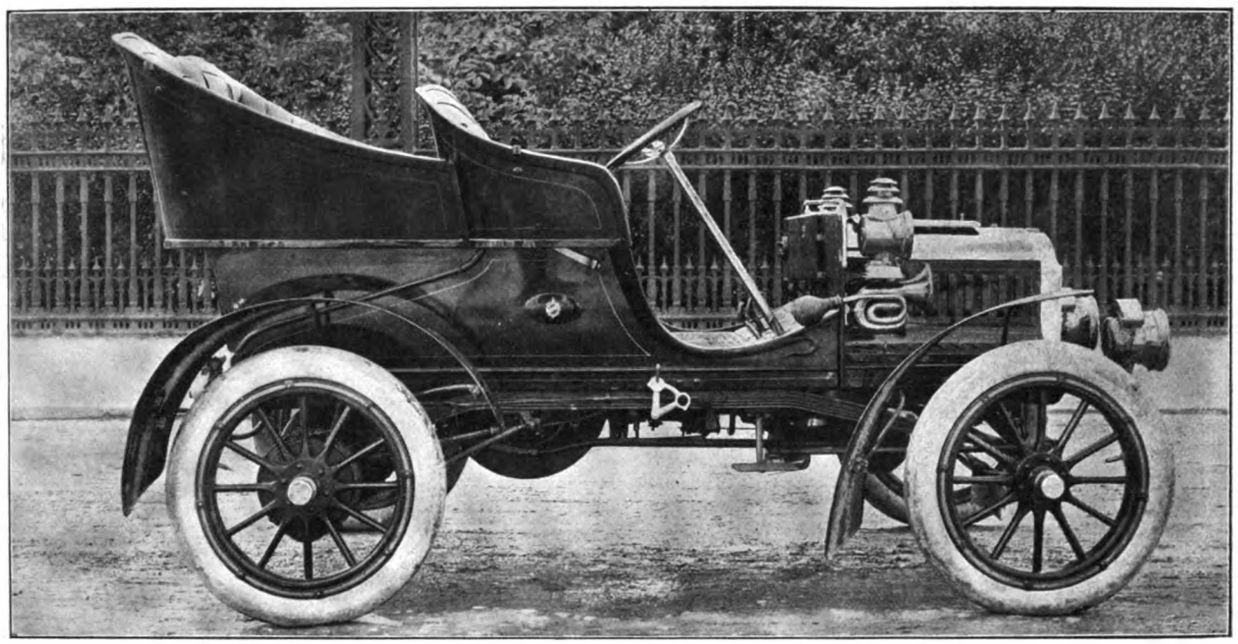
THE OLDSMOBILE TONNEAU.

MESSRS. JARROTT AND LETTS, Limited, are now placing before British motorists a new Oldsmobile of greater power and larger capacity than the little runabout which they have popularised on this side of the Atlantic. They will, of course, continue to market the familiar 6-h.p. vehicle, but in the new model they have a vehicle more fitted for touring purposes, although characterised by a similar economy in price.

The new Oldsmobile has a tonneau body, as shown in the accompanying illustration, the motor being of 9-h.p. and horizontally located, the cylinder being 5½ in. bore by 6 in. stroke.

An extra heavy crank shaft is used, which has three wide main bearings, these with the worm gear being lubricated by the splash system from the crank case. The cylinder, water jacket and cylinder head are cast in one piece, and the valves are mechanically operated. The motor is set with the cylinder head at the forward end of the machine, under the footboard, so that the working stroke of the piston drives down upon the crank shaft instead of up. In this way the wear upon the cylinder walls caused by the weight of the piston is prevented. The fixed half of the main bearings is set at an angle of forty-five degrees, thereby taking both the chain pull and the motor thrust upon a solid bearing, eliminating any chance of breaking stud bolts. When necessary the cylinder can be removed from the crank case without disturbing any other part of the motor or the crank shaft; flywheel and transmission gears can also be lifted off without disturbing the rest of the motor.



The transmission, of a new type, runs direct on high speed, with friction clutch having metal to metal faces. Two speeds and a reverse are provided. Wide bronze bushed wearing surfaces are a feature of the gears, which are oil encased.

The angle steel frame upon which the motor is hung completely supports the body, and as the body is separate at the dashboard it can easily be removed by the loosening of the four bolts for the inspection of the motor. The bonnet, dashboard, brake levers and steering post all remain attached to the frame. The brakes act upon the hub of the wheels and differential, so that the machine can be stopped on any grade, even if there has been an accident to the chain, rear sprocket, differential, or to one wheel.

The steering apparatus is of the worm gear type, the steering post tilting back and forward at the axis of the gear, enabling the wheel to be adjusted to the comfort of each individual driver. The spark and throttle levers are located on the steering wheel convenient to the driver's hand. High and low speed are obtained by a controlling lever at the seat, and reverse and brakes are operated by foot levers. The carburettor is of the simple Olds design, the throttle control being by lever on the top of the steering wheel. The tool equipment comprises everything necessary. The finish is an automobile green with black trimmings.

High-tension ignition system is fitted. The induction coil and switch are placed on the dashboard, and the commutator on the cam shaft. The bonnet is of sheet metal, with brass trimmings, at the front being a honeycomb radiator, and inside are the water and petrol tanks, each of five gallons capacity, and the batteries.

The well-known Oldsmobile side springs have been provided, so that the passengers do not find inconvenience from road inequalities. Artillery wood wheels, with pressed steel rims and 3½ in. pneumatic tyres, are fitted. Among other features of interest is a safety device for preventing back fires, the sector when moved back to allow the entrance of the starting handle opening the relief and shifting the sparking lever back to late position.

General View of the Oldsmobile 9-h.p. Tonneau.

In the design of the body due regard to the convenience of the passengers has been paid. The front seats are divided, and the tonneau is very roomy, while the seats are arranged to give an unobstructed view of the road ahead. The tonneau is removable, and the rear portion of the frame can then be utilised for luggage, etc. The new vehicle, which has a wheel base of 7 feet 10 inches, is to be placed upon the market at a figure which should command the notice of the Man of Moderate Means who seeks good appearance and reliability as well as economy in his automobile.

MESSRS. SYDNEY LEE AND COMPANY, LIMITED, the old-established firm of trade auctioneers, advise us that H.M. Government have acquired their salerooms at Furnival Street, Holborn, E.C., where they have sold for nearly two decades past, and they will remove from their premises during the ensuing fortnight. The final sales at their rooms will be held on Thursdays the 18th and 25th inst., when a large stock will be sold without reserve. The address of their new salerooms will be shortly announced.

CONTINENTAL NOTES.

Another Public Service in France.

A public service of motor-cars was inaugurated last week between Trouville and Villers. Nine journeys per day are made in each direction.

◆ ◆ ◆

The Gordon Bennett Race.

It is well known that the Gordon Bennett race proved very costly to the German Automobile Club, but it was hardly expected that the accounts would show a loss of £7,250. The guarantors of the expenses fund have been called upon to pay 80 per cent. of the amount for which they undertook to be responsible.

◆ ◆ ◆

A Motor-Cycle Relay Ride in Germany.

The German Motor-Cyclists' Union has decided to organise a motor-cycle relay ride in September next from Stuttgart to Kiel, *via* Heidelberg, Frankfort-am-Main, Marburg, Bielefeld, Hanover and Hamburg, a distance of 530 miles. The course will be divided into eight sections of about 66 miles each.

◆ ◆ ◆

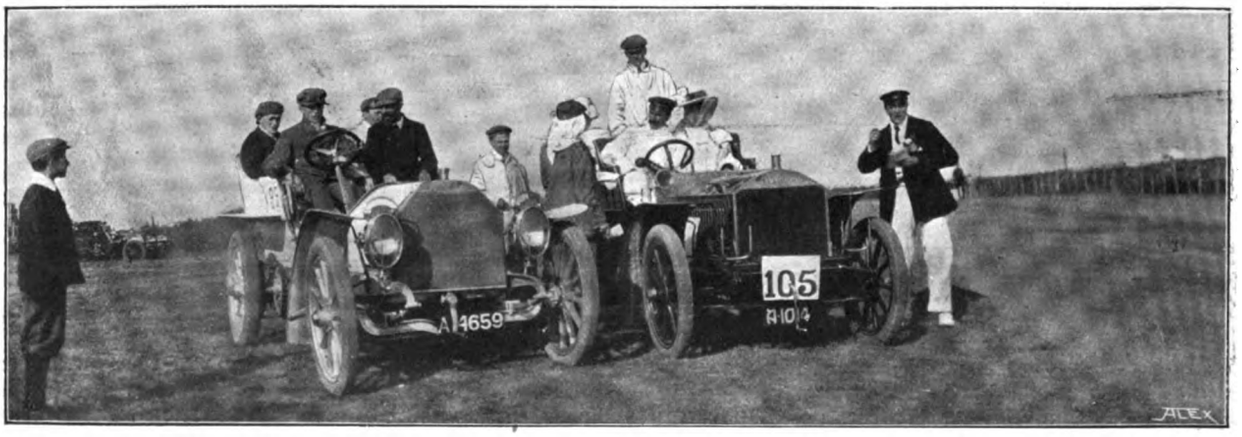
Motor-Cars in Military Manœuvres.

At the forthcoming Austro-Hungarian military manœuvres motor-cycles and cars will form a prominent feature. Some thirty members of the Austrian Automobile Club and Motor Cycle Union who volunteered for service have already been drafted into various corps. The military authorities intend to thoroughly investigate the suitability or otherwise of motor-vehicles for military service.

◆ ◆ ◆

Public Services in Switzerland.

Quite a number of new public services are projected in Switzerland. It is intended to start a service of electric motor-'buses between Interlaken and Wilderswil, in the canton of Berne. The establishment of a service between Yverdon-Sottons-Moudon, canton of Vaud, is also contemplated. A regular service is to be inaugurated between Frauenfeld and Steckborn, in the canton of Thurgau. It is also proposed to increase the number of motor-'buses running on the recently opened lines Muenchwilen-Fischingen and Muenchwilen-Turbenthal, in the same canton.



◆ ◆ ◆

Laying the Dust.

A new system of road tarring, said to possess superior merits both as regards efficiency and economy, has recently been brought to public attention in France. It is due to M. Girardeau, county surveyor of Fontenay-le-Comte (Vendee). With this system, it is claimed, the tar penetrates into the road-bed, thus increasing the life of the tarred coating. The amount of tar used is one kilog. per square metre, or nearly 2 lbs. per square yard.

Mr. J. H. Dew's 24-h.p. Bollee v. Mr. J. Miller's 24-h.p. Fiat.

Mr. A. L. Guinness' 60-h.p. Mercedes v. Mr. S. F. Edge's 20-h.p. Napier.

Photos by] THE BEXHILL MEETING. [*Mr. Frederic Coleman.*

A German Automobile Congress.

As has already been announced, an automobile congress is to be held at Breslau from the 18th to the 20th inst. Among the papers to be read are one, "The Technical Development of the Automobile," by Herr Max R. Zechlin, one on "Overcoming the Dust Nuisance," by Her Leo van Westrum, the inventor of Westrumite, and one on "What the 1904 Gordon Bennett Race Taught us with regard to Road and Track Races."

◆ ◆ ◆

The Dauphine Automobile Week.

The Dauphine automobile week was brought to an end on Sunday last. The programme included a 530 kilometre touring competition, in which the highest number of marks was secured by M. Cormier, on a De Dion. In a 500 metre speed trial with a standing start and a stopping finish, the best time, 40 secs., was made by M. Vitalis, on a 35-h.p. Rochet-Schneider.

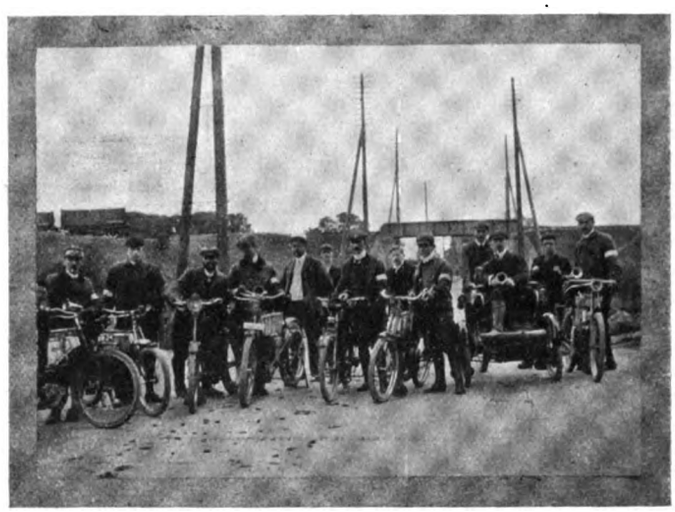
MOTOR CYCLING NEWS.

THE most important of the competitions of the Motor-Cycle Union of Ireland took place last week, when the 200 miles Reliability Trial from Dublin to Waterford and back for the prizes presented to the Union by the proprietors of the "Irish Cyclist and Motor News" was decided. The contest took the form of a team race confined to teams of four riders, each of whom was mounted on the same make of machine. The pace was limited to twenty miles an hour, with a minimum of fifteen, and for each minute gained on the minimum, or lost on the maximum time, one mark was deducted. For further stoppages on the road no penalties were enforced, but the competitors were required to execute whatever repairs or adjustments might be necessary with implements carried on their machines, and without outside assistance save from those in their own team. Four teams took part in the competition, two of them being mounted on Triumph bicycles and two on F.N. machines. One of the latter teams was not able to get the full number of four starters, and consequently the competitors numbered fifteen. It speaks eloquently for the reliability of the modern motor-bicycle that of the fifteen competitors eight completed the journey within the limits of time fixed by the committee and received full marks. The most successful team was the Triumph No. 2, the full number of riders completing the run. Two of the Triumph No. 1 team had trouble in the earlier stages of the competition and retired at Carlow, fifty-one miles from the start. The No. 2 F.N. team also had trouble in the earlier stages of the journey, and of the No. 1 team, two of the riders retired about half-way on finding the roads very wet. The performances taken all round are remarkable in many ways, particularly when it is taken into account that for about two-thirds of the journey the roads were wet and rain fell unremittingly during the day. The result was as follows:—

Triumph Team, No. 2:—
A. Summers, 100 marks.
L. Summers, 100 marks.
G. Mayne, 100 marks.
J. G. Drury, 100 marks.

F. N. Team, No. 1:—
C. B. Franklin, 100 marks.
R. F. Franklin, 100 marks.
T. R. Turpin, retired.
W. B. Martin, retired.

Triumph Team, No. 1:—
R. M. Talbot, 100 marks.
T. W. Murphy, 100 marks.
R. W. Stevens, retired.
F. A. Wallen, retired.



◆ ◆ ◆

WE have received some additional particulars of the Land's End—John o' Groat's record made by Mr. H. Williamson on a 3½-h.p. Rex motor-bicycle, to which a brief reference was made in the last issue of the *Journal*. The rider started from Land's End at daybreak, 4.15, on the 28th ult. It had been raining incessantly for a week in the West of England, making the roads in a very heavy and greasy state. Consequently the speed to Worcester, which should have been the fastest of the whole journey, was much below what was expected, and night fell between Warrington and Wigan, in which latter town a heavy fog made it somewhat difficult riding. Trouble was also experienced at the latter town with lamps. Afterwards, getting clear of Wigan, fast time was made through Preston nearly to Lancaster, when a puncture prevented that town being left till midnight. The next trouble experienced was a puncture, or rather two punctures together, on the famous "Shap." In repairing these considerable delay occurred owing to the darkness, and the brow of the Shap was not passed until day was breaking. From here through Carlisle, Lockerbie, Lanark, Stirling, to Perth very good progress was made. After leaving Perth for Inverness through the Grampian Hills, whose roads are celebrated for being the worst in the whole route, and which, owing to dry weather, were, if possible, in a worse condition than ever, a good average was kept up, and, excluding the time taken for a puncture just above Kingussie, the 115 miles was covered in about four hours and three-quarters.

◆ ◆ ◆

AT Inverness considerable delay was caused through two more punctures. After crossing Cossack Ferry, and trusting on a fast road from there to Tain to pick up the time lost, Mr. Williamson was again delayed by punctures, and after crossing Mickle Ferry, by which time night had set in, he experienced difficulty with his lamp and finally rode without a light. From this point to Berriedale the roads were in a very loose condition, patches of stone being met every 200 or 300 yards over most of the distance, and consequently progress was very slow. However, despite these troubles, he reached the top of Berriedale brae by daybreak of Saturday, and covered the last forty odd miles to John o' Groat's in one hour and twenty minutes, arriving at 4.51 a.m. on Saturday, the 30th ult. Throughout the whole of the journey, except for punctures and lamps, he experienced no trouble whatever. Stops for refreshment and replenishing for oil and petrol were made at Exeter, Worcester, Wigan, Carlisle, Perth, and Inverness.

◆ ◆ ◆

The Motor Cycling Club's Selection Trial for the Team for the Brown Trophy Competition.
Photo by [*E. W. Ashworth.*

◆ ◆ ◆

ON Saturday last the Motor-Cycling Club held a competition to select a team of riders to take part in the inter-club contest at Oxford on the 27th inst. The trial consisted of a fifty miles non-stop run from Redbourne to a point twenty-five miles along the Coventry road, and return. Eight members started off at 3.45, viz., Messrs. Arnott (Princeps), Hulbert (Hulbert-Bramley), Crundall (Humber), Densham (Anglian), Reeves (R. and P.), Sale (Quadrant), Maffert (Bat), and Wells (F.N.) Out of this number Crundall was the only one who did not complete the run, his failure being due to the breaking of a coil trembler spring. The remaining seven members had afterwards to compete in a series of starting and stopping tests. The course measured off was just a mile out and home, and seven stopping places were comprised in the distance. The best times for the mile were:—Densham, 3 min. 14 2-5 secs.; Reeves, 3 min. 31 3-5 secs.; Maffert, 3 min. 38 secs.; so that, in all probability, these three will figure in the team.

THE directors of the Great Northern Railway Company (Ireland) have satisfied themselves that for short distances, such as between Belfast and Lisburn, or Dublin and Howth, or the Ardee Branch, economy could be gained by the use of motor-cars for passengers and perhaps greater frequency of service. They are now, as a trial, taking tenders for four steam cars.

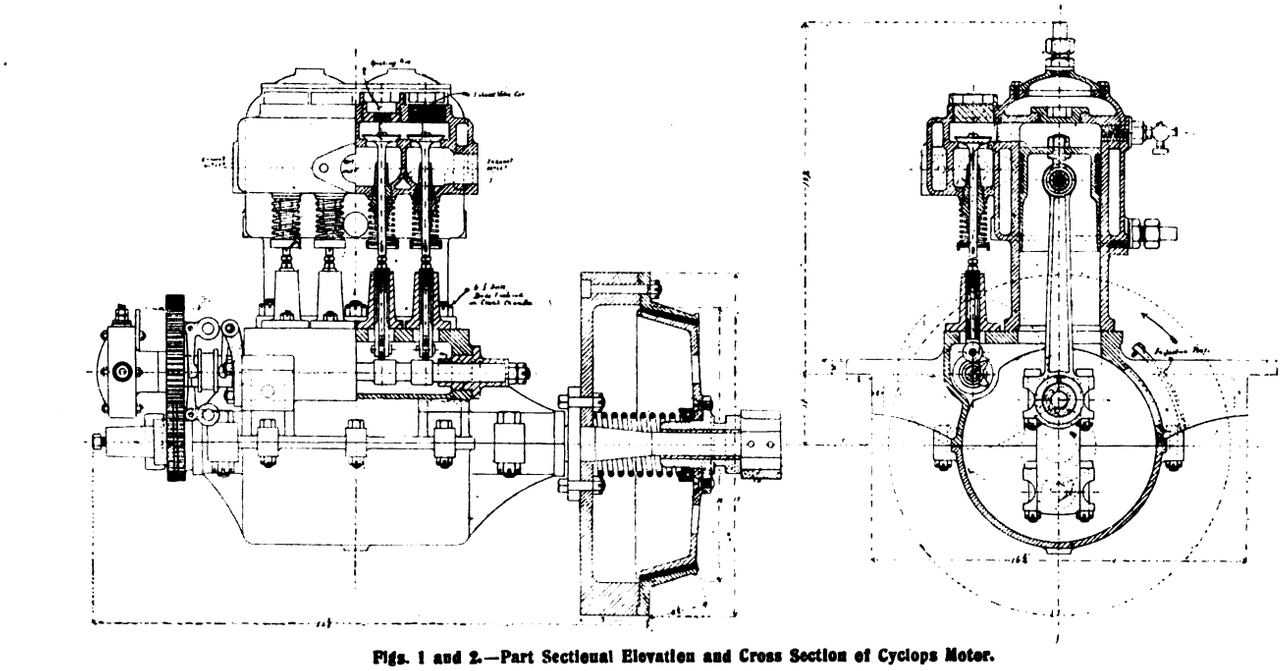
ACCESSIBILITY.



ACCESSIBILITY of parts, and especially of parts subjected to wear, is one of the most essential features of any motor or motor-car. In the earlier automobiles probably no feature of value was more neglected than this. The inventor began with his motor, placing it on the frame, and then piling the accessories and other parts around it wherever room could be found. The result was that, as a rule, whenever something on the engine broke or needed readjustment, practically the whole vehicle had to be pulled to pieces to get at the parts affected and repairs on the road were almost out of the question. The earlier workers naturally did not take the broad view of the whole combination of a vehicle like present designers, who have many models to serve as their guides. Probably, also, they failed to appreciate the importance of accessibility, which, although it might have been forecasted by a theoretical consideration of the nature of the machinery employed and the conditions under which it works, has only been fully established by road experience with actual machines.

In a petrol vehicle that which requires most frequent attention is the motor, or, to come down to narrower limits, the valves and ignition mechanism of the motor. The motor should therefore be so designed that all the parts constituting the valve and ignition mechanism can be easily withdrawn and without disturbing any of the other parts. This requirement has received full consideration in the design of many of the better petrol motors of to-day, and we now have examples which are probably not far from perfection in this respect. However, it is not sufficient that the parts of a motor be easily dismounted when the latter is placed on the shop bench or on a testing stand. The motor must be so placed in the vehicle that these same parts are readily accessible when it is in position. This requirement demands the exercise of no little ingenuity on the part of the designer when determining the general arrangement of parts and when designing the body. It is certainly objectionable to be compelled to get below the vehicle to reach certain parts.

A ready accessibility of parts not only aids in quickly repairing a fault; it also facilitates locating it. Locating the defective part and removing it from the machine usually consume the greater amount of time lost on the road, and a reduction in the time lost through such delays greatly increases the practicability of automobiles. The whole problem we are here dealing with may be summarised as follows:—The various operating parts of a vehicle must be so assembled that they can easily be taken off when required. The parts must be compared with each other as regards rapidity of wear and liability to damage, and those most affected must be placed in the most accessible positions. The mechanism must be divided into groups which are as nearly as possible independent of each other.

THE "CYCLOPS" PETROL MOTOR.

WE herewith give two sectional views of a new two cylinder petrol motor which has lately been introduced by the Cyclops Motor Works, of Staniforth Street, Birmingham. The engine, which develops 8-h.p. at a speed of 900 revs. per min., comprises two cylinders 3½-in. bore by 4-in. stroke. The cylinders, with their heads and water-jackets, are made in one casting, so that there are no water joints to give trouble. The inlet and exhaust valves are both mechanically operated off one cam shaft, which can be detached endwise by simply taking off two nuts. The valves, valve-lifters and guides are all interchangeable. A feature of the pistons, which are each provided with four rings, is, that they are turned both inside and out, so that they retain their rotundity, and consequently maintain a uniform compression. The gudgeon pin, it will be noticed, is supported from the top of the piston. The crank chamber is of aluminium, with large removable door to allow the big end of the connecting rod to be inspected. The engine is arranged for the usual electrical ignition, with wipe contact located in front. The flywheel is made to act as part of a clutch of the internal type. Great care appears to have been taken in the design of the motor, very ample bearings being provided. We understand that the Cyclops firm are also engaged on the construction of a four cylinder engine on similar lines.

Figs. 1 and 2.—Part Sectional Elevation and Cross Section of Cyclops Motor.

A COMMITTEE of the Automobile Club of Havana, Cuba, recently waited upon President Palma, requesting his support of a movement to hold automobile races in the Cuban capital during the early autumn.

AN immense album, containing pictures of all the members of the Chicago Automobile Club in their cars, is being made by the official photographer of the club for the reading room of the club-house. In addition to the name of the persons, the make and horsepower of the car will be given, together with other data of interest.

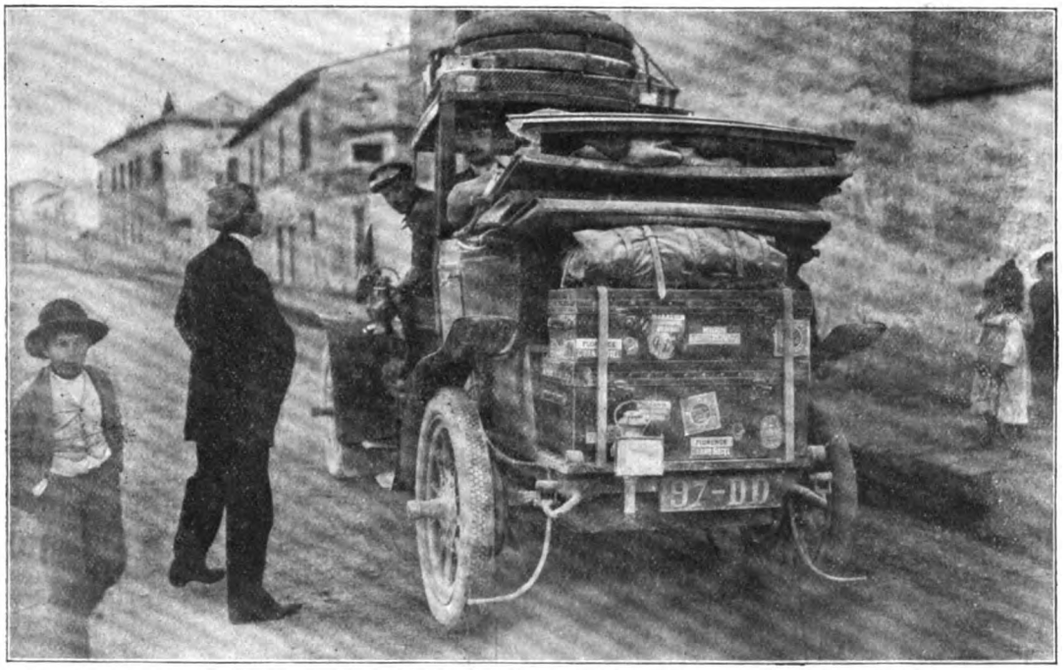
TOURING BY MOTOR-CAR.

TO derive the maximum of pleasure from a motor tour, it is essential that no serious trouble be experienced with the car. Nothing is more vexatious, when touring by automobile, than to be subjected to long delays on account of repairs. Some day there will be a repairing establishment at every cross-road, or, perhaps, there will be automobiles that never break down. At present, these are things which must be done without, wherefore every man who takes a long tour or a short one commits an inexcusable folly, and earns any misfortune that may befall him, if he fails to include in his touring equipment a number of spare parts and a full complement of tools.



Many a motorist has seriously injured his car, and perhaps walked miles, because he lacked a few steel balls or rollers, to replace broken ones in the wheel bearings, or a spare inner tube for the tyres, or a reserve sparking plug, or a spanner to open the carburettor, or enough oil, or a little emery to grind a valve seat or a needle valve, or any other of a wide range of articles that in the aggregate might weigh fifteen or twenty pounds at most. Such a motorist deserves to have trouble. He is like a horseman who would take out his steed with a loose shoe, an engineer who would start on his run without fuel and water, or a ship captain who would venture on the high seas without chart and compass.

No motor-vehicle, however well made and designed, will run surely and indefinitely upon mere pulling of levers. It must be cared for—groomed, provided with fuel and lubricant, electric current, and new parts when necessary; adjustments and inspections must be made from time to time, and every precaution exercised to avoid misusing it. On the highroad, inconveniently far from expert aid, a motorist is wholly dependent upon the knowledge and materials he has at hand. He need not be an engineering expert, but if not, he should have a well-indexed book or at least a pamphlet of directions to inform him in an emergency. He need not make of his car a travelling machine shop, but he certainly should carry a few tools and spare parts. Different cars require different equipments. As a general rule, two classes of parts, supplies and tools should be carried—those most likely to be needed, and those likely to be most difficult to obtain.

In the first class are such things as the different parts of bearings, spare inner tube and outer cover for tyres, sparking plugs, springs for inlet and exhaust valves, extra chain links, spare accumulator, files, wrenches, spanners, screwdrivers, punches, a cold chisel, a hammer, a small vice, wire nippers, and tyre repair outfit. In the second class would fall extra bolts and nuts, a hand drill stock, plenty of fuel and lubricant, calcium carbide for acetylene lamps, a small soldering kit, etc.

It takes considerable thinking and not a little planning to make one's first tour a success—to keep up satisfactory progress and get a rational enjoyment out of the new experience. Then in all probability, especially if one has a genuine liking for that sort of thing, the whole problem seems simpler and easier than at first thought possible. Bad weather or poor roads, or both, accidents and the like, may temporarily cloud this view, but in the end it is sure to prevail. Advance schedules have a certain value to the entirely unacquainted motorist, since they often help him to decide between different routes for the same district, give him an idea of the roads and nature of the accommodation along the way. Long descriptions may be read before one starts out and possibly taken along on the car; but it is safe to say that not once in a hundred times are they referred to in the tour.

The most in smallest compass is undoubtedly furnished by a convenient size and accurate scale map of the district to be covered. One in need of essential information should find, if possible, someone who has gone over the same route in a motor-car, which is the best possible way of solving the matter. The average native is to be depended upon only for strictly local directions; not always for that; prove what he tells you by another if opportunity affords, nor be surprised if both are proven wrong by subsequent developments. Ask the hotel keeper or the householder rather than the man found walking along the highway. When the tourist comes to know any district thoroughly through experience, the opportunities for the makeup schedules suited to his times and convenience, as well as to the speed and power capabilities of his car, will develop far ahead of the possibilities for using them. Fortified in this way, if the ready motorist happen to find himself at almost any point, with much or little time to spend touring, he can, remarks the New York "Motor," make his plans in short order with confidence in his ability to carry them out. As one's mastery of the subject advances, too, the difficulties in the way relatively diminish. He can put in many a day advantageously which another would very likely waste.

Touring on the Continent.—A well-equipped Car.

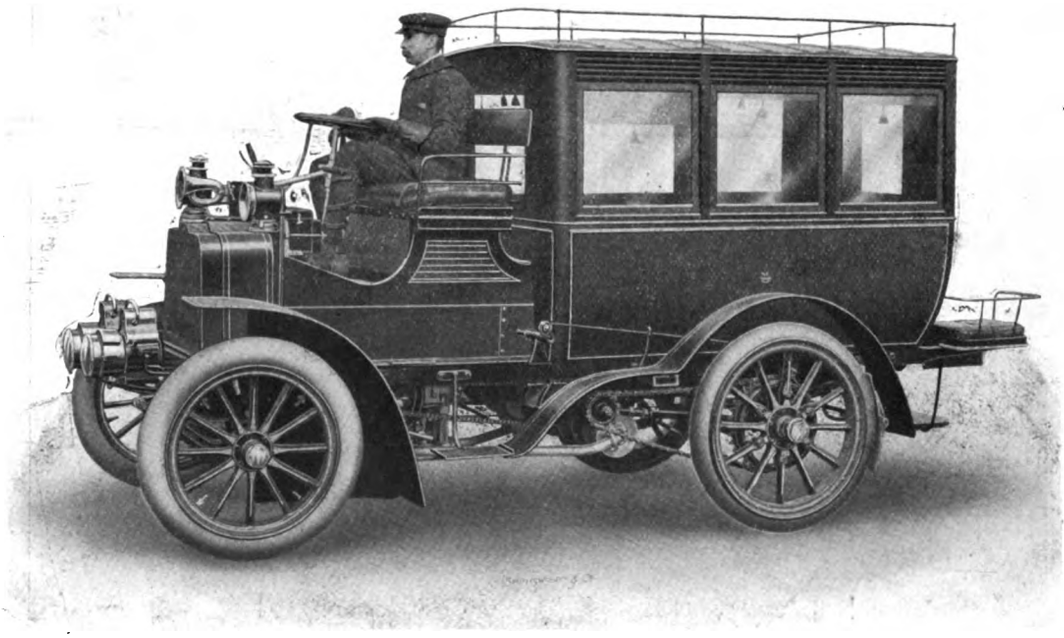
MOTOR COOLING PROBLEMS.



RECENT competitive events have shown that in many cars the water cooling system is one of the most vulnerable parts, and the experience of private users has largely confirmed this point. In most cases the trouble experienced is not inherent in the system, but is due to irrational arrangement of the parts, or to faulty construction. The general practice of leading the water into the jacket at the lowest point and leading it out at the highest is undoubtedly based upon the fact that this course of the water assists circulation, for water has a natural tendency to rise as it becomes heated. On the other hand, in a vertical engine with such a course of the water the cooling effect is greatest where least needed—that is, at the lower end of the cylinder—and least where most needed, viz., around the valves and cylinder heads. With positive pump circulation it would be possible to force the water downward through the cylinder jackets, but the danger of steam pockets forming would thereby be increased. If the pump was not absolutely positive and liable to cease working at low engine speeds, it would, of course, be inadvisable to attempt to force the water downward through the jacket, as with the counterforce, due to the heat imparted to the water in the jacket, the pump would simply cease operating so much sooner.

The most serious ill effect of forcing the cooling water from the coolest to the hottest end of the jacket is a loss of thermal efficiency. For highest efficiency the temperature of the entire cylinder should be just below the point where the heat interferes with lubrication, and it is obvious that if the temperature of the upper end of the cylinder is not too high for this, the temperature of the lower end must be much below the most advantageous point. The many objections to circulating the water through the jacket from top to bottom have been partly overcome in some cases by jacketing only the upper part of the cylinders.

The usual practice in designing the radiators required has been to make the radiating surface proportional to the horse-power of the motor. While this rule may, considers the "Horseless Age," give fairly satisfactory results, it is obviously not scientifically correct, because the heat absorbed by the jacket water increases as the surface of the cylinder, or as the square of its linear dimensions, while the power increases as the third power of the linear dimensions. Consequently a motor of double the horse power of another (and the same number of cylinders) does not require twice the length of radiating coil, a very fortunate condition, as otherwise the cooling of the large, powerful motors now coming into use would involve considerable difficulties.

THE WOLSELEY PRIVATE OMNIBUS.

WE illustrate herewith one of the latest productions of the Wolseley Tool and Motor-Car Company, Limited—a 24-h.p. private omnibus with seating accommodation for twelve passengers. As will be seen, in this car the standard Wolseley lines have been largely departed from. The driver's seat is placed well forward, and allows of a roomy body being fitted. The car is hung fairly low in order to secure stability when travelling fast. Two seats are arranged at the back to carry footmen; these are so arranged that they may be detached when not in use. The roof is made strong enough to carry passengers' luggage, while the 'bus top is made detachable, allowing the vehicle to be converted into an open wagonette for summer use. The front wheels are shod with pneumatic and the rear wheels are fitted with Sirdar solid tyres. The motive power is supplied by a four-cylinder horizontal engine having cylinders 4½ in. diameter by 5 in. stroke, and running at a normal speed of 800 revs. per min. The ignition is by coil and accumulators, while the water-cooling is maintained by a slow-running rotary pump and a honeycomb radiator, the latter being a new departure for the Wolseley Company. Half-compression cams and exhaust valve lifters are provided to ease the compression when starting the motor. The ignition can be advanced and retarded from the steering pillar, and in addition the speed of the engine can be regulated by means of a throttle on the admission pipe. An auxiliary throttle is also fitted in conjunction with the brake pedal, so that as the brake is applied the supply of gas to the motor is further cut down. The transmission is on the usual Wolseley system, that is, by Renold silent chain from engine shaft to gear box, and by side roller chains from sprockets on the differential shaft to the driving wheels of the car. Four speeds forward and a reverse are provided. The vehicle has a wheel base of 7 ft. 6 in. and an overall width of 5 ft. 3 in.; the weight of the *chassis* is 20 cwt., while that of the complete car is approximately 26 cwt.

The Wolseley 24-h.p. Private Omnibus.

HERE AND THERE.

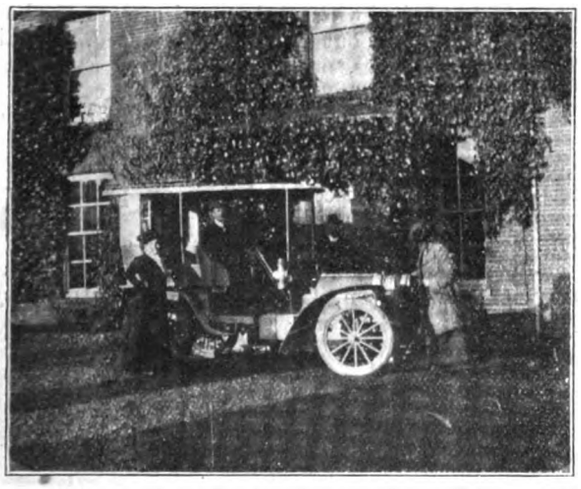
FAULTY carburation is the motor's indigestion.

AN automobile club is in course of formation at Warsaw, Poland.

THE Grand Duke of Saxe-Weimar has ordered a 35-40-h.p. Benz-Parsifal car.

THE German Automobile Club proposes to organise another motor-boat race in the autumn.

THE United Motor Industries, Limited, have just issued a new edition of their catalogue of motor parts and accessories. A number of additional articles are included in the list, a copy of which can be obtained on application.

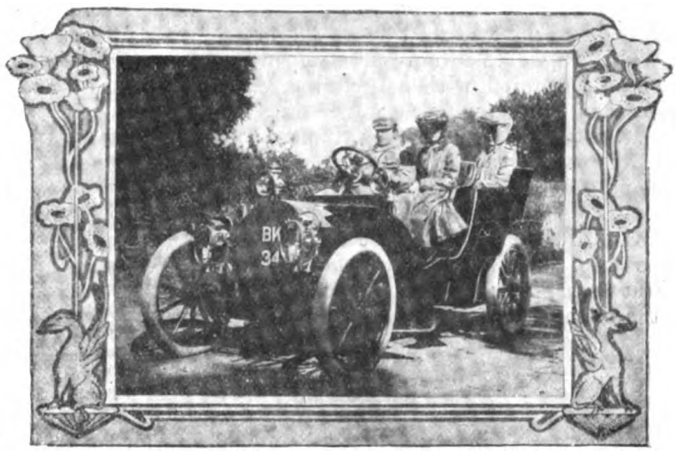


THE Caledonion Motor-Car Company, Limited, have secured on a 10 years' lease the large and central premises lately occupied by Campbell's, Limited, carriage work department, in Bon-Accord Street, Aberdeen, which they will occupy in October.

AT the Motor-car Exhibition held at Oxford in connection with the meeting of the British Medical Association, the Mayor, Dr. E. A. Bevers, took very great interest in the exhibits, and before leaving accepted a set of the Wilton-Cox puncture-resisting device for the tyres of his car.

THE police commissioners of St. Louis, U.S.A., have authorized the purchase of two high-speed motor-cars, which will be stationed in the Forest Park section for use in causing the arrest of violators of the motor traffic regulations. An experienced driver and a policeman will be in each vehicle, which will be provided with a speedometer.

THERE is such a thing as too much tinkering. If you have a mechanician who is inclined toward mechanical ingenuity, it is well sometimes to restrain him. Keeping a car in good condition does not mean trying to improve upon the work of the car manufacturer. The latter did the best he knew, and very likely he had years of experience to guide him.



THE Britannia Motor Garage Company, Limited, has been registered with a capital of £20,010 in shares of £1 each, and 200 founders' shares of 1s. each, to carry on the business of keepers of motor-garages and show or sale rooms, manufacturers and vendors of motor-cars and vehicles, etc., and to adopt an agreement with Messrs. J. H. Adams and T. Underwood. There will be no initial public issue.

A 16-h.p. Argyll at Whitwell Vicarage. The Car is fitted with a special body known as the "Stradbrook," made by Messrs. Botwood and Egerton.

AN excellent preparation is found in the See fluid for vulcanizing patches on inner tubes and covers of motor tyres. The fluid exempts the patch from liability to leakage, and is not affected by heat or wet, while it has the further advantage of being easily applied, and is quite inexpensive. The fluid is handled in this country by the Otto-Bennett Motor Company, of 8, Snow Hill, London, E.C.

IN his report on the trade of Central Italy for 1903 the British Consul states that if a larger number of commercial travellers extended their visit to Central Italy British manufacturers would benefit by substantial orders. He adds that the number of motor-cars in Rome is increasing, and considers that a good local agency for the sale of British motor fittings, tyres, etc., would do a remunerative business.

Mr. and Mrs. J. Buckwood, of Southsea, on their 18-28-h.p. Mercedes Car.

A PUBLIC service has lately been started by the Central Motor Touring Company between Blackpool and Garstang, a distance of sixteen miles. The vehicle, a 12-h.p. Milnes Daimler twenty-seated wagonette, makes two journeys a day in each direction. A number of interesting villages are passed through, and while passengers taking return tickets from either terminus are given preference, a scale of intermediate fares has been arranged.

ON Thursday last Mr. Williams, of the firm of Messrs. Deasy and Company, Limited, started from London on a Martini car, with the object of making a tour over practically the whole of the United Kingdom. The tour is for business purposes only, there being no idea of record breaking, the object being to demonstrate in every large centre the capabilities of the Martini, not only as a hill-climber, but in every other department of automobile excellence.

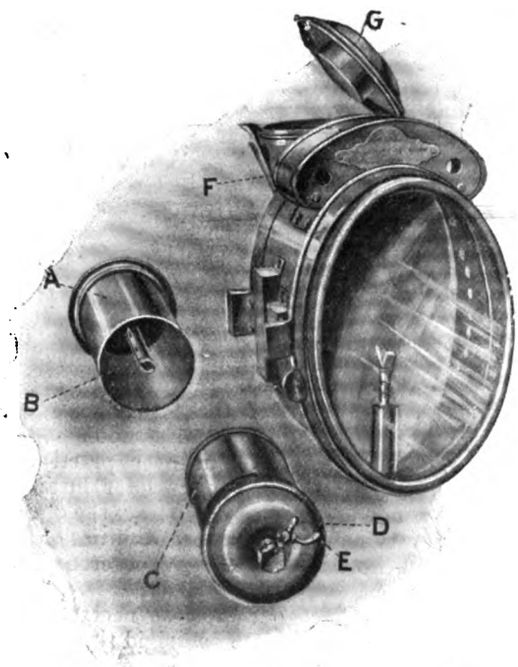
To drive a motor-car in Chicago it will be necessary in future to pass an examination so elaborate and rigid that it has been denounced as "absurd" and "ridiculous" by motorists of that city. The new regulation establishes a board of registry, and requires that every driver shall be registered, for which a fee of 12s. 6d. is charged annually. Intoxicated and reckless persons are prohibited from being registered. Persons having defective eyes who have the defects remedied by glasses "shall have the glasses securely fastened to the nose by a steel frame." The board of registry are charged with ascertaining that all applicants are physically and otherwise capable of operating a motor-car before they are registered.

MR. H. TAYLOR sends us particulars of a tour he has lately made on his 10-h.p. Decauville. "Starting from Ealing, I struck the Great North Road at Finchley and drove straight away to Glasgow—411 miles. During this journey I was obliged to adjust the commutator spring; but, with the exception of this item, I never touched the engine from start to finish. During my stay in Scotland I took daily and week-end trips from Glasgow, which served as headquarters, and one week-end did a round of 250 miles. I did not spare the car in the matter of hills; but she went up them all splendidly, including the 'Devil's Elbow.' I took the same road home to London as I had followed out, and during the return journey the tyres fully established their claims to spoiling a record run by two punctures. The engine was never touched throughout the whole of the time, with the exception of the adjustment of the spring above mentioned. I estimate that in all I covered 1,650 miles."

Digitized by Google

AN automobile club has just been formed at Toulon, France.

A GARAGE has been opened by Messrs. Richardson, Limited, at St. Peter-at-Gowt, High Street, Lincoln.



THE Wolseley Company have just delivered a 16-h.p. Siamese phaeton to the War Office for the use of the Inspector of Iron Structures.

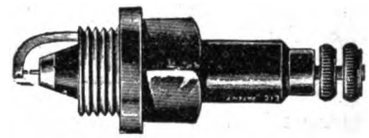
THE Mors motor-car lately owned by the Marquess of Anglesey, and most sumptuously fitted for long touring, has just been knocked down at auction for £825.

THE Highgate Motor-Car Company's Successors, Limited, has been registered with a capital of £1,000 to carry on the business of motor and cycle manufacturers and dealers, &c.

IN Little Donegal Street, Belfast, Messrs. J. B. Ferguson and Company have garage accommodation for a large number of cars and also carry a large stock of oils, spare parts, etc., for motorists.

ONE of the most difficult accessories to select for the motor-car is the lamp. Something towards the solution of the problem is to be seen at Gamage's, where the "Zanardini" acetylene lamp is a feature of the motor department. There are no rubber bags to cause trouble. All the parts are get-at-able, and it is possible to turn the gas off and on constantly till the carbide is used up, as the water is driven out of the carbide chamber immediately the light is turned out. At an exhaustive trial of motor lamps held by the Rhone Automobile Club last year, this lamp took the first prize, scoring high marks for the power of the light, its projection on the road, the steadiness of the flame, and the possibility of re-lighting time after time without re-charging. The front of the lamp is elliptical, and the reflector parabolic, while the accompanying illustration shows its various parts.

A, generator.
B, water tube.
C, screw down cap.
D, gas supply nipple.
E, gas tap.
F, air passage.
G, lid to generator chamber.



OUR French contemporary, "L'Automobile," as a result of the subscription for the benefit of the mechanicians on the French cars in the Gordon Bennett race it recently opened, has divided a sum of £60 between the three men.

AT a bazaar in aid of a church restoration scheme at Saxmundham last week a motor-car was raffled. One hundred and thirty tickets at one guinea each were taken, the lucky number falling to Mr. Simpson, of Darsham, who, curiously enough, had purchased an automobile three days before.

MOTORISTS touring in the Blackpool district of Lancashire will find that there are still several tolls to be reckoned with. There is one over Freckleton Marsh, between Preston and Lytham, where sixpence is charged for a motor-car. At the Shard Bridge over the Wyre, on the road from Poulton to Stalmine, the charge is twopence per car and one penny for each passenger. What we consider an imposition is a charge of a shilling to drive a car across the small Gartford Bridge over the same river; it might, at least, be the same as that at the Shard.

MR. JOSEPH CHAMBERLAIN enjoyed a trip by motor-car from Welbeck to Belvoir Castle on Saturday.

MESSRS. BROWN, BROS., LIMITED, the wholesale agents for the specialities of the Electric Ignition Company, send us a sample of a new E.I.C. sparking plug, which has recently been introduced to compete with low-priced foreign mica plugs. The new plug, which is known as the model B, is lower in price than

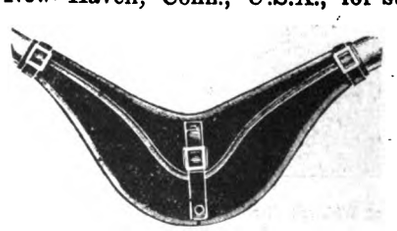
the ordinary E.I.C., but it appears to be well made and reliable One of the special features of the plug is the tapered construction whereby each explosion of the engine automatically fastens the plug in its body, while subjected to expansion and contraction, making a perfectly gastight joint without the aid of packing and nuts and screws.

AT Bulawayo a Wolseley car plies for hire, conveying parties to the Matoppos and other places of interest.

MR. PEMBROKE COLEMAN has sent in his resignation as the official timekeeper of the National Cyclists' Union.

MESSRS. H. M. HOBSON, Limited, are opening a depot and garage for motor-cycles and cars at 85, King's Road, Chelsea, S.W.

THE Birmingham Brake Company has been registered with a capital of £7,500 in £1 shares, to carry on the business of motor and other brake manufacturers.



THE chairman of the Bridges and Roads Committee of Northumberland has declared against the suggestion for an application for a reduction of the speed limit to ten miles an hour in their county.

ON the lines of the *Motor-Car Journal's* Identification Card, that issued by Mr. T. Throup, of Bradford, has had a wide sale in the north. It gives diagrams of the new signposts and is of a size suitable for the waistcoat pocket.

WEST-END GARAGE, LIMITED, is the title of a company registered to carry on the business indicated in the title. The first directors are Messrs. T. F. Gillett and H. A. S. Glover. The registered office is at 188, Blythe Road, West Kensington.

ACTING under instructions from the Highway Commission, the police in Boston, U.S.A., recently stopped automobiles in all parts of the city in order to ascertain by an examination whether the owners had complied with all the requirements of the State law. It is reported that out of 248 cars stopped, 114 did not carry the required lamps, numbers, certificates, or badges, 62 drivers could not show certificates for either the car or himself, 29 had no certificates for the car, and 13 had no driving licences. Thirty-five cars had no numbers on the lamps, and 5 had no lamps. Two cars did not show the same number on the lamps and certificate. It is expected that many prosecutions will follow.

THE accompanying illustration shows a grease bag which has been devised and introduced by the Gilbert Manufacturing Company, of New Haven, Conn., U.S.A., for strapping over

steering connections or universal joints. The bags, which are filled with grease, protect the bearings of the joints from grit or water, and will, the makers' claim, keep them clear and well lubricated for an entire season.

THERE are now 5,840 motor-vehicles in Massachusetts, the highway commission of which state has during the last six months had £2,026 added to the treasury by the income from the granting of licences.

CORRESPONDENCE.

EXPERIENCES WANTED.

To the Editor of *The Motor-Car Journal.*

Sir,—In reply to "Rustician's" letter in the *Journal* of the 30th ult., the statements he makes in his letter quite astonish me and would certainly prevent my purchasing a car if it gave so much trouble as the "two parties" seem to have experienced. I have had an 8-h.p. Argyll car for the last three years and can say it has given me the greatest satisfaction. I have not had the least trouble in starting the engine and have had very few breakdowns. The axle broke on one occasion through a flaw in the shaft, which might happen to any make of car.

I adopt the following method in starting. Turn on the petrol and slightly move the spill of the carburettor up and down a few times to get a good mixture, give the engine a few quick turns with the starting handle, then switch on the ignition, and the engine invariably starts on the first turn of the compression. The car must be kept thoroughly clean and all parts properly lubricated, the four-volt accumulator well charged, and the engine, after a run of forty or fifty miles, washed out with paraffin by injecting a small syringeful through the compression tap, give a few turns to the engine, and allow waste oil to drain off, and be sure to give a full charge of oil again before start. The wheels should be of equal size and a spare inner tube always carried, in case of a puncture. I think if "Rustician" follows my suggestions he won't have much trouble with his car. Of course, he is not going to jump on a car for the first time and do a twenty or thirty mile spin until he has gained a little experience in driving and handling a car, but with reasonable care he should learn to surmount any little difficulty that might crop up.

Get a good gauge pump and see the tyres are up to the necessary pressure, as it is a most important thing that the tyres are properly inflated. Do not forget to fill the petrol tank and keep it full. I was hung up on two occasions by neglecting this simple matter; and one more most important thing, keep a clear head before attempting to start on your journey, as by not taking this precaution may account for "Rustician's" acquaintance being in the surgeon's hands.—Yours truly,

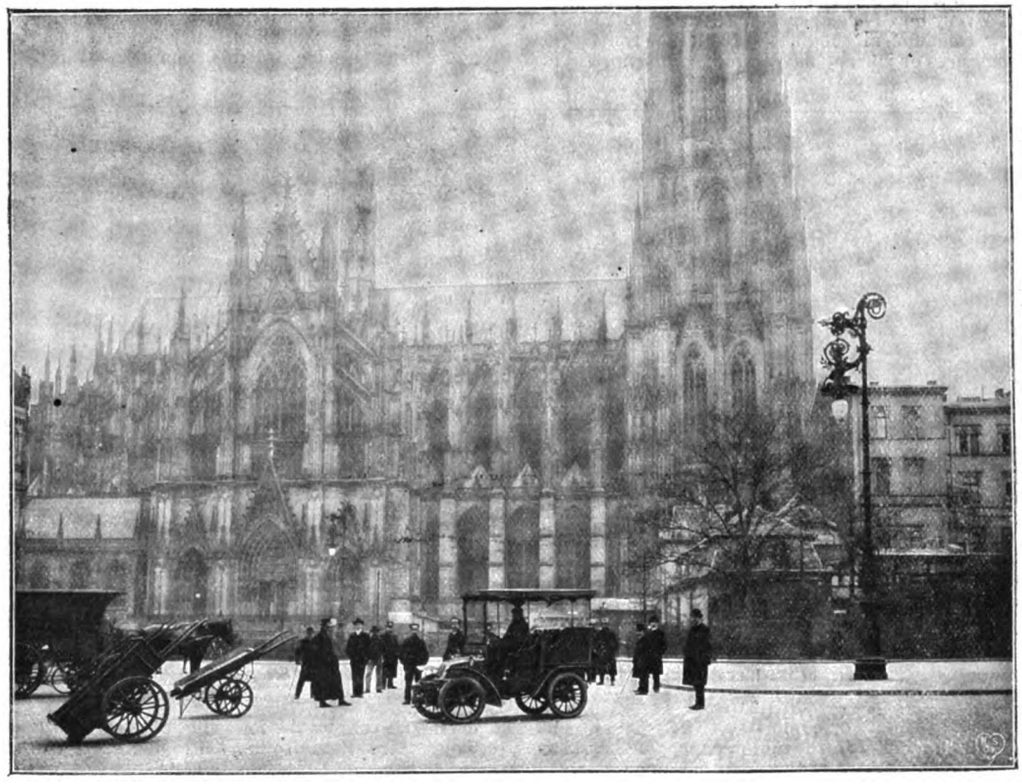
W. F. Rowe.

THE BEXHILL MEET.

To the Editor of *The Motor-Car Journal.*

Sir,—While at Bexhill last week end, watching the motor races from my car, which was drawn up with others alongside the track, I was informed by a man, accompanied by a police constable armed with an official looking note-book, that I had the option of paying 10s. for standing room or of moving the car away, and apparently every car owner was in turn accosted in the same manner. Personally, I neither paid nor moved away (as I exceedingly doubted the legality of the claim), and I was not troubled further; but, as I saw other cars moving out of the line of spectators, I presume they believed the claim to be legal, and so probably some of those who remained had paid for the privilege of doing so. It would be interesting to know if there were any legal right to these payments, and if not, the Automobile Club should be asked to take up collectively the question of having the payments refunded.

If the claim be legal, I take it my case would not have been concluded with a refusal on my part to either move or pay. My name was not even taken.—Yours truly,



Ernest H. Arnott.

REGISTRATION.

To the Editor of *The Motor-Car Journal.*

Sir,—I should like to warn your readers not to be too anxious to register their cars before being actually in possession of same. Having sold my old car through an agent, I applied to the Middlesex County Council for transfer of my old number to my new car, a Darracq on order, which they granted me on payment of £1. Owing to protracted delay in delivery I cancelled my order and bought a car of another make. I applied to the Council for the alteration to be made in the register, but they replied to do so they would require another £1. Meanwhile, however, the buyer of my old car had applied for my number, which the Council gave him, so of course I cannot have that. Through being overanxious, I have had to pay £3 for two numbers, which I think is a great imposition, and in future will rather run the gauntlet with my old number till in actual possession of the new car before applying for registration. I think you will agree with me that some provision should be made to prevent a repetition of this downright imposition.—Yours truly,

Late 186.

A Cudell Car in front of the Cathedral at Cologne.

HORSE v. MOTOR.

To the Editor of *The Motor-Car Journal.*

Sir,—In reply to "Practioner's" letter in the *Journal* of the 30th ult. *re* the respective merits of horse and motor, I will try to give a brief *resume* of my two years' experience of a motor-car. Two years ago I bought a new 8-h.p. four-seated motor-car. My first troubles, occurring very frequently, were ignition troubles. These I soon overcame by having a wipe spark contact breaker put on instead of the previous trembler. Then my next trouble was with the tyres (Goodyear), of which I went through some dozen or so tyres in less than eighteen months, then I got Colliers fitted on the hind wheels, three of which were soon ruined by cutting by the rims. I then got other two tyres of same

Digitized by Google

kind, but this time the makers put in new rims; these have been fairly satisfactorily. On my front wheels I have Continentals, which have done well. By this time fresh troubles began to arise, principally clutch slipping, engine getting almost red hot, universal joint bolts wearing out, etc. But the greatest trouble of all was that although there are at least a dozen of so-called motor engineers within thirty miles, there is not one who properly understands motor work. One firm, with their crack expert, took out the friction clutches to remove the cause of slipping, and punched the surface of the clutches with a steel punch, and charged over £7 for the work. Another firm of motor engineers tried to mend this by filing the surface of the clutches, and, with one or two minor repairs, charged between £13 and £14.

Another firm overhauled the car during last winter, took out the differential gear and replaced it by new wheels. The whole of the old ones I have got back with difficulty, and it can be seen that they should not have been touched. The cylinder head and crank case have been removed and fixed up innumerable times before this engineer (?) could set it right; the result is that the mechanism is now unreliable, and there is a bill of over £80 for this meddling.

Anyone giving up horses and taking up motoring must have a thoroughly good motor engineer within decent distance, and one who will be honest in his work and charges; but my experience is that such is impossible to find. I might give an instance. Some time ago I sent an accumulator to be recharged. It seems that in recharging one of the cells burst. The accumulator was sent by the motor firm to Coventry to be made right, and I am charged £1 8s. 6d. for this. My advice to "Practitioner" is, that horses are very much cheaper and much more reliable than motors. I must now conclude, although, if space had permitted, I could have given many instances of journey having to be given up, and of having to hire from the nearest place a horse and trap to get some urgent work done. There is too little written in the motor papers of the drawbacks of motoring, and too much about the pleasures.—Yours truly,

ANOTHER PRACTITIONER.

P.S.—I would be pleased to have readers' opinion of the charges, especially that for recharging accumulator.

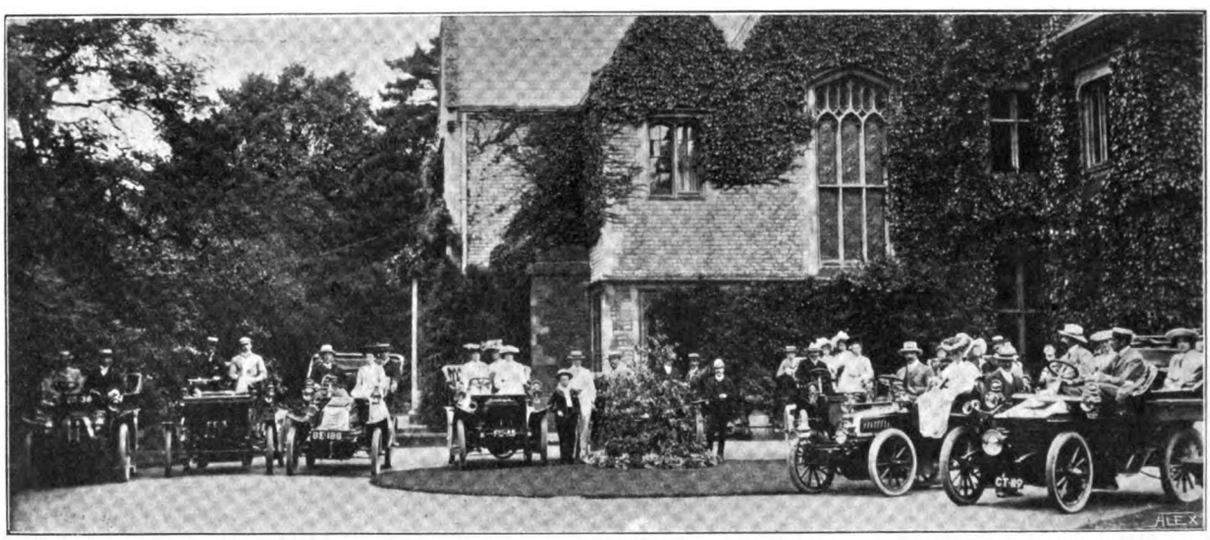
THE CHOICE OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is an undoubted fact, lamentable, no doubt, but none the less true, that the majority of cars purchased in this country are of foreign manufacture, a state of affairs now and then drawn attention to by weak-kneed wails and accusations of lack of patriotism from those interested in home productions, but none the less deserving of careful consideration by all who have the welfare of British automobilism at heart. What, then, it may be asked, determines the purchaser's choice of a car? In the case of the "old hand," it may generally be summarised as "reputation," a quality that may be acquired by a particular make by many years of good performance, or by some particularly successful public achievement, for which the chances in this country are painfully limited. The numerous contests held on the Continent have enabled many manufacturers previously little known to leap into temporary and profitable popularity, without detriment to the older and well-established firms. In the case of the novice it is seldom that he does not get advice from more experienced friends, who have probably, from the nature of the case, graduated on foreign cars. There is no doubt that the best English cars are at least equal in workmanship and durability to the foreign production; it is the fault of our manufacturers if they are not produced as cheaply; and, racing apart, they are as speedy as the ordinary user can require. But the facilities of determining which is the best are greater on the Continent than here, and the multiplication of trials, costly though it be, is the only way of hastening that survival of the fittest which, otherwise, time alone can effect, and which the publication of the makers' own opinion of their cars, in which some show such a pathetic faith, can do nothing to bring about.—Yours truly,

OLD HAND.

QUERIES RE PETROL CARS.



TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would any of the readers of the *Journal* kindly answer the following queries, which I think you will agree are of general interest? First, What are the general causes and remedy for the occasional bang or loud report in the exhaust box often heard on even new motors properly timed and valves correctly ground? The general idea is, of course, a misfire in the cylinder or a series exploded in the hot exhaust box. Is there a danger of exploding and firing petrol tank when adjoining?

Are there any cars fitted with both magneto and electrical ignition? Is the combination workable; or is it a fact, as I have heard from those who have tried, that they short circuit each other through the engine or frame?—Yours truly,

PETRO.

[The general cause of the loud banging in the exhaust box is a number of misfires in the cylinders; the charges are then passed into the silencer, and when sufficient gas is accumulated it is fired either by the hot exhaust box or by the following charges which are fired in the cylinder. This is most likely to happen in engines of two or more cylinders. There is not much fear of exploding or firing the petrol tank unless very close. There are several cars fitted with both high tension and magneto ignition which work very satisfactorily. If properly fitted, there is no fear short circuiting].

The Meet of the Lincolnshire Automobile Club at Westholme, Sleaford. (*See page* 513.)

CLEANING OUT A PETROL MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the injection of paraffin into a petrol motor to clear it of gummy oil, should the paraffin be put in so that it comes into contact with the valves in the combustion chamber? My engine is of the high speed type. Should I take out the sparking plug, inject a tablespoonful or so into the combustion chamber, and then turn the engine over several times? It would seem to me that this procedure would coat the entire engine with a layer of paraffin oil, which, when the engine heated, would burn. Of course most of the products of combustion would come out of the silencer, but it seems to me that there would also be a residue of carbon left, which would leave the engine in a worse condition than when it was gummy. I should like to have your opinion on this matter.—Yours truly,

NOVICIO.

[This is a very important item, and is best accomplished by means of paraffin or petrol, the former by preference. If no compression tap is fitted, it is best to remove the sparking plug and inject through the hole into the cylinder. The bulk of the paraffin passes the piston into the crank case and should be drawn off through the tap or plug provided in the base, after which a fresh charge of oil should be given. The paraffin has no effect on the cylinder walls, and does not leave a great amount of

Digitized by Google

deposit. It really becomes mixed with the lubricating oil, and so prevents the piston sticking when the engine is cold or the oil gummy.]

BELT TRANSMISSION.

To the Editor of *The Motor-Car Journal*.

Sir,—How is it that inventors have given up trying to adapt the belt for cars? Every practical man knows that for flexibility, simplicity and noiselessness it would be peculiarly suitable if successfully applied. It seems to me that for connecting the two vibrating ends of drive in a vibrating frame the belt should be supreme—the conditions seem, indeed, to demand it.

Is the problem to be given up altogether? I have heard of belt-driven Benz cars running 5,000 miles without the belt being touched, and some time ago I saw a notice of some inventors having successfully used belt race cones. I should be glad to know the opinions of others on the belt question.—Yours truly,

J. B.

ESPRIT DE CORPS.

To the Editor of *The Motor-Car Journal*.

Sir,—I have in my possession a pocket voltmeter in purse case, by Peto and Radford, which was picked up on the road yesterday morning, August 2nd, in the parish of Hollingbourne, about five miles from my place on the Ashford road.

A 14-h.p. Clement (registered A but number unknown) had just previously most courteously stopped to proffer assistance and had allowed me the use of the selfsame voltmeter, which shortly afterwards was picked up some 200 yards from the place where I had stopped.

If you will kindly make this known through the columns of your valuable journal I shall be most happy to return the voltmeter to its owner, together with my best thanks for his courtesy and timely assistance.—Yours truly,

A. T. Falwasser.

Owner Wanted for Lamps.—Found on the Holyhead road beyond Fenny Stratford, about forty-five miles from London, two motor-car rear lamps. The same were picked up in the week ending July 23rd. They can be had by applying to Mr. C. A. Gibbons, motor-car agent, Fenny Stratford, Bucks.

CLUBS AND ASSOCIATIONS.

LADIES.

The Committee of the Ladies' Automobile Club have adjourned until October. At the last meeting the following ladies were elected to membership of the club:—Mrs. St. John Coventry, Miss Austin-Jackson, Lady Tennant, Mrs. Rideout, and Mrs. Philip Waterlow. The Committee have accepted Mrs. Wilson Noble's invitation to the members of the club and their friends to motor to Tangley Park, Guildford, on Saturday, Oct. 15th. This will be the only meet that can be arranged until next spring, and it is hoped that as many members as possible will be able to attend.

The club now numbers 307 members; the subscriptions for town and country members being five guineas, with an entrance fee of five guineas. Members who are elected on or after October 1st (in any year) only are required to pay one subscription for the period ending December 31st in the following year.

SCOTTISH.

The Western section of the Scottish Automobile Club held a meet at Abington, Lanarkshire, on Saturday last. The weather was very unfortunate, as during the entire afternoon it was wet, the rain at some times falling in torrents. Notwithstanding this and the fact that Abington is in a remote and exposed district, a dozen cars arrived at the hotel at the appointed time.

KENT.

The Kent Automobile Club are holding a hill climb at Detling Hill to-day, Saturday, at 1.30. After the climb the members are invited to Mr. Austen's residence at West Court, Detling, for tea.

VICTORIA.

The Automobile Club of Victoria has decided to hold a motor race meeting at Aspendale Park, near Melbourne, on Monday, 31st October. The racing will take place on a special gravel track, which is now being laid down by Mr. J. R. Crooke, the proprietor of Aspendale Park. The track will be 66 feet wide, banked at the corners, and is being constructed to allow a speed of between 50 and 60 miles an hour to be attained. An inter-state invitation race will probably be one of the leading features of the programme, which will also comprise an open car and an open motor-cycle race, besides many other interesting events.

LINCOLNSHIRE.

Another of those very pleasant gatherings for which the Lincolnshire A.C. has become noted took place on Thursday of last week, when the members were entertained to a garden party at Westholme, Sleaford, by Mr. H. A. Peake. Between 20 and 30 cars, carrying nearly 100 passengers, put in an appearance. Some of these were magnificently appointed vehicles. The photograph on page 512 shows several of these. Reading from left to right they are:—Capt. J. A. Cole, J.P. on a 12-h.p. Durkopp, Mr. Walter Pennell on a Locomobile, Mr. A. A. Padley on a 10-h.p. De Dion, Mrs. J. R. Richardson on an 12-h.p. Richardson, Mr. C. W. Pennell, J.P., on a 16-22-h.p. Martini, Mr. R. M. Wright on a 12-h.p. Georges Richard, and Mr. T. W. Mays on a 12-h.p. Wolseley. Others present were Capt. and Mrs. Gleed on a Baby Peugeot, Mr. W. Nissler and Miss Nissler, 8-h.p. De Dion, Dr. Gilpin, 7-h.p. New Orleans, the Rev. M. and Mrs. Wilkins, Baby Peugeot, Dr. Benson, J.P., and Mr. J. H. Carter 6½-h.p. Humberette, Capt. and Mrs. Newsum and Mrs. Livens, 18-h.p. Richardson, Mr. and Mrs. A. W. Holloway, Baby Peugeot, Dr. and Mrs. De Beauvais, 7½-h.p. Daimler, Mr. W. S. Foster, the Misses Foster and Mr. G. H. Hazlehurst, 24-h.p. Georges Richard, Mr. G. W. Jeffery with Mr. and Mrs. Fletcher Mercer, 12-h.p. Darracq, Mr. H. T. Pilley with Mr. and Mrs. Dodds and Mr. G. Holland 8-h.p. Peugeot, the Rev. T. A. and Mrs. Stoodley and Miss Farrer, 5½-h.p. Daimler, Mr. H. Rose with Mr. R. Connell and Mr. W. Connell 15-h.p. National, and Mr. Wilkinson and Mr. Yates on motor-cycles. Mr. Padley brought Mr. Stokes, a visitor from Johannesburg, who made his first trip on a motor-car, Mr. R. M. Wright brought the Rev. J., Mrs. and Miss Bell (Kettlethorpe), Mr. C. Pennell brought Miss Hart, and Mr. W. Pennell had Mr. Cyril Nelson on board. After partaking of tea the guests spent a most enjoyable time in roaming about the charming grounds. Croquet and other lawn games were provided, and a string band played selections of music at intervals. The company separated between 6 and 7 o'clock, having spent a most delightful time.

MOTORING IN THE PARKS.

Sir Albert De Rutzen on Tuesday gave his decision at Bow Street (London) Police Court in the case of Mr. Montefiore Mendelssohn, of the Albany, Piccadilly, who appeared before him on two adjourned summonses charging him with infringing the park regulations by driving a motor in St. James's Park at a speed exceeding ten miles an hour, and with failing to produce his licence when requested to do so by a police officer. The magistrate said that during the adjournment he had carefully considered the points of law raised on behalf of the defendant by Mr. Staplee Firth. It was, he remarked, argued by Mr. Firth that the regulations limiting the speed of motors in St. James's Park to ten miles an hour, which came into force this year, were *ultra vires* on the ground that the Parks Act, on which they were based, only mentioned vehicles, barrows, and trucks, whereas it had been ruled that a motor-car was a carriage. It was perfectly clear, however, that a motor-car was a vehicle, and he held that the regulations were good. He overruled, too, the other points raised by Mr. Firth, viz., that there ought to be proof that the regulations had been laid before the Houses of Parliament, and that there was no authority to impose a ten-mile limit without the consent of the Local Government Board. The magistrate went on to say that he knew nothing more uncalled for than the remarks which had been made to the effect that the police gave their evidence unfairly in motor-car cases because they were prejudiced against motors and their drivers. It would be just as unfair to suggest that magistrates were prejudiced. The police at Scotland Yard used motors supplied by the authorities, and it would be difficult to find anything more useful. Motors, however, were very powerful, and it was necessary to restrict their speed, especially in the parks. The police adopted the best known system of estimating the pace of motors, and it was evident that the defendant in this case had gone at the rate of about twenty miles an hour. For that offence he would be fined 40s. Referring to the summons against the defendant for failing to produce his licence, the magistrate said he was willing to believe his explanation that he did not think it necessary to carry it with him. It was perfectly clear, however, that the Legislature intended that drivers should carry their licences with them, and the defendant must pay 9s. costs.

THE ENDORSEMENT OF LICENCES.

After a motorist had been convicted at the Hadleigh Petty Sessions of an offence under the Motor Car Act, the Clerk asked him if he had his driver's licence, as it would require to be endorsed. Defendant expressed his opinion that the action was under the 1896 Act. The Clerk read a communication from the Home Secretary in which he was ordered that the offence should be entered upon it. Defendant said he read many cases in the newspapers where the fine was only 5s., and in no case was the licence endorsed. It meant a good deal to him, as he was a professional driver. The Clerk said the Bench had no option in the matter. The licence was accordingly endorsed.

POLICE TRAPS.

There is a police trap on the main road from London, about a quarter of a mile past Uxbridge, starting near a public-house on the right hand side of the road. The policeman is in the hedge further down. One of the directors of the West End Garage, Limited, the other day, had a narrow escape there, being just warned in time.

On the Leeds road, near Huddersfield, the police have a carefully-devised trap.

CASES DISMISSED.

MR. PHILIP DAWSON, of Lawrie Park, Sydenham, was summoned before the Croydon County Bench on Saturday, the 6th inst., for driving a motor-car in the parish of Coulsdon, on the 16th July, at a speed exceeding twenty miles an hour. There was a great conflict of testimony. Mr. O'Gorman was in attendance to give evidence for the defendant, and after hearing Mr. Staplee Firth, who appeared for the defence, the Bench dismissed the summons.

A POINT in regard to motor-car prosecutions has been raised with effect at Stroud Police Court. Mr. A. H. Wilson, of Queen Street, Huddersfield, was summoned for driving his motor-car on two occasions at excessive speed. Mr. Reed, who defended, contended that the prosecution must fail because no one could identify Mr. Wilson as having been in the car or having driven it. The chairman accepted this view, and dismissed the summons, adding that he thought the law should be altered.

MR. PEEBLES, of Russley Park, Baydon, Wilts, was summoned at Swindon for driving his motor-car at a speed which was dangerous to the public on July 17th last at Swindon. Mr. Firth, who appeared for Mr. Peebles, cross-examined no less than ten witnesses for the prosecution, and the summons was dismissed.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Harrogate	Dangerous driving	£3, etc.
Malton	No number	20s.
Acock Green	No licence	£3, etc.
Brighouse	No rear light	£1, etc.
Daventry	Dangerous driving	£5, etc.
Hatfield	No number	10s., etc.
Wilmslow	Dangerous driving	£5, etc.
Norton	Not stopping when requested	£2, etc.
Wooler	„ „	£1, etc.
Epsom	No number	5s., etc.
Wokingham	No rear light	20s., etc.
Richmond	No light and no licence	£4, etc.
Stone	No rear light	1s., and 10s. 6d. costs.
St. Neots	Ten cases of driving to the common danger	Fines ranging from £5 to £7 —total amount £57.
Malton	Riding motor-cycle without rear index mark	20s., etc.
Slough	Negligent driving	£10.
Greenwich	Fraudulent use of motor-car mark	£5, etc.
Hadleigh	No rear light	£2.
Colchester	Driving beyond legal limit	£2, etc.
Guildford	Driving to the common danger	£1.
Wareham	Not stopping when requested	£2, etc.
Kingston	No light	£1.
Brighton	Excessive speed	£5, etc.
Oxford	No number	10s., etc.
Thames (London)	No licence	£5, etc.
Dunmow	Not stopping after causing an accident	£1, etc.
Leeds	Beyond legal limit	£3, etc.
Huddersfield	Furious driving	£5.

THE
Motor-Car Journal.

VOL VI.] LONDON, SATURDAY, AUGUST 20, 1904. [No. 285.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE General Council of the Scottish Automobile Club have had brought under their consideration various cases of reckless or inconsiderate driving, and have resolved to make a general appeal to the whole membership on the subject. The fact that the Motor Car Act, 1903, expires on 31st December, 1906, and that prior thereto the entire legislation with respect to the use of motor-cars on the highways will again be under the consideration of Parliament, makes it imperative that during the interval the conduct of all automobilists should be such as will not only prevent antagonism and prejudice, but will gain appreciation and support on the part of the public. It is further of extreme importance, in view of various applications by Burgh and County Councils to the Secretary for Scotland for the closing of roads and limitation of speeds in their respective areas, that no cause of offence should be offered, and that the General Council's argument, in their notes of objections to these applications, that Section I. of the Act of 1903, which deals with reckless and dangerous driving and puts the responsibility on the driver, is a sufficient protection to the public, should be amply borne out. The General Council trust their assurance to the Secretary for Scotland, that a loyal observance of the spirit of Act will be given by this club, will have the invariable support of every member. This is essential to successful opposition to unnecessary restrictions.

◆ ◆ ◆

A Small Mercy.

A REPLY has been received by the Roads Improvement Association from the Board of Trade with reference to the points raised by the deputation which recently waited upon the Government Depa tment. Although the Board cannot promise to prohibit the use of centre poles on roads by tramway companies, they will be prepared to enact in tramway and light railway orders that centre poles shall not be used without their express consent. The Board do not consider that it would be advisable to fix a statutory limit as to the width of roads that might have the effect of prohibiting urgently needed lines. In dealing with applications for tramway and light railway powers, the Board always keep in view the nine feet six inches space referred to in Section 9 of the Tramways Act, 1870, and make provision to secure it wherever practicable. The concession, for such it is regarded by the Roads Improvement Association, with reference to the centre poles is one of great importance if local people will do their duty in seeking to influence the Board of Trade when occasion requires.

◆ ◆ ◆

Extraordinary Traffic.

AT the last meeting of the Chelmsford Rural District Council the Ingatestone Parish Council called attention to the damage that might be caused by heavy motor-engines to the roads, and asked the Council to consider the desirability of taking some steps to protect the ratepayers. The letter, in particular, referred to the motor-wagon used by a firm of brewers. Rev. E. P. Gibson thought it a very good suggestion, as their roads were practically being made into railways. The assistant-clerk, Mr. A. S. Duffield, said they would have to prove damage caused by "extraordinary traffic." Mr. Kidner thought there would be no difficulty in establishing it as "extraordinary traffic." This kind of traffic was entirely an innovation, and demanded new measures to meet it. The assistant-clerk remarked that this particular engine came under the heading of "light locomotives," and not traction engines. Mr. Conybeare said it weighed nineteen tons. It drew three truck loads of barrels, and each truck with its load weighed about fifteen tons. If that were a "light locomotive" he should like to know what a heavy one was. The clerk was instructed to reply that no action could be taken unless damage could be proved.

◆ ◆ ◆

Hastings Automobile Meet.

BEXHILL is evidently not to have the monopoly in the provision of a motor carnival for the entertainment of its visitors. Probably incited by the recent success at the neighbouring seaside resort, a committee in Hastings has arranged for an automobile meeting to be held in that town on Saturday, the 27th inst. The cars will assemble in Warrior Square at noon, and a procession will proceed up and down the Parade, prizes being awarded for the best appointed motor-cars taking part therein. Later in the day a gymkhana will be held, several interesting contests being arranged in connection with this. There is no doubt as to the attractiveness of such gatherings, but we fear that the organisation of the forthcoming event has been delayed somewhat too late to admit of entries from a distance.

◆ ◆ ◆

The Irish Programme.

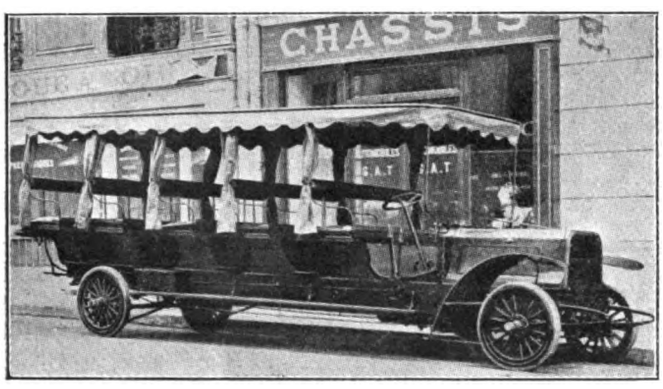
ON the 6th and 7th of September an automobile meeting will be held at Portmarnock, co. Dublin, under the auspices of the Irish Automobile Club. An interesting programme of motor-cycling events has been arranged under the rules of the Motor Cycle Union of Ireland, and those for cars include five classes in the tourists' section and two in the racing section. In the latter, interest will doubtless be evoked in the contest for the Irish Automobile Club's 200 guinea challenge cup, now held by Mr. J. E. Hutton, and also the 100 guinea challenge cup in the possession of Mr. A. Rawlinson. This annual Irish meeting draws together the numerous motorists in the Emerald Isle, and has hitherto been well supported by owners of cars on both sides of the Irish Sea. Such help will doubtless be continued and even extended.

◆ ◆ ◆

Cars in the Cemetery.

THE Hove Town Council has been considering a clause in the report of its Cemetery, Parks, and Baths Committee resolving "to place a notice at the cemetery entrance requesting motor-car drivers not to drive their cars in the cemetery." One councillor innocently asked if the proposed notice was an "order" or a request, whereupon a long discussion

Digitized by Google



ensued, which was, appositely enough, unenlivened by a gleam of humour. Councillor Bedford not only failed to see any objection to motor-cars going into the cemetery, but he thought that before long such vehicles would be used at funerals. Councillor Voysey, too, thought that automobiles should be encouraged rather than prohibited, and moved the deletion of that part of the report authorising such a warning notice. Councillor Marks having expressed the view that motor-cars were "the vehicles of the future"—should he not have said the vehicles of the "past"?—the amendment was seconded, and only lost by one vote, whereupon, we note with relief, the council had "a hearty laugh." All's well that ends well.

◆ ◆ ◆

British Enterprise.

SOME animadversions having been made by enthusiastic newspaper correspondents on British makers of automobiles because they have not secured all the orders that have been out for public services, Mr. H. Austin has made a very complete reply. It must be borne in mind, he says, that the motor industry in this country is still very young, a point which is apt to be overlooked owing to its extraordinarily rapid progress. Hitherto the demand has lain chiefly in the direction of pleasure vehicles for private owners; nevertheless the possibilities of a self-propelled public service vehicle have by no means been lost sight of by our principal manufacturers, and had it not been that their resources have been taxed to the utmost to supply the demand for the ordinary type of car, it may be taken for granted that they would have been in a position to supply equally good commercial vehicles to those of Continental make. There are at least half a dozen English firms who are in a position to build and supply good reliable vehicles for public service. The main reason that orders for this class of vehicle have been placed away from England has been on the question of delivery, as it will be evident that a works already over-taxed with orders for other types of car must take longer to deliver special work than would otherwise be the case.

◆ ◆ ◆

The Motor Char-a-banc for Yarmouth. (See page 520).

◆ ◆ ◆

Motor-'Buses on the Coast.

THE automobile continues to advance in popular favour. In our "Continental Notes" this week we refer to French activity in providing cars for public service at Yarmouth. The vehicles in the neighbouring resort of Lowestoft have been a great success, and the Great Eastern Railway will doubtless extend the service next season. At the half-yearly meeting of the Great Western Railway, just held, Earl Cawdor emphasized the good results that had attended the running of automobiles in Cornish holiday resorts, and now we learn that in developing their undertaking the directors of the Torquay Motor-Omnibus Company have established a circular route between the Strand and St. Marychurch. This route will have a half-hourly service, starting at nine o'clock. The first 'bus proceeds by way of Wellswood and Babbacombe, returning down St. Marychurch Road and Union Street; and at 9.30 the second 'bus runs up Union Street and St. Marychurch Road, returning by way of Babbacombe and Wellswood. The communication is obtained by the St. Marychurch 'buses meeting the Tor and Torquay Station motors at Castle Circus and the Strand respectively. A long-felt need is thus provided for, and improved travelling facilities afforded which will doubtless be as much appreciated as the motor-'buses generally have been since they commenced running. At Morecambe, too, motor-'buses are proving a success, and at the moment of going to press we learn that the West of England Motor Service Co. propose to run a motor-'bus between Bodmin and Newquay.

◆ ◆ ◆

Motor Cases Only.

"ONLY motor cases will be heard in this court, all other cases in next court." Such was the opening remark of Sir William Chance at Guildford last Saturday. This state of affairs is remarkable, for here was a bench of magistrates in a county town recognising that all their time would be taken up in hearing motor prosecutions. Our own test for alleged driving to the common danger occupied nearly four hours, and a verdict in our favour was grudgingly given. What the other cases were we do not know, as we were glad to get into the fresh air again; but there were several others, at all events. In many of these cases a considerable amount of time is wasted in hearing evidence which, after it has been heard, the magistrates themselves declare to be inadmissible. This evidence is usually obtained by the police for the purpose of creating predjudice, and, although the magistrates themselves say it is not relevant, yet we are convinced it must leave some impression upon their minds. The persecution that is going on at the present time is beyond all belief, and it will soon be that the majority of motorists will have at least one endorsement on their licence. We know of several who already have three, while many have at least two, some of the endorsements being for driving when the tail light has gone out.

◆ ◆ ◆

A Surrey Combination.

A COMBINATION of most of the motorists in Surrey is being formed to defend their rights against the extraordinary opposition which they have now to encounter from the police and a large section of the public. For many months it has been apparent that the old days of the police trap have been revived with all the prejudice that could be fostered by local councillors armed with "a little brief authority." The Bench, too, has joined in the general attack on motorists and the proposed union of self-defence comes none too soon. In fact, it was urged upon the secretary and the solicitor of the Motor Union by the Editor of the *Journal* long ago, and it is really regrettable that something was not done earlier to bring the motorists of Surrey into line.

◆ ◆ ◆

General Booth's Tour.

GENERAL BOOTH has had experience of automobile ups and downs, and has taken advantage of the opportunities provided by punctures to attend to correspondence and to admonish the wicked on the roadside. When delays have proved of lengthened duration he has transferred his person to another car, leaving the stubborn vehicle to follow according to its own inclinations. As is usual on such trips, the Press car has suffered severely in this respect, and several times the journalists thus hindered in their work have looked towards the General as though they would like to say things. As for the leader of the Salvation Army, his vigour seems to have increased with his experience of motoring. "I am getting used to motors," he said when arriving at Okehampton after eleven hours' continuous riding, "and in fact I can now do business with my commissioners on a car." At the same time the General has not been wholly converted to automobilism, and declares the great

Digitized by Google

fault of the car to be the "expense," which shows that, like John Gilpin's wife, he has "a frugal mind."

◆ ◆ ◆

A Dusty Spin.

ON Saturday the party left Ilfracombe, and, after an hour's delay caused by a puncture, made good pace towards Crediton. On the way they passed a constable who, with another person, was partially concealed in a gateway. The officer was busily occupied in consulting his notebook, and doubtless took the General's No. After Crediton, the dust, and when the cavalcade of cars reached Exeter the veteran leader was as white as a miller from the top of his cap downwards.

◆ ◆ ◆

A Defence Fund Suggested.

WHEREVER there are half a dozen owners of cars in a town or village, they should be encouraged to form a local committee to defend every case against any of their number who may be summoned. Only by such an universal movement can the great injustice of the present position be brought home to the people of the country and their representatives in Parliament, the latter of whom will have to settle the re-imposition or otherwise of the Act at the end of 1906. The Motor Union being a national organisation should open a defence fund, which should be freely available for the purpose of the litigation which local bodies may have to undertake. For such a purpose the trade would doubtless subscribe liberally, and there would be a good response if an active campaign were entered upon. But the period of sloth must be passed by and a determined plan of campaign undertaken, otherwise every driver's licence will soon be full of endorsements.

◆ ◆ ◆

Keep on the Right Side.

HIS Honour Judge Gye, at the Isle of Wight County Court last week, in giving judgment for a motorist, who was sued for damages by a cyclist who complained of having been run down, said he did not take the savage view that any stick was good enough to beat motor-car drivers. The Judge held that the cyclist was guilty of contributory negligence by riding on the wrong side of the road, and said he was afraid accidents happened through drivers of horse vehicles taking the view that motorists must keep out of their way under all circumstances. There should be mutual concession between drivers of motor-cars and other vehicles. This is a view that we should like to see more generally recognised than it is at present. Many of the accidents lately recorded as automobile mishaps have occurred owing to drivers of horse-drawn vehicles being on the wrong side of the road.

Notice Should be Given.

AT Chorley, on Tuesday, a useful point was successfully raised in defence of a motorist summoned for driving at an excessive speed. The defendant's solicitor claimed that the case failed because the constable who stopped his client did not tell him he would be prosecuted, but simply that he would be reported. The magistrate's clerk stated that the point for the Bench to decide was whether what the constable said was a sufficient notice that the defendant would be prosecuted. The Bench disagreed on the point, and the case was withdrawn, the clerk pointing out that it would have been sufficient if the constable had said "You may be prosecuted." Such little points as this should be noted and remembered by motorists, who never know when they may be prosecuted.

◆ ◆ ◆

The Police Method.

THE police are a resourceful set of individuals, and if they displayed the same ingenuity in the capture of criminals as they show in the trapping of motorists, the crime of the country would quickly decrease. Many motorists use the same road frequently, and this fact is noticed by the intelligent police-constable O, who is usually stationed at the same spot. He takes out his note-book, jots down the number of the car, and writes particulars as he chooses. Every time the same car passes the same process is repeated. The sequel is that at last the P.C. deems the motorist to have had sufficient run for his money, and then steps forward, raises his mighty hand, and announces to the astonished motorist he is going to issue a summons. His notebook is produced, and the numerous entries shown. This method of persecution refers chiefly to the south, and although not so great in the northern counties at present, it may extend in that direction. But "Oh, Law, thou art indeed divorced from justice,"

◆ ◆ ◆

The Hereford Trials.

ELSEWHERE we give particulars of the entries received for the forthcoming light car trials of the A.C.G.B.I., to be held in the Hereford district. These will be fully illustrated and described in subsequent issues of the *Journal*, and should attract considerable attention in South Wales and the western counties—a locality where motoring is becoming increasingly popular among the wealthy. The daily procession of forty small automobiles from the cathedral city should demonstrate the possibility of motor-car ownership to the man of lesser means, and there is little doubt that a goodly number of people will assemble in such important places as Worcester, Bromyard, Ludlow, Leominster,

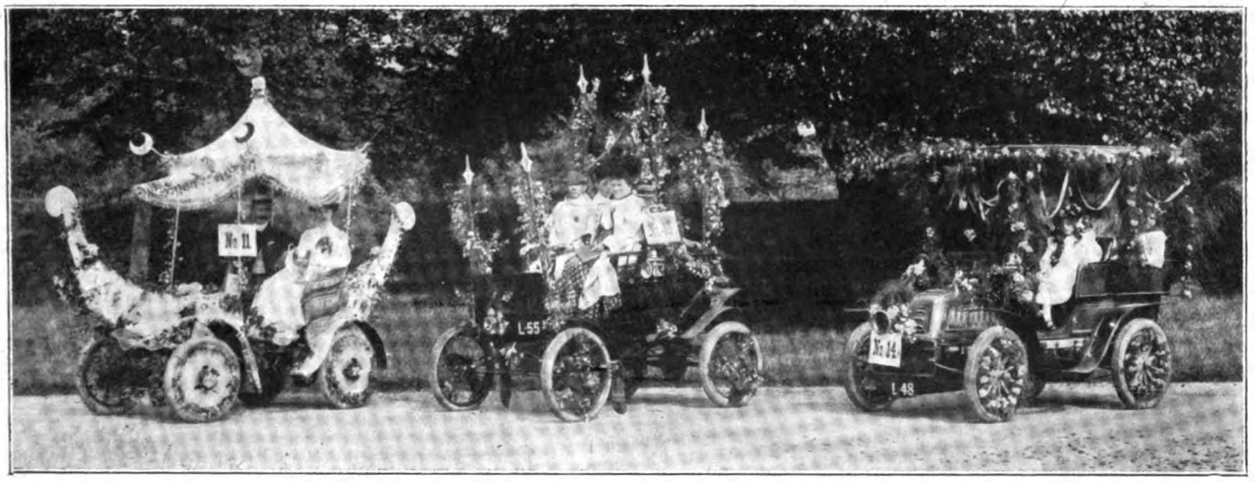


Photo by] The Display of Decorated Cars at Cardiff. (*See issue August 6th*). [*A. Freke.*

Digitized by Google

Kington, Ross, and Ledbury, all of which towns will be visited during the course of the trials, a full programme of which will be given next week.

◆ ◆ ◆

Rules for Motor-Vans.

THE Local Government Board has drawn up regulations, which are expected to be in force by the end of this month, for heavy motor-cars or lorries. Metal-tyred vehicles are not to exceed a speed of eight miles per hour. If the unloaded weight exceeds three tons, and a trailer is drawn, or the axle weight is over six tons, the speed limit is reduced to five miles per hour. Non-metallic tyred vehicles may travel at twelve miles per hour if the axle weight exceeds three and is not more than six tons. If over six tons, the speed must be reduced to eight miles per hour. No motor-vehicle of over three tons weight unladen, used as a stage carriage or for the conveyance of passengers, will be permitted to draw a trailer. Six months will be allowed from the passing of the regulations for adapting old cars. After six months the new regulations will be enforced.

◆ ◆ ◆

Dangerous Hills in Surrey.

A LIST of the principal dangerous and precipitous places on the highways in Surrey was contained in a report presented by the County Surveyor at a recent meeting of the Surrey County Council. It was not proposed to take any action at present beyond instructing the County Surveyor to have warning posts erected at about sixty of the most dangerous hills. Mr. Longman criticised the action of the Highways Committee in not recommending that notices should be placed at all the dangerous corners, and asked how many accidents must happen before the committee could be induced to act. Mr. Ellis, the chairman of the committee, said that the list of dangerous corners in Surrey which they had received from the local authorities was incomplete. There were thousands of them, and it would be unwise of the County Council to specify any of them unless it could specify them all, for if a person happened to be killed at a place not marked then people might turn round and accuse the council of not doing its duty.

◆ ◆ ◆

Alertness still Necessary.

THERE would seem to be a fresh outbreak of anti-automobilism in many places, and several county authorities are seeking to restrict the legal rights of motorists on the road. At the quarterly meeting of the Anglesey County Council the Road and Bridge Committee have just recommended that the speed of motor-cars over the country roads be restricted to seven miles an hour, with the exception of the Holyhead main road, where it was to be ten miles. Captain L. Williams and Mr. Harry Clegg strongly opposed these stringent rules, and eventually it was resolved that a speed of twelve miles be allowed on the Holyhead and Menai Bridge road, or rather that application for the restriction should be made to the Local Government Board. Such instances are becoming so frequent that we would remind motorists not to relax the efforts lately made to perfect their organisation, local as well as national.

◆ ◆ ◆

Driving in Towns.

THE Committee of the Irish Automobile Club have addressed a circular to motorists dealing with the urgent necessity for special care when driving through Dublin city and suburbs. The feeling which prevails amongst a section of the public appears to be most acute at present, the circular says, and complaints have been made to the club, and, it is believed, also to the police, of inconsiderate and too fast driving, and of unnecessary blowing of horns. The Committee earnestly trust that the co-operation of motorists may be relied on when driving in Dublin to remove any grounds which may exist for this feeling. The warning of the Irish Club is one that should be regarded by all British motorists as well.

◆ ◆ ◆

Signposts in Hampshire.

THE Hampshire County Council have recently considered a recommendation to erect 274 warning signposts throughout the county, in accordance with Section of the Motor Car Act, 1903. The cost of carrying out the recommendation was estimated at £350, but it was also shown that motorists had already contributed £720 to the county in licence fees, and there was likely to be an annual income from drivers' licences of nearly £300. An amendment was, however, proposed to refer the matter back, and the Marquess of Winchester, supporting it, urged that it was better not to have any posts at all, because he thought that, if anything, they would tend to increase the danger. The Duke of Wellington was of a similar opinion, but the Hon. John Scott Montagu, M.P., thought that warning posts ought to be put up in extremely dangerous places. On a vote being taken, the amendment to refer back was carried by a small majority.

◆ ◆ ◆

Next Year's Racing.

THE committee of the Automobile Club have unanimously adopted the following resolution:—"That, in order to ascertain what are the best conditions for a form of racing intended to promote the improvement of touring cars rather than the construction of cars suitable only for racing at high speeds, the Club Committee, after consultation with the committees concerned, forthwith take steps to obtain permission for the running of such a race in the Isle of Man or elsewhere next autumn (1905), and announce to makers that the conditions will be those which were settled prior to the Gordon Bennett Race of this year, subject to such alterations as may be agreed to by this Committee." It is also of interest to note that entries for the Gordon Bennett Selection Trials, which will probably be held in the Isle of Man—although near Bristol and in Yorkshire have also been suggested—have been received from Lieut.-Col. Mayhew, Mr. John Hargreaves, Mr. Lionel de Rothschild, and Messrs. S. F. Edge, Limited.

PRINCE IBRAHIM, of Cairo, is at present touring in Italy on a 12-h.p. De Dion car.

THE 18-28-h.p. Mercedes car illustrated in the last issue of the *Journal* belongs to Mr. G. Brickwood, of Southsea.

THE Government of New South Wales have an expert in this country studying the progress of the automobile movement.

MOTOR-CAR trips in the pleasant district about Sydney, N.S.W., is a feature of the Colonial business of Messrs. T. Cook and Son.

WHEN *en panne*, be calm and endeavour to locate the trouble. Do not let your temper explode simply because the mixture will not.

A POLICE trap has been established near the South End Park at Beckenham, and is generally in active operation on Saturdays and Sundays.

VISCOUNT BARING, the Earl of Dalhousie, Baron R. A. L. Lehmann, and His Excellency D. G. Metaxas have been elected to membership of the A.C.G.B.I.

MR. C. H. DODD, of Reading, and Mr. G. T. Langridge, of Epsom, have been elected chairman and vice-chairman respectively of the General Purposes Committee of the Motor Union.

AN eight days' endurance run of 1,012 miles between San Francisco and Los Angeles, Cal., and back, is being jointly organised by the Automobile Clubs of California and Southern California for the coming autumn.

A PROSPECTIVE motorist is said to have asked the dealer whether the motor-car they were inspecting could stop in its own length? "Why," replied the agent, "it sometimes stops twice before it goes as far as that." And the client was satisfied.

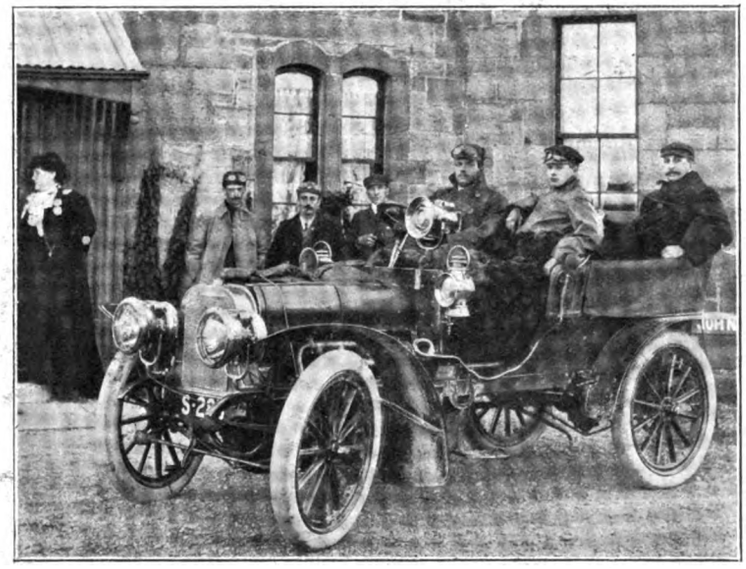
JOHN O' GROAT'S TO LAND'S END ON AN ARGYLL.

By E. J. Robertson Grant.



SOME little time ago I purchased a 14-h.p. "Argyll" car from the Hozier Engineering Company. The vehicle ran so well that I came to the conclusion that it was well able to do a trip from John o'Groat's to Land's End in as good if not better time than had yet been done. I consequently studied the roads a little and made preparations for the run. Accompanied by two friends we made a first attempt some ten days ago, but when about half way down we came to grief owing to running into a stray cow on our way over "Shap" in the mist of an early morning. Nothing daunted, but rather encouraged, we laid our plans again, and Sunday, the 7th inst., found us enjoying the hospitality of John o'Groat's Hotel, the while we studied the weather and discussed our chances of making an end-to-end record. The road was all mapped out, and a time table, allowing an average of twenty-one miles per hour for the 883 miles we had to travel, carefully prepared. The writer and his companion, Mr. J. Begg, at 3.10 a.m. on Monday, the 8th inst., set off amid the cheers and yawns of the folks in the hotel, all of whom had tumbled out of bed to give us a send off. The morning was dark and miserable, a heavy haze hung over the Northern Ocean, blotting out from our view the rough outline of the South Ronaldshay and forming a thick pall, through which the rays of the rising sun struggled to reach us. The way ran by the sea side over a road of heavy red clay, having here and there great pools of water, the result of the previous day's heavy storms. Luckily it did not actually rain, and our feelings improved as the sun succeeded in overcoming the mist and the temperature rose. After some fifty miles skirting the sea we drew away inland to get round Dornoch Firth. Along the rough and narrow Highland paths the car sped with never a falter, westward and southward, along roads almost deserted and without a house in view for miles. Approaching Inverness with the sun now high in the heavens, dust took the place of water underneath, and the railway began to dispute with us as to the right of way, a level crossing compelling our first halt, and robbing us of a non-stop to Inverness. Good weather and fine roads were ours for the next fifty miles, but Perthshire brought heavy rain accompanied by thunder, which somewhat dimmed our ardour and lessened our comfort, yet on we went, meeting many cars on their way to the north for the shootings, and passing every now and then parties of tourists on cars and horse-drawn vehicles on their way to visit one or other of the famous beauty spots of Scotland. On nearing "the fair city" we had unexpected trouble—a long sharp nail pierced clean through one of the rear Michelin tyres; protected though it was by a Grose non-skid band, the iron found its way between the studs and right through everything to the rim, on touching which it curled over and defied our endeavours to pull it out. This unexpected occurrence delayed us twenty-five minutes and made us fifteen minutes late at Perth. From the latter city westward to Stirling in the afternoon was good going over roads with a fine surface, and we made up time. At Stirling we had completed three hundred miles, and were again exactly on time, the first third of our journey having occupied 11 hrs. 50 min. Mr. Owen's garage provided a welcome supply of food, and not less necessary refill of petrol, and now, for a time, under convoy of a 20-h.p. Argyll from the Glasgow works, we proceeded through the busy and populous district in the vicinity of the Northern Metropolis.

Avoiding Glasgow itself, with its heavy traffic and watchful police, we proceeded by Lanark to Abington and the main road to the Border. At Gretna in the gathering gloom we lit our acetylene head lamps and in a drizzling rain began our attack on the long stretch of road from north to south of England. Without incident but for minor troubles with our wayward head lamps we dashed along all night, our way being picked with difficulty when the acetylene failed us; yet, despite the darkness (the moon gave us no assistance, but hid behind a heavy cloud the whole night), we only missed our way once, taking a private carriage way for the high road. Midnight found us running through Carlisle a few minutes ahead of time, with 410 miles behind us and somewhat more ahead. From Preston to Warrington all was well—roads good—ourselves sleepy and feel somewhat "seedy," yet determined as ever. Here our friend, Mr. Carlisle, of Manchester, took us in charge, provided us with supplies, and gave us a cheery pilotage through the Midland towns during the early morning hours.

Too sleepy to trouble much about the nature of the country through which we whirled, troubled only by the many flocks of sheep and herds of cattle that sought to claim a monopoly of the King's highway, we kept our eyes towards Bristol. In due time, and just when expected, we drew up at the depot of the Bristol Motor Company to take in our last supply of the needful for engine and man, and then we turned our car a little more to the west and began the last stretch of 200 miles to Land's End

Mr. H. Williamson and his Rex Mo or Bicycle on arrival at John o'Groats.

Mr. J Robertson Grant, of Buenos Ayres, leaving John o'Groats for Land's End.

TWO END-TO-END RECORD BREAKERS.

Digitized by Google

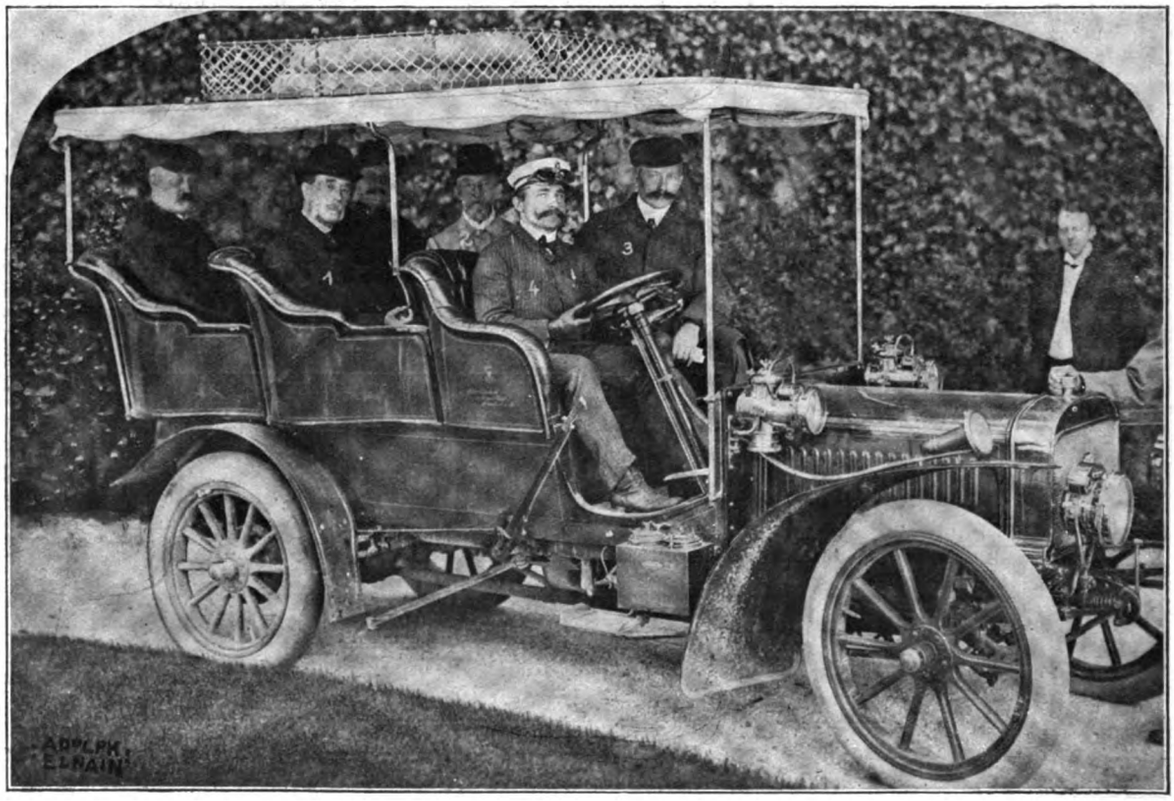
At this stage of the journey we were welcomed everywhere by excited natives, all of whom seemed anxious to point out our way, and give us a cheery salute as we passed. By Exeter and Bodmin we went in the afternoon of the second day, a heavy thunderstorm daunting our ardour for a while. The deepening shadows found us at Penzance, where welcome shouts reached us, "This way to Land's End," Here's the road to the End." 9.15 p.m. (five minutes behind time) on Tuesday, found us very sleepy, very stiff, almost too hungry to eat, but very well pleased with ourselves, stepping from the car which had carried us so well at Land's End Hotel door.

Our total time for the 883½ miles, as attested by certificates, was 42 hrs. 5 min., thus beating the best previous record held by Mr. Cecil Edge by 3 hrs. and 20 min. Looking back on the run after a good rest, the remarkable feature even to ourselves is the closeness with which we were able to adhere to our time table. Despite our one delay we were never more than fifteen minutes behind time and arrived only ten minutes from our schedule. This is as good time keeping as that of the best long distance train, and better than that of most with which it has been our luck to travel. We did the whole distance on one accumulator. The engine, one of the Hozier Company's own build, ran beautifully from start to finish with never a falter, while the car gave no trouble of any sort.

On the 3rd prox. the Wolverhampton Club will hold some petrol consumption tests at Market Drayton. Motorists intending to enter should communicate with the hon. secretary, Mr. S. R. Rhodes, Lichfield Street, Wolverhampton, before the 27th inst.

A few days since, in an unofficial run, a 6½-h.p. Coventry Humberette, carrying its full complement of two passengers, climbed Sun Rising Hill from a standing start, including two voluntary stops, in 4 min. 50 secs. A Humber Olympia tandem reached the summit in 3 min. 10 secs., but did not observe the stops.

CONTINENTAL NOTES.



Royalty and Automobilism.

During his recent visit to Wiesbaden the aged King of Denmark enjoyed a number of runs in a 24-h.p. Adler car, visiting Frankfort-on-Main, Rumpenheim, and other places of interest in the district. He is stated to have been so pleased with the experience that he intends next year to make the journey from Copenhagen to Frankfort *en automobile*

◆ ◆ ◆

A Huge Motor Char-a-Banc.

A Parisian firm—Messrs. Gallet and Treffière—have lately completed a 22-seated motor char-a-banc, said to be the first of six they are building for a service at Yarmouth. The vehicle, which is propelled by a four-cylinder 16-h.p. engine, has a wheel base of no less than 15 feet. The car is chain-driven and has three speeds forward and a reverse. The road wheels are shod with solid rubber tyres.

The King of Denmark's First Motor Trip.

1. The King of Denmark. 2. Prince Hans of Denmark.

Motor-Boat Racing in Switzerland.

An International Regatta for motor-boats is to be held on the Vierwaldstattersee by the Lucerne Regatta Association on September 10th and 12th. The races for pleasure boats are to take place in two series on the 10th, thus:—1. Boats not over eight metres long, and of not more than 30-h.p. 2. Boats over eight metres long, and of not more than 50-h.p. September 12th is set apart for racing craft of unlimited h.p., but not more than twelve metres long.

◆ ◆ ◆

Motor Postal Vans in Russia.

The Russian post and telegraph authorities are about to inaugurate some experiments with motor-cars in connection with the transport of the mails in the St. Petersburg district.

◆ ◆ ◆

Motor-Cars for Mail Service in Denmark.

The commission recently sent abroad by the Danish Government on a tour of inspection with a view to reporting as

Digitized by Google

to the adaptability of the automobile for short-route mail service has lately returned to Copenhagen. The commission, which was composed of officials from the post-office and other governmental departments and engineers appointed by the Government, visited a large number of places in north and central Germany, France and England. In the course of the report it is stated that from what they learned it was evident to the commission that the automobile gives excellent results where the modern machine has been employed in the public service. It is, however, only on the shorter routes that motor-cars have as yet been introduced into the postal service. If speed were not a consideration, it was evident to the commission that it would not be advisable to replace the present stage service with automobiles. On the other hand, if quicker delivery is the main object, motor-cars will best meet the requirements. It is the intention in Denmark, possibly, to replace the day coaches (stage service) by automobiles. It will be required that the automobiles have a speed of about twelve miles an hour on the average, which is about the speed maintained in the public mail service in foreign countries. The Danish Government has recently entered into a ten-year contract with a local company for the delivery of mails over the stage routes in Denmark proper. This company proposes, with the consent of the post-office department, and under its supervision, to install motor coaches in place of horse-drawn vehicles. This is an important branch of the postal service, since there are so many small islands without railways. The passenger and freight traffic would make many of the routes quite profitable. Four automobile omnibuses of French and, probably, German and Scotch manufacture will be given a three months' trial, beginning with September of this year. It is confidently expected that the experiment will be successful, and if so, that there will be a large demand during the next two or three years for automobiles of the omnibus type. The following are the rather severe conditions to be met before any particular make of car will be purchased. The body of the vehicle, exclusive of machinery, must be approved by the commission. The machine must be run 250 miles after coming from the factory, at the maker's expense, an inspector appointed by the commission being on board all the time. The car is then to be taken to pieces and each part carefully inspected, cleaned, and readjusted, and the car is to be run for three days at the expense of the maker. The car will then be forwarded to Copenhagen and run for three months by a driver furnished by the maker, who will be accompanied by a representative of the commission. The latter will pay the salary of the driver, will provide petrol and oil, and stabling for the car. The commission will pay one-third the price of the car on ordering it, one-third on its delivery in Copenhagen, and one-third at the end of the three months' trial, if it is found satisfactory. The trials are to be conducted under the supervision of the post office department, and from their decision there is no appeal. The car must accommodate sixteen persons, including the driver, and in addition be capable of carrying a load of one ton at an average speed of twelve miles an hour on a 9 per cent. grade. The commission has practically determined to try the "Schneider-Creuzot" omnibus, a car with a four-cylinder engine of 24-h.p., and accommodating twelve passengers inside and three on the platform.

◆ ◆ ◆

The Dust Nuisance in Bavaria.

A MEETING has been held in Munich with a view to forming a society for the purpose of dealing with the dust nuisance. It was convened at the instance of Dr. Herzog and Dr. Uebel, whose work, entitled "Roads free of Dust," was recently issued by the Association for Protecting the Interests of Bavarian Cyclists and Motorists. Dr. Uebel opened with a speech in which he reviewed the efforts of authorities and private individuals, both at home and abroad, to grapple with the dust problem. Finally, a motion proposing the foundation of a Society for the Prevention of Road Dust met with general acceptance, the object being to further all enterprises and experiments for the purpose of mitigating the dust nuisance.

Public Services in Austria.

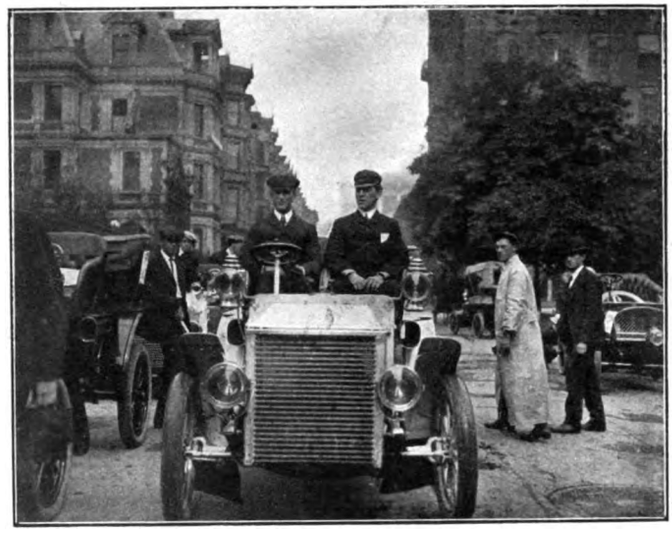
A number of public services of motor vehicles is contemplated in Austria. Among others it is proposed to start a service between Carlsbad and Giesshubel-Sauerbrunn and one between Peterswald, Schonwald, Tellnitz, Arbesau, and Aussig.

◆ ◆ ◆

The Austrian Club.

The Austrian Automobile Club is considering a proposal to establish a testing laboratory on the lines of that of the A.C.F. It is also proposed to organise a trial of heavy motor-vehicles.

◆ ◆ ◆



The Ventoux Hill Climb.

The Automobile Club Vauclusien, of Avignon, is organising a hill-climbing competition up Mount Ventoux for the 28th and 29th inst., the first day being devoted to the tourists and the second to the racing section. The course is about twenty-one kilometres long, and the average gradient eight per cent. The record for the climb (24 min. 50 sec.) is held by Rougier on a Turcat-Mery, but as several of this year's racers have been entered for the event it is expected that a new record will be easily established.

◆ ◆ ◆

An International Motor-Cycle Race.

As has already been mentioned in the *Journal*, an international race for motor-cycles, on the lines of the Gordon Bennett race, is to be organised by the Moto-cycle Club de France. The rules for the event have now been drawn up and challenges issued to all countries. An eliminating race is to be held on September 11th to select the French team, and the international event itself is to be held on September 25th, on a fifty-four kilometre circuit in Seine-et-Oise. The race is over a distance of 270 kilometres, so that the circuit will have to be covered five times. Challenges can only be sent through a club recognised by the French Automobile Club or the Moto-cycle Club de France. Each competing club may enter one, two, or three machines, and the fact that one country may only enter a single machine will not prevent another having three in the race. The event is restricted to machines weighing not more than 110 lbs. and made entirely in the country for which they are entered. A cup is being offered in connection with the event, to be held by the winning club, to whom challenges must be sent before February 1st in any year. It is to be hoped that England will send a team to compete in the cup race, full particulars of which can be obtained from the secretary of the Moto-cycle Club de France, 55, Rue Pergolese, Paris. It may be added that challenges for the first race will be received until September 7th.

One of the three White Steam Cars which took part in the Tour from New York to St. Louis.

MOTOR CYCLING NEWS.

ON Monday the Auto-Cycle Club's reliability trials commenced, there being forty-five starters, comprising thirty-seven motor-cycles, two motor-tricycles and six quadricycles. Details of the runs have already been given. That of the first day was from the headquarters of the Auto-Cycle Club, in London, to Great Yarmouth, by way of Colchester and Ipswich. At the former place lunch was enjoyed and all the machines were kept well up to the legal limit. At Ipswich the local arrangements for timing were in the hands of Mr. J. R. Egerton. The first to arrive, at 2.35 p.m., was Mr. F. Cremonini, who was riding a 2¾-h.p. Star. He was missed by the first timekeepers, being much earlier than was expected, but passed Mr. Vulliamy at 2.40, closely followed by Mr. A. Jennings, of London, on a Mabon (3-h.p.). Next came Mr. P. Lambert on a 2¾-h.p. Griffon; Mr. W. King, of Cambridge, on a 3½-h.p. King; and Mr. S. Bramley Moore on a 4½-h.p. Hulbert-Bramley. Mr. E. J. Steele, on a 3-h.p. Rover, a rider on a 2½-h.p. Alldays, and Mr. H. Williamson on a 3¼-h.p. Rex, reached Ipswich before the previous three, but lost time in coming through the town. Much interest was aroused in Lowestoft by the passage of the motor cyclists through the town, and the competitors began to arrive at Yarmouth shortly after six o'clock. The roads from Ipswich to Yarmouth were much better than those on the earlier part of the journey, which were somewhat loose and pebbly. They experienced fine weather throughout the latter part of the ride, with a strong wind blowing in their favour. A large crowd gathered to witness their arrival.

◆ ◆ ◆

ON Tuesday the reliability run was resumed. Forty-one of those who started on the first day continued the journey from Yarmouth to Stamford. The distance was 203¼ miles, being by way of Norwich, King's Lynn, Ely, Cambridge, Hitchin, Bedford, Eaton Socon, and Huntingdon. Coil troubles on one machine and the buckled wheel of another, arising by the driver taking an awkward corner too sharply, led to the withdrawal of two entries. The first to arrive at Stamford were:—W. H Wells (Vindec), A. Hoffmann (Ariel), R. M. Brice (Brown), T. Hooydonk (Ariel), P. Lambert (Griffon), W. King (King), J. Platt-Betts (Rover), E. J. Steele (Rover), J. van Hooydonk (Phœnix Trimo), T. Silver (Quadrant), H. Tyler (Humber), and J. Thompson (Clyde). Up to eight o'clock twenty-four riders had arrived.

A TWO hundred miles non-stop trial on motor-bicycles was held on Saturday last under the auspices of the Motor Cycle Union of Ireland for a cup presented by the Ariel Cycle and Motor Company, Limited. The course was from Dublin to Waterford and back. The competing machines had to be of British manufacture. Six racers took part in the competition as under:—W. J. Thompson, Ma'low (Ariel); J. L. Dixon, Dublin (Hobart); T. W. Murphy, Dublin (Singer); F. A. Waller, Dublin (Triumph); G. Mayne, Dublin; (Triumph); and W. Keating, jun., Raheney (Triumph). Two of the riders had punctures in the first eighty miles, and three of them had other troubles before reaching Waterford. The remaining rider, W. Keating, covered 150 miles without a stop, but got a side slip, the rain having fallen heavily after leaving the turning point. The competition will be run off again before the end of the season.

◆ ◆ ◆

THE Coventry Motor Cycle Club has selected a team for the Motor Cycling Club team competition on the 27th inst., as follows:—Motor-cycles carrying two passengers: B. Yates, Humber tri-car; S. Wright, Excelsior bicycle and trailer (air-cooled). Reserves: V. Riley, tri-car; E. W. Harris, Singer tri-car. Single motor-bicycles, with engines of any dimensions: Riley (Riley); H. W. Duret (Singer). Reserve: H Starley (Starley). Motor-bicycles, not exceeding 76 by 76: R. W. Ayton (Triumph), B. H. Owen (Humber). Reserve: J. Wright (Riley).

The Auto-Cycle Club's Reliability Trials.—The Start at Regent's Park.

◆ ◆ ◆

A MOTOR-CYCLIST riding from Tunbridge Wells to Uckfield recently, shortly before midnight, was proceeding cautiously down a hill, when his acetylene lamp revealed three or four men standing across the road. He endeavoured to pass them slowly, when one of the men caught hold of the handle of his bicycle, and he was thrown violently to the ground and severely dealt with. Fortunately his assailants have been arrested, but the incident adds another terror to night riding.

◆ ◆ ◆

"THE New York and Philadelphia Limited" is the name given to a run from New York to Philadelphia and return, which the New York Motor-cycle Club is organising for the 28th inst. The "Limited" arises from the maximum and minimum time limits of fourteen and eleven hours, respectively, that have been fixed. To qualify for medals it will be necessary for competitors to finish within those periods of time. The distance to be covered is about 200 miles.

THE STANLEY STEAM CAR.

THE Stanley steam car for 1904, as manufactured by the Stanley Motor Car Company, of Newton, Mass., presents no radical differences from the 1903 model, but a full description of the latest product may not be without interest. The frame consists of two tubular axles connected by a pair of hickory reaches. The underframe which is thus formed is strengthened against distortion by means of a triangular bracing. The rear axle consists of a cold-drawn steel tube enclosing the axle itself, of 1 1-16 inch diameter, which runs upon four sets of ball bearings containing three-eighth inch balls. Two of the bearings are near the springs, and two of them are close to the differential, which is of the bevel gear type, containing three pinions. On the composition spider of the differential is secured a brake drum and a phosphor bronze spur gear of eighty teeth which meshes with the engine gear and constitutes the driving mechanism. The rear axle tube, as well as the front one, is strongly trussed beneath. Means are provided for adjusting the gears of the differential to counteract any wear which may take place. The front axle is of the same size tubing as the rear one, and carries the inclined steering pivots, which are very substantial in character. Double elliptic springs of good length and wide spread are used throughout. Wire wheels of 28-inch diameter are employed, and are fitted with the standard form of clincher rims to fit any standard make of 28 inch by 2½ inch tyre. The body shows very graceful lines and provides a seat for two additional persons at the front by letting down a footboard. The space under this seat is occupied by the petrol tank and the pressure tank, the former of which holds thirteen gallons, which is said to be sufficient to run the vehicle 125 miles over ordinary roads. In the extreme rear of the body is the water tank, which has a capacity of twenty gallons, and is stated to contain a sufficient supply to operate the machine for forty miles on good roads.

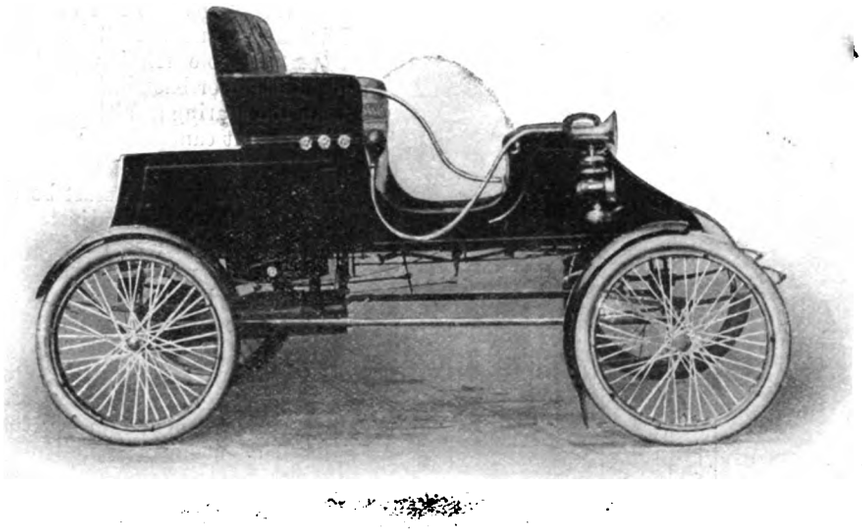

Fig. 1.—General View of Stanley Steam Car.

The boiler is worthy of particular description. It consists of a shell of one-sixteenth inch copper tubing, into the ends of which are flanged the crown sheet and the bottom sheet of the boiler plate punched for the reception of the copper flues. Electrically-welded steel rings are shrunk on hot to securely hold the crown sheet and bottom plate to the shell. Two hundred and ninety-five seven-sixteenth inch copper flues are expanded and flanged into the two plates, and the boiler shell is then wound with copper-plated piano wire under tension, the wire covering its entire length. The boiler is then tested with cold water under a pressure of 650 lbs. to discover any weeping or leaks. Besides the holes punched in the plates for the flues, there are additional holes for the super-heating tubes, to be described later. Special attention is paid to the flanging in of the flues in the bottom plate, their ends being completely flattened against the plate so that the fire cannot enter between the tube end and the sheet.

Toward the bottom of the water space of the boiler it inserted a tee which is closed by a plug of fusible metal. It terminates inside the boiler in two vertical tubes, and constitutes the safety device, which is intended to prevent accidental burning out of the boiler. When the water has fallen below the ends of these two tubes the circulation of the liquid which has hitherto been maintained in this pipe necessarily ceases, and the fusible plug, which normally is kept from melting by this circulation of water, is soon surrounded by steam which becomes very hot and finally attains a temperature sufficient to melt the plug and allow the escape of steam, which notifies the driver of low water.

The peculiar construction of the Stanley boiler, which enables a considerable degree of superheat to be maintained in the steam without the employment of metallic superheating surfaces carried at the fire temperature, well merits a brief review. The construction (Fig. 2) which effects this end is as follows: a main steam pipe leaves the steam dome of the boiler, and after passing the working throttle B, which is of balanced construction, enters the auxiliary throttle C. The pipe then returns through the crown sheet of the boiler and passes vertically downward through the water space and through the bottom plate. There it takes a circular bend and passes upward through the bottom plate, water space and crown sheet, where it again makes a circular bend and passes downward as before, and after passing up again terminates in the steam connection of the engine D, which is of a swivel construction, enabling the head end of the engine to move slightly in relation to the boiler. The figures in the drawing denote the vertical tubes through which the steam successively passes.

The principle which is employed to effect superheating with this construction is that of throttling and subsequently allowing the steam to expand in the superheating tubes which are exposed to the boiler temperature. The normal boiler pressure being about 400 lbs. and the engine being capable of operating on, say, seventy-five pounds pressure, it is obvious that a large degree of throttling is contemplated. After the working throttle is passed and the pressure so greatly reduced by "wire drawing," there is an opportunity for the steam to expand in the superheating pipes. Steam at this reduced pressure has a much lower temperature than that of the unthrottled steam, but the unthrottled steam, being in the superheating tubes and in contact with the water of the boiler, must necessarily abstract heat from it. If we assume that the steam in these pipes is saturated, it

Digitized by Google

is obvious that the heat which passes in from the water space must go to superheating the steam. If, on the other hand, there is water or "priming" in the steam, the heat which will then be abstracted through the tube walls from the hot water will be utilised in evaporating that priming into saturated steam at the reduced pressure or even slightly superheat the steam. The degree of superheat which will be attained by this arrangement under a given throttle opening will be in proportion to the original dryness of the vapour received from the boiler. Superheated steam furnished to the engine results in very marked fuel economy, a minimum of cylinder condensation, and in an exhaust which contains so little water as not to be objectionably noticeable. Furthermore, as by superheating the vapour a larger amount of energy is imparted to each pound of it, a given quantity of water will carry the car farther than would otherwise be the case, resulting in an extensive radius of action.

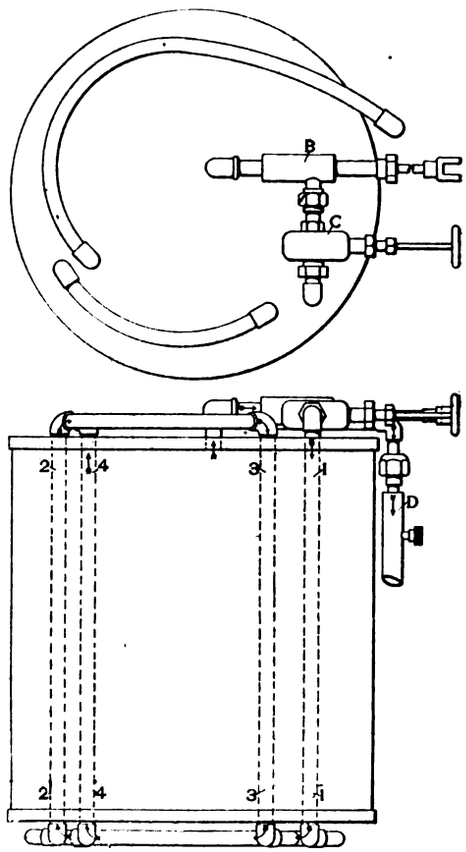

Fig. 2.—Plan and Elevation of Superheating System.

The maintenance of a water gauge of the ordinary form upon a boiler carrying 400 or 500 pounds pressure would be almost impracticable, and the Stanley Company has discarded this apparatus in favour of a mechanical water-level indicator, which is designed to advise the driver either by sight or by touch as to the condition of the boiler. The arrangement consists of a chamber, very much like the ordinary water column, provided with try cocks and piped into the boiler in the ordinary manner. In this chamber is suspended a hollow brass float to which is attached a cable running over a sector carried by a light and accurately constructed pivot passing through the wall of the chamber and provided with a steam-tight packing. This pivot carries on its extreme end a wheel, upon which runs a cable suspending a lead counterweight, which is so proportioned as to balance the float when it is partially full of water. This pivot carries also a wire indicator in a position within easy reach of the driver's hand, so that by touching it he can determine its angular position, from which by experience he can accurately judge the position of the float.

(To be concluded.)

SOME USEFUL NOTES.

A THING done right is done for ever. Whenever a motorist has occasion to remedy a fault, however slight, let him have the work done positively right. Anything less is a makeshift that may serve temporarily, but eventually will turn up once more to be done over again. The rule is absolute and certain; you can prove it by seeking to evade its requirements.

◆ ◆ ◆

EVERY owner of a motor-car should endeavour to know his vehicle sufficiently thoroughly that he is at least capable of recognising when adjustments and repairs have been properly made, if he does not care to make them himself. It is an old truth, and will stand repeating a good many times, that a little attention before starting out will in many cases save a great deal of annoyance, if nothing more serious, on the road. Take lubrication, for example. It is not an onerous task to see that each part has its proper supply of oil, yet neglect of this precaution is responsible for a lot of unnecessary trouble. Once let a bearing or rubbing surface run dry, and it will in a very short time wear more than in a season's running under proper conditions.

◆ ◆ ◆

WORN gear-wheels are almost insatiable in the matter of lubrication, and should be well looked after, as they are subject to considerable friction, and any wear quickly shows itself in lost motion or back-lash. It is better to be a trifle over generous than too sparing; although no good can come of swamping in oil where it cannot lubricate anything.

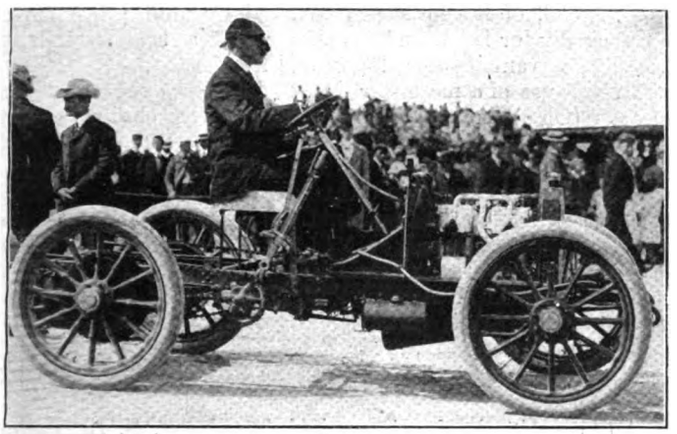
◆ ◆ ◆

AN excess of oil must be avoided in the cylinder, where the oil feed should be adjusted with the greatest care. Where splash lubrication is used it is only necessary to see that the oil is at the proper level and that it is changed at the right intervals; but where a sight feed is used it must be carefully adjusted to the rate of feed recommended by the maker of the vehicle. Too much oil will cause a smoky exhaust and will cover the sparking plug with a sooty deposit, which will soon cause the engine to miss explosions, occasionally at first and with increasing frequency until it refuses to run. Remedy, clean the plug and cut down the oil supply. When you once find where the lubricator works best, always keep it feeding at the same rate, though adjustments must be made in case of great changes of temperature, cold oil feeding more slowly than warm.

◆ ◆ ◆

ANOTHER trouble that may arise from too much oil is a sticking exhaust valve, a gummy deposit on the stem interfering with its free action. When this happens, the exhaust valve will not become seated, or else will come down so slowly that the motor will not develop normal speed. This is sometimes a difficult trouble to locate, as the valve may have time to settle into its place before it can be examined. If the motor fails to develop its power after an excess of oil has been used, this is very likely to be the trouble, though it takes a good deal of oil to cause sticking, and it should not occur often. Use the oils and greases recommended by the makers, unless you are an expert and know of something better. A little graphite will improve grease, but will clog an ordinary oil cup by settling to the bottom.

◆ ◆ ◆



HOT bearings may be the result of lack of lubrication, too close adjustment, or both, and should be carefully watched for, especially when the vehicle is new. Feel the bearings frequently at first, and if any one is found hot, see if it is getting its proper supply of oil. If it is, but runs hot notwithstanding, ease it a little by slackening the adjustment nuts or screws until it turns freely without lost motion. A little time spent in the adjustment of bearings is a good investment, for lost motion quickly multiplies itself. A bearing that is frequently adjusted will last much longer than one that is only attended to when the wear becomes serious.

HERE AND THERE.

MESSRS. THORNYCROFT AND CO. have just received a second repeat order from the City of London Corporation for two municipal steam wagons fitted with interchangeable tipping dust carts and watering bodies.

THE Newport, U.S.A., Amusement Association recently held a race meeting on the sand at Sachuest Beach. Several races for locally-owned machines attracted considerable interest.

Col. John Jacob Astor on his 20-h.p. Mercedes at the Newport Races.

Colonel John Jacob Astor on his 20-h.p. Mercedes made good running in the contest, which was over a course of one and one eighth of a mile. In the class for vehicles exceeding 10-h.p. and not exceeding 24-h.p. Mr. H. Hamlin won on a 24-h.p. Panhard in 1 min. 35¼ sec., Colonel Astor being only a second slower.

THERE is a toll of 1s. for motorists crossing the swing bridge at Sandwich. The tollkeeper keeps a keen eye to business, and recently hung on to a car when the driver attempted to back his vehicle from the bridge. The sequel was that the motorist was fined £20 for reckless driving—a conviction against which he intends to appeal.

THE Empress Gold Paint Company, Limited, have recently introduced an aluminium solution known as "Aluminamel," which can be used for painting any raw surface, whether of iron, wood, glass, or other material. The preparation always remains bright and has the advantage of rendering all metals to which it is applied proof against rust. It can therefore be advantageously used on many parts of motor-cars and cycles.

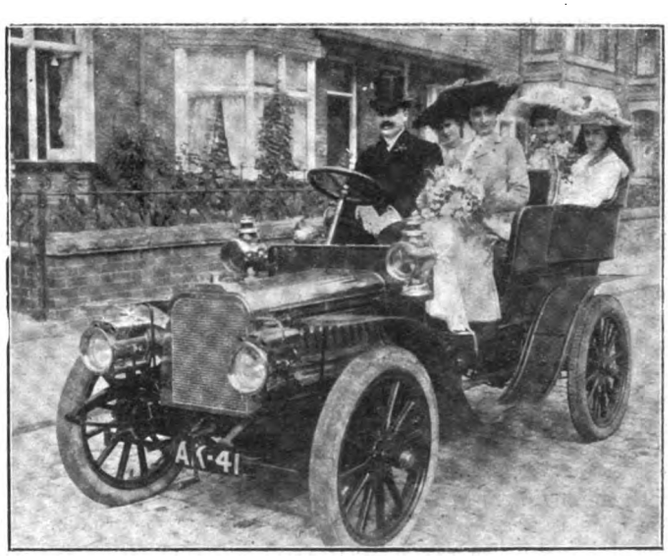
FROM Messrs. Alfred Russell and Company, of Walsall, comes a catalogue of their motor lamps and motor-car accessories. The special feature of the list is an illustrated specification of the new patent riveted "Bedford" petroleum side-light, the details of construction of which have evidently been carefully studied. Lamp brackets, motor beading, motor door handles of every description, hinges, and general car-building ironmongery are included in the catalogue.

MESSRS. FULLER, MACLEOD AND COMPANY, LIMITED, are introducing a new paraffin burner suitable for use on steam cars and launches. This burner uses common paraffin or kerosine oil, and in working gives an intensely hot, smokeless flame. There is only one jet, which is of such a size that it does not, it is claimed, stop up or require cleaning. The flame is regulated by a needle which projects through the jet, actuated by a hand lever, which allows the flame to be instantly regulated from "pilot light" to full flame or any intermediate degree, this being the only working part. The flame is spread out in a thin film over a dome-shaped deflector and takes up air proportionate to its requirements, at all degrees of adjustment. Working under a patent watertube boiler the burner is stated to give an evaporation of fifteen pounds of water for one pound of oil. The burner is made in any size from 6-h.p. upwards, and can be used with any type of boiler.

NOTICE boards are to be placed at the several entrances to the town of Holywell requesting motorists to reduce speed while passing through the town.

FROM the Speedwell Motor and Engineering Company, Limited, comes a copy of their new catalogue of Speedwell light cars. These are made in various styles and powers, ranging from 6-h.p. to 10-h.p., the last-named having a double-cylinder engine.

THE motor-car track at Bexhill will shortly be devoted, on certain days, to the purposes of auction sales by Messrs. Bell and Moore. Cars offered for sale will be tested on the track before going under the auctioneer's hammer, an innovation that will be appreciated by buyers.



THE Headcorn, Sutton-Valence, and Maidstone Motor Omnibus Company, Limited, has been registered with a capital of £4,000, to carry on the business of motor-omnibus proprietors. The first directors are Sir R. Filmer, Bart., Messrs W. S. Forster, W. R. Ward, J. Wood, and J. Boorman

A MOTOR-CAR has been imported into British Central Africa by the African Lakes Corporation for the transport of passengers from Chiromo to Blantyre. During the past two or three years several motor-wagons have been introduced by the same Corporation, and it is probable that they will be employed in the transport of the next cotton crop.

THE WINDSOR MOTOR AND ENGINEERING COMPANY, LIMITED, has been registered with a capital of £5,000, to take over the business of dealers in motor-cars and other vehicles, etc., carried on at 5, 7, and 9, Sheet Street, Windsor, as the Windsor Motor and Engineering Company, and to adopt an agreement with Mr. A. V. Williams.

"SEASIDE WATERING PLACES" is the title of a volume published by Mr. L. Upcott Gill, which is now in its 28th year of publication. Here we have within the compass of 250 pages a description of the various holiday resorts on the coast of England and Wales, the Channel Islands, and the Isle of Man. In addition to the guide book, information of hotels and leading tradespeople in the various towns add to the completeness of the volume, reference to which is facilitated by an excellent index.

MR. A. W. DOUGILL, the hon. secretary of the Yorkshire Automobile Club, was married last week, and, with commendable consistency, both he and his bride rode to and from the church in motor-cars.

Mr. A. W. Dougill, the Hon. Sec. of the Yorkshire Automobile Club, and his Bride. *Photo by* [*O. Brooks.*

MOTORISTS passing through Bridgnorth will find a stock of petrol and accessories at the depot of Mr. Clement Jefferies, 70, Whitburn Street. Garage accommodation is not at present available, but, reaching the town late the other day, Mr. W. J. Rivers, the manager, went to much trouble in helping to locate ourselves and car for the night.

Digitized by Google

CONVENIENCE for motor-cars is being provided at the Mount Pleasant Inn, between Dawlish and Starcross.

MR. J. H. PATTERSON, of Aberdeen, has been appointed vice-president of the Scottish Society of Manufacturers and Traders.

THE enjoyment of a long run is multiplied when you have the assurance that your car will be as strong and dependable coming home as it was going away.

TWENTY motor-cars belonging to the Motor Volunteer Corps were engaged in the recent military operations in the Thames Valley.

THE George Eliot Cycle and Motor Company, Limited, has been registered with a capital of £1,000 to acquire the business carried on by Mr. J. N. Birch, at Nuneaton.

THE Motor Castings Company, Limited, has been formed with a capital of £1,000 to acquire from Mr. C. H. Rush the business carried on by him at 101, Gray's Inn Road, W.C.

DURING the A.C.G.B.I. Reliability Trials, Messrs. Woollard, Limited, of 10, High Town, Hereford, will carry a stock of lubricating oil, "Castle" accumulators, and other accessories likely to be required by motorists participating in that event.

THE Anglo-American Motor-Car Company, Limited, have just received delivery of an improved type of Cadillac car designed to meet the requirements of those who require a somewhat more roomy vehicle, and one having more in the way of small refinements, than the popular model "A." The new vehicle, which is known as "Model B," is supplied either as a two-seater, as a tonneau, as illustrated herewith, or as a Surrey with a side entrance, beside which delivery vans intended for loads of from five to six cwt. are also constructed on the same *chassis*. The vehicle has a pressed steel main frame instead of one

built up of angle steel, the front-axle, too, being formed in the same way. The wheel base is 6ft. 4in., and the track 4ft. 6½in. The artillery wheels are fitted with 800 mm. by 85 mm. tyres. The general arrangement of the engine and the transmission gear remain almost exactly the same as on the earlier model, the bonnet merely serving to cover the water-tank and the tool box. Amongst the improvements that have been made the following may be specially referred to. It is now impossible to introduce the starting-handle without first automatically retarding the ignition, and, since the compression is reduced at the same time, there is no fear of back-firing. Then, too, the two-way switch connected with the ignition batteries is so linked up with the engine lubricator that the latter is turned on and off at the same time as the electrical circuit is made or broken. The new lubricator has four adjustable sight-feeds, and has a much larger capacity than on the older cars. All three types of body for the touring cars are of comfortable construction, and afford ample room for the passengers. Complete, and in running order, they vary in weight from 11½ cwt. for the runabout, to 12¾ cwt. for the tonneau, whilst the delivery van weighs but 13 cwt. The bodies are so fitted that they can be taken off without disconnecting any portion of the mechanism. Altogether the new model B may be expected to fully maintain the excellent reputation which the Cadillac cars have already earned for themselves in this country.

THE Admiralty have placed a large order for L.B.G. sparking plugs with Messrs. Lamb Bros. and Garnett.

AT Heathfield, Sussex, motorists will find Mr. Ryder of considerable assistance should they be in distress.

THE Hozier Engineering Company, Limited, have upwards of one hundred thousand pounds worth of orders on their books for next year.

THE exports of automobiles and motor parts from the United States during June last reached a value of £36,358, as against £33,654 in the corresponding month of 1903.

A GOOD catalogue of motor garments comes to hand from Messrs. Nicoll, of Regent Street, W., and Cornhill, E.C. These are principally for ladies and gentlemen, but a large section is devoted to servants' motor clothes and liveries.

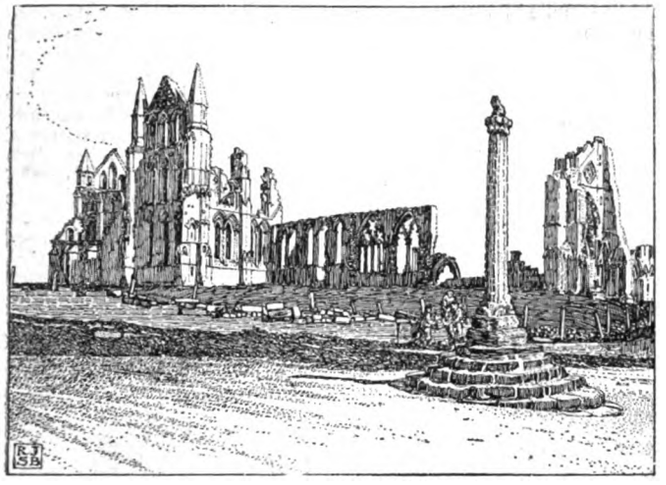
BY the use of a motor-car, Mr. C. P. Cole, president of the Lancaster (Ohio) Bank, was able to prevent the closing of the bank's doors in the face of a run. He carried a sum of £11,000 in gold from Columbus to Lancaster in record time.

MESSRS. BENNETT AND CARLISLE, LIMITED, have opened a new motor garage at the Cheshire Line Railway Arches, Deansgate, Manchester, where they will have every facility for the storage and repair of motor vehicles.

THE Roots Oil Motor and Motor Car, Limited, have sub-let their automobile garage in Chicheley Street, York Road, Westminster Bridge Road, S.E., to Mr. F. Graham Notley, who will also act as their London agent, and, after the 15th prox., as secretary of the company.

THE two Herald *chassis* supplied by Messrs. S. R. Bailey and Lambert, Ltd., to the London Express Motor Service, Ltd., for their motor hansom cabs have now run without intermission for six months on the London streets without trouble, and a further order has been placed with the agents. The additional vehicles are expected to be on the London streets in about six weeks' time.

THOSE who attended the Gordon Bennett race in Ireland will have pleasurable memories of the day at Castlewellan, which so many motorists reached by way of Newcastle, co. Down. To the latter pleasant district Mr. Wm. Beatty has written a capital guide-book, which is published by Messrs. R. Carswell and Son, of Belfast. The region round about is a most delightful one, while the good roads should be a further inducement to owners of cars to visit that part of co. Down, which includes Dundrum, Rathfriland, Clough, Rostrevor, and other pleasant places.



MOTORISTS have lately been freely seen on the east coast, and many of the public have been amusing themselves by tracing the towns from which have come the various cars they see. At Felixstowe more than a score of cars from northern districts have been garaged, and with the help of such a handbook as that published by Messrs. Jarrold and Sons, Ltd., their owners have been able to enjoy some capital drives in lanes and byeways made familiar by Constable and Gainsborough. Messrs. Jarrold's guides to various places in the eastern counties are uniformly excellent, which is giving high praise indeed.

LORD PEARSON in Court of Session has issued his judgment in the action by the Equitable Life Assurance Society, London, against the General Accident Assurance Corporation, Limited, Perth, for payment of £2,000. Pursuers insured the life of Loraine Barrow for £2,000, and the defenders guaranteed them to the full extent against any loss which might be incurred by them under the policy through the death of Mr. Barrow arising directly from an accident to a motor-car which he might be riding. Mr. Barrow was killed in the Paris-Bordeaux motor-car race in 1903. The premium paid by pursuers to the defenders was 2s. 6d. per cent. Defenders denied liability on the ground that their guarantee was procured by misrepresentation and concealment of the true nature of the risk. The insured was described as "Claude Loraine Barrow, of Valla la Romana, Biarritz, France, gentleman," and the description "gentleman" was that of a first-class risk. Nothing was said about driving motor-cars or driving cars in races, and such risks could only be covered (if at all) by a much larger premium. Lord Pearson has assoilzied the defenders, with expenses.

THE NORTH RIDING.

THE latest of Messrs. Methuen and Co.'s "little guides" is concerned with the North Riding of Yorkshire, which is dealt with on the excellent plan that has proved so convenient with other counties. Mr. J. E. Morris, B.A., is responsible for the letterpress, and Mr. R. J. Bertram for the illustrations, two of which we reproduce by the courtesy of the publishers. The surfaces of the main roads in the North Riding are

Whitby Abbey.

excellent, but many of the bye-paths are loose and stony, and will require much attention ere accessible to motorists desirous of touring in comfort. In the dales winding roads are the rule, but Wensleydale, Teesdale and Swaledale may be traversed with ease and pleasure. Some fine river scenery is to be met with in this county, and Messrs. Methuen's guide will prove of material assistance in ascertaining the beauties of the district.

Roseberry Topping, which can be approached from the village of Great Ayton or the more considerable town of Guisborough, is only of modest elevation, but it is famous historically, and being of conical shape, located on the edge of a moorland plateau, is the most conspicuous hill in the Cleveland district of the North Riding. From its summit an extended view of pleasant pastures and cheerful corn fields can be obtained, while to the east is a limitless view of Yorkshire fells.

The second illustration is of Whitby Abbey, situated in the most picturesque town on the Yorkshire coast and having a long history from the days of Hilda of Hartlepool, who established a religious house there in the seventh century. The site of the Abbey is only rivalled by that of Tynemouth, in Northumberland. The ruins are on the crest of the cliff, 200 feet above the sea-level, and consist almost entirely of the chancel, north transept and part of the nave.

The "Little Guide" is rendered all the more useful to the reflective traveller by an admirable bibliography of the North Riding and an excellent map.

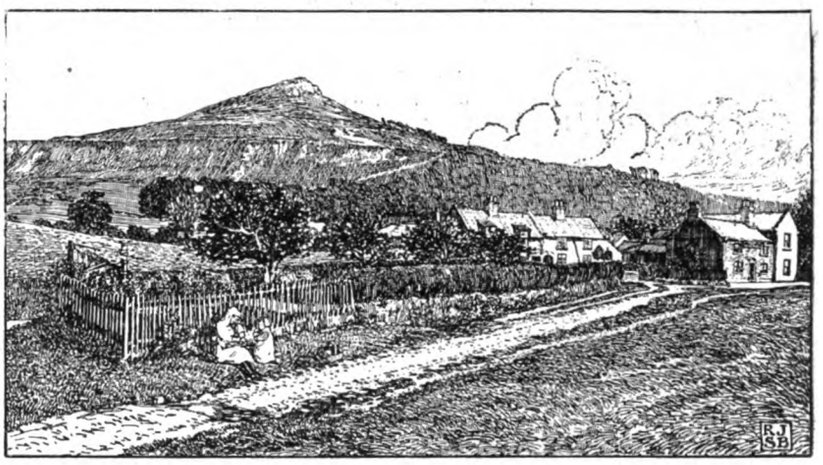
THE WEST END MOTOR COMPANY, LIMITED, has been registered with a capital of £3,000 to acquire the business carried on by Mr. A. S. Ross, at 61 and 62, High Street, Bloomsbury, and 83, Hatton Garden, E.C., as the West End Motor Company.

ON Friday, the 12th inst., the quarterly 100 miles non-stop trial of the A.C.G.B.I. was held, the entries being a 12-h.p. King car and one of 16-h.p., both entered by Messrs. King and Company, of Leicester. Both cars ran well throughout the trip, and made non-stop runs.

THE LIGHT CAR TRIALS.

IN our issue of the 6th inst. we gave a map showing the routes for the reliability trials for light cars organised by the Automobile Club. So far there are thirty-six entries.

Class A is for cars of a selling price of £125 or less, and three entries have been received, one from the Horley Motor Company, the others being a 6-h.p. Jackson dogcart and a 6-h.p. Speedwell car, both having single cylinders of 90 mm. by 110 bore and stroke respectively.



In Class B the entries are twice as numerous as in the first category, the range of price being £25 higher. All the vehicles entered are of the single cylinder type, and comprise a 6-h.p. Jackson dogcart, a 6-h.p. light Vauxhall, 7-h.p. Oldsmobile runabout, 6½-h.p. Service, 6-h.p. Pelham and a Horley car.

For cars selling from £150 to £175 Class C has been provided. Here the two 7-h.p. Stars and the vehicle entered by Messrs. Chambers and Co. have two cylinders, the others only one. The entries thus far are as follows:—

	Bore and stroke of cylinder.
6-h.p. Light Wolseley...	4½ in. by 5 in.
6-h.p. Mobile	
8-h.p. Brown	110 mm. by 120 mm.
9-h.p. Speedwell	100 mm. by 120 mm.
7-h.p. Swift	95 mm. by 110 mm.
7-h.p. Little Star	3½ in. by 4½ in.
7-h.p. Little Star	3½ in. by 4½ in.
6½-h.p. Royal Humberette	4 in. by 4½ in.
7-h.p. Alldays No. 1	4 in. by 4½ in.
6-h.p. Siddeley	4½ in. by 5 in.
7-h.p. Chambers	3⅛ in. by 4½ in.
6-h.p. Light Wolseley...	4½ in. by 5 in.

Class D is for cars of a selling price of more than £175 and not more than £200—the maximum price allowed for the trials. In this class the Chriton Automobile Company has entered a four-cylinder car; the Swift, Royal Enfield, Royal Humberette, and Messrs. Garner and Company's entry have two cylinders, all the others having single cylinders. The 8-h.p. Mobile is a four-seated vehicle, the 10-h.p. Oldsmobile, the 9-h.p. Anglian and the 7-h.p. Alldays have three seats, all the others having accommodation for two passengers, including the driver. The entries are as follows:—

6-h.p. De Dion	90 mm. by 110 mm.
6-h.p. De Dion	90 mm. by 110 mm.
8-h.p. Mobile	
10-h.p. Oldsmobile	5½ in. by 6 in.

Roseberry Topping.

7-h.p. Swift	80 mm. by 85 mm.
8-h.p. Royal Enfield	3½ in. by 4 in.
9½-h.p. Cadillac	5 in. by 5 in.
10-b.h.p. Chriton	3 in. by 3½ in.
9-h.p. Anglian light car	100 mm. by 120 mm.
7-h.p. Alldays No. 3	4 in. by 4½ in.
8-h.p. Rover	4½ in. by 5 in.
7½-h.p. Royal Humberette	3½ in. by 4 in.
6-h.p. Belsize Junior	115 mm. by 125 mm.
8-h.p. Simms	110 mm. by 110 mm.

CORRESPONDENCE.

THE BEXHILL MEET.

To the Editor of *The Motor-Car Journal.*

Sir,—Noticing Mr. E. H. Arnott's letter *re* the Bexhill meet, may I say that I also was asked by the man he refers to for 10s., which I paid, being under the impression that everyone had to do the same. On noticing, however, that the occupants of other cars did not seem to comply with his demands, I followed him, and found that some paid, until one gentleman, on close enquiry, discovered that if the car was moved to the other side of the road no charge was made. This discovery "pricked the bubble," and most of the cars moved to the other side, and, as far as I could see, the man gave it up as a bad job. In my opinion the whole proceeding was done in an underhanded manner, as no information was given anywhere that a charge would be made for cars, or that they would be free on one side of the road. I am afraid the 10s. is lost, but am rather curious to know who takes the money for this "rush." Trusting you may find room for this letter, as it may be the means of saving 10s. to motorists next Bexhill meet.—Yours truly,

Fleeced.

A HINT TO REPAIRERS.

To the Editor of *The Motor-Car Journal.*

Sir,—We have recently had a small experience which may be useful to others in the trade. We had occasion to take to pieces a car engine of well-known and very excellent French make, and among other things to take down the two to one gear. It is usual in engineering practice to mark gear wheels that have to be kept in step with marks so that when the wheels are put together with the marks adjacent the wheels are right. We noticed that there were such marks on the wheels and therefore took no measures to mark them ourselves, but put them together according to the marks and found that the engine would not run satisfactorily. Before taking her to pieces we had had the curiosity to find out how the valves and ignition were set, and found that in order to set the same the wheels had not to be put together to the marks, which were therefore misleading. On being set as before the engine ran all right. The moral is, when taking an engine to pieces either put your own marks on the wheels or see that those that are there are right.—Yours truly,

Strickland and Co.

THE OLDSMOBILE.

To the Editor of *The Motor-Car Journal.*

Sir,—Would any readers of the *Journal* kindly tell me of their experiences with a 5-h.p. Oldsmobile? What I should like to know is whether the car is reliable and easy to keep in going order without continual repairs and renewals; also whether the back axle and springs are sufficiently strong to stand the strain of a third person on the back seat.—Yours truly,

A. H. K.

THE HOUSING OF MOTOR-CARS.

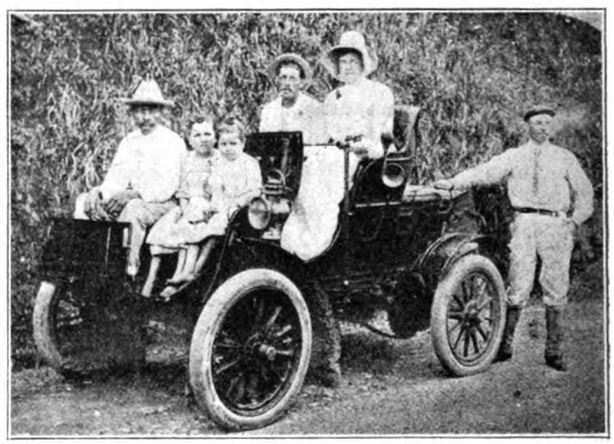
To the Editor of *The Motor-Car Journal.*

Sir,—A large majority of motorists are converts from what our Gallic neighbours call "hippisme," and consequently use their old stables for their new steeds; but, though a good stable is adaptable as a very satisfactory motor-house, the problem of motor-car accommodation is not best solved by the architect who proceeds on old-fashioned stable lines. In towns, the stable is generally perforce in close proximity to the house, but in country districts it is usually as remote from it as possible, an arrangement obviously preferable for hygienic reasons where horses are concerned, but quite unnecessary and inconvenient in the case of motors. A motor-house I saw recently was built abutting on the outer wall of the kitchen, from which hot-water pipes, forming part of the house system, were carried to warm it in cold weather; while in another case the car-shed, also warmed in a similar way, took the form of a well-appointed room, accessible from the hall, so that preparations for starting could be made comfortably in cold weather. Such luxurious appointments cost little where a new house is concerned, and deserve the attention of architects.

The warming of existing stable is a more difficult question. It is objectionable to leave lamps burning in the proximity of petrol containers, unless a safety stove somewhat on the Davy lamp principle could be supplied for the purpose; a flue under the concrete floor, with an outside grate like a greenhouse or a Roman bath, would be better, but is expensive. Well-closing doors, the exception rather than the rule in ordinary coachhouses, will do much to keep frost out of a brick building unless severe, but, of course, a corrugated iron one—often used for cars—is no protection against cold. With petrol cars, the use of glycerine in the cooling water, or the emptying of tanks, removes the risk attending frost, except that of injury to the tyres, which do not benefit by low and variable temperatures; but with steam cars, the trouble of running off the water is too great for some protection against frost not to be demanded.—Yours truly,

W. M. Lewis.

TROUBLES WITH SECOND-HAND CARS.



To the Editor of *The Motor-Car Journal.*

Sir,—I have recently acquired an old Daimler wagonette. On jacking it up I find that all the work, both backward and forward, is done by the near side back wheel. Is this right, or should the far side wheel have control of the reverse gear? If so, will you please tell me the probable cause of the trouble? A man used to motors told me that one wheel should work the backward speed and the other the forward speeds, as the machine is fitted with a differential gear. This is not the case, as one wheel seems to do all the work while the other remains nearly motionless or makes a sudden move occasionally of 1 or 2 feet, perhaps, to the other wheel's 5 or 6 revolutions.

The machine is fitted with four speeds, 3, 6, 9, 12 miles per hour, and reverse. On starting I have some difficulty in getting the machine to take the second and third speed, there being such a rattling, grating, and knocking of cogs in the gear-box that I am afraid I must be doing some damage. On Saturday last I went for a short run of six miles. I started all right except for the first mile or so. I could not get over three miles an hour out of the car. I tried several times to get on the second speed and every time the engine stopped. At last I stopped, and started on the second speed and continued the run, the car then going all right. On starting the return journey I had great difficulty in getting the engine to start, it seeming to always give a nasty kind of back stroke almost like wrenching your arm. At last I got the engine started, and this time had practically no difficulty in getting on to the second speed. When about two miles out I noticed that the engine was running steadier, so I lifted the accelerator, but to no purpose, as the car gradually slowed down and stopped. What was the reason I cannot say, because we were at the foot of a slight dip in the road we had just passed over, and there was no rise ahead of us. I did not put the clutch out so as to let the engine free. Should I have done so? Anyhow, I did not know what was the matter, so I tried to start the engine again. It refused for a few strokes, always striking back, but with a little perseverance I got it started again. Another two miles, conditions practically the same, bottom of slight hill, another stop, did not touch clutch, although

Interested Spectators at Ponce.

MOTORING IN PORTO RICO.

Digitized by Google

lifted accelerator. A bit of persuasion and another start, and a run to the finish. If you can give me any information as to what was the matter, it will be very highly appreciated.—Yours truly,

C. W. P.

[By jacking up the rear wheels of the car it is very probable that one wheel would run in a forward direction and the other in a back, this because of the differential gear, but if one of the wheels is held stationary, the other will still rotate; it does not matter which wheel is held. When the wheels are on the ground, both take the drive equally, both forward and backward. The use of the differential gear is to compensate the difference of speed of the wheels whilst going round a corner, the outside wheel always travelling a larger radius, and therefore has to cover a greater distance. With regard to the driving of car and the grating of gears, we would strongly recommend a few lessons under a competent driver, as nothing but practice will give anything like satisfaction. The changing of gear should always be done with the clutch out, and should never be done with the clutch in, otherwise grating of the gears results.]

HOTEL CHARGES.

To the Editor of *The Motor-Car Journal*.

Sir,—Having had experience of the exorbitant charges made by hotel-keepers for accommodation for motorists, I recently determined on a method of escaping the same. It may seem somewhat out of place to the person of means, but for the ordinary man who does not want to be fleeced I would commend it. I arrived at a town, left my car with a local motor agent and secured hotel accommodation for myself and party. Consequently I was charged at about half the rate that would have been my lot to pay had I driven up in the car. Hotel-keepers have only themselves to blame in the matter. A little reasonableness on their part would be mutually agreeable.—Yours truly,

A Touring Motorist.

A WRINKLE IN TESTING PETROL.

To the Editor of *The Motor-Car Journal*.

Sir,—Having had a deal of trouble with cloggy valves, I have discovered a better method of testing spirit than by densimeter. You may find your spirit the proper density by densimeter, and still be troubled by sticky valves; on the other hand, you can get petrol at ·715 to ·720, and not have sticky valves. Get a small crucible cup (such as are used by photographers), they can stand any amount of heat. Put about a tablespoonful of spirit in cup, and light it and let it burn out. If it leaves a sticky substance in bottom of cup, one can be sure it is not good petrol.—Yours truly,

Scotia.

LOOK AFTER THE CHAINS.

To the Editor of *The Motor-Car Journal*.

Sir,—We again read of a fatal motor-car accident, this time in Newport, Mon. What I would like to suggest is, are the sprocket chains of most of our modern motor-cars made heavy enough? I have travelled over 6,000 miles on the car I am in charge of since January last, and I am using my fourth set of chains. My employer finds this expensive, and I may say he often does not know the risks that are incurred through having chains too light. I am driving an English-built car, and may say they are turning out worse hand brakes on their cars than they did three years ago. The brakes can be adjusted to practically hold the car up on any gradient, empty, but when there are two passengers in the car and a chain snaps, it has no effect.

Some might say this lies in faulty adjusting, but I wage that it is in the faulty principles of their newfangled brake ideas. When I am running on practically level roads I use my old chains, but when I am ordered for such hills as Whistlefield, Rest-and-be-thankful, Dalmally, or any Highland touring, I always make it a point to have a good set of chains on the car. It is very seldom a roller chain jumps the sprockets, in my experience they oftener snap. A word of warning may not be amiss to the novice. If you hear any of your chains clicking when you are running it is certain that the chain is badly stretched. Take it off and have any links it requires replaced. The chain is a thing that must not be overlooked by builders of motor-cars. It was only the other week, on Loch Lomond side, I saw a car that was overturned through a faulty chain, but happily no one was seriously hurt.—Yours truly,

Six and a Half Years' Experience.

REGISTRATION.

To the Editor of *The Motor-Car Journal*.

Sir,—"Late 186" is not the only one who has been imposed upon. I think my case deserves notice. I ordered a small two-seated car from a firm in Eccles a short time before the Act came into force, and, wishing to retain a small number, registered it, paying 20s. On the arrival of the car I found it to be very unsatisfactory and after some trouble returned it to the makers, who kept it for some time. In the meantime I purchased another car from a different firm, and, wishing still to retain a small number, and to quash the previous registration, again paid 20s. After trying this new car for a few weeks, I found it to be faulty, so exchanged it for a more expensive car. I was again mulcted for 20s. Now, to crown all, I have the first car returned from the makers, and I am worried by the Excise to take out an additional licence, which means £2 2s., and another 20s. for a new number, although I have not used the first car and do not intend doing so, as the one I have is very satisfactory and quite answers my purpose.—Yours truly,

Victimised.

[There is no need to pay excise duty unless the car is used. Then we are afraid our correspondent would have no remedy, should an Inland Revenue officer challenge him on the subject. We shall be glad to have the experience of other motorists on the subject, which is one of general importance as well as of particular interest.]

STEAM CARS.

To the Editor of *The Motor-Car Journal*.

Sir,—As a motor enthusiast, I should like to say a few words about the steam car. To my thinking there exists to-day an unwarrantable prejudice against the light steam car, though I must admit until recently I myself scoffed at them. A friend of mine who has a Stanley has lately taken me one or two runs on his car, and I can assure you the way it travels, whether up hill or on the level, has been an eye opener to me. For ease and comfortable riding it is delightful, and, though I drive a fairly powerful car myself, I cannot take the hills like this little car. Perhaps the water question is a little troublesome, but with the aid of an injector it is only a matter of a very short time to fill the tank again,—Yours truly,

Enthusiast.

BELT TRANSMISSION.

To the Editor of *The Motor-Car Journal*.

Sir,—"J. B." is not the only one who would hail a perfect gearless belt-driven car, but the problem is not so simple as it looks. The trouble has been in keeping several belts tight, adjustment on the road, and the number of pulleys. The belt race cones he mentions would reduce the number of pulleys to two and only require one belt, thus we arrive at the minimum sought after, but can this belt be controlled? If it can, as "J. B." hints, then we may see a belt resurrection.

The matter of take up is also a vital one to success; this must be automatic, say by spring frictionless jockey or sliding centres. Another cause of failure has been the small belt surface. There is plenty yet in the subject for pioneers to work at, and a market when the right thing comes.—Yours truly,

Onlooker.

SOLID TYRES.

To the Editor of *The Motor-Car Journal*.

Sir,—Could any of your correspondents advise me as to the best solid tyres to use on the back wheels of a 7-h.p. Panhard car which is running daily over flinty and slippery roads?—Yours truly,

(Hon. Mrs.) Julian Byng.

Charges for Petrol.—"Tourist" writes:—"A run from London to Blackpool and back brings out many variations in the price of petrol. The average charge at present appears to be 1s. 2d. per gallon. The lowest was 1s. at the Central Motor Garage, Blackpool, and the highest 1s. 4d., at Preston Motor Garage, Charnley Street, Preston. I strongly demurred at the latter charge, which surely is exorbitant in a town the size of Preston."

Petrol at Ullswater.—"A. E. G." writes:—"It might interest motorists to know that they will have to pay 2s. per gallon for Pratt's A Motor Spirit at the Ullswater Hotel, Ullswater; at least, this is what I had to pay last week, and was informed it was their usual charge."

A Jack Found.—When out motoring recently Mr. R. Southworth, of Fairfield, Clitheroe, picked up a jack, which he will be pleased to return to the owner on receipt of information giving the name of the maker, and stating, as near as possible, where it was lost.

A Rushin' Japanese Affair.

CLUBS AND ASSOCIATIONS.

LINCOLNSHIRE.

THE question of amalgamating the two Lincolnshire Clubs—the County Club and the South Lincolnshire Club—which some of the members unsuccessfully tried to bring about a short time ago, is again under consideration, and at a meeting of the County Club held at the White Hart Hotel, Sleaford, on Thursday last week, under the presidency of Captain J. A. Cole, J.P., the proposals of the South Lincolnshire Committee were considered. These, however, were not as a whole acceptable to the meeting, and the following resolution was passed:—"That the members of the South Lincolnshire A.C. be accepted as members of the Lincolnshire A.C. and be affiliated with the Motor Union for the rest of the present year on payment of 12s. 6d, per member, subject to the consent of a general meeting. That the present vacancy on the committee be filled by the appointment of a member residing in the Holland Division. That for the future the committee of the Lincolnshire A.C. recognise that two members of the committee should be resident in the Holland Division, but that this question must be left to the general annual meeting of the Lincolnshire A.C., although the committee will do their best to ensure the election of two such members. That all members of the South Lincolnshire A.C., who are also members of the Lincolnshire A.C., be credited with the sum of 12s. 6d. towards their subscription for the year 1904." Other business transacted at the meeting included the appointment of a sub-committee, at the request of the Lindsey County Council, to advise regarding the erection of danger boards in the Lindsey Division. The meet and competition at Roxholme Hall (the residence of the Chairman of the Club), which was fixed for to-day, was postponed to the 27th inst., and an invitation by the Hon. Maurice Gifford for a club meet at Grantham was accepted. The following new members were elected:—Mr. B. H. Gainsford, Woodthorpe Hall, Sheffield; Mr. Charles Hardy, Bulwell Hall, Notts; Mr. G. L. Haslehurst, Lincoln; and Mr. Arthur Booth, Lincoln.

There was a somewhat novel meet at Lincoln Castle on Saturday, Lincoln members of the Lincolnshire Club combining to entertain the out-of-town members of the county club at a garden party. The castle grounds had been placed at the disposal of the members, and very pretty and animated they appeared when the whole of the fifty cars had arrived from various parts of the county and were placed about the grounds. The band of the Lincoln Volunteers played a selection of music, and a pretty marquee had been erected in an enclosure on the lawn, where refreshments were served. Before tea an appearance competition was held, sixteen of the visiting cars entering. The judges were Mr. C. H. Seely, M.P., and Mrs. Seely, the Mayor and Mayoress of Lincoln, and Mr. and Mrs. M. H. Footman, and they awarded the first prize, a piece of plate, to Mr. T. W. May, Bourne, 12-h.p. Wolseley, a noteworthy car. Mr. W. T. Gent, Misterton, was second with his 10-h.p. Rose, a Gainsborough car. After tea the visitors inspected the Norman keep and Norman gateway, and the several other interesting features of the castle.

Among those present were Captain J. A. Cole, J.P., Captain Lyall, Mr. W. R. Lilly, Dr. Godfrey Lowe, Mr. J. R. Richardson, Mr. R. W. Wright, Mr. C. Holland, Mr. J. T. Coleman (chief constable), Dr. W. H. Brooke, Mr. E. Cragg (hon. sec.), Dr. H. Steil, Canon Hutton, the Rev. M. C. Wilkins and others. Mr. C. W. Pennell was chairman of the committee formed to carry out the local arrangements, Mr. C. Nelson being the hon. sec.

KENT.

ON Saturday Mr. and Mrs. J. E. Austen entertained the members and friends of the Kent Automobile Club at West Court, Detling, near Maidstone. A most pleasant afternoon was enjoyed by those present.

A competition was held, restricted to amateur drivers only, there being two classes, the first being for cars of over £300 selling value, and the second under that sum, each car competing having to carry the full complement of passengers. Dr. Charles Firth, Mr. W. Willis and Mr. J. D. Siddeley acted as judges, and Mr. H. J. Swindley officiated as timekeeper. Mr. Granville Kenyon (the hon. secretary) started the cars from the foot of the hill. Detling Hill, which is on the main road from Maidstone to Sittingbourne, is a very good test hill for cars, being about a mile in length, and the steepest gradient being 1 in 11. In the first class Mr. T. H. Nash on his 10-h.p. Renault was the winner, his time being 2 min. 58 3-5 sec.; Mr. R. Lucas' 14-h.p. Lucas car, driven by Mr. Owen Firth, being second in 3 min. 12 2-5 sec. In the second class Dr. Firth's 14-h.p. Lucas car, driven by Mr. Owen Firth, was the winner, his time being 2 min. 56 2-5 sec., Mr. Reed, driving his 8-h.p. De Dion, being second in 4 min. 44 4-5 sec. The two Lucas cars were by error entered in the first class, but were of quite different design, Mr. Lucas' car having a balanced engine with two speeds, whereas Dr. Firth's car had an unbalanced engine with one speed, and was therefore a lower priced vehicle and came in the second class. Mr. H. O. Hall drove his 15-h.p. Darracq and was timed up the hill, but did not compete; his time was 2 min. 36 4-5 sec., being the best time done.

After the competition the members and their friends adjourned for tea and refreshments to the beautiful grounds adjoining Mr. Austen's residence, where the band of the Royal Engineers was much appreciated.

The Meet of Lincolnshire Motorists at Lincoln Castle.

The hon. secretary having announced the result of the competition, Mrs. Austen presented the prizes, Mr. Nash receiving a handsome electric inspection lamp and Dr. Charles Firth an automobile watch and case. The times of competing cars were as follows:—

CLASS 1.

Owner.	Car.	Time. m. s.	Driver.
1. T. H. Nash	10-h.p. Renault	2 53⅘	T. H. Nash.
2. R. Lucas	14-h.p. Lucas	3 12⅘	O. Firth.
3. F. S. Hallows ...	16-h.p. Clement	3 31⅕	F. S. Hallows.

LEICESTERSHIRE.

THE annual run of the Leicestershire Automobile Club to the Monastery, Charnwood Forest, took place on Thursday of last week. Among the members and friends who participated in the run were Mr. E. G. Mawbey, the president of the club, Mrs. Mawbey, Mr. Maurice Mawbey, Mr. and Mrs. Victor Oliver, Miss Bryant, Mr. Evans, the Rev.

Digitized by Google

Lammas, Mr. E. H. Herbert, and Mr. Alan McAlpin (hon. secretary). Through the charming lanes that lead to Nanpantan and Loughborough the party sped, and soon after leaving Loughborough the lovely panorama in which the Monastery nestles lay before them. At High Tor Farm tea was taken, and after another ramble the cars were turned homewards, Leicester being reached *via* Markfield. To-day's (Saturday) run will be to Matlock Bath.

DORSET.

AT the Blandford meet of the Dorset Club, to which brief reference was made in last week's *Journal*, several interesting competitions were held. Mr. C. E. Mason won the coach house competition for cars under 10-h.p. on his Oldsmobile; the bending race fell to Captain Kitson, on his 15-h.p. De Dietrich; the Rev. H. C. Coote's 20-h.p. M.M.C. was successful in the ladies' passenger race for cars over 10-h.p.

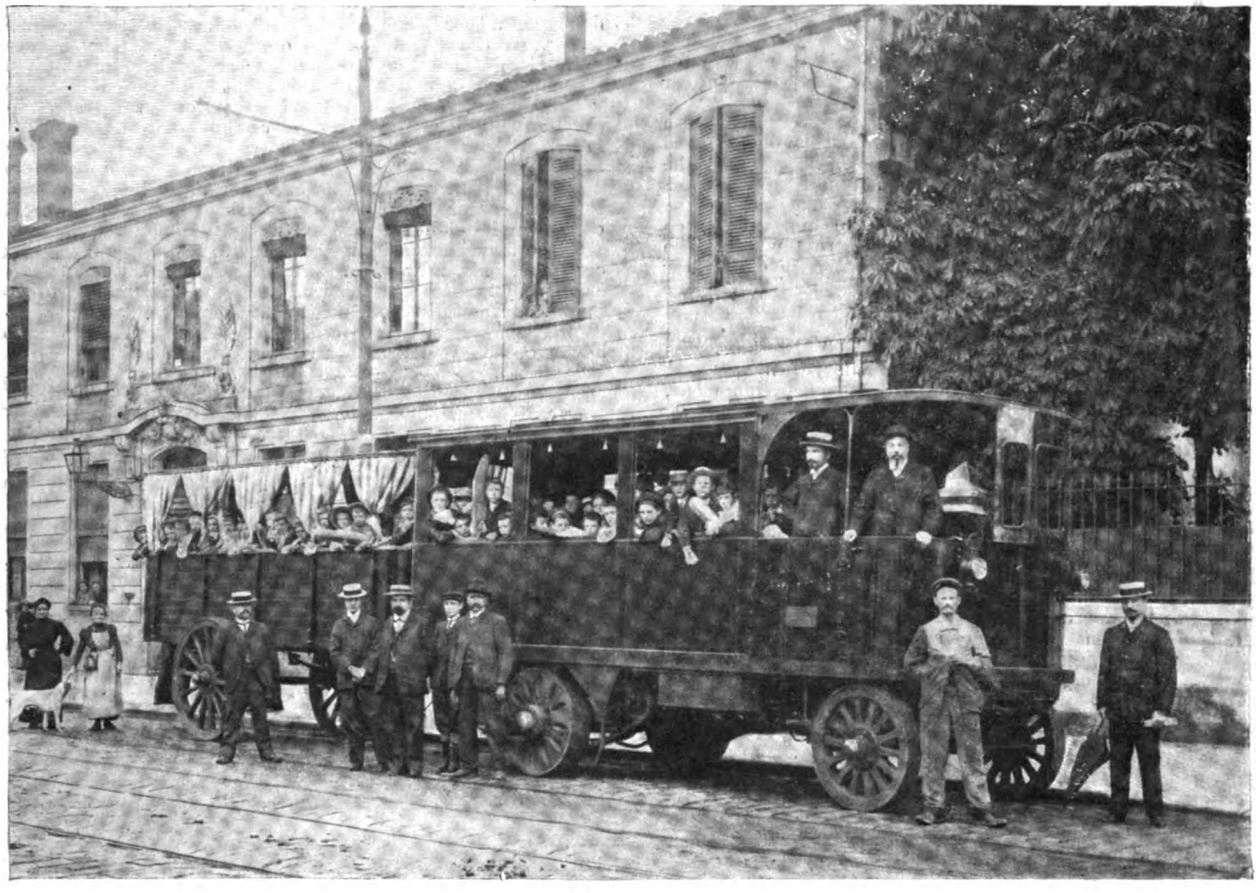
NORFOLK.

AT the invitation of Major and Mrs. Guy Withington, the Norfolk Automobile Club have had a most successful meet at Thelveton Grange, Scole. Altogether twenty-one automobiles put in an appearance, as follows:—Major Guy Withington, 20-h.p. Brooke; Messrs. J. Hargreaves, 22-h.p. Daimler; E. Estcourt, 14-h.p. Brooke; H. R. Griffin, 14-h.p. Gladiator; Gilbert Morse, 12-h.p. Brooke; Dr. Ballance, 12-h.p. Darracq; H. W. Egerton, 12-h.p. Gladiator; S. A. Rayns, 8-h.p. De Dion; G. Sillem, 12-h.p. Gladiator; Walter Crawshay, 14-h.p. Brooke; W. Gibson, 12-h.p. Darracq; W. E. Long, 10-h.p. Panhard; A. Mayor, 10-h.p. Swift; J. N. C. Ray, 8-h.p. Wolseley; S. L. Cocks, jun., 7½-h.p. Wolseley; J. W. Brooke, 14-h.p. Brooke; H. W. Williams, 4½-h.p. De Dion; C. H. A. Lock, 6-h.p. De Dion; W. P. Cubitt, 6-h.p. De Dion; H. W. Garland, 4½-h.p. De Dion; G. C. Davies, 6-h.p. De Dion.

HERTFORDSHIRE.

ON September 10th the Hertfordshire Automobile Club, which, by the way, has cancelled its picnic at Burnham Beeches, will hold an open hill-climbing handicap. The competition will be a handicap based on the following formula:—

$$\frac{\text{(average speed)}}{\text{actual h.p.}} \times 1{\cdot}33 \times \sqrt{\frac{1}{\text{mean dia. of wheels.}}} \times \frac{\text{weight loaded}}{\text{weight empty.}}$$



and will be carried out on Aston Hill, between Tring and Wendover, Bucks.

EASTERN COUNTIES'.

THE seventh summer meet of the Eastern Counties' Automobile Club took place on Saturday, at Dedham. Mr. A. O. Stopes, one of the most enthusiastic automobilists in the district, met the members and their friends at the Marlborough Hotel, Dedham, and acted as guide. Amongst those present were Captain W. T. Pretty, Mr. John Howells (from Kington, Radnor), Mr. J. G. Howells, Dr. E. L. Rowe, Mr. E. C. Sayer, Mr. J. C. Edwards, Mr. H. G. Kettle, Mr. Norman Adlard, Mr. John Spinks, and others.

THE MOTOR CAR ACT.

THERE were three summonses on Tuesday at Greenwich against Robert Box, a motor driver in the employment of Mr. F. Hoar, of High Street, Woolwich, for breaches of the Motor Car Act; and Mr. Hoar was summoned, as the owner, for causing the offences to be committed. The cases were heard separately, Mr. Baggallay remarking that the orders and clauses of the Act were very complicated. On the first summons, it was admitted that the weight of the motor was not painted on the side while it was used for drawing another vehicle, and exceeded 15 cwt. unladen. On this summons Box was fined 10s. and 2s. costs. On the second summons a fine of 40s. and costs was inflicted in respect of the vehicle drawn by the motor having a brake only acting on one wheel. The third summons was for failure to have two independent brakes to the motor itself. The defence was that the reversing gear was a brake, but Mr. Baggallay ruled otherwise, although an expert witness said the reversing gear would stop the car going down hill. His worship, however, reserved his decision in the third summons. He ordered Mr. Hoar to pay 2s. costs on the first and second summons, the third being withdrawn, having by some error been issued as a duplicate of the second.

A School Treat by Motor Wagon at Bordeaux. [*La France Automobile.*

POLICE TRAPS.

COLCHESTER now has its police trap—a measured quarter of a mile in Lexdon Road, from the drinking fountain to St. Mary's Lodge.

TWO or three traps are in active operation near Coventry—one at Allesley, on the Birmingham road, and another at Marton, on the way to Southam.

AT Coulsdon the police have a trap over a distance of 220 yards.

THE police are very active in the Washington district, on the Worthing road.

Digitized by Google

CASES DISMISSED.

At Colchester Police Court, Mr. Hatherly Wood was summoned for driving a motor-car at over twenty miles an hour—to wit, thirty miles an hour—on the 31st ult. Mr. Elliot Barker (of the firm of Jones and Son) defended. P.-s. Ball said that, in company with Detective Hammond, he was on the watch for motor-cars on a measured quarter of a mile in Lexden Road. The defendant, who was alone in the car, drove over the quarter of a mile in 29 secs.—working out at 31 and 1-29th miles per hour. At the end of the quarter of a mile witness called on him to stop, and he pulled up within a hundred yards. Witness was thirty-two yards past the mark, so that it took him 132 yards to pull up. Witness offered to measure the distance for him, but he said he would take witness's word. Witness told him that he would be summoned, and he replied that he had not been driving to the public danger. After Mr. Wood had given evidence the Bench dismissed the case.

Mr. F. W. Shorland, of London, was charged at Alford (Nottingham), with recklessly driving a motor-car at South Reston on the 1st inst. Mr. Firth, of London, appeared for the defendant. The evidence for the prosecution was that on the night in question Mrs. Scargall was driving home from Mablethorpe, in company with another lady, her servant, and four children. When passing through the village of South Reston the defendant, who was driving a motor-car, ran into the rear of the trap, with the result that the occupants were thrown out. The defendant maintained that the responsibility for the accident rested upon Mrs. Scargall, who pulled her trap right across the road when the car was within six feet of it. The case was dismissed.

The Rev. A. J. Heelis, Brougham, was charged at Penrith with riding a motor-cycle at Penrith on the 16th ult., without having attached to the rear of the machine an identification plate. P.C. Taylor said he saw defendant ride down Castlegate, and following him saw him stop at Mr. Tinkler's, in King Street. He called defendant's attention to the omission, and the reply was that it was not needed. Defendant pointed to two identification plates, one on each side of the front wheel. The County Council regulations, however, said there must be one on the rear of the cycle. The Bench dismissed the case, believing that Mr. Heelis had been misled by a handbook to motor-cycle law by which he had been guided.

At Madras, Mr. Mir Hassan Ally, of Messrs. Ally Brothers, was charged, at the instance of the Hon. Henry Bradley, with rash and negligent driving of a motor-car. His Worship, in a lengthy judgment, acquitted the accused. The Court found it hard to discover why accused was supposed to have acted as alleged. In conclusion it was observed that the opinions of the experts examined proved how difficult it was to estimate the real pace at which a motor-car might be proceeding. Two of them said that even when they seemed to be going fast they might be going at but a moderate pace, and one said a comparison between the assumed pace of a horse and a car was unsafe. Such comparisons had been proved defective and untrustworthy. That this prosecution had been conscientiously launched there could be no doubt whatever, but the Court thought that it was based on a misconception of speed which induced a belief that betrayed conclusions and would tend to possible harm. It did not seem to the Court that such belief was well-founded having regard to such facts as had been put before the Court. The use of motor-cars in Madras was a comparative novelty, and this prosecution would not have been altogether without its advantages if it tended to caution on the part of car drivers by proving that their actions were keenly watched by an observant public.

Before Sheriff Smith, at Dundee, John Hayward, a motor-car driver, Brechin, was charged with having, on a public road in the parish of Auchterhouse, near Dundee, driven a motor-car at a speed of from fifteen to twenty miles, which was considered dangerous to several persons, and, in addition, with having refused to give his name and address when asked for. The evidence went to show that Hayward, while driving his car, encountered a man on horseback. The horse, on the approach of the car, reared in the air, and had the rider not dismounted and pacified the animal, a serious accident might have happened. In defence it was stated that Hayward sounded his horn immediately on seeing the man on horseback, and that the driver gave no signal for him to stop. The Sheriff found the case not proven.

At Basingstoke, Leonard Boyne, of The Limes, Epsom, appeared in answer to a summons charging him with driving his motor-car at an excessive speed through the town on Tuesday, June 21st, and knocking down a lad named Neville, who was leading a pony attached to a cart, but it appeared to the Bench that the boy contributed to the accident by drawing across the road in the way of the car, though the horn was sounded. The excessive speed alleged was not made out. The case was dismissed.

Mr. L. M. Robertson, of St. James' Street, London, was summoned at Maidstone for driving his motor-car in High Street, Maidenhead, at 23 miles 1,204 yards an hour on July 24. Mr. E. Grimwood Mears (instructed by Mr. Staplee Firth) cross-examined the timing of the police on the day in question. One of the policemen said that the alleged offence occurred at 11.35 a.m. and the other one who was called to corroborate him said that the time was 4 p.m. The Bench dismissed the case.

Mr. Leonard G. Elger, Wroxton House, Banbury, was summoned at Bedford on a charge of driving a motor-car in Bromham Road at a speed dangerous to the public. Mr. Baxter (the Town Clerk) prosecuted, and Mr. Clare defended. Defendant pleaded not guilty. P.C. Leutchford said he was in the Bromham Road about 12.55 noon, on June 29, when the motor-car was driven furiously past him. The defendant drove past several vehicles, and then knocked the Rev. Mr. Libbey, who was going in the same direction, off his bicycle. Mr. Libbey was on his proper side of the road, and close to the path. One man just avoided a collision by whipping his horse, and pulling on to the wrong side of the road. Defendant was on his correct side. Mr. Clare, in his speech for the defence, complained of the manner in which the case had been brought, and the long delay, in which the police were making distasteful inquiries in the defendant's village, when the constable could have obtained all the necessary information from him at the time of the accident. The fact that the car was pulled up in so short a space, and the constable was so quickly on the spot, disproved the contention as to pace the car was travelling. The defendant said he passed the constable at about ten miles an hour, and that was the maximum speed at which he continued to Union Street. At the corner he could see the cart coming round sharp on its wrong side, and in order to prevent running into it he pulled up sharp, and turned a little to the left, thereby touching Mr. Libbey. The car stopped within its own length. After a long retirement the Mayor said the Bench did not think the evidence sufficiently clear to convict.

At Guildford, on Saturday, Maurice de Brou was summoned for driving at a speed dangerous to the public. In the course of evidence it transpired that a collision had occurred at Thursley between the car driven by defendant and a butcher's cart. Mr. Moresby White, in his speech for the defence, pointed out that it had been held in the case of "The King v. Wells," that driving a motor-car at a speed in excess of the limit was one offence under this section, and that driving in a manner dangerous to the public was another altogether, and they were not entitled in considering the one to go into evidence affecting the other. Dr. Hall, of Milford, said he was a motorist, and knew the corner well. He was at the spot soon after the accident. The car was on its right side of the road. Had it been travelling over five miles an hour he would have expected to find it in a much more serious condition. Mr. Edward K. Purchase and Mr. R. W. Buttemer also gave evidence, and after a brief consultation the Chairman of the Bench said they had come to the conclusion that there was not sufficient evidence before them to justify convicting the defendant. The case was dismissed, having occupied three hours and three-quarters.

HIRING A MOTOR-CAR.

At the Leeds Assizes, Mr. A. Elsworth, Bradford, sued Mr. A. R. Garnett, London, for damages for injury to one of the plaintiff's cars and loss caused by the detention of the car. The plaintiff's case was that the defendant hired the car at the reduced rate of two guineas a day, and was allowed to drive it himself on signing a document agreeing to make good any damage. The car was taken to Harrogate and Morecambe, and was received by the plaintiff at the end of a fortnight in a damaged condition, the repairs being estimated at £30. Mr. Garnett said the car was in a very bad condition indeed when he took it out. The car ran with extreme noise. On the following day they went to Morecambe, and there the car broke down. His lordship gave judgment for the defendant on the claim, and awarded Mr. Garnett £2 on a counter-claim.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Huntingdon	Furious driving	£2, etc.
Shipston-on-Stour	Beyond legal limit	£2, etc. *
Southampton	Excessive speed	£7 10s.
Belfast	Furious driving	10s., etc.
Sunderland	" "	20s., etc.
Bishop Stortford	Not producing licence when required	10s., etc.
Malton	Not stopping when requested	£2, etc.
Lewes	Reckless driving	50s., etc.
Settle	Using an obscured identification mark	2s. 6d., etc.
Epsom	No number	5s., etc.
Roborough	Furious driving	£7 10s., etc.
Knaresborough	" "	£5, etc.
Sunderland	" "	20s., etc.
Wimbledon	Driving at excessive speed	20s., etc.
Bromley	Not producing a licence when required	10s., etc.
Woking	Keeping motor-cycle without licence	25s., etc.
Battersea	Excessive speed	£1, etc.
Exeter	Driving on wrong side of road	2s. 6d., etc.
Altrincham	Furious driving	£1, etc.
Liverpool	Dangerous driving	40s., etc.
Enfield	Lending number plate to fellow motor-cyclist	10s., etc.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, AUGUST 27, 1904. [No. 286.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ACCORDING to Lord Stanley, the Postmaster-General, some progress has been made during the past year with the use of motor-vans for the conveyance of mails. Mail services between the following towns are at present being performed by means of motor-vans:—London and Epping, London and Redhill, Manchester and Liverpool, Sunderland and Newcastle, and Birmingham and Warwick. Several motor-vans are also being used on mail services in London. The best results have been obtained on the service between London and Epping Speaking generally, the motor-vans that have been tried have not proved so reliable as horse vans; and it has been necessary to exercise caution in extending their use for the conveyance of mails in order that the public service should not suffer. The superiority of the motor-vans in point of speed is, however, an important advantage; and the Postmaster-General hopes that when they have reached a higher stage of development it will be possible to employ them extensively for the conveyance of mails.

◆ ◆ ◆

The Care of the Number.

THE old adage as to driving a coach and four through an Act of Parliament may now be modernised in connection with the Motor Car Act. The law says that in the event of a motor-car changing ownership notice of the alteration shall be given to the authorities by either the new or the old owner. No penalty is attached to either person in the event of neglect to do this, but the car sinks from its official state and becomes a mere unregistered car liable to be mentioned in the police-court. This is a point brought out at Manchester in a case reported on another page, and is one that those who buy or sell cars should not ignore. Care should be taken to see that the number is properly transferred.

◆ ◆ ◆

Alcohol for Manufacturing Purposes.

COLONEL SADLER, M.P., who is interesting himself in the movement for the relief of alcohol intended for manufacturing purposes from duty, says there are more than a hundred products in which alcohol is necessary. A great many of the processes were discovered here and worked in this country, but when Germany came into the field with cheap alcohol, it was found impossible, owing to the heavy duty obtaining here, to compete with the German manufacturers, and English factories had perforce to shut down, the Germans securing the trade. Good alcohol, says Colonel Sadler, could be produced here at from 8d. to 9d. a gallon, but under existing circumstances the cost is 12s. 6d. a gallon. The hon. member for Middlesbrough holds that if the duty on alcohol that had been rendered unpotable were removed, thousands of people would be afforded employment in manufactures on the one hand, while agriculture would be appreciably benefited on the other. In Germany many millions of potatoes are grown annually in order to obtain industrial alcohol, while 3,000,000 tons of beet were used last year in France for the same purposes. The purposes to which alcohol are applied in Germany are many and varied. Colonel Sadler, who has visited the alcohol-producing districts, says that it is largely used for lighting and cooking purposes, while as many as 30,000 spirit engines are at work in out of the way places. One firm in Berlin between October, 1903, and January, 1904, sold no fewer than 50,000 alcohol lamps.

◆ ◆ ◆

Motor-Car Imports and Exports.

IT is noteworthy that while the number of foreign motor-cars imported into this country in July was less than in the same month of last year, the value of the imports shows a marked increase. The number of cars imported last month is returned at 633, of a value of £251,472. Parts were responsible for £26,656, bringing up the total for July to £278,128, as against £295,312 in the preceding month and £235,947 in July, 1903. So far this year, that is to say, for the first seven months, the imports stand at £1,545,958, or approximately £245,000 more than in the same period of last year. Passing now to the exports of British automobile productions, the returns are somewhat disappointing, only forty-eight vehicles being shipped last month, these with the "parts" being valued at £21,535, while for the seven months ending with July the exports are returned at £161,465, or slightly below the total recorded for the corresponding seven months of last year.

◆ ◆ ◆

Motor Houses.

THE architectural profession is naturally interested in motoring, for its advent has brought a new factor in the design of houses for the middle classes as well as for country gentry. This is being recognised by the learned societies, and the Society of Architects has just had a students' competition for an automobile club-house, in which the design of Mr. James Stewardson was placed first. In this the club rooms and conveniences are on the ground floor, and the dining room, kitchens, caretaker's house, etc., on the first floor. The basement contains wine cellar, coal store, etc., and is connected to the bar by a spiral staircase. The rear of the building is occupied by a large garage and repairing shed with top lights. The repairing shed is provided with four pits for access to the underside of motor-cars. The dining room is a large well-lighted apartment, with vaulted ceiling. The kitchen, etc., are in close proximity to the dining room. The caretaker's house is arranged for ready access to all parts of the building, but is shut off from the same by a passage. The entrance to the caretaker's house is by a staircase from the large archway. The estimated cost of the building is £5,500.

◆ ◆ ◆

For Tourists in Ireland.

SO much has lately been written as to the inhospitality of Irish hotels, and the extraordinarily extravagant notions which some of the proprietors have of the depths of the pockets of motorists, that it is quite refreshing to come across an instance which seems to reveal the better character of the Irish people. The Automobile Agency, of Percy Place, Dublin, inform us that during the month of September they will give free

Digitized by Google

garage to English and Scotch motorists when in the Irish capital. We trust that their enterprise will have its full reward and that a good number of British automobilists may be found in the Emerald Isle during the coming months, for, after all, the stories of high charges which have lately been in circulation are not entirely true of the whole of the country. Those of us who had experience of Irish hotel-keepers during the Gordon Bennett week of last year know that they did not err on the side of financial modesty during that busy season; but Gordon Bennett races do not occur every week, and it is quite possible that in normal times motorists may be able to live in Ireland at reasonable rates.

◆ ◆ ◆

Motor Schools.

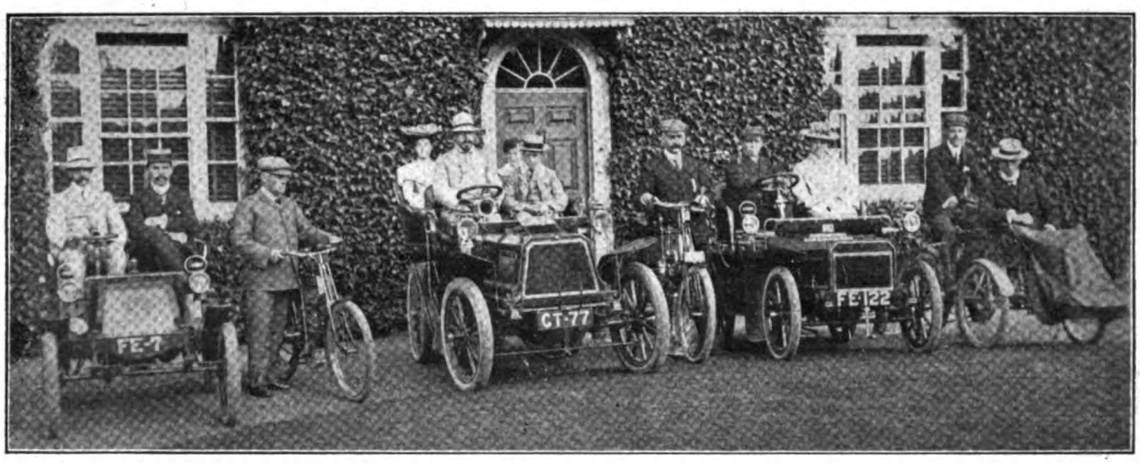
ONE accompanying feature of the growth of the automobile industry has been the springing up of a large number of places where instruction in motor-driving is given. To attract pupils the offer of diplomas, certificates, situations, and other pleasant things, is publicly made, and the fees vary according to the age of the school or the sweet innocence of the prospective pupils. As a rule agents or makers selling cars are able to sufficiently instruct purchasers as to the handling of the cars, while conversation with other owners, a careful study of the automobile press and an ordinary supply of common sense will prove real factors in the education of the driver. Still, schools are useful, especially where the fees charged are not out of all proportion to the value of the information imparted. But intending patrons should have the promises of the instructors clearly set forth in writing, so that there is no loophole for escape from the specious bait which so many are inclined to dangle before owners of cars and guineas.

◆ ◆ ◆

A Meet of Motoring Medicos.

THERE are a great many doctors in Lincolnshire who use, and have used for years, motor-cars in their profession, and Dr. Sharp, of Brant Broughton, has had the happy idea of inviting a few of them, his personal friends, to an informal meet at his place. It proved quite a success when held a week ago. After tea and chat on motoring the party mounted their cars and were photographed, as shown in the accompanying illustration. Dr. Sharp is in the centre on his 12-h.p. Richardson, a well-known visitor at the Lincolnshire A.C. meet; on his right is Dr. Newcombe, Caythorpe, who was on a Minerva motor-cycle; on "F.E. 7" is Dr. Overay, with Dr. de Beauvais, of Ancaster, on his New Orleans. Standing on Dr. Sharp's left is Dr. H. Stannard, Humber motor-cycle; Dr. D. J. G. Watkins, Lincoln, is at the wheel of his Humberette (F.C. 122), and Dr. Godfrey Lowe, Lincoln, has, on his Rex forecar, Dr. Purvis. All these are ardent motorists, and find their automobiles very useful indeed.

◆ ◆ ◆



In the Midlands.

MOTORISTS in the Midlands were freely upon the roads last week-end. In the Redditch district some rough roads were met with and the Holland Road in Sutton Coldfield was being re-metalled. Around Tamworth and Stratford-upon-Avon the roads were in splendid condition. The main street of Bridgnorth is being repaved. We shall be glad to hear from readers as to main roads under repair with the view of warning motorists as to roadways to avoid.

◆ ◆ ◆

The Courtesy of the Road.

A STRIKING instance of consideration towards motorists is related by Dr. Hall, of Milford. He was recently stranded on the steep hill at Brook, near Witley, Surrey, by an empty petrol tank and a subsequent air-lock in the petrol pipe (a species of *en panne* which, though uncommon, it may be useful to draw attention to) when a carriage and pair, with an elderly lady therein, passed. Some ten minutes after he was surprised at seeing the lady walking down the hill towards him—she had returned to offer any assistance in her power, finding he had not overtaken her carriage, though quite a stranger to him. Such an experience is as gratifying as unusual, and he is glad to take an opportunity of expressing his thanks in print, though it is to be feared it may not meet her eye.

Motoring Medicos at Lincoln.

◆ ◆ ◆

The Small Car Trials.

ELSEWHERE we give a preliminary article on the Small Car Trials organised by the A.C.G.B.I.'s Technical Committee mainly within the county of Hereford. Considerable interest is naturally being taken in the event throughout the country, and considerable importance will doubtless be attached to the awards, which will consist of certificates to every vehicle completing the whole distance of the Trials, and gold, silver and bronze medals. This year a reasonable time will be allowed the competitors each day for adjustments, thus more nearly approximating the conditions to those of ordinary touring. Given cheerful weather the Trials should be a great success.

◆ ◆ ◆

Canals and Motor-Boats.

THE advent of the motor-boat should do something to revive interest in the neglected waterways of the country. Although very ancient so far as their history is concerned, the great development of canals did not take place until the quarter of a century, 1780–1810. It was thus contempor-

Digitized by Google

aneous with the first efforts of British engineers in connection with automobilism. As is well known, the advent of the railways not only detracted public attention from the development of mechanical traction on roads, but also frustrated the efforts of those who looked on canals as likely to be the great carrying arteries of the country. It would be rather interesting if, just when railway companies are beginning to recognise that the motor-car will be a help and not a hindrance to their revenue, there should be an attempt made to again utilise the waterways.

◆ ◆ ◆

Some Hindrances.

SHOULD the progress of the motor-boat develop as rapidly as has the motor-car, there is no reason why it should not be a means of transport for the imperishable goods that now go by train. The motor-boat, too, opens up another extension of social intercourse, for the canal system is sufficiently well developed to admit of boats going long distances, the only drawback being the frequency of locks and the growth of weeds which might interfere with the pleasures of fast-going craft. Neither of these obstacles are insuperable, and the subject is one to which automobilists probably will give some attention in the near future. If the motor-boat restores the canals to the height of their early promise it will have justified itself.

◆ ◆ ◆

To Blow or not to Blow.

POLICE insolence is fairly familiar to motorists on southern roads, and the constable who told Colonel Bosworth, when driving through Guildford and blowing his horn to warn the public of the approach of a car, to "stop that noise," should certainly be informed as to the limits of his authority. The Colonel is still awaiting a reply from the Chief of the Police at Guildford to a question as to what motorists are to do when passing through the town. Some have been summoned for not giving audible warning of their approach; others have been insulted for doing so. What is to be done? The answer of the Guildford Watch Committee is anxiously awaited. Probably the new musical horn introduced by Mr. Moffat Ford will be useful in this difficulty.

◆ ◆ ◆

The Number and Car.

IT cannot be too widely known that the number assigned to a motor-car is only to be applied to that particular vehicle. A case has just been heard at Greenwich in which a motorist was fined £5 and costs for fraudulently using a mark for identifying a motor-car. The defence was that the act was done in ignorance of the law, and the word "fraudulently" was, of course, only the legal way of putting the matter. To say that the owner of a car is under the impression that he is entitled to use the same number on any car he drives may appear to place the defendant in a very innocent light, but it is no excuse. When securing numbers owners have to describe their cars, and such description should indicate that any mark which may be assigned is applicable only to that particular machine.

◆ ◆ ◆

Children and Cars.

THE other day, as the Earl of Leven and Melville was motoring in Fulham, and travelling at a moderate rate of speed, having regard to the traffic about, a little girl ran out from the pavement in front of the car, which passed over her ere the driver could stop. At the inquest, the jury returned a verdict of "Accidental death," and the driver, in giving evidence, said that at the top of the street where the accident occurred there were a number of children playing, and as he approached them they stood in the road and defied him, so that he had to pull the car up dead. Shortly after he had restarted the unfortunate child darted from the pavement right in front of the vehicle, and, although he applied his brake and pulled up instantaneously, the fatal accident occurred. Unfortunately, children have too great a habit of regarding the roadway not only as their playground but also as a vantage point from which to amuse themselves by annoying others; and the fact cannot be too emphatically urged that the rising generation must be taught to regard the pavement as a place intended for pedestrians, the roadway only to be used for crossing and re-crossing. Such accidents as that to which we have referred are unfortunate, but, until children adequately recognise the dangers of street driving, we are afraid they are almost inevitable.

◆ ◆ ◆

Antipathy in the Lake District.

AT the monthly meeting of the Ulverstone Rural District Council, Major Alcock Beck recommended that the Council write to the Lancashire County Chief Constable calling attention to the speed of motorists going through the Lake District villages of Hawkshead and Sawrey. Mr. W. R. Nash said the road from the Ferry (Windermere Lake) to Hawkshead was far too narrow for the summer traffic, and they suggested asking the Lancashire County Council to prohibit motorists using it. In some places it was only twelve feet wide. Councillor Garfitt suggested that the only way to pull up some motorists would be to have a wire rope across the road from one end of the village to the other. Such an irrational attitude on the part of local councillors, in districts which depend so much for their prosperity on the presence of visitors, is not likely to serve the best interests of the district.

◆ ◆ ◆

A Warning to Touring Motorists.

SO many cases of the removal of trunks and other necessary impedimenta from automobiles while their owners have lingered in hostelries or engaged in conversation have lately occurred that a warning appears really necessary. Many of the people who lounge about hotels have eyes on things which may be easily transferred, and their consciences are elastic enough to help them to reach to articles of ready conveyance which do not belong to them.

◆ ◆ ◆

Mr. Edge and Racing.

THE report given on the authority of a contemporary that Mr. S. F. Edge has decided to give up motor-car racing will be of universal interest. No one has had more experience than Mr. Edge in automobile contests, and his decision is therefore a matter of some moment. The reason assigned for the decision is the indifference of the A.C.G.B.I. towards its representatives in international events—an attitude in marked contrast to that of the French club towards its champions. The truth is that the British Club ought to recognise that, when once its team of representatives is chosen it should play its part in seeing that rules are adhered to and the passage to victory, or failure, made as comfortable as possible. Possibly in thus retiring Mr. Edge, by drawing attention to the official apathy, may be rendering an awakening service.

The Small Car Trials.

IN a few days the gentle noise of the motor-car of small degree will be heard in the quiet streets of ancient Hereford, and in the delightful lanes roundabout 38 motor-cars, none costing more than £200, will be performing a series of daily trips to demonstrate their reliability for the medical man, the minister with a widely-scattered parish, the commercial traveller who

The Old House in High Town Hereford.

desires to be independent of trains, or anyone else anxious to economise time and extend his range of pleasure.

The forthcoming Trials will provide a dual innovation. Hitherto the A.C.G.B.I.'s annual test has included the mighty motor of great horse power. This year comparatively diminutive vehicles will be engaged, the following being a complete list of entries:—

CLASS A.—Cars declared at a Selling Price of £125 or less.

Official number.	General Description.	No. of Passengers, including Driver.	No. of Cylinders.	Cylinder Dimensions.	Brake Horse-power.	Weight Unladen.	Size of Tyres.	Price of Car.
						cwt.		£ s.
1	6-h.p. Jackson dogcart (A) ..	2	1	90 by 110 mm.	6	9	700 by 85	125 0
2	6-h.p. Speedwell	2	1	90 by 110 mm.	6	8	700 by 65	123 18
3	8-h.p. Horley (F)	2	1	4 in. by 5½ in.	8	10	700 by 85	125 0
CLASS B.—Cars declared at a Selling Price of more than £125, and not more than £150.								
4	6-h.p. Jackson dogcart (A) ..	2	1	90 by 110 mm.	6	9	28 in. by 2½in.	141 15
5	6-h.p. Light Vauxhall Car ..	2	1	4 in. by 5 in.	6	7	3 in.	150 0
6	7-h.p. Oldsmobile Runabout ..	2	1	5 in. by 6 in.	7	10	3 in. by 28 in.	150 0
7	6½-h.p. Service	2	1	88 by 110 mm.	6½	9	750 by 85	150 0
8	6-h.p. Pelham	2	1	90 by 110 mm.	6	7	700 by 80	150 0
9	8-h.p. Horley (F)	4	1	4 in. by 5½ in.	8	12	700 by 85	145 0
CLASS C.—Cars declared at a Selling Price of more than £150, and not more than £175.								
10	6-h.p. Light Wolseley (D) ..	2	1	4½ in. by 5 in.	6½	10	28in. by 3½in.	175 0
11	6-h.p. Mobile	2	1	90 by 110 mm.	6½	10	28in. by 3¼in.	175 0
12	8-h.p. Brown	2	1	110 by 120 mm.	9	12	30in. by 3½in.	175 0
13	9-h.p. Speedwell	2	1	100 by 120 mm.	9	10	700 by 85	175 0
14	Single-cylinder Swift	2	1	95 by 110 mm.	7	9	3in.	175 0
15	7-h.p. Little Star (B)	2	2	3½ in. by 4½ in.	7	—	28in. by 3½in.	175 0
16	6½-h.p. Royal Humberette ..	2	1	4 in. by 4½ in.	7½	9	28in. by 2½in.	157 10
17	Alldays light car No. 1 (C) ..	2	1	4 in. by 4½ in.	7	9	700 by 85	165 0
18	6-h.p. Siddeley	2	1	4½ in by 5 in.	6½	10	700 by 85	175 0
19	7-h.p. Downshire	2	2	3½ in. by 4½ in.	7	7	700 by 80	170 0
20	6-h.p. Light Wolseley (D) ..	2	1	4½ in. by 5 in.	6½	10	28in. by 3½in.	175 0
21	7-h.p. Clyde	2	1	85 by 110 mm.	7	8	28in. by 2½in.	175 0
CLASS D.—Cars declared at a Selling Price of more than £175, and not more than £200.								
22	6-h.p. De Dion (E)	2	1	90 by 110 mm.	6	8	28in. by 3½in.	200 0
23	6-h.p. De Dion (E)	2	1	90 by 110 mm.	6	8	28in. by 3½in.	200 0
24	8-h.p. Mobile	4	1	100 by 120 mm.	9	12	28in. by 3½in.	200 0
25	9-h.p. Oldsmobile	3	1	5½ in. by 6 in.	10	13	3½in. by 30in.	200 0
26	7-h.p. Swift	2	2	80 by 85 mm.	7	9	3in.	200 0
27	8-h.p. Royal Enfield	2	2	3½ in. by 4 in.	8	10	700 by 85	200 0
28	8-25-9-65-h.p. Cadillac	4	1	5 in by 5 in.	9·65	11	800 by 85	199 10
29	10-b.h.p. Chriton	2	4	3 in. by 3½ in.	10	—	750 by 85	195 0
30	8-10 Croxted	2	2	3½ in. by 4½ in.	10	13	760 by 90	200 0
31	9-h.p. Anglian light car ..	3	1	100 by 120 m.m.	9	11	750 by 85	200 0
32	Alldays light car No. 3 (C) ..	3	1	4 in. by 4½ in.	7	9	700 by 85	180 0
33	8-h.p. Rover	2	1	4½ in. by 5 in.	8	8	750 by 85	200 0
34	7½-h.p. Royal Humberette ..	2	2	3½ in. by 4 in.	7½	11	28in. by 3in.	200 0
35	6-h.p. Belsize Junior	2	1	115 by 125 mm.	8½	10	700 by 85	183 15
36	8-h.p. Simms	2	1	110 by 110 mm.	9	—	700 by 85	200 0

38	7-h.p. Little Star (B)	2	2	3½ in. by 4½ in.	7	—	28in. by 3½in.	160 0

AA, BB, CC, DD, EE, FF respectively will be run as a team.

In previous years the Crystal Palace has been the venue of the Trials; now Hereford will be the centre from which the trials radiate, and instead of the modern seaside resorts being the objective of many of the runs, old-world towns like Ross, Ludlow, and Leominster will prove a pleasant variation of scenery to the drivers of cars that are well behaved. We have just spent some time in the district, making the Mitre Hotel, at Hereford, which is the headquarters of the Herefordshire Automobile Club, our resting place. This is a comfortable hostelry with garage accommodation for cars, a feature for which, like the Green Dragon Hotel across the way, it takes credit unto itself.

Starting from the Drill Hall at Hereford, the cars will make two journeys of fifty miles each day—both over the same route. During the week Ledbury will be visited six times, Worcester and Ludlow twice, Leominster four times, and some of the villages in the Kington district will see the cars four times on the 3rd prox., the last day of the runs, the full programme of which is given below. Originally the run to Leominster was to have taken place on Tuesday, but this arrangement was, as the result of telegraphic communications between the Herefordshire Club and the A.C.G.B.I., altered on Friday last. The discovery was made that on that day an agricultural show would be held at Leominster. Hence the change.

The starts will be made each day at 8 a.m. and again at 2 p.m., each trip lasting about three hours.

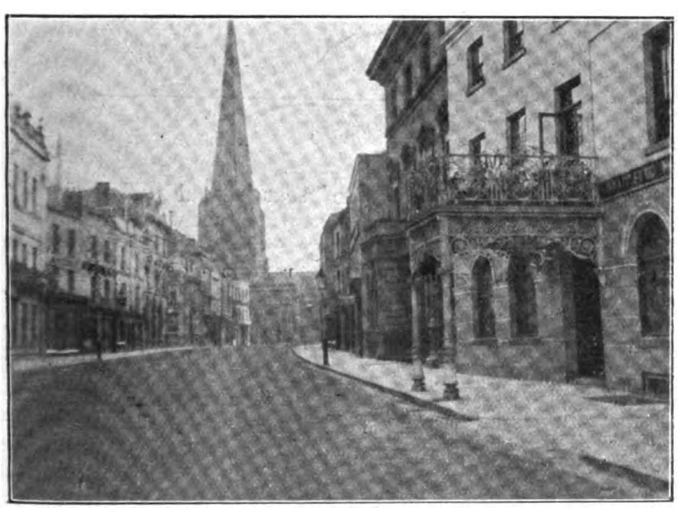
Monday, August 29.—Holmer, Dinmore Hill (climb), Leominster, Brimfield, Ludlow, to the railway bridge, two miles beyond, returning to Hereford by the same route—51 miles.

Tuesday, August 30.—Newtown, Frome's Hill (climb), Stiffords Bridge, Leigh Sinton, Bransford, Worcester, Knightsford Bridge, Bromyard, Stoke Lacy, Burley Gate to Hereford—52 miles.

Hereford Cathedral—from the Wye.

Wednesday, August 31.—Bartestree, Tarrington, Ledbury, Bishop's Frome, Munderfield Row, Bromyard, Bredenbury, Steen's Bridge, Leominster, Dinmore Hill (climb), to Hereford—50 miles.

Thursday, Sept. 1.—Bartestree, Tarrington, Ledbury, Playley Green, Staunton, Long Green, Eastnor, Ledbury, Tarrington, to Hereford—52 miles.



Friday, Sept. 2.—Callow, Llandinabo, Peterslow, Ross, Much Marcle, Ledbury, Bishop's Frome, Bromyard, Stoke Lacy, to Hereford—50½ miles.

Digitized by Google

Saturday, September 3.—Stretton, Lugwas, Yazor, Woonton, Lyonshall, Kington, Walton Knill, Titley, Kington, Lyonshall, Woonton, Yazor, to Hereford—52 miles.

The Herefordshire Club is one of the most virile, although one of the most youthful, of automobile organisations, with a capital president in Mr. J. T. Hereford, of Sufton Court, and an enthusiastic hon. secretary in Mr. Wilfrid Groom, whose services in connection with the forthcoming trials have been of great value to Mr. Basil Joy, the technical secretary of the A.C.G.B.I., who arrived at Hereford on Tuesday to complete the organisation he has had in hand for many weeks. The membership of the local club has reached sight of the hundred, being actually eighty, with owners of cars slightly predominating. Doubtless it was a bold move when this club invited the parent body to travel from the south and hold its annual Trials in a place distant from London 140 miles but it must also be remembered that Hereford is only sixty-five miles from Coventry, fifty-five from Birmingham, 100 from Manchester, and is in a district which should provide the industry with many clients ere the season of 1905. These facts doubtless weighed with Mr. Joy and the Committee of the Automobile Club in accepting an invitation most cordially conveyed and sustained by the offer of free accommodation for the cars in a Drill Hall well adapted for the purpose. Local friends are rallying towards the subscription list, which Mr. Groom's popularity and persistence is lengthening daily, and everything possible will be done by the local people to make warm the welcome to the motorists about to visit the city.

In addition to the enthusiasm of county motorists, it is gratifying to be able to recognise the co-operation of the authorities. On enquiry at the office of the County Surveyor we learned that the local surveyors in all the districts which will be traversed during the trials have been notified of the event by special circular, the hope being expressed that no loose stones will be left on the roads—a piece of courtesy that contrasts very pleasantly with memories of roughly metalled and unrolled stretches that have worried drivers on previous tests. Although the dust nuisance will doubtless be experienced should the weather prove fine, it is not anticipated that it will be so pronounced as was the case during the runs through Kent last year, the surface material being of a materially different character. The roads are good and generally wide,

The Mitre Hotel, Hereford—The Headquarters of the local Automobile Club.

although on some of the routes narrow and curly portions will require careful negotiation. Dinmore Hill, where one of the hill climbs is to take place, is not to be very anxiously anticipated, and although it is about a mile long on each side, it need present no great difficulties. On the Hereford side the portion of the ascent where Messrs. T. H. Woollen and F. Straight will time the competitors is 5,340 ft. long, with a rise of 282 ft., the average gradient being one in 18·93. On the Leominster side from the Royal Oak Inn to the milestone, the distance is 4,800 ft., the rise being 283 ft., with an average gradient of one in 16·9. About half way up there is a stretch of twenty yards with a rise of one in 10·84, this being the stiffest portion. On the other hand, Frome's Hill, on the Worcester road, has some sharp rises and is universally acknowledged as a "terror." In its length of 2,812 ft. there is a rise of 230 ft., the average gradient being one in 12 2. After about a quarter of the distance has been negotiated, there is an ascent of one in eight, and the last hundred feet to the top is the stiffest of the journey, being one in 7·5.

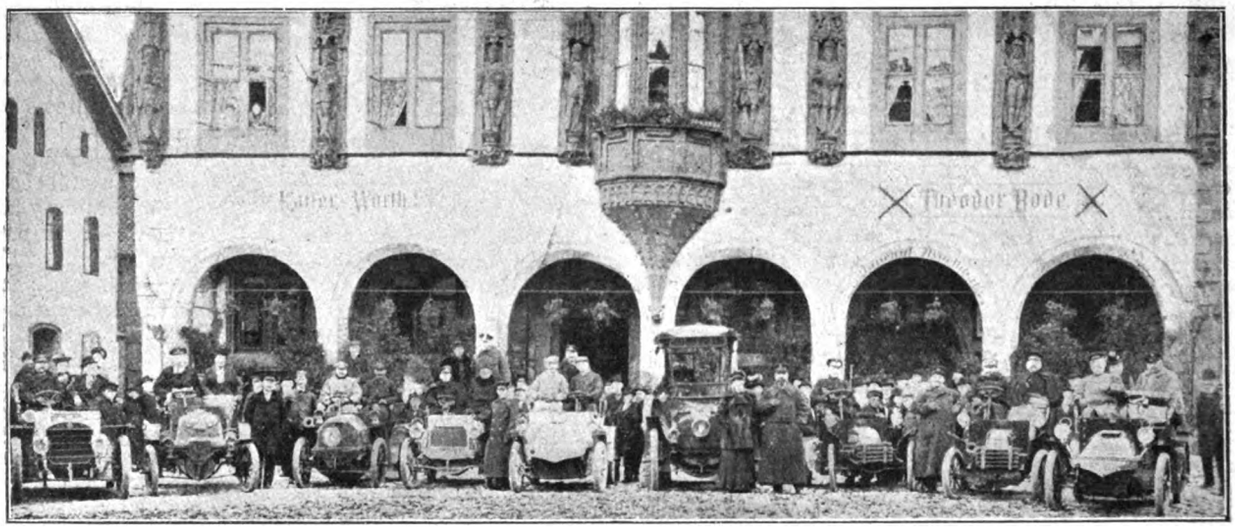
High Town, Hereford—The Spire of St. Peter's Church is seen to the right.

The police have been equally as considerate as the administrative departments, and not only will the week be free from the wearisome and vexatious traps of last year, but officers may be expected to be willing guides at doubtful corners. This friendly attitude is also characteristic of ordinary times, the relations between the police and the motorists of Herefordshire having always been of the most happy character. The police are too manly to lay traps and hide behind hedges; the motorists too friendly to take unfair advantage of the facilities for pleasant touring they experience at their hands.

In the *Journal* of the 6th inst. we published a map of the routes to be followed, and some notes on the principal centres of interest to be visited may be of service to strangers. Herefordshire is a delightful county, with only half a dozen places of any size—the rest are large hamlets quietly nestling among orchards and (in one district) hop fields. From the Cathedral Tower the visitor will obtain a clearer notion than print can convey of what the country is like. Beautiful hills, luxurious valleys, the Wye entering at Clifford Castle, flowing past Ross, and bending round Symond's Yat till it forms the boundary between Herefordshire and Gloucestershire—these, with an alternating landscape of meadow and cornfield, orchard and woodland, offer a picture for the eye to linger on with delight. The most considerable towns, with their distances from the county town, are as follows:—Ross, fourteen; Kington, nineteen; Ledbury, fifteen; Leominster, thirteen; Ludlow, twenty-four; Bromyard, fourteen miles.

Beyond the Cathedral there are only a few points of interest in Hereford. The old house, now devoted to the purpose of banking, which stands in the High Town, is a remnant of the Butchers' Row that originally formed a central line in what is a great wide thoroughfare. Near by is St. Peter's Church, and at a little distance the new Municipal Buildings and old Shire Hall. Mr. Albert Marriott, the official repairer to the A.C.G.B.I., who is making complete arrangements for the supply of petrol to the competitors, has his headquarters in St. Owen Street, where he is contemplating extensive additions to an already well-fitted workshop. As an expert he has a wide reputation, and has every facility for rendering assistance to motorists in distress. Near the station Messrs. Connolly and Son, an enterprising firm of carriage builders, are watching the progress of the automobile industry and adapting themselves to the altered condition of things. They have excellent garage accommodation, and, like Messrs.

Digitized by Google



Howell Bros., whose premises are in the same street, have been very busy lately in letting cars on hire.

Although it is only within the last few years that Ross has come forward as a centre from which to tour the Wye Valley, the name must be familiar to many who have read Pope's eulogium of John Kyrle, the "Man of Ross." Whether approached by boat—for the town hangs immediately over the river—or by road, Ross, with its houses paying obeisance below the handsome church spire, and environed in the most sylvan of scenery, is a town much, and deservedly, appreciated by the tourist. Here it was that the immortal John Kyrle lived and died and was buried in the parish church. It was he who left the "Prospect" as a gift to the burghers as a pleasure ground, to day much used and prized. From here a fine river view is to be obtained. Situated in the centre of the irregular, informal clusters of houses, and no less informal than these, is the Town Hall, near to which is the house of John Kyrle. Ross was visited by the plague in 1637, a cross in the churchyard commemorating the visitation.

Stretching right from Hereford to the Malvern Hills is one long valley—the hop garden of the county. In the midst of this lovely valley lies the town of Ledbury, a place of no size, but of considerable beauty. Near to here it was that Elizabeth Barrett Browning spent her youth—at Hope End—living among the "Hills, vales, woods, netted in a silver mist."

Looking from Ludford Bridge at the almost faultless grouping of the houses on the opposite side of the river, with the graceful tower of St. Lawrence crowning the whole, Ludlow town is a sight to inspire a Railton or a Pennell in black and white, or in colour a Cotman or a Prout. So truly beautiful, too, are the surroundings that the antiquarian interest is submerged by the artistic; not, however, that the former ranks low in importance, for this border town, with its magnificent castle—for long the Court of the Marches—has seen many vicissitudes, and many a border fray was fought on the banks of the Teme and in the Whitcliff woods opposite. In more peaceable times the castle was the scene of revels, and it was here that Milton's masque of "Comus" was first played. The Court of the Marches was done away with in 1689, and from that date this stronghold began to fall into ruin; but so beautiful in its decay is it that Ludlow has nothing better to show.

Leominster is a typical country market town, such as one finds depicted so faithfully in the works of Thomas Hardy; a quaint old-world town ensconced amid the folds of the broad ploughed lands of North Herefordshire. And in the old days "Lempster Market" was no mean institution; indeed, it became so famous that in the fourteenth century Hereford and Worcester, in jealousy, remonstrated, so that Henry III. changed the market day from Saturday to Friday.

A Meet of the Brunswick Motor Club. *Automobil Welt.*

A piece of architecture in the middle of the town, which cannot fail to attract attention, is the market-house, a half timbered building upraised upon its sixteen stout pillars of sweet chestnut wood. The Church of St. Michael and All Angels affords much interest to the student learned in "styles," and has many interesting features for those not so informed—one a peculiar sundial formed in the glass of one of the aisle windows. Ledbury did not escape in the Civil Wars, and a fierce fight took place in the streets here between the forces of Prince Rupert and those of Col. Massie. Not far from Ledbury is Eastnor Castle, the seat of Lady Henry Somerset.

Situated on the old London road to Aberystwyth, on the very border of the county, is the little hill town of Kington, which, although there is not much in the way of relics or ruins to tell a tale, if we are to judge from the verses concerning Thomas ap Rosser, Lord of Hergost, has had a romantic history. It is a thumb-nail sketch of a town of about half a dozen streets. The surroundings, however, are undeniably romantic, and the soft beauty of the Herefordshire landscape is lost in the sternness of the rugged Radnor Hills—the gates of Wales. It is, therefore, to the artist and the sportsman that this neighbourhood will especially appeal, although those of poetic vein cannot remain unimpressed by the haunting and wild beauty of the borderland.

The "good buildings of timbre" that Leland spoke of remain to this day to tell us of its ancient wealth and to afford charming perspectives of overhanging and gabled houses to please the eye. "Grange House," a private house rebuilt from the materials of the old market-house, is one of the most beautiful specimens of old timbered house in the county. An interesting possession of the town's is a ducking stool in proper working order, but which was last used in 1809. Of one local peculiarity of pronunciation care must be taken. Leominster is not pronounced as it is spelt, but "Lempster" is the way in which the people of the county speak it.

During next week visitors from the surrounding districts will be numerous in Hereford, and the following Identification Numbers for cars will be familiar in the streets of the delightful old town:—

C. J.—Herefordshire.	F. K.—Worcester.
A. B.—Worcestershire.	F. O.—Radnorshire.
A. D.—Gloucestershire.	O.—Birmingham.
A. W.—Salop.	D. U.—Coventry.
A. X.—Monmouthshire.	A. E.—Bristol.

The Editor of the *Motor-Car Journal* invites photographers to send snapshots of incidents of interest to motorists. Where these are of the trials or current events the unmounted prints should be despatched on the same day or not later than the day following the occurrence.

Digitized by Google

SOME NEW CARS IN THE TRIALS.

THE majority of the cars competing in the trials have already been described in the *Journal*. There are a few new comers of which the subjoined particulars will no doubt be of interest. The 6½-h.p. "Service" car entered in Class B by the Civil Service Motor and Cycle Agency, Limited,

Fig. 1.—Miss Dorothy Levitt on the 6-h.p. De Dion she will drive in the Trials.

is a two-seated vehicle following the general lines of live axle cars. The frame is of tubular construction, and the motive power is supplied by a 6½-h.p. governed Aster engine, with pump circulation. Three speeds forward and a reverse are controlled by one lever, the drive on the top speed being direct, with the intermediate gears at rest. The differential gear is of the spur-wheel type.

Among the new vehicles in Class C is the "Chambers," made by Messrs. Chambers and Company, of Belfast, the moving spirit of which firm is Mr. J. H. Chambers, late of the Vauxhall Ironworks Company. The car, which is designed to seat two

Fig. 2.—The 10-h.p. Chriton Car.

persons, with ample space at the rear for luggage, is propelled by means of a 7-h.p. double-cylinder engine, the cylinder dimensions being ⅞ in. bore by 4¼ in. stroke, and the normal speed 1,200 revs. per min. The ignition is electrical, a good enclosed wipe contact with trembler coil being fitted. The inlet and exhaust valves are very accessible, both being vertical. The carburettor is of the float-feed spray type of the firm's own design, and has an extra air inlet which is automatically operated, and with the spraying chambers is partially jacketed by the circulation water. A throttle valve controlled from the inclined steering wheel is also provided. The water circulation is on the thermo-syphon system. Three speeds forward and a reverse are provided by means of a crypto type of gear, working in oil. From the gear shaft a central chain transmits the power to the back axle. The tie rods and chain case are incorporated in such a way as to be a rigid but separate part, and yet flexibly connected, so as to give movement for springing, and a single point of adjustment for the chain. The firm has protected a special triangular design of frame, carrying the back axle, so that the strain due to the pull of the chain is taken on bearings on each side of the sprocket, both front and back, thus saving the heavy pull on the engine bearings and doing away with the usual radius rods. The car has, with the exception of the electric ignition, the gear wheels and the tyres, been entirely made in Belfast. The first specimen has been on the road for over 1,500 miles, and so far has done admirably.

Fig. 5 shows the "Brown" 8-h.p. two-seated car entered by Messrs. Brown Bros., Limited. The engine is of the single cylinder-governed, vertical type, 110 mm. bore by 120 mm. stroke, developing its power at 1,200 revolutions a minute. The frame is of wood, strengthened with flitch plates. Ignition is the usual high tension, by coil and accumulator with a wipe contact maker. The water circulation is maintained by a gear-driven

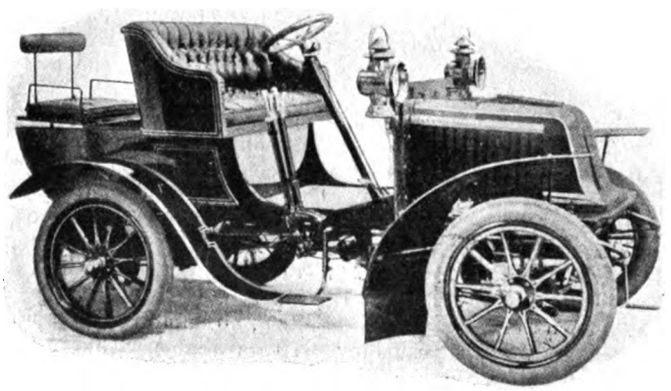


Fig. 3.—The 9-h.p. Anglian Car.

pump, fitted in a very accessible position in front of the engine, and a honeycomb radiator. The transmission from the gear-box to the rear live axle is by a cardan shaft with universal joints, the axle being carried on ball-bearings. Three speeds and a reverse are fitted, controlled by a single lever. The lubrication of the engine is effected from the dash by a combined force and drip lubricator, the plain bearing of the bevel driving pinion being also lubricated from the dashboard. The brakes are of the metal to metal type; the countershaft brake is applied by a pedal, and the two brakes on the rear wheels are actuated by a side lever. The artillery wood wheels are all of equal size, and are shod with 30 in. by 3½ in. tyres. The levers for throttle and advance spark are mounted on the steering pillar, the connection being by Bowden wires; the air regulator to the carburettor is on the dashboard.

In Class D there are several cars making their first appearance in the trials. The 10-h.p. Oldsmobile and the 9½-h.p. Cadillac have been illustrated in recent issues. Fig. 2 shows the Chriton two-seated car which enjoys the honour of being the only four-cylinder vehicle in the competition. The vehicle, which is made by the Chriton Automobile Company, of Saltburn, is provided with a 10-b.h.p. vertical engine, the diameter of the four cylinders being 3 in. by 3½ in. stroke. All the valves are mechanically operated, and the normal speed of the motor is 1,200 revolutions per minute. The engine is fitted with a "Universal" silencer and Van Raden coil with Carpentier tremblers. Spark intensifiers are mounted on the dashboard in a visible case,

Digitized by Google

and each cylinder is provided with a separate cut-out switch. The radiator is of the tubular type, containing 1,060 tubes, and is provided with fan to induce a current of cold air through it. The drive is taken from the engine through a leather-faced friction-clutch to gear-box, which gives three speeds forward and one reverse, all worked off the same lever, and thence to live back axle by flexible shaft and universal joints. On the top speed the drive is direct. The petrol tank has a capacity of ten gallons, and the water tank, which forms the case of the radiator,

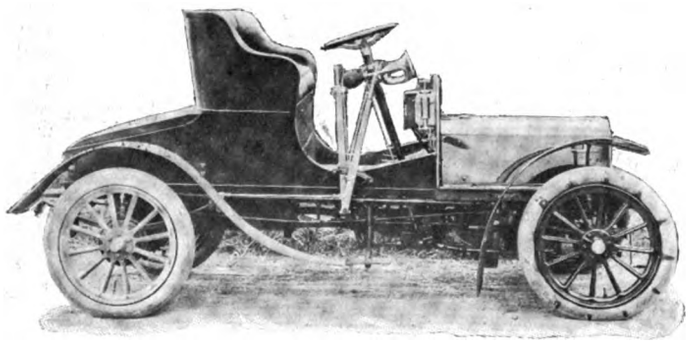

Fig. 4.—The 8-h.p. Royal Enfield Car.

holds eight gallons. Three brakes, all of the internal-expanding type, are provided, one operated by a push forward pedal, and the two hub brakes by a pull backward hand lever. Lubrication is by sight drip feed from the dashboard, from which the crank case and gear-box, etc., are fed. By means of the foot-controlled throttle valve the car can, it is claimed, be driven on top speed from a crawling pace up to forty miles per hour.

The "Croxted" two-seated car entered by Messrs. Garner and Company is a vehicle of French construction, designed on the basis of not greatly exceeding a speed of twenty-five miles an hour on top speed but of climbing hills at a good rate. The engine is a double-cylinder Aster engine of the latest type, developing 10-b.h.p. The cylinders are 4 in. diameter bore by 5 in. stroke and the normal speed 1,000 revs. per min. The water circulation is on the thermo-syphon system, no pump being employed. Three speeds and the usual reverse are available, with direct drive on top speed. From the gear-box the drive is by cardan shaft and live axle. The peculiarity of the latter lies in the fact that a solid axle bent from the hubs of the two hind wheels bears the whole weight of the back of the car, the bevel gearing being contained in a case resting upon the solid axle.

The "Royal Enfield" 8-h.p. two-seated car entered in Class D by the Enfield Cycle Company, Limited, is depicted in Fig. 4. The motive power is supplied by a double-cylinder vertical engine developing 8-h.p. at 1,200 revs. per min. The cylinders are 3½-in. bore by 4-in. stroke. The valves are all mechanically operated and interchangeable. A governor operating on a Longuemare carburettor is provided. Three speeds forward and reverse, with a direct drive on top speed, are controlled by one lever. From the gear box the power is transmitted by a universal shaft and bevel gear to a live axle. The water circulation is maintained by a friction-driven pump and an extra large ribbed-pipe radiator.

The Anglian Motor Company, Limited, have entered the "Anglian" three-seated car shown in Fig. 3. This is provided with a 9-h.p. De Dion single-cylinder engine, the bore and stroke being respectively 100 mm. and 120 mm. The gear box is adapted to give three speeds forward and a reverse, controlled by a single lever, the transmission being by a universal-jointed shaft and bevel gear on to a rear live axle running on ball bearings.

Owing to pressure on our space we have had to hold over a description of one or two of the other new cars entered in the Trials.

DOUBLE-ACTING BAND BRAKES.

THE term double acting as applied to brakes is somewhat ambiguous. If it is interpreted to mean that the brake effects a retarding action on the vehicle for each direction of motion, then all the brakes which have come to our notice, and probably all that have ever been made, are double acting. If, on the other hand, it is interpreted as meaning that the retarding effect is exactly equal, with equal operating pressures, for both directions of motion, then the class of so-called double-acting brakes most commonly used only deserve their name when certain conditions as to dimensions are fulfilled. The class of brakes we refer to, remarks the "Horseless Age," is the band brake in which both ends of the band are movable and are fastened to the opposite arms of a double-armed lever.

By varying the design of this brake, that is, by changing the distance between the centre of brake drum and centre of brake lever, the length of the lever arms and the length of the band, it may be made either a perfectly double-acting brake with equal effect for both directions of motion, a brake exactly similar in action to the so-called single-acting band brake with one end of the band fixed, or it may occupy any position between these two extremes. In practice the brakes of this class usually belong to the last category; that is to say, they are not quite as powerful for reverse motion as for forward motion. There is, of course, no reason why we should insist upon the theoretical condition of equal power for both directions being complied with, especially as, on account of the higher forward speeds of vehicles, the greatest braking effort is always required to arrest forward motion; but, at the same time, if judicious design permits us to increase the brake power for reverse motion without seriously affecting the power for forward motion, we might as well take advantage of it. It is, at any rate, well to know what are the theoretical conditions underlying the equality or inequality of brake action for the opposite directions of rotation of the brake drum. In the ordinary band brake, in which one end of the band is fixed, the tension in the band varies from end to end. For forward motion it is greatest at the fixed and least at the opposite end. Similarly in a band with both ends movable the tension varies from point to point, but the point of least tension is never at one end.

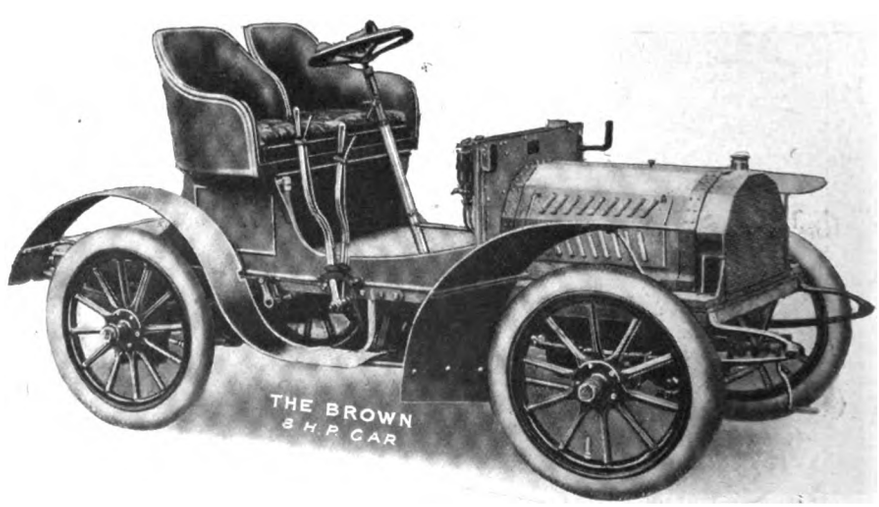

Fig. 5.—The 8-h.p. Brown Car.

In order that the braking effect may be the same for both directions the tension applied to each end of the band must be the same. To ensure this the length of the band must be so adjusted that when the band is drawn tight the effective lever arms, through which the operating power is applied to the ends of the band brake, are the same.

THREE MEN IN A POND.

[TO SAY NOTHING OF THE CAR.]

IT was a darkling night when three of us set forth from Hereford to visit a wounded motorist away at Wellington, near unto the height of Dinmore. At least it dimmed later, for when we started there was light enough to see the glorious sunset after passing the pretty village of Holmer, with its name set forth clearly, according to regulations, above the post office.

And it was a sunset; such a scene as, limned on canvas, would be regarded as the mere figment of a Werts or an over-reaching of the reality. The reds stretched into the greys and the greys melted into the yellows, until the splashdash effect became a kaleidoscope far more wonderful in its varied combinations of colour than was ever sold in a toy bazaar.

And we motored along the tortuous lanes, with their green carpets on the one hand, and, on the other, high hedges vainly seeking to seclude the orchards beyond. For here was Apple Land—the country of cider and of fruit, as yet undusted by the automobile cavalcade that next week will splash the trees with a coating of sand and dull the verdure of the land thereabout.

Here and there a horse whose education had been neglected reared himself as far above the terrestrial sphere as his sense of equilibrium would allow; now a rabbit would cross our path, and then some nervous lady, undecided whether to flee to the right or the left until a mighty blast from the horn awakened her to the presence of the motor-car. And then she would run ahead, finally darting into the hedge with a hunted expression. Thus, too, performed the fowls.

The journey was void of incident. The car devoured space and swallowed miles with the ease that the conjuror at a country fair causes hot irons to disappear. With its comfortable New Orleans body and a Thornycroft engine of 20-h.p. it proved as reliable as any of more uniform constitution. But then the driver knew his car—and the personal equation is as great a factor in driving a motor-car as it is in timekeeping for automobile races.

We visited the victim of a motor-bicycle mishap, and, having spent a delightful hour in the twilight at Wellington, prepared for a night ride. A little crowd of natives assembled as an acetylene lamp that had done duty on a miniature motor vehicle was attached in front, the generator being placed on the footboard, and the connecting tube lying idly on the bonnet. Farewells had been said when—the light went out. The lamp was relit. The same phenomena occurred, and a similar match was applied. Result—the same. And not until fifteen precious minutes had gone into the waste paper basket of the Past, and many words of bucolic simplicity had been issued to the roaring crowd, was the reason of the thing discovered. In jumping up to take his seat by the side of the driver one of our party had trodden on the connecting tube, and darkness had come upon the scene with wearying reiteration.

And then we started, peering into the gloom to avoid direct encounter with stationary and moving objects. A mile had been traversed when the splash of water was heard, and felt. The brakes were jammed on sharply, and the car came to a stand up to its knees* in water, the cold dirty water of a horse pond. Then the driver jumped, an act which convinced the narrator that the nautical fashion of the captain sticking to a sinking ship did not apply to motor-cars. A glance at the lamp revealed to the remaining passengers that the car was sinking in the mud, and, nothing loth to follow the leader's example, we plunged into the element and reached dry land in safety.

There's not to reason why,
There's but to run or fly,
Into the village.

Thus we cogitated, and leaving the captain on the bridge—or rather the brink of the pond—the crew retraced their track towards the hamlet for assistance. Our wounded motor-cyclist was aroused, and with lighted lanterns we walked through the lanes calling on the labourers to come from their cottages. They responded with a genuine goodwill, and with all the heartiness of a lifeboat crew. For never before had a wreck occurred in that village. They knew the motor-car was displacing the horse in many ways, but they were ignorant of the cleanly habits of the mechanical animal, as evidenced by its presence in a pond.

And so we strode forth—a rescue party of determined men with a band of curious women in the rear. On the way we recounted the adventure; told of the splashing of the foam and the displacement of the mud, and prepared our friends for the worst.

Suddenly in the distance the glare of an acetylene lamp was seen. We approached, and there, with his nose homeward turned and his car on *terra firma*, was our driver and the car; a couple of natives with trousers turned up as though they had been cockle-hunting standing waiting by. The advancing crowd gave a lusty cheer, as though to indicate that help was at hand.

All was well. Standing in the water, a labouring man had started the engine, the driver had put in the clutch, and reversed on to dry land. And the horse—to say nothing of the two score donkeys or more we had caused to assemble—neighed a loud note of disapproval as we disappeared in the darkness, leaving them to wonder on the event.

As for the three passengers, they said nothing, but thought much as to the bravery of man under trying conditions and the value of a motor-boat in certain circumstances.

* Axle is here probably meant.—ED. *M.C.J.*

THE STANLEY STEAM CAR.

(*Concluded from page 524.*)

THE tendency is for the float to fall in the chamber until its weight becomes less, and finally balances with the lead counterpoise and sinking into the liquid with a corresponding movement of the indicator. It is possible after a little experience to judge by the "feel" of the indicator whether the float is touching the water or not, and quite an accurate estimate of the water height may be made.

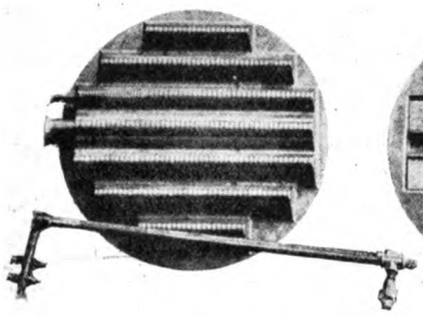

Fig. 3.—Top View of Burner.

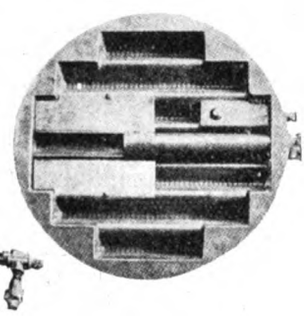

Fig. 4.—Bottom View of Burner Plate.

The Stanley burner is of peculiar construction. The round burner plate is a thin iron casting bearing raised parallel corrugations which cross the circular plate as equidistant chords. These raised portions have transverse slots about one-quarter of an inch apart, which are the gas outlets. The pilot light is formed by a small compartment in one of these rai-ed corrugations, which is separated from the rest of the burner and slotted with finer holes (Figs. 3 and 4). The burner plate is entirely closed at the sides and bottom by another plate, and the only opening into it is the air inlet into which is directed the gas nozzle. The mixing of the gas and air is very simply effected by a mixing plate. The pilot light compartment receives gas and air in the same manner. The petrol coming from the pressure tank passes through a coil of brass pipe above the boiler flues and then to the burner, passing twice through the fire before entering the mixing chamber.

The carrying of large quantities of petrol under a heavy air

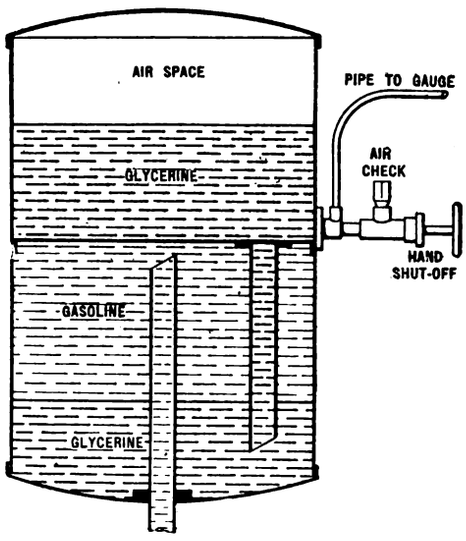

Fig. 5.—Section of Pressure Tank.

pressure is rightly regarded as a dangerous practice, and in the Stanley car this danger is minimised, as only about a pint of the fuel is under pressure. The petrol is taken by gravity from the supply tank, which is at atmospheric pressure, into the petrol pump, which is operated mechanically from the engine, and is thence forced to an automatic diaphragm which controls a bypass leading back to the tank. The petrol thence may pass to the pressure tank, a small metal vessel carried in the bonnet of the car. As there is no outlet from this tank except to the burner, the air in it is compressed as the fuel is forced into it, until a pressure of about 90 lbs. is attained, when the diaphragm opens the bypass and allows the pump to return the excess of petrol to the tank until such time as the pressure falls somewhat below 90 lbs., when the bypass is closed and pumping into the pressure tank (Fig. 5) is once more resumed. As it is desirable that the petrol shall not become saturated with air, the pressure tank is ingeniously arranged so that there will always be a layer of glycerine between the air and the petrol. The amount of fuel under pressure in this small receptacle is sufficient to maintain the pilot light burning for about three hours. If the car is left standing for any length of time it will be necessary to pump petrol into the tank by means of a hand-pump conveniently provided.

The Stanley engine (Fig. 6) is of the double-acting, twin-cylinder, horizontal type, with Stephenson link reversing gear. It carries a steel spur gear of thirty-six teeth on its crank shaft, which meshes with the gear on the differential, and the engine frame extension carries circular straps, which encircle the rear axle tube and constantly maintain the proper relation between the engine and the driven axle. The head end of the engine is strapped to the car frame. The cylinders are 3½-inch stroke by 2½-inch bore, and the cut-off is set at five-eighths of the stroke. The steam chest cover is easily removable, giving access to the two slide valves, which are correctly ground by special machinery.

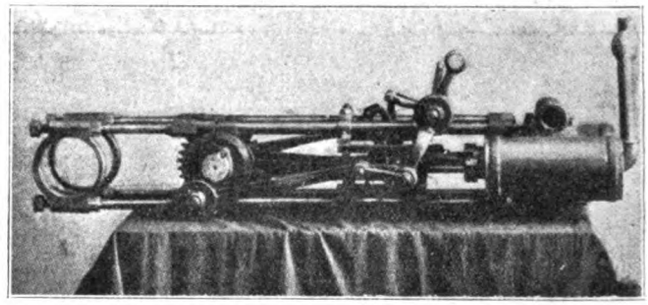

Fig. 6.—Side View of Engine with Casing removed.

The pistons each carry two broad packing rings, and the piston rods are riveted into the piston heads. All bearings in the engine, with the exception of the wrist pins, are of the ball type, including the crank shaft bearings, crank pins, eccentric rod straps and the guides. Two of the four eccentrics are integral with the crank shaft, and the other two are made fast with special care to prevent slipping. The engine crosshead actuates a linkage supported on ball bearings which operates the water, petrol and oil pumps, and this linkage is capable of adjustment to secure a variable throw on the water pump. A copper jacket encloses the engine cylinders, and a removable burnished copper case completely protects from dust the whole engine, the differential gear and brake. A pedal operates the reverse, and it is automatically restored to the forward position by a spring. Cylinder lubrication is effected by a positive mechanical force feed lubricator, which consists of a piston pump drawing oil from a tank of large capacity and forcing it directly into the main steam pipe, where it enters the cylinders. The pump has sufficient force to drive the oil against the maximum boiler pressure, and it is operated by means of a cylindrical cam, which is given a slow motion by a ratchet and pawl device moved by the pump linkage. Water is supplied to the boiler by a piston pump of large capacity and capable of a variable throw. A manually operated by pass serves to divert any water which is not needed by the boiler feed back to the supply tank. There is also a water hand pump of the usual folding variety.

Steam pressure is automatically maintained by a diaphragm, which acts to cut off the petrol supply absolutely from the main burner whenever the pressure exceeds 400 lbs. or thereabouts, and to open the supply when the pressure falls much below that

Digitized by Google

figure. The engine exhaust is piped into the chimney and escapes with the products of combustion, at the same time aiding in the draught. Before reaching the chimney it has been passed through the usual form of muffler. A galvanised iron hood gathers the spent gases from the top of the boiler and conveys them to the rear of the water tank, where the chimney deflects downward and discharges its contents toward the ground. As the burner is entirely enclosed there is no likelihood of its being blown out by outside air currents, and all the air which is used in combustion is drawn in through the single aperture at the burner.

All piping in the car is of brass and all check valves are of an improved type, making use of steel balls instead of conical checks. All pumps and piping are protected from road dirt by the flooring of the car, which arrangement also conduces to safe operation in cold weather. Every one of the controlling devices is easily reached from the seat, including the water bypass, main burner shut-off, pilot light shut-off, main petrol shut-off, and the water level indicator. The equipment includes an ejector for filling the water tank, together with sufficient rubber suction hose, which is carried on hangers around the body frame. The pedal-operated brake is of the double-acting variety, and the usual leather strap is superseded by a specially prepared canvas band, which will not absorb oil. The centre tiller form of steering is retained.

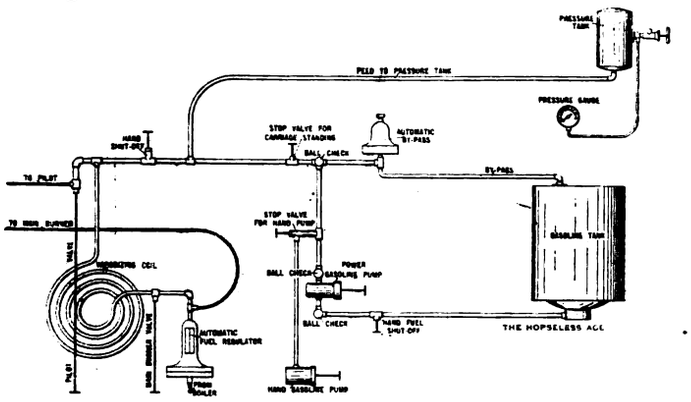

Fig. 7.—Diagram of Petrol Feed System.

The weight of the car is between eight and nine cwt., with all supplies, and it has a wheel base of 6 ft. 6 in., with a 4 ft. 6 in. gauge.

Mr. F. Wilkinson, of Manchester, one of the agents for the Stanley steam car in this country, writes us with regard to the fuel capacity of the vehicle. He states that the petrol tank has a capacity of 10 gallons, which is sufficient for a run of 160 miles. If paraffin be used instead of petrol the car will travel 200 miles on one filling of the tank.

POSTAL parcels are carried by motor-van between Warwick and Birmingham.

THE Automobile Club of America has just issued a notice stating that it is open to receive entries for the 1905 Gordon Bennett cup race. In order to prevent entries being sent in merely for purposes of advertisement, with no real intention of competing, a number of new conditions have been laid down, among which are the following:—Each entrant shall deposit with the Club the sum of £120. Each entrant shall file with the secretary, on or before April 15, 1905, an affidavit, signed by two responsible persons, containing the following statements, based on their own knowledge:—(1) That the car has been completed for a period of over four weeks. (2) That they have driven the car over one thousand miles on the road. (3) That they have driven the car over two hundred and fifty miles without stopping the engine. (4) That they have driven the car more than forty miles in less than sixty minutes on track or road. Entrants must submit to the racing committee the names of the intended drivers of each car, and they must be approved by the committee.

CONTINENTAL NOTES.

The Gordon Bennett Race.

The question as to the rules under which future Gordon Bennett Cup races shall be run is, it appears, under discussion at the French Automobile Club. Count De Dion is credited with the intention of proposing certain modifications in the rules, among which the following may be mentioned. In the first place he suggests that the race should be over a distance of 1,000 kilometres and spread over two days; the competing cars to be locked up in a garage for the intervening night and not allowed to be touched in any way. All repairs, even to pneumatic tyres, would have to be made on the road, and by the tools, etc., available on the car. He proposes that, as hitherto, the French team should be selected by an eliminating race, but that each firm competing should enter a team of three cars, and that the selected team should be that which makes the best total time. He further suggests that the cup race should be run on similar lines and under the same conditions, but that, on the other hand, it should be permitted to the competitors to change the drivers of the vehicles if they so desire at any time during the race.

◆ ◆ ◆

The Course for the 1905 Cup Race.

The question as to the course for next year's cup race continues to attract attention. M. Tampier, the official timekeeper of the A.C.F., has been commissioned by the Sporting Commission of the Club to examine several routes and make a detailed report on each. Among the districts he has inspected he has been particularly impressed with the roads and general conditions in the Central Plateau of France. On the other hand, the authorities of Aix-les-Bains are using every possible means to induce the A.C.F. to select that district for the contest. The town offers to subscribe several hundred thousand francs as a guarantee fund similar to that of Homburg. The authorities of the town of Vichy offer to do likewise, and are equally desirous of having the race in that region.

◆ ◆ ◆

The Dust Nuisance in Austria.

In a letter to a German contemporary Baron de Caters relates how he recently met with a new phase of the dust question. Arriving at Theresienfeld, Austria, his car and another were stopped by an imposing group, consisting of the mayor, the council of the village, and the whole body of the local police, and the motorists' names were demanded, in order that summonses might be issued against them for raising the dust!

◆ ◆ ◆

The International Motor-Bicycle Race.

The Moto-Cycle Club de France has received the necessary official permission to hold its international race on the Dourdan-Ablis-St. Arnoult. The course, which measures fifty-four kilometres and comprises four neutralisations, has to be covered five times. Challenges have already been received by the club from England and Italy.

◆ ◆ ◆

Motor-Boat Racing in Italy.

What is said to be the first motor-boat race meeting in Italy is to be held on Lake Maggiore next month, under the auspices of the Verbano Yacht Club. On September 18th there will be a thirty kilometre event for racers, and one of fifteen kilometres for cruisers. On the 19th a 100 kilometre competition for racers and a fifty kilometre for cruisers are to be run off. On the 20th there will be a handicap race and a series of mile speed trials for the racers.

◆ ◆ ◆

The Paris-Trouville Motor Boat Race.

The motor-boat race from Paris to the sea was in progress during the whole of the past week. It proved very successful, no fewer than fifty-five entries being received, of which thirty-three actually started. The distance was 221 miles, divided into six stages, the last being at Trouville. The locks was the chief trouble, and caused a deal of irritating delay. The boats were, however, timed in and out, and therefore suffered no actual loss through the accidents of their detention. No English boats

Digitized by Google

competed, unless Trefle-a-Quatre is to be regarded as representing this country, the vessel being now the property of an Englishman. The feature of the week was the racing of Mercedes IV. and Hotchkiss. It was evident in the cross-channel race that the latter was very fast, and but for the blowing out of her plugs she would probably have made a better showing on that occasion. From Paris to the sea the two fliers fought out their battle. In the stage of fourteen and three-quarter miles from Elbeuf to Rouen, Mercedes IV. took 31 min. 8 sec., while the time of Hotchkiss was 32 min. 41 sec. La Rapee III., a boat of 26 ft., with a 60-h.p. motor, did 31 min. 59 sec. Over the knot at Rouen Mercedes IV. did 3 min. 0 3-5 sec., the Hotchkiss 3 min. 11 2-5 sec., and La Rapee III. 3 min. 16 2-5 sec. Of the thirty-three boats which started only fourteen were classified as arriving at Trouville. The best time was made by Mercedes IV., belonging to M. Vedrine (time 7 hrs. 34 min. 16 sec.), this boat being thus first in the general classification, and the winner of the 8-12 metre racer category, the Hotchkiss boat driven, by M. H. Fournier, being second in 8 hrs. 58 min. 56 sec.

◆ ◆ ◆

The Gaston Menier Cup Motor-Boat Race.

The motor boat race for the Gaston Menier Cup was run off at Trouville on Sunday last over a distance of three nautical miles. The event proved a victory for the Hotchkiss boat driven by M. H. Fournier, the time being 8 min. 27 2-5 sec., the Trefle-a-Quatre, with Richard-Brasier motor, being second in 9 min. 46 3-5 sec., and Mr. S. F. Edge's Napier II. third in 10 min. 11 2-5 sec. The average speed of the first three was respectively 39⅛ kilometres, 35 kilometres, and 32¾ kilometres per hour, as against 29 kilometres of the Napier boat which won the Cup in 1903. It will thus be seen that great improvement has taken place in the twelve months in the speed capabilities of motor-boats.

◆ ◆ ◆

Hill-Climbing in Italy.

The Florence section of the Italian Automobile Club will hold its annual hill-climbing competition from Pontassieve to Consuma on September 11th. The course is fifteen kilometres long, the gradients varying from 7 to 10 per cent.

◆ ◆ ◆

Public Services in Austria.

The authorities of the health resort of St. Radigund have established a public motor-car service between that place and Gratz. The vehicle, which was built by the Austrian Daimler Company, has accommodation for eight passengers, and makes three journeys a day in each direction. Arrangements are also in hand for a service between Kulm, Karbitz and Aussig.

Chateau-Thierry and Gaillon.

The "Auto" is arranging to hold the annual hill-climbing competitions at Chateau-Thierry and Gaillon, October 23rd being the date fixed for the former and October 30th for the latter. It is proposed to confine the Chateau-Thierry climb to touring vehicles, as there are two bends on the course which render it unsuitable for racers.

◆ ◆ ◆

A Scandinavian Automobile Week.

The Danish Automobile Club, in conjunction with the Stockholm, Gothenburg and Malmo Clubs, proposes next year to hold an automobile week. Among the events will be a 1,100 kilometre reliabilty trial for cars and cycles, and a motor-boat race between Copenhagen, Stockholm and Gothenburg.

◆ ◆ ◆

The Brescia Automobile Week.

An "automobile week" is to be held at Brescia, Italy, from the 28th inst. to the 4th prox. The first two days will be devoted to an exhibition of the cars, while on the 30th the vehicles will take part in the military manœuvres. On Thursday, September 1st, there will be a series of speed trials over a kilometre, one mile, and five kilometres. For Friday, September 2nd, a tour to the Lac de Garde and Solferino is being arranged, while a procession through the town forms the event for Saturday, September 3rd. The meeting will close with a 370-kilometre race for tourists and racing vehicles. The course, which is stated to be the best in the district, will comprise two neutralisations of two minutes duration each. Great interest is being shown in the race, so much so that it has been decided to erect grand stands at Brescia, Mantua, and Cremona. The entries already include the three Fiat Gordon Bennett racers, an 80-h.p. Opel-Darracq, a 70-h.p. Panhard, and several 60-h.p. Mercedes.

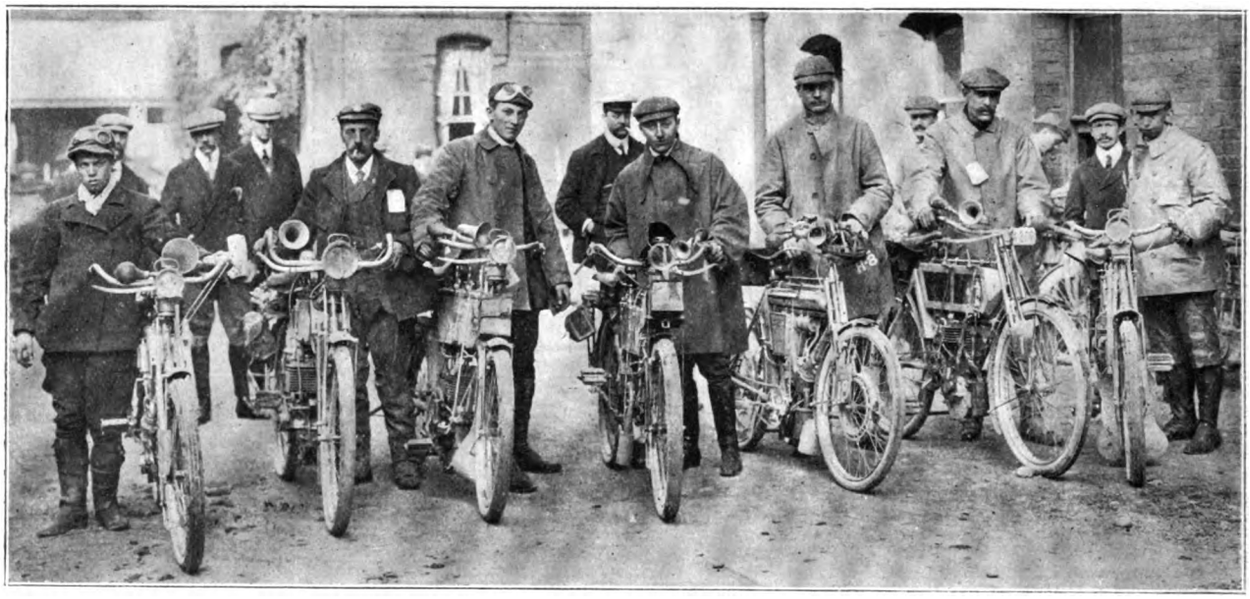

Photo by] The Auto-Cyc'e Club's Reliability Trial. The Start from Oxford for the last Day's Run. (*See page* 547.) *[Argent Archer.*

From Mr. Rowland Hill, of the Albion Foundry, Coventry, comes a catalogue of the motor castings in iron, brass, and aluminium he is bringing out. The list also deals with frames, radiators, tanks, and other motor components.

The "All's Well" is a new brand of lubricating oil for petrol motors which has been put on the market by the Bowring Petroleum Company, Limited. It is made in three qualities, respectively for air cooled, water cooled, and air and partly water cooled engines; the oil is of a dark red colour, and is stated to contain no acids or alkalies. We are at present giving the oil for water-cooled cylinders a practical trial, and hope to be able to report well of it in a later issue.

HERE AND THERE.

A SPACIOUS motor garage is being erected in the Steine Road, on the Sutton Estate, at Seaford.

THE Sandgate Council have decided to erect boards in their district warning motorists to moderate their speed when passing through the streets of the town.

MR. E. R. OSBORNE has severed his connection with the Motor Mart, Limited. He intends shortly resuming business in a similar occupation with an old-established motor business.

A 10-h.p. Turner-Miesse Steam Car with side-entrance body.

A NEW dust screen has just been placed on the market by Mr. Hunt, of Montague Street, Kettering, which possesses the advantage of being quickly taken off when not required. A small plate is screwed on to the back of the tonneau, and a couple of studs on either side.

SIR KEITH FRASER, BART., arrived at Kintail, Inverness-shire, by motor-car the other day for the shooting season. His residence, Inverinate House, is charmingly situated on the north-east shore of Loch Duich, the wooded slope behind the lodge forming a rich background to the picture.

THE Berkshire Automobile Club, of Pittsfield, Mass., is to have the honour of the possession of the first specially-built track for motor-car racing in America. The track will be a mile in circuit. A great inaugural meet is being projected, for which the entry of some of the fastest cars in the country is already promised.

THE Sirdar Rubber Company, Limited, will, early next month, open their new show room in Down Street, Piccadilly, next door to the Automobile Club Garage, where they will not only exhibit wheels fitted with Royal Sirdar-Buffer tyres, but also pneumatic tyres and their patent pneumatic tyre tube, which is compressed and therefore toughened and strengthened against punctures, and when fitting it or inflating it, it is claimed that it cannot get nipped by the cover.

ON the way north the other day we looked in at the depot of Mr. Victor Ashby at Towcester. The premises are on the main road, and consist of an old chapel which has been converted to the purposes of a motor garage and repairing establishment. Facilities are available for carrying out all classes of repairs, charging accumulators, etc., while a stock of petrol and motor accessories is kept on hand. Mr. Ashby is an enthusiastic motorist, and at the time of our call had just returned from a tour in Wales. His motoring experience dates from 1896, at which time he enjoyed (?) himself on one of the old Bollées.

A NON-ENGINE stop run of 1,000 miles was completed on the Gross Pointe track, Detroit, U.S.A., on the morning of the 8th ult., by a 24-h.p. Packard four-cylinder car. The 1,000 miles were covered in 29 hours 53 minutes 37 3-5 seconds. The objects sought in the trial were to test the motor under the steady grind of a 1,000 mile non-stop run, and to secure data on the consumption of petrol, oil, water and electricity. The car was, of course, stopped at intervals to replenish the supply of petrol or put on new tyres, but the motor was not stopped for an instant. The quantity of petrol used was 70 gallons, and of lubricating oil 3 gallons.

MR. FRISWELL is at present touring in Switzerland on an 18-h.p. Peugeot car.

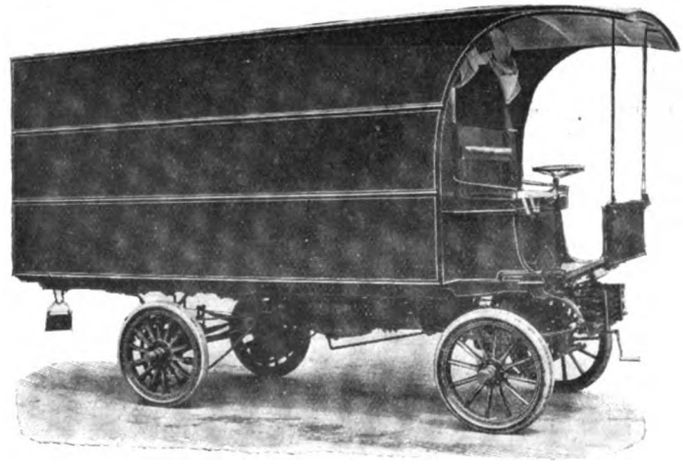
A MOTOR-OMNIBUS service is shortly to be established between Ripon Station and Studley Park Royal.

LORD HARLECH, of Malpas, Cheshire, has joined the ranks of motorists, he having lately acquired a 12-h.p. Wolseley.

EXPERIMENTS are being made at Leamington with dust-layers to overcome the dust nuisance, which is said to have been locally aggravated by motoring.

A READING jobmaster states that among the causes of his insolvency are the introduction of the corporation electric tramway and the popularity of motor-cars.

ON Saturday last 30 of the employees of the Bristol Motor Company, Limited, had their first annual outing, since the change of title, to Portsmouth and the Isle of Wight.



THE Great Western Railway Company's motor-cars from Slough Station to Windsor and Beaconsfield carry about 900 passengers a day. The car running to the Royal Borough has carried approximately 12,000 people in just over three weeks.

THE Prince of Wales arrived at Studley Royal from Bolton Hall on Thursday of last week on a visit to the Marquis of Ripon. The latter placed his motor-car at the disposal of the Prince, who, with his equerry, enjoyed a twenty-nine mile drive across the Nidderdale Moors.

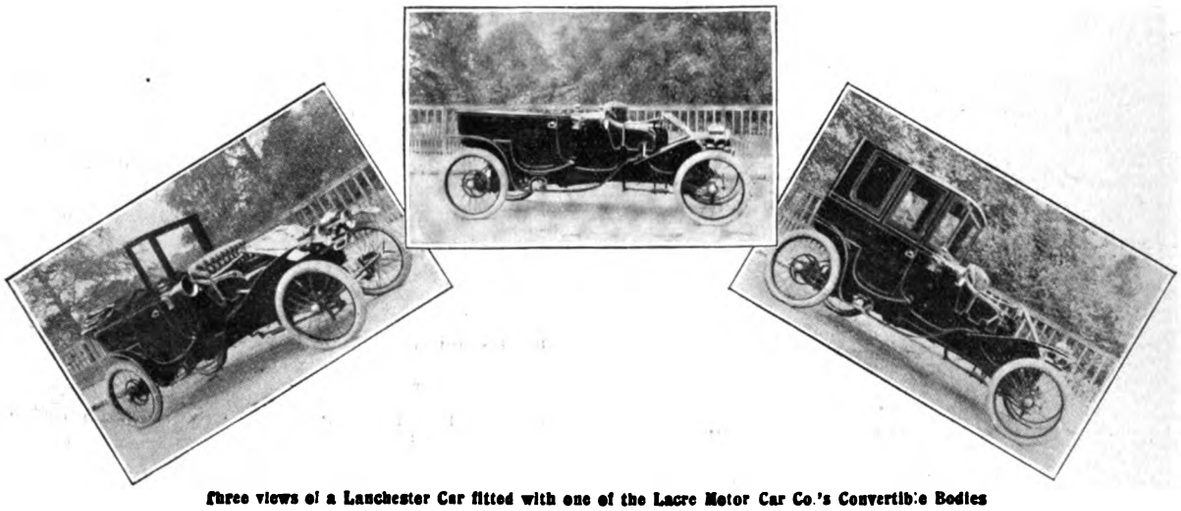
ON the motion of Mr. W. Field, M.P., the Blackrock (Dublin) Urban District Council has requested the Local Government Board of Ireland to make an order reducing the speed at which automobiles are permitted to be driven through the district from a maximum one of twenty to ten miles an hour.

IN consequence of the development of business, the Palmer Tyre, Limited, have secured extensive premises at 119, 121 and 123, Shaftesbury Avenue, London, W. While the motor tyre department has been transferred to this address, the London and district cycle business will still be carried on at 78, St. John Street, Clerkenwell, E.C.

THE accompanying illustration shows a Gladiator two-ton delivery van lately completed by Messrs. S. F. Edge and Company, Limited. The vehicle, which is fitted with a large body weighing twelve cwt., was recently submitted to an exhaustive trial ere being taken over by the purchaser. The work it had to

do was as follows :—Travel from Regent Street to other side of Esher Hill unloaded, about 15 miles ; time occupied 1 hr. 40 min. Esher Hill to Kirby Street, E.C., loaded with 1½ tons of paper, 2 hrs. 3 min. The van with its load climbed Wimbledon Hill on second speed, and Kingston Hill on first speed.

AMONG the papers read before the engineering section of the British Association at Cambridge this week was one by Mr. E. Dugald Clerk on "Flame Temperatures in Internal Combustion Motors," and one by Prof. H. L. Callendar on "Indicator Diagrams of a Small Petrol Motor."



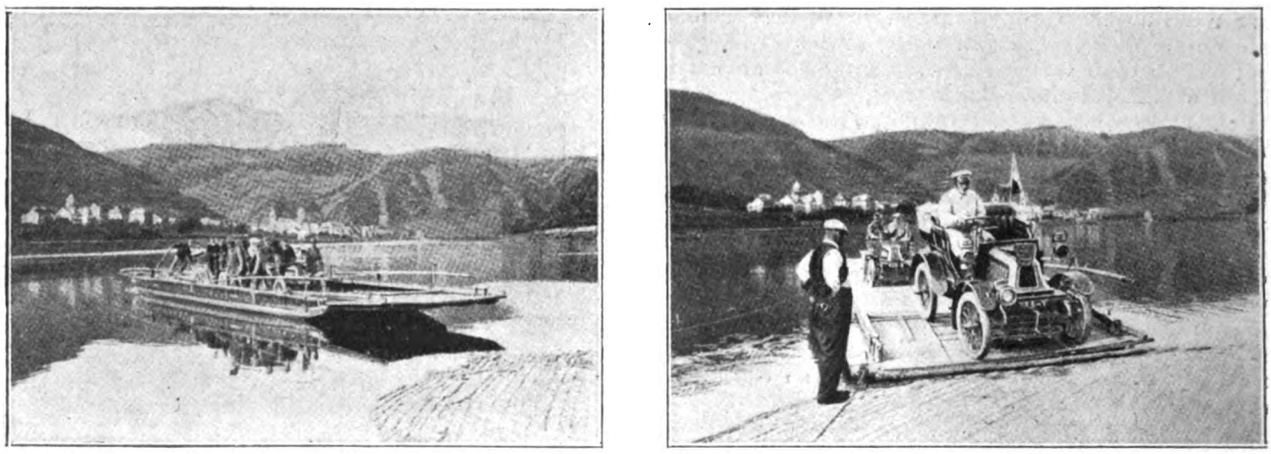
Digitized by Google

THE Eclipse Motor Company, of Earlsfield, S.W., have just completed a 3-h.p. motor-bicycle for the chief electrician of H.M. Dockyards in Bermuda.

DR. A. R. WOOD, of Woolpit, recently ran a 7-h.p. Star car up to London by Chelmsford and back by Newmarket, a distance of nearly 180 miles, on 4½ gallons of petrol.

A MOTOR-CAR service has been established at Bray by the Bray and County Wicklow Car Company, of which Mr. J. O'Neill, of St. Anne's, Dalkey, is the moving spirit.

FROM the Scottish Motor Garage Company, Limited, comes a catalogue of their accessories for all kinds of motor-cars and motor-cycles. The company has every convenience for motorists passing through Glasgow, their garage for 100 cars including several private boxes, which are provided free to customers of the company. The establishment is open day and night, and the company's stock of motor parts includes everything that is likely to be wanted by motorists on tour.



Three views of a Lanchester Car fitted with one of the Lacre Motor Car Co.'s Convertible Bodies

A 6½-h.p. Humberette with a large canopy was recently put to a severe test at Lincoln, being driven up Clay Lane, a very steep hill near Arboreteum. It was first driven up with three men (it has only seats for two) and then with four up. At one point the gradient is 1 in 4½, and is 1 in 6 the rest of the way.

IT is easy enough to be pleasant
When your automobile's in trim,
But the man worth while
Is the man who can smile
When he has to go home on the rim.

Chicago Record Herald.

THE team selected by the Committee of the Motor Cycling Club to compete for the "Motor Cycle" Challenge Trophy today (Saturday) is as follows:—Tricars, Messrs. J. Van Hooydonk and H. J. Densham. Reserve, Mr. F. J. Jenkins. 76 by 76 MM. Class, Messrs. F. Hulbert and J. H. Reeves. Reserve, Mr. W. H. Wells. Any power class, Messrs. J. W. Milligan and A. Candler. Reserve, the Rev. B. H. Davies. The event will be run off in the neighbourhood of Bicester, and motor-cylists and motorists generally will be heartily welcomed as spectators.

Touring on the Continent.—De Dion Cars on the Ferry over the Moselle at Tries, near Coblenz.

SINCE a recent accident at the dangerous Dye House Hill, near Thursley, a policeman has been stationed at the spot, a precaution which would be of great use if he took up his stand at the dangerous corner. He is, however, generally in concealment, it being apparently more important to observe accidents after their occurrence than to prevent them.

STRANGE were the references to the Hertfordshire Club in two of our contemporaries last week. One dealt with this club's forthcoming meeting as though it were connected with the Herefordshire Club, and another gave the formula for the former's hill climbing contest in connection with an imaginary gathering of the Herefordshire Club. Verily in the multitude of counsellors there is confusion.

THE Racing Board of the American Automobile Association announces that the time for closing the entries for the Vanderbilt Cup road race is fixed for September 8th. Every entry must be accompanied by a letter from the Secretary of the Club that the car represents and certifying to that fact. Four entries have already been received, two Whites and two Panhards, and correspondence indicates the probable entry of two British cars.

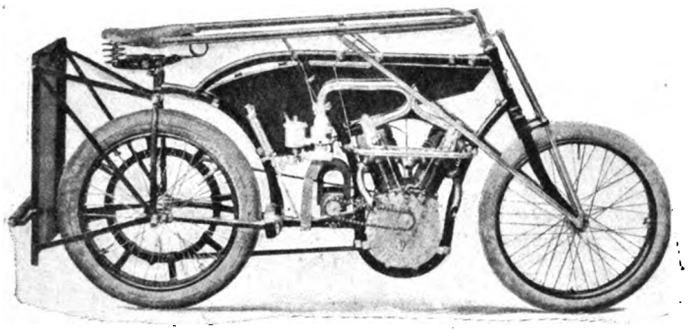
MOTOR CYCLING NEWS.



THE annual race meeting for the *Motor-Car Journal* and other Press challenge cups will be held at the Crystal Palace on the 24th prox.

◆ ◆ ◆

FORTHCOMING events organised by the Auto-Cycle Club include a members' reliability trial on September 15th and 16th and a consumption trial on October 1st.

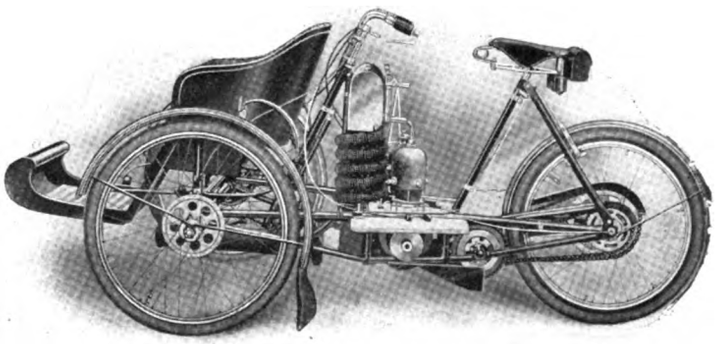
◆ ◆ ◆

ON Wednesday the Kingston-on-Thames motor-cycling club had a run to Uxbridge. On Sunday, the 28th, the

An Austrian Racing Motor-Bicycle, said to be capable of a speed of 60 miles an hour.

run will be to Maidenhead *via* Slough, leaving headquarters at 2.30 p.m. Hill-climbing contests will be held in September.

◆ ◆ ◆



OF the forty-five motor-cycles that started from London on Monday week only twenty-four left Doncaster on the fifth stage of the Auto-Cycle Club's thousand miles reliability trials. The route lay through Nottingham, Leicester, Coventry, Warwick, and Cheltenham to Oxford, a distance of 185 miles, and at Oxford the first arrivals were H. Williamson (3¼-h.p. Rex), J. F. Crundall (2¾-h.p. Humber), T. Silver (3-h.p. Quadrant), F. W. Chase (2¾-h.p. Chase), A. G. Reynolds (2¾-h.p. Bat), A. E. Lowe (3-h.p. J.A.P.), W. J. Milligan (3-h.p. Peerless), J. Platt-Betts, (3-h.p. Rover), A. Hoffman (3½-h.p. Ariel), H. Harding (3½-h.p. Lagonda), A. Ryder (Alldays), and W. King (3½-h.p. King). The weather improved as the day progressed, and there were not many incidents. A. Wright (3½-h.p. Roc), broke a piston, and was towed into Worksop by the Mars earette, while the Bradbury forecar finally came to grief at Stratford-on-Avon through smashing a hub. The trial was brought to a conclusion on Saturday with a run to London, via Malmesbury, Chippenham, and Marlborough, a distance of 147 miles, making the exact distance covered during the trial 1,000¾ miles. A short way out of Marlborough the second hill-climbing test of the trial was held. The hill was 1,000 yards long, with an average gradient of one in twenty, and a steep portion of one in ten. Of the forty-five competitors who started on the tour twenty left Oxford on the last stage, and at a late hour on Saturday night nineteen had reached the Club's headquarters in Piccadilly. The first to arrive was A. Van Altena, on the 3-h.p. Altena; and then followed:—J. Crundall (2¾-h.p. Humber), H. Williamson (3¼-h.p. Rex), E. Clarke (2-h.p. Leader), J. Platt-Betts (3-h.p. Rover), A. E. Lowe (J.A.P.), F. W. Chase (2¾-h.p. Chase), R. M. Brice (3½-h.p. Brown), H. A. Palmer (3½-h.p. Allday), T. S. Lock (2½-h.p. Allday), J. C. C. Brodie (2¾-h.p. Noble), A. G. Reynolds (2¾-h.p. Bat), W. J. Milligan (3-h.p. Peerless), H. Harding (3½-h.p. Lagonda), T. Silver (3-h.p. Quadrant), J. Van Hooydonk (3½-h.p. Phœnix Trimo), W. King (3½-h.p. King), P. Lambert (2¾-h.p. Griffon). Altena finished at 5.55 p.m., and the others were within three-quarters of an hour of that time. W. Hayes, on the 3½-h.p. Rex tricycle, arrived at 7.35 p.m.

◆ ◆ ◆

AT Bangor, the police have summoned Hugh Pritchard, Llangefni, for driving a motor-cycle without a licence. According to the evidence the defendant was riding his cycle along High Street when Sergeant Jones stopped him and called his attention to the fact that he had not the registered number of his machine fixed on in proper form. The defendant then proceeded along High Street and entered a cycle dealer's premises, whither he was followed by the officer, who asked him to produce his licence. This the defendant was unable to do, as, according to his explanation, he had left it at home. Addressing the bench, the defendant submitted that there was no case. He went on to explain that a fortnight or three weeks prior to the alleged offence he left his motor-cycle at the Castle Hotel, Bangor. Calling for it on the day in question, he found that every drop of the petrol had evaporated, and he was in the act of taking the machine to get a supply of petrol when the police officer stopped him. The point which he made was that, there being no petrol, he was merely riding the cycle, and not driving it within the meaning of the Act, and on that ground he maintained that the summons should be dismissed. The police officer, recalled, could not remember whether the machine was being ridden or driven. After looking up the provisions of the Act, the bench decided to dismiss the case.

◆ ◆ ◆

ONE of the latest additions to the ranks of tri-cars is the machine which has been introduced by the Raleigh Cycle Company, Limited, and of which an illustration is given herewith. It is known as the "Raleighette," and is provided with a 3½-h.p. water-cooled engine, the cylinder being water jacketed throughout. The ignition is by accumulator and coil with wipe contact. Two accumulators are provided, either of which may be used by operating a two-way switch. The carburettor is of the latest Longuemare type with auxiliary air inlet valve. The water cooling is effected on the thermo-syphon system, both tank and radiators being ample to cool the motor for a distance of about 100 miles without replenishing. The arrangement, as will be seen by the illustration, is of the simplest character, both tank and radiator being set as much in the line of the air draught as possible. The engine is arranged to be started by a strap which winds over a pulley seen below the driver's footrest. The clutch is of the leather-faced coned variety, and is actuated by the usual foot lever. The power is transmitted to a counter-shaft by a Renold silent chain, and thence by a pair of chains to the rear wheel hub. The Raleigh two-speed gear is fitted to

the back hub, and is operated by Bowden wire. By twisting the right handle grip the high gear is brought into action, while by revolving the handle inwards the low gear is obtained, the relative speeds approximating to about thirty miles an hour on the high, and twelve to fourteen on the low. Ample brake power is provided, there being two brakes of large diameter on the hubs of the front wheels and a foot-applied rim brake on the rear wheel. The frame is rigid, yet resilient, and well braced, the two main members being reinforced by an under frame and tension rods. The road wheels are 28 inches diameter, and are shod with 2 in. tyres at the front and 2¼ in. at the rear.

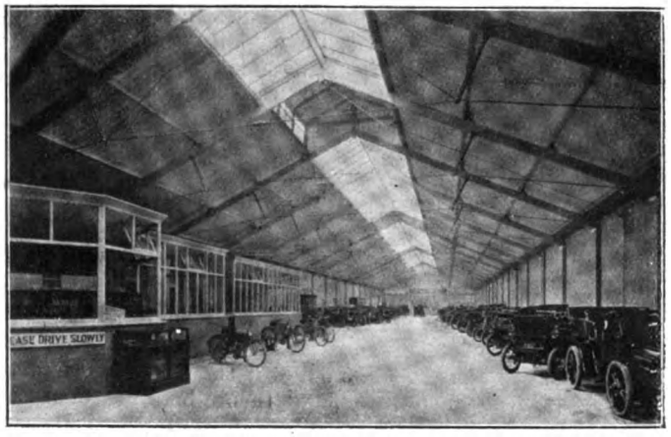
CORRESPONDENCE.

KNOCKING IN THE ENGINE.

To the Editor of *The Motor-Car Journal.*

Sir,—I saw a letter in the *Journal* some time ago from "Puzzled Novocastrian" asking for help to locate the cause of a "knock" in his engine. I have had the same trouble, but in my case it seemed to be from premature ignition. After a long time I found the cause to be owing to the sparking points in a certain type of plug getting red hot. I had used two kinds, one with a dome to receive the spark, and the other a thick crossbar. The knock quite ceased as soon as I put in a plug with fine wire sparking points. I daresay these plugs may answer very well where the exhaust does not pass by them.—Yours truly,



Charles Percy Dean.

BELT TRANSMISSION.

To the Editor of *The Motor-Car Journal.*

Sir,—When the wealthy have become in a measure satisfied with the pleasures of motoring, the business-car era will have been ushered in. Manufacturers should therefore be asking themselves questions as to what types will meet the want. To my mind, the car must have solid tyres, comprise no delicate machinery, few hidden parts, few wearing parts, if possible without any "boxed up cogs" that he cannot see, one that he can see most of the working parts of at a glance, load up and get off at fifteen to twenty miles an hour. The price, too, must not be forgotten. I have an impression that the belt will come in here. There is certainly plenty of room for inventors yet in this direction. The problem will yield to brains.—Yours truly,

Engineer.

The New Garage at Eastover, Bridgwater, lately opened by the Bridgwater Motor Co.

EXPERIENCES WANTED.

To the Editor of *The Motor-Car Journal.*

Sir,—Quite recently there has been a very interesting collection of experiences published in your columns from medical men and others who use a motor-car as a means of locomotion in their daily work. One is struck by the fact that, though various types and various makes of cars are favoured by different men, there is no exception to the universal chorus of praise as to their efficiency, practical immunity from failure, and the pleasure of using them; indeed, the account is such a pæan of approval that one is rather surprised that the antiquated doctor's gig is not being more rapidly swept from the roads than it is by its fascinating rival. The experiences recorded are indeed charming, and those happy enough to have been so favoured are most fortunate. To my mind, however, the whole series of letters puts the matter in a far too favourable light, and I do not imagine the "average success" is as high as these happy men would have us suppose.

I, too, am a motorist. A year ago I bought a steam car of foreign make, highly recommended as a first-class article by the London house that sold it to me, and I may add that the car had a good reputation on the market and was their latest and most powerful design, and not at all a cheap one. Although fond of mechanics myself, and having a first rate man to devote his time to the care of this car, it has been by no means a success either as regards reliability, cheapness on the road, or soundness in construction. From the very first there have been troubles, which the agents in London have duly considered, but which have been a source of continual expense and worry. In fact, my experience is very different to the general one related in your correspondence. And, although I would not give up motoring, it seems to me that a fair percentage of cases must arise where, as I have done, the medical motorist must put up with a great deal of worry and disappointment, and that to the novice the general idea conveyed in your columns is rather too much "couleur de rose.'

I have been unfortunate, I admit, but I went to a first-rate house for my car, which had a good name, and paid a very fair price for it. Can a beginner do otherwise? I am afraid I am not the only one who has found medical motoring fall short of his hopes, though it is possible the number of disappointed ones is a constantly decreasing one, especially as the genus "mo or expert and repairer" tends to become more of a thoroughly reliable engineer and less of a tinker.—Yours truly,

A General Practitioner.

HORSE V. MOTOR.

To the Editor of *The Motor-Car Journal.*

Sir,—In connection with the correspondence on this subject I may mention that I have kept very careful accounts for two years. All my man's time is charged to the horse account. The car is a 6-h.p. of well-known make. I keep one trap horse and one hunter.

	Stable Upkeep. £.	Motor Upkeep. £.
1st half year ...	80	64
2nd " " ...	33	36
3rd " " ...	33	37
4th " " ...	80	37
	226	174
Per year ...	113	87

My car cost £200, and is now worth, I suppose, £30; the depreciation is £170 in two years, or £85 a year. Therefore the cost of the motor-car per year, £87 plus £85, equals £172. My horses, so far, have gone up in value, so cost of two horses is, per year, £113. The horses were nearly always ready for use. The motor took six weeks' holiday constantly for repairs.—Yours truly,

H. K.

To the Editor of *The Motor-Car Journal.*

Sir,—I was amused to read the letter signed "Another Practitioner" in your *Journal* of the 13th inst., but he does not answer the question asked by "Practitioner." It would be interesting to hear his estimate of cost per mile. Certainly "Another Practitioner's" experience is somewhat exceptional; in fact, there is good matter on which to found a novel. Just fancy engine getting almost red hot; was the water almost red hot? It would be advisable to state the part of the country from which such a letter originates, so that we motorists can avoid a district in which there is not a second wise man. Then we read, £7 for punching surface of clutches, and £14 for unpunching. I think someone wanted punching. Then £80 for something not ordered, and car made unreliable. If this is as he states, he has his remedy in the law courts. I cannot believe that the motor mechanic is so far down in the scale of life as he would have us believe; but there are black sheep in the motor trade as well as in the medical profession. I have run a 9-h.p. car over two years with Clipper Michelin tyres, but have not had any of "Another Practitioner's" troubles. True, I have had tyre troubles, but carry a separate inner tube for replacement on the road. My advice is to go to a good man, of whom there are many. Tell him you want an estimate and specification for thoroughly fixing up the car in first-class order, and, if you think price reasonable, give him the job. Do not suggest that this or that should be done, because someone says it will be better. Trust to your man. When your car is finished, see that the specification is carried out; result, satisfaction to all. If you employ a driver, let him be a man is who acquainted with the difference between a screwdriver and hammer, not a garden labourer or person without experience. If you have an intelligent person in your employ that you wish to become your driver, then send him for a few weeks to some motor works for instruction, and don't expect the same man to feed the pigs and fowls, clean front of house, keep garden in order, and do other work, and keep a car in order, or you will be disappointed.—Yours truly,

E. R.

ENGLISH MOTOR INDUSTRY.

To the Editor of *The Motor-Car Journal.*

Sir,—Attention in the past has frequently been called to the enormous extent of the motor-car industry enjoyed by our Continental rivals, an industry in which this country at first took little share, because of the obstacles placed in the way of its progress by the antiquated law of the land as to mechanical progress on the highways. But was this the only reason for this country's backwardness? Those obstacles have now been swept away, and we enjoy a freedom equal if not superior to our neighbours. But the lack of enterprise, want of promptitude, and inattention to the reasonable demands of motor users on the part of British makers are subjects of constant complaint in motor circles, and the methods of French and German makers are compared with ours to our marked disadvantage.

I have just had a bitter experience. My car has now been laid up for over a month owing to the teeth of a small gear pinion having worn away. This was sent to the makers of the car, an eminent firm in the Midlands, to have a new one made. This was promised in eight or ten days, but week after week has passed without any sign of the part. Post cards only have come promising it shall be sent "next week certain," but still nothing turns up. I know that I am voicing the complaints of

Digitized by Google

many, and if we are to get our cars and parts in this country makers must realise that promptness and faith in carrying out their promises, whether orders are large or small, are business attributes which must be studied.—Yours truly,

ERNEST B. HAYNES.

LOOK AFTER THE CHAINS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—The writer, "Six and a Half Years' Experience," makes a useful suggestion in the last issue of the *Journal*, and I should like to have the benefit of the experience of others as to the life of a chain, for example, a Brampton chain usually fitted to a four-cylinder motor-car. For how many miles may it be trusted to run?—Yours truly,

A. T.

PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I have a 9-11-h.p. Clement car, two cylinders. The roads in my district have an excellent surface, and are, on the whole, level—few long gradients and only two or three stiffer short ones. My trouble is petrol consumption. Can you tell me what a car such as mine (weight 12 cwt.) should make in miles per gallon? I always try to keep her going on the minimum of gas for sweet running, but can get only eighteen miles a gallon. A friend, with a similar car, assures me he does thirty-five to forty miles a gallon, according to the roads and his load. I fear my carburettor is at fault, so far as being economical goes. It is a Clement type. If, as another motorist tells me, twenty to twenty-two miles is a good average per gallon, then it is not worth the expense of a new carburettor to change, but if I ought to do thirty miles then I should do so. —Yours truly,

NOVICE.

[With careful handling of the throttle valve the car should run twenty-eight miles on a gallon of petrol.]

ENGINE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—As a constant reader of your *Journal*, I should like the opinion of others upon the engine in my car, viz., a 12-h.p. Aster. My trouble when the car was new was the inlet cotters continually breaking and being sucked into the cylinder. I overcame this difficulty by having some washers turned and screwed on the inlet stems with split pins through. My next difficulty was the flywheels which build up the crank becoming loose on the shafts. On taking the engine to pieces I was surprised to find these were screwed up on the shaft with no feathers. I may also mention that my type of engine has three flywheels and no centre bearing for crank shaft. Since then I have had a lot of minor troubles, including three exhaust heads breaking off.—Yours truly,

MUTEL.

PUBLIC SERVICE VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I would be very grateful if you or any reader of the *Journal* would advise me how to treat the tyres of the motor-'bus I drive. The 'bus is one of Milnes-Daimler 12-h.p. to 16-h.p. type, with solid rubber tyres. I find that after running about twelve miles with a load the tyres get very hot. I make special stops and pour water on to them; I also cool and place wet sacking over them before I leave at night. Although I do this the tyres seem to burn away and get slack. What I would like to know is, is there any special method of treating the tyres of heavy 'buses when they get hot, and if I am taking the right procedure in doing as I have done? Also, how do you account for grease cup, which was properly screwed up, leaving a driving wheel hu on the axle becoming hot? The cup was picked up and found to be quite good.—Yours truly,

PERPLEXED.

ADVICE WANTED.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I have lately bought a motor-car, and would like your advice, as it causes me trouble. Like "C. W. P.," mine is chain-driven, and I thought by the wheels going in opposite directions it would be a powerful brake. I would like to know where the handle is for working it; is it automatic? Where do I find the box of gears? Is it in the round pot at the bottom of the car? I hardly think mine is gear boxed, as I am told it is electric magneto.

I had a man come to start it, and after he had gone I touched one of the magnetos and it nearly paralyzed me. I have since touched it with no effect. Why was that? Will it always play these tricks? Last Monday I wound it up two or three thousand times and it suddenly threw the handle through my front window. Are these chain drives explosive? Would it be safer to take that engine out and put in a twenty ampere four volt battery and dynamo, or would it be safer steamed?—Yours truly,

J. S.

[Our correspondent is evidently not quite familiar with technical terms. Perhaps some of our readers will reply to him in equally untechnical terms.]

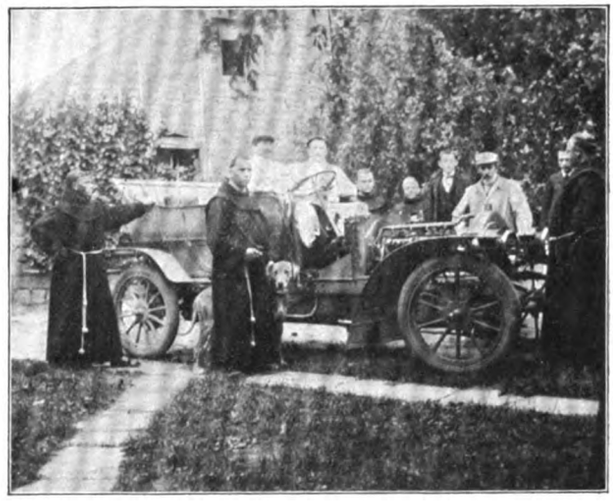
THE OLDSMOBILE.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In your last issue "A. H. K." writes for advice in regard to the 5-h.p. Oldsmobile. I may say that in February last I purchased one of these little cars and have been driving it without any trouble whatever. I have found it perfectly reliable in every way and have had no renewals. As far as I can see every part is as good as new. Last week I returned from a trip in Norfolk, and made the journey from Cromer to London (S.W.), about 140 miles, in nine hours, which included a stop of one hour for lunch and refilling water tank. Being a pleasure trip I did not run the car at full speed. The car carried two heavy people and 100 lbs. of luggage. I may add that I take good care of the car, as I look after it entirely myself and keep it well oiled and adjusted, therefore it gives perfect satisfaction.—Yours truly,

R. ROCKWELL STEELE.

STEAM CARS.



TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I should be glad if any of your numerous readers who are users of steam cars having boilers of the "Locomobile," viz., fire-tube type, could give me their experience of tubes bursting whilst running.

I am thinking of going in for one of this type of car for commercial work, but would like to know the method of procedure on getting a burst tube, whether the tube hole is plugged or not with a copper plug, and is there any danger of the boiler contents emptying upwards, to the discomfort of the occupants?

Any figures as to life of boiler tubes and cost of upkeep would be greatly appreciated by—Yours truly,

SUPERHEAT

A Benz-Parsifal Car at the Engelberg Monastery, near Miltenberg-am-Main, Germany.

BELTS.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—"J. B.," in the *Journal* of the 13th inst., raises a question that many would like answered. Despite the fact that the gear is having its day, and no doubt will always claim its share of devotees, the belt has qualities that no other drive possesses; all that is wanted is that it may be perfected, *i.e.*, free from the defects of earlier constructors. I am inclined to think their blunders stifled a good thing in its infancy. Some of these were really stupid; look, for instance, at some of the short and narrow straps of the early Benz cars. I wonder they do as well as they do. What is the belt race cone system that is being spoken of? If this is single belt speed cones with belt races thereon, I should like to know how it is arranged. This seems to me to dispense with another difficulty, viz., having several belts to keep in order. Evidently the case for the belt is not so bad, after all.—Yours truly,

J. W.

A CLASS in automobile construction and management is being organised in connection with the Technikum, at Aschaffenburg, Bavaria.

WITH a photo of "Mercedes" as a frontispiece and some excellent illustrations scattered about its pages, "The Princess Passes" is a volume of pleasant reading by C. N. and A. M. Williamson. It is the romance of a motor, a subject of delight to the novelist in search of copy, and will doubtless be widely read among motorists, especially those who have enjoyed Continental touring.

CLUBS AND ASSOCIATIONS.

SOMERSET.

On Tuesday last week the members of the Somerset Automobile Club were invited to lunch by Mr. John Hargreaves, of Templecombe. The day being exceedingly fine, many members availed themselves of the kind offer, and a grand show of nearly forty cars was arranged on the terrace in front of his house. The club members were augmented by the attendance of several motorists from London, who had come, not only as a compliment to Mr. Hargreaves (who, it will be remembered, has acquired more than Somerset fame with his car, being, in fact, one of the competitors in the eliminating contest for the British team for the Gordon Bennett Cup race), but also that they were invited to witness a polo match of the Blackmore Vale Polo Club to be played upon the Purse Caundle Ground, midway between Templecombe and Sherborne. Over fifty guests sat down to lunch, amongst whom we noticed Sir Wroth Lethbridge (president of the club), Sir H. Hoare, Mrs. Travers, Mr. A. Langman, Mr. A. Armitage (hon. sec. of the club), Mr. W. McCreery, Capt. E. Hardy, Mr. A. Tyrwhitt Drake, Mr. H. Boden, Mr. F. Hargreaves, Mr. J. Hargreaves, Mr. J. Wills, Mr. H. Tucker, Mr. Montague Cooper, Mr. H. Carver, Mr. W. Allen, Mr. A. Allen, and many others. After the repast, Sir Wroth Lethbridge thanked Mr. Hargreaves on behalf of the club for his kind and generous hospitality. Mr. Hargreaves in replying hoped that that would not be the last occasion members would visit his house.

The members having seated themselves in their cars were photographed by Mr. Montague Cooper, of Taunton. A start was then made for the polo field and Templecombe was alive with the hum of motors and the tooting of horns. A very fast match was played between the Frizhill and Tiverton teams, the former of which eventually won by four goals to one. One of the finest exponents on the field was Mr. Rawlinson, manager of the English Darracq Company, who performed very brilliantly throughout the game. Part of the polo ground was reserved for the automobilists, and the sight was probably a unique one, one side of the enclosure consisting of a line of cars, in a field associated hitherto solely with the horse. After the match, the members gradually dispersed to their various homes in the county, all having unanimously agreed that a most enjoyable day had been spent.

PETERBOROUGH AND DISTRICT M.C.

HILL-CLIMBING CONTEST IN GRIMSTHORPE PARK.

In exceedingly pleasant weather—after a postponement on account of rain—the members of the motor-cycle section of the Peterborough and District Motor Club brought off an interesting hill-climbing contest on Thursday, the 18th inst., in Grimsthorpe Park, by permission of the Earl of Ancaster, whose son, Lord Willoughby de Eresby, M.P., is a keen supporter of the pastime. The hill, which is well known locally, is about half a mile in length, with a gradient of 1 in 9. The competition took place under handicap conditions, and so well was this arranged that the first five men finished within 2½ seconds of each other. The competitors were allowed three ascents, and the best time was taken. Pedalling was allowed for the first 100 yards only, and there were no failures to mount the hill. In fixing the handicaps, the horse power of the motor and the weight of the rider were taken into consideration. Twelve members entered, but only nine of these competed. The prize was a gold medal offered by the club. B. C. Holmes made the fastest time—39½ seconds. He again rode his 3½-h.p. Vinco, fitted with a Minerva engine, and upon which he won the silver cup in the club's 100 miles non-stop run from Peterborough to Lincoln and back recently, after a keen struggle with T. Woodman, the winner of the present contest. Both these competitors accomplished the 200 miles run in 11 hours from Peterborough to Yarmouth and back a few weeks ago. In the competition under notice Holmes' time worked out at about 45½ miles an hour. The following were the times recorded, the figures in brackets being the time allowances :—

			Net time. secs.
1.	T. Woodman (5 secs.) ...	3-h.p. Clarendon ...	38
2.	H. P. Mays (5 secs.) ...	2¾-h.p. Vinco ...	39
	F. T. Heighton (8 secs.) ..	3½-h.p. Vinco ...	39
3.	B. C. Holmes (scratch) ...	3½-h.p. Vinco ...	39½
4.	T. A. Morris (6 secs.) ...	2¾-h.p. Vinco ...	40½
5.	W. Jeffcoat (7 secs.) ...	2¾-h.p. Enfield ...	43½
6.	H. Brown (8 secs.) ...	2½-h.p. Bradbury ...	46½
7.	B. Gibson (3 secs.) ...	3½-h.p. Vinco-tricar ...	51½
8.	T. S. Rickman (6 secs.)	2¾-h.p. Enfield ...	56

The following entered but did not compete—P. R. Heighton, 2¾-h.p. Vinco; W. E. Wadsley, 2½-h.p. Vinco, and T. Southwell, 3½-h.p. Bat. Mr. Ingamells and Mr. James officiated as handicapper and timekeeper respectively.

LEICESTER.

The members of the Leicester Automobile Club had one of the largest runs of the season on Saturday, a visit being paid to Matlock Bath. A start was made at 10.30 a.m. in beautiful weather, which kept its favourable character all through the day, and with the roads in capital condition the outing was a most enjoyable one. The president, Mr. E. G. Mawbey, had his new car out for the first time. The route was by Loughborough, Derby, and Belper. At Derby a little difficulty was experienced in getting through, owing partly to the new electric tram lines, and at Belper the cars had to crawl because of the large crowds assembled for the annual fete, but Matlock was reached in good time. Luncheon was provided at the New Baths Hotel, and afterwards the visitors dispersed for an inspection of the lovely scenery in the neighbourhood. They met together for tea at the hotel at 5.30, and two hours later the return journey was commenced, Leicester being reached about 10.30. Those taking part in the run, which was a very successful one, were Mr., Mrs. and Miss Mawbey, Mr. Maurice Mawbey, Mr. C. D. Lucas, Mr. T. C. King, Mr. and Mrs. Dorran, Mr. Whitby, Miss F. Whitby, Mr. and Mrs. G. H. Wait, Miss Wait, Mr. A. H. Leavesley, Mr. and Mrs. Faulkner, Mr. H. E. Barron, Mr. J. Haines, and Mr. A. McAlpine (hon. secretary). To-day (Saturday), the club will have an outing to Moseley Hall, by invitation of Sir Arthur Hazelrigg, Bart.

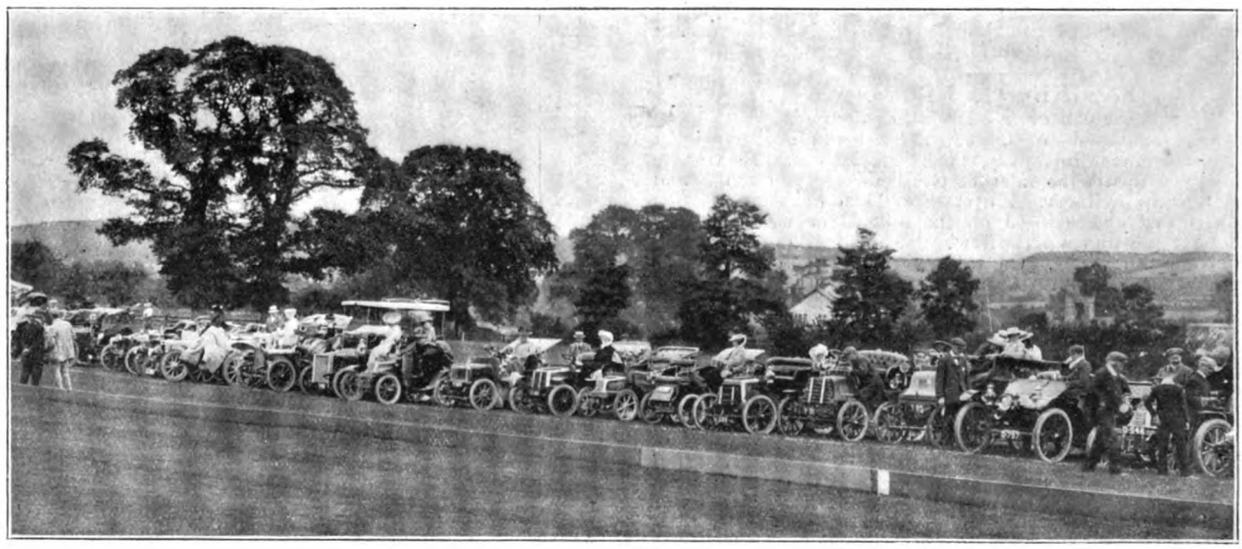

Photo by] **The Meet of the Somerset Automobile Club.** *[Montague Cooper.*

DERBY.

The members of the Derby and District Automobile Club held their second hill-climbing contest on Saturday. Mr. Frank Bolton, on a 22-h.p. Daimler, made the fastest ascent, and won the club medal. The second fastest time was made by Mr. Norman Sayer on a Serpollet steam car.

WEST SURREY.

At the invitation of Mr. and Mrs. Armitage, the West Surrey Automobile Club had a most successful gathering at Green Hills, Tilford, on Saturday, over fifty members and friends being present. Among them were Col. Fairtlough (Darracq), Mr. and Miss Ingram (C.G.V.), Mrs. Healy (16-h.p. Rex), Mrs. Clement (Wolseley), Mr. Ponsford (Clement), Mr. Praschkauer (Milnes-Daimler), Mr. and Mrs. Pullman and Mr. R. Crothers (Durkopp), Dr. Rideal (Benz), Mr. J. H. Knight (Benz), Mr. Warne (Dennis), Mr. and Mrs. Vogan (24-h.p. Simms-Welbeck), Mr. Bryan Hook (Locomobile), Dr. Tanner (Stirling), Mr. Horniman (James and Browne), Mr. Martineau (James and Browne), Mr. and Mrs. Buttemer and Mrs. Green (Decauville). After tea the cars were

marshalled by the host—on his luxuriously appointed J. and B. car—on the spacious lawn for photographic purposes, and the company separated, not, however, until too late to carry out the run that had been contemplated, after one of the most successful and enjoyable meets of the season.

SHEFFIELD.

The competitions for the gold medals offered by Mr. James Barber, for the longest "non-stop" run made by a member of the motor-car section of the Sheffield Club, and Mr. J. T. Thompson for the longest "non-stop" run made by a member of the motor-cycle section of the same organisation, close on September 30th. Up to the present the following gentlemen have carried out non-stop runs of 100 miles and upwards:—Mr. Harvey Foster, 10-h.p. Wolseley, 100 miles in 4 hours 51 minutes; Mr. Benj. Hind, 9-h.p. Clement, 172 miles in 9 hours 55 minutes; Mr. J. T. Thompson, 6-h.p. Humber, 100 miles "over the club course," in 8 hours 10 minutes.

To-day (Saturday), the club will meet at Ruxford (six miles beyond Retford) Newcastle Arms, at 4.30 p.m. The motor-cycle division will meet at the corner of Effingham Road, near Victoria Station, at 2.15 p.m., for a run to Tuxford.

IN FAVOUR OF THE MOTORIST.

The Folkestone Motors, Limited, sued in the Faversham County court, on Monday, George Wyley, a baker, of Faversham, for £7 11s., in respect of damage done to one of their cars through the alleged negligent driving of defendant's son. The defendant's son stated that the horse took fright and this was the cause of its backing. Witnesses, however, stated that the horse showed no signs of fright after the collision. Judgment was given for plaintiffs.

What it may come to!

LIABILITY FOR AN UNREGISTERED CAR.

An unusual motor-car case has been before Mr. J. M. Yates, K.C., the Manchester county stipendiary. It was one in which Mr. Harold Slack, a Southport gentleman, was summoned for furiously driving a motor-car, to which was affixed no rear light, through Stretford on June 27th. Mr. Percy Jordan, who represented Mr. Slack, proved that the car in question—N 157—had in May last been sold by auction by the defendant to a person named Samuel Haines. In the records, however, the change of ownership had not been indicated, and the constable who identified the car by the number at the back naturally summoned Mr. Slack, who was supposed to still possess the car.

Mr. Yates thought that the regulations held that when disposing of the car Mr. Slack should have notified the authorities of the change, and, wishing to consider the question, he said he would give his decision on October 4th—a date selected to suit the convenience of Mr. Jordan, who was going away.

However, to the surprise of the court, Mr. Jordan put in an appearance last week, explaining this by saying that a new development of the case had arisen.

Mr. Haines, to whom the car was sold, he said, had read a report of the proceedings in the evening papers, and, behaving in a very straightforward manner, had called at his office that morning and had come down to the court with him. As a matter of fact, he (Mr. Haines) was driving the car through Stretford on the morning in question. He admitted that the omission to change his name was entirely his fault, and wanted to absolve Mr. Slack from all blame and accept service of the summons himself.

Mr. Yates said the point was: Was a person who was a registered owner of a motor-car responsible for what happened to it until he chose to get the registration changed? He had looked into the matter and read carefully through the rules—the Act did not help one. The penalty which was imposed, not so much upon the person but upon the car, for not changing the registration was that the registration of the motor-car was void. The rules provided that notice of the change should be given by either the new or the old owner, but it did not say anywhere that if that was not done any penalty was attached to any of them, except that the registration of the car was void. Then the person would be driving an unregistered car and liable to a penalty. He confessed he was astonished when the rule was made, directing that notice of the change should be given, that a penalty had not been directed upon the new or old owner. If the old number was kept on, a person might be killed and no one would be able to ascertain who was the driver of the car. He thought that in this case no penalty should be imposed upon Mr. Slack. Reading through the articles it seemed that this particular car was an unregistered car when it was being driven by its present owner.

Mr. Jordan said he assumed the summonses would be re-issued against Mr. Haines, and asked that they might be made returnable for October 4th.

Mr. Crofton, for the police, intimated that the summonses would be re-issued, and the Stipendiary directed that they should be heard on the desired date.

CASES DISMISSED.

Recenly at Staines, the magistrates were engaged in hearing a charge preferred against Lord Howard de Walden's chauffeur, who was summoned for driving at a speed dangerous to the public on Hounslow Heath. The police swore that the pace was 28 miles an hour, but were cross-examined by Mr. Moresby White, and admitted that they had never before timed motor-cars. It was shown that very few people were about, and no one was any the worse for the car being there. After a long hearing, the Bench ordered the summons to be dismissed.

Francis Beville de Foe Paynter was summoned, before Mr. d'Eyncourt, at the Clerkenwell Police-court, for driving a motor-car without being registered, and unlawfully and fraudulently using a mark for identifying a motor-car. Edward Penman, of High-street, New Barnet, was summoned for aiding and abetting Paynter to fraudulently use a mark for identifying a motor-car. On the 22nd July the car, driven by Paynter and containing also Mr. Penman, collided with another vehicle in Caledonian Road. When the police officer questioned the driver he said, "You had better speak to the owner." The officer spoke to Mr. Penman

Digitized by Google

and it was alleged that that gentleman replied that he expected to be the owner in a few days. As a result of inquiries summonses were taken out against the owner and driver. Mr. Blundell protested strongly against a summons being taken out against his clients under section 5 of the Motor Act for fraudulently using a mark, which really meant that the number had been altered so as to cheat someone. As a fact Mr. Penman had not entirely completed the purchase of the car, but registration was applied for as early as July 8th. Mr. Penman drove to London on July 22nd for the purpose of getting his plate numbers, but they were not ready, and he allowed to remain on the car the numbers which had been affixed to it by Messrs. Swan, the vendors of the vehicle. It was quite clear that the car was registered at the time, and the summons, he contended, should be dismissed. As for the other charge, he denied that there had been an attempt to cheat anyone, and held that the summons should have been taken out under sub-section 4 of section 2. As a matter of fact the number plate was delivered at Mr. Penman's address on July 23rd. Mr. d'Eyncourt, while agreeing with counsel, said if Mr. Penman had given full information to the constable perhaps the summons would not have been taken out. The first summons would be dismissed, and on the other he ordered the defendant to pay the costs.

CHARLES PARKER, of Brudenell Grove, Leeds, was summoned at the Leeds police court for driving a motor-cycle at an excessive speed, and also for having failed to give due warning of the approach of his machine. Mr. Willey appeared for the defence. It was stated that on July 31st defendant drove a motor-cycle on Chapeltown Road, near King Lane, at a speed of thirty miles an hour. Defendant was not then stopped, but his car was identified a day or two later at Headingley. For the defence it was contended that it was a case of mistaken identity, someone using a motor bearing the same number as defendant's. At the time he was alleged to have been at King Lane he was at York spending the day with some friends. He had not been nearer King Lane

The Dieppe-Varengeville Public Service. Two of the Cars at Dieppe.

than Harewood Bank. A policeman who gave evidence said that he had seen two motors, one of which was driven by defendant, pass through Harewood within a few minutes of each other, both bearing the same number. The chairman said the Bench were satisfied that the officers had been mistaken, though they had done what they thought was their duty in the matter. Defendant was accordingly discharged.

ON Friday, the 19th inst., Mr. G. M. May, of Chesterfield, was summoned to appear before the Bakewell Bench, first, for not stopping when called upon to do so, and refusing to give his name and address; secondly, for driving to the common danger when on the road between Owler Bar and Fox House, near Hathersage, on Sunday, July 17th. When the case was called the plaintiff did not put in an appearance. The case was therefore dismissed with costs, which Mr. Middleton, of Chesterfield, who appeared or Mr. May, pressed should be for a substantial amount, owing to the trouble and inconvenience his client had been put to in subpœnaing and bringing witnesses from Hathersage, Chesterfield and Sheffield to the court. Costs to the amount of £6 15s. 6d. were allowed.

POLICE TRAPS.

THERE is a measured distance of 220 yards near Potters Bar.

THE police have had their trap in the Portsmouth road, Surbiton, in active operation lately.

ON the road between Colyford and Seaton (Devon) the police have lately been watchful for motorists.

MOTORISTS are advised to steer clear of Lifton, near Launceston, where police traps have lately been installed.

MOTORISTS should be particularly careful when reaching the tram lines at Norbury, and all the way through Croydon to the end of the tram-lines at Purley. Several police traps are in daily operation in the district.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Mansfield	Driving to public danger	£3 3s.
Kingston	Driving at excessive speed	£5, etc.
Haywards Heath	Not producing licence	10s.
Exeter	Driving on the wrong side of road	2s. 6d. etc.
Brighouse	No rear light	5s., etc.
Crewe	Driving at dangerous speed	10s., etc.
St. Neots	Driving to common danger	£8, etc.
Kingston	,, ,, ,, ,,	£5, etc.
Highgate	Driving at excessive speed	40s., etc.
Barnet	Exceeding legal limit	£5, etc.
Folkestone	No rear light	10s., etc.
Axminster	Furious driving	£2, etc.
Jedburgh	Not stopping when requested	£5, etc.
Brampton	No licence	£1, etc.
London, E.	No headlight	5s., etc.
S.W. London	Refusing to produce licence	8s., etc.
Lifton	Driving beyond legal limit	£10, etc.
Barnet	,, ,, ,, ,,	£5, etc.
Highgate	Driving dangerously	40s., etc.
Exeter	Driving on the wrong side	2s. 6d., etc.

ASSAULT ON A MOTORIST.

A MAN named Cotter was fined £5 at Chester-le-Street for assaulting a motorist who sounded his horn several times for him to move out of the way. As the defendant did not move from the middle of the road, the prosecutor was trying to steer past him when Cotter struck him heavily on the head with his walking-stick.

MR. EDWARD WHITE, the hon. sec. of the Irish Automobile Club, has lately acquired a 16-h.p. Richard-Brasier car.

MOTORISTS temporarily residing in Hereford can obtain copies of the *Journal* from Messrs. Adams and Sons, 29, High Town, or from the railway bookstall.

THE Berkshire Automobile Club will hold a meet on the 24th September at Easthampstead Park, Wokingham, by invitation of the Marquis of Downshire.

FIGURES recently compiled by the authorities of Hartford, Conn., which was the first American city to abolish the horse and substitute automobiles for police department work, indicate that the cost of maintenance for an electric outfit in the department is about 60 per cent. of that when horses were used. The motor equipment installed three years ago comprises an electric petrol wagon and an electric ambulance, the two doing the work of four horsedrawn vehicles. In his report Mr. Cornelius J. Ryan, the chief of police, states that the patrol service covers the entire city, which has 90,000 inhabitants, spread over an area of 10 square miles.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, *39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, SEPTEMBER 3, 1904. [No. 287.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MILITARY officers using their own motor vehicles on public journeys may now draw the allowances mentioned below from the War Office:—(a) In all cases where conveyance is admissible by the existing Allowance Regulations, provided that the allowance is not more in amount than the cost of ordinary means of conveyance. (b) In cases where the amount is more than the cost of ordinary means of conveyance, if approved by the G.O.C. on either of the following grounds: (1) That the employment of the motor vehicle enables duties to be carried out which could not have been satisfactorily performed by other means, *e.g.*, staff rides; (2) that the gain in time consequent on the employment of the motor vehicle justifies the extra expense involved. When a motor vehicle has been used under (1) or (2) for a duty commencing at a point at a distance from the officer's station mileage rates for the whole journey may be granted, or in the case of a motor-bicycle the cost of carriage of the bicycle by train may be refunded. The mileage rates shall be as follows: If four persons on duty are carried, 3d.; for every person carried on duty in addition to four, 1d.; for a motor-bicycle used on duty, 1½d. An allowance at the rate of 2s. 6d. per night for a motor-vehicle, and 1s. per night for a motor-bicycle, will be granted for every night that a privately-owned motor-vehicle is necessarily absent from its station on duty, and on which nightly rate of travelling allowance is admissible for the owner. The above regulations may be applied to warrant officers and soldiers so far as regards motor-bicycles, the claim being supported by a certificate signed on behalf of the G.O.C., that the use of the motor-bicycle was required in the interests of the public service. These conditions and rates will remain in force for a period of one year.

◆ ◆ ◆

Kentish Main Roads.

THE new County Surveyor of Kent has presented a report to the Bridges and Roads Committee on the proposed method of road management from April 1st next, and the expenditure thereon. The county is divided into four divisions, the mileage being: Northern 152, Southern 153, Eastern 151, and Western 140. It is essential to the system of direct control that appliances and tools should be purchased. Mr. Maybury therefore presented a detailed estimate of the cost of ten steam rollers and scarifiers, of ten motor-locomotives, and twenty trucks for haulage, water vans, and sleeping vans, engine houses, sites, etc. The estimate of the probable cost of machinery and plant he puts at £20,000. The management and prospective annual expenditure under direct management is also gone into by Mr. Maybury, each division being dealt with separately. He hopes the committee will agree to a considerable reduction in the use of local rag and flint, and to the purchase of more hard and durable material for the improvement of the roads. He does not suggest that the use of flints should be discontinued altogether, being useful in certain districts. His estimate of the details and annual cost of main road management is £75,280 10s., equal to £124 per mile.

◆ ◆ ◆

Notice of Prosecution.

WE recently reported a case in which a motorist won the day because his solicitor emphasized the fact that the constable, when stopping him for his name and address, did not tell the victim that he was to be prosecuted. Had the constable told him that he might be prosecuted the result would have been different. Such was the ruling of a Lancashire magisterial bench. But in the south a similar objection to prosecution was over-ruled by the magistrates. No wonder, then, that the official organ of the Automobile Club records with evident pleasure the fact that Mr. Moresby White, the counsel engaged in the case, has advised his client to appeal to the High Court for a writ of *certiorari* to quash the conviction, on the ground that no notice was given by the police of their intention to prosecute. The decision of the High Court upon the point, continues our official contemporary, will of course be authoritative and will bind all courts of summary jurisdiction throughout the country.

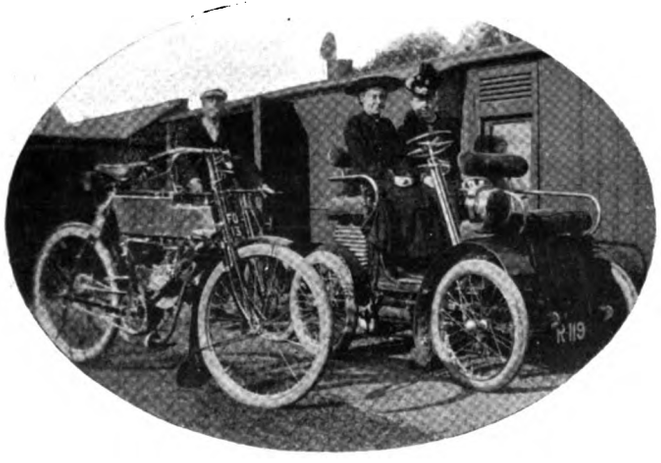
◆ ◆ ◆

The Curious Consistency of Officialdom.

SUCH being the case, it may come as a surprise to many that the Motor Union, formed, we understood, to maintain the rights of motorists, have declined to associate themselves with the test case. This is all the more remarkable in view of the opinion of their own legal advisers, and seems to indicate a waywardness that should be absent from such a body. In this instance it was proposed to fight a test case—acknowledged to be of universal importance—if the Motor Union would give it the moral support that should count for so much in any appeal from one court to another. But that body declined to be associated with the matter. Now, when the member who had given notice has withdrawn from the appeal, because of the refusal of the Motor Union, the Club comes forward and proclaims the importance of the issue. Verily consistency is a blessed word of which the meaning is not very clear in Piccadilly.

◆ ◆ ◆

Trials in India.



AUTOMOBILISM is making great headway in India, and at Christmas the first reliability trials, held under the auspices of the Motor Union of Western India, will take place. The trials will be run from Delhi to Bombay, a distance of about 880 miles, over stiff roads. The Gaikwar of Baroda has offered a handsome cup for the car which goes through the trials with the least number of involuntary stops, and other Maharajahs are offering cups for other tests. One of these cups will be reserved for a special race arranged for motor-bicycles, tricycles, and quadricycles. The native princes take a great interest in motoring generally, and the hope is being expressed in India that several English automobilists will take part in the trials.

The Glidden Cup Touring Contest.

AN informal meeting of the American Automobile Association was held in St. Louis on the 13th ult. to consider the conditions under which the Glidden cup should be competed for, and the following suggestions were adopted. The cup shall be known as the Charles J. Glidden touring cup, and shall be competed for annually, beginning with the year 1905, by members of the American Automobile Association, or by any club in the world recognised by it. The distance driven shall not be less than 1,000 miles, nor less than 500 miles weekly, and shall be over regularly used highways. The car shall be driven by the owner or a driver approved by the committee, the owner being a passenger in the car. The contests for the year 1905, 1906 and 1907 shall be held in either the United States or Canada or both. The rules governing the contest shall be fixed by a committee of seven, consisting of the president of the American Automobile Association, who shall be chairman; the presidents of the automobile clubs of America, Great Britain and Ireland, France, Germany, and Canada, to be recognised by the American Automobile Association and the donor; or a representative selected by the above-named persons. A committee was appointed to formulate the rules and regulations governing the contest for next year and submit the same to the general committee. Four entries for the competition were received at the meeting.

◆ ◆ ◆

Agricultural Advance.

Is the motor-car to be regarded in the light of what Carlyle called a "Morrison's pill" to cure all diseases of the body politic? It would appear that it is in danger of being looked at in that light by many people. Mr. Balfour was one of the first to point out the effect that the automobile was likely to have in relieving some of the congested districts of large towns, and now, in such a reasoning and reasonable journal as the "Agricultural Students' Gazette," Mr. Dudley Cosby declares strongly in favour of the establishment of motor-car services in rural districts as being the most helpful adjuncts they can have to their work. This is an aspect of the case that farmers and market gardeners should be quick to appreciate, for so much of their success or failure depends on their ability to get their crops quickly to market.

◆ ◆ ◆

Motor-Wagons in Australia.

So far the subject of motor delivery wagons has not been seriously debated in Australia, although several of the larger firms have been convinced for some time past that sooner or later something will have to be done in that direction to keep abreast of the times, and to ascertain whether or no the motor is cheaper and more efficient than the horse. The steam lorry which has been in use for some months in the vicinity of the wharves in Melbourne is, according to the "Australian Cyclist," the first practical vehicle of its kind ever seen in those parts, and it has given great satisfaction. Some years ago a steam wagon was seen running about Melbourne, but it was considered before its time, and it is only within the past few weeks—since the advent of the steam lorry already mentioned—that the motor traction problem seems to have taken a definite shape. Messrs. Foy and Gibson have lately landed a motor-delivery wagon, very similar in appearance to one of their large covered-in, two-horse-vehicles, and the other day we had, states our contemporary, the pleasure of witnessing the turnout, with Mr. E. L. Holmes in charge, climb Rucker's Hill, Northcote, at ten miles an hour. The engine is of 12-h.p., and three speeds forward and reverse are available. The body of the wagon will accommodate about two tons of merchandise, but Mr. Holmes states that although half a ton is the limit which has been carried on the trial runs which have been held in the various suburbs, no changing of gear has so far been found necessary on any of the hills which have been encountered.

◆ ◆ ◆

Ten Miles in Leeds.

MOTORISTS have learned with some concern that the Watch Committee of the Leeds Town Council has decided to adhere to a previous decision to request the Local Government Board to restrict the speed of motor-cars within a radius of two miles from the centre of the city to ten miles per hour. It will thus be seen that the efforts of the Yorkshire Club have proved unavailing in this matter, and we shall now watch, with some interest, the influence of the A.C.G B.I., which should certainly be exerted upon the central authorities against such a proposal. Such restriction has been regarded as quite unnecessary in the City of London, where the traffic is as congested as anywhere in the Yorkshire town.

◆ ◆ ◆

Consideration on the part of Drivers.

AT an inquest held in a Kentish town the other day on the body of a lad who received fatal injuries from being knocked down by a motor-car, the coroner said that that was the first really serious accident which had occurred in his district, and seing that comprises an area of sixty parishes, it says something for the considerate way in which the Kentish motorists drive their cars. In fact, the coroner, in summing up the evidence given at the inquest, gave public utterance to this view, and asserted that the drivers of automobiles in the Garden of England fully recognised the rights of other users of the highway. This is a fact with which, of course, owners and drivers are perfectly familiar, but it is well to have it thus officially and publicly declared by an unprejudiced person, who is sufficiently familiar with the subject to make his opinion of real value.

◆ ◆ ◆

Political Campaigning.

MR. R. WINFREY, who is to be a Parliamentary candidate for South-West Norfolk at the next election, has just been enjoying a political motor-car tour through that agricultural constituency, and reports that the prejudice against the motor-car seems to have entirely died out among the rural population. He stayed twelve weeks at his house at Hunstanton, and only twice during the whole of that period saw the inside of a railway compartment, a fact of which the railway companies might make note as indicating a tendency of some importance to their exchequers in the near future. Three weeks of his time were spent by Mr. Winfrey in the political tour through a hundred parishes. Each night he returned to his home—although the boundaries of the constituency were twenty four miles from Hunstanton—on his 12-h.p. two cylinder car. 1,700 miles were covered without having a breakdown, and Mr. Winfrey was always able to keep his appointment with a punctuality that was regarded with some surprise in many of the out-of-the-way villages.

The Automobile Protection Association.

A MEETING of the Council of the Automobile Mutual Protection Association was held at Cecil Chambers, Strand, W.C., on Tuesday afternoon, when, in the absence of Lord Shrewsbury, the chair was taken by Lt.-Col. Elton-Burroughs. The secretary, Mr. E. Shrapnell Smith, reported that since the last meeting the Marquis of Londonderry, K.C., had accepted office as a vice-president of the Society, and that Messrs. Cordingley and Co. had acquiesced in the recommendation of the council, and had agreed to reserve the entire floor space of the Minor Hall at Islington for the commercial vehicle section of the 1905 Royal Agricultural Hall Motor-Car Exhibition. The following, being numbers 161 to 166 on the register of members, were elected:—Messrs. Jesse Ellis, Limited, Maidstone; the Hercules Motor Wagon Company, Manchester; Savage Bros., Limited, King's Lynn; James Robertson and Son, Fleetwood; the Yorkshire Patent Steam Wagon Company, Leeds; W. H. M. Burgess, London. It was decided to defer the appointment of a Competitions, Races, and Trials Committee to the September meeting of the Council of the Association.

◆ ◆ ◆

General Booth's Tour.

GENERAL BOOTH continues his motor-car trip with unabated zeal and enthusiasm. On Monday night he completed the first thousand miles of his tour, during which he had made no less than 100 separate addresses, which those interested in figures will work out at one for every ten miles. As he went northward his troubles increased, and at Northallerton two or three cars in the procession proved somewhat stubborn, and the General's transfer to another automobile was necessitated. But still he continues his motor-car progress, and to-day (Saturday) should arrive at Perth. Doubtless inspired by the success of this motor tour, the Church Society for the Promotion of Kindness to Animals has arranged a motor campaign from London through the Midlands to Leeds and York, returning through East Anglia into Kent and Sussex. During the tour, literature is to be distributed, and addresses given on the virtue of kindness to animals, which will be done in a practical way by the motor-car itself, as it is rapidly proving itself capable of relieving horses of many of the burdens they hitherto have had to bear.

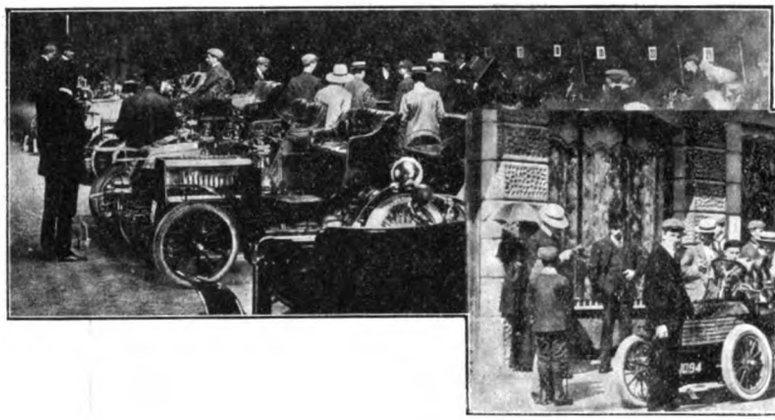
Hedges and Margins on the Roads.

AT the last meeting of the Hambledon District Council, a London solicitor wrote on behalf of his client complaining of the danger of overhanging trees in the village of Graywood and in the neighbouring hamlets. There is no doubt that overhanging trees constitute a great danger to those who travel on the road, especially at twilight or later, and the attention of councils throughout the country ought to be drawn to this important subject. The Hereford trips of the last few days have revealed not only this annoyance to those who travel on the road, but the road margins of that district would have been a source of danger in many cases had the motorists driven at night, and we would suggest that the Rural District Council of Ludlow will do well to fall in with the suggestion of a member of the body who at the last meeting asked that the County Council's attention be drawn to the state of the road margins in that district. He said that in some places the margins were a foot high, and that state of things had caused the death of one man—the margin was his murderer. Another matter which has been the cause of considerable complaint is the wide turf margins on the sides of the main roads. In some places these are from two to three feet wide, rendering the highway much narrower than is justifiable now that traffic of all kinds has so increased.

◆ ◆ ◆



A Wise Decision.

AT a recent meeting of the Manchester Motor-Cycle Club, which, by the way, is now known as the Manchester Motor Club, a resolution was adopted which might be made of universal application among organisations holding trials and competitions of any kind. On the occasion of the first reliability trial held by this club, three members were summoned and fined for driving to the danger of the public, but their fellow members have rightly recognised that they were merely the representatives of the club, and that the prosecution, though naturally against the three individuals, was really aimed at the organisation itself. Consequently they considered it would be an act of courtesy on the part of the general body of members to reimburse those who were fined the amount of their expenses. This is a perfectly right attitude to take up, and one that we hope will be generally followed should members of clubs be fined when on trials or tours.

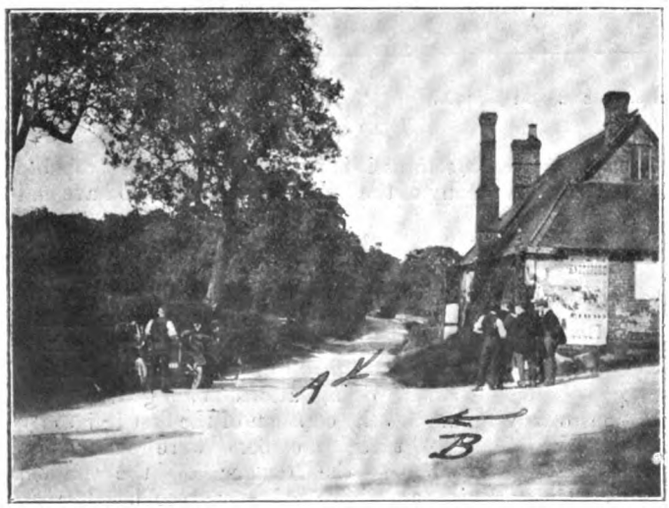
The Small Car Trials.



THE invasion of Hereford began early last week. It was an unaccustomed sight, this mixing of poesy and prose, this jostling of the old world and the new; the quaint, ancient carts, wagons, and wains rolling unconcernedly along, whilst in and out the cavalcade threaded countless cars. By Saturday all the hotels were thronged, and no such thing as a stable existed; a hastily-printed bill in glaring traitorous red proclaimed the latter as "the garage." Few of the entered cars turned up until Saturday morning, when a number of interested spectators gathered at the Drill Hall to witness their arrival. Most of the cars put in an appearance well before twelve o'clock, looking very trim; the professional photographer was busy. Three cars were missing when, close upon noon, and without their arrival, Mr. Joy had to announce the time limit up. Later in the afternoon, telegrams were received stating that Belsize Junior (No. 35) would not appear.

The Cars in the Drill Hall.

The Two Wolseley Cars outside the Mitre Hotel, Hereford.

The Scene of the Accident to the Belsize Junior Car.

On the way down to Hereford a motor-car coming round a corner at B in the above illustration, drove into the "Belsize Junior" (travelling in the direction A) entered for the competition, snapping the back axle in two, breaking most of the spokes in the two back wheels, and bending the frame. The only course open to the makers to prove its merits, is to enter it for the Automobile Club quarterly trials, and this is, we believe, contemplated by the Belsize Motor Car and Engineering Company, Limited. The Simms car (No. 36), was also delayed. But the big disappointment was the non-arrival of 29, the four-cylinder Chriton, whose performance was looked forward to with not a little curiosity.

Every arrangement for the storage and washing of the cars was ready by the preceding day, and the latter facilities were put to the test on Friday in the presence of Mr. Basil Joy and Mr. Wilfrid Groom, and pronounced satisfactory. Experiments were also made the same day with Westrumite and an admixture of a disinfectant which this week will be put to the proof.

With everything in good fettle it only remained for the weather to keep fine. Unsettled conditions was the experience of the first days of last week, but with the dust on the roads laid the rain passed away. Saturday and Sunday were two perfect

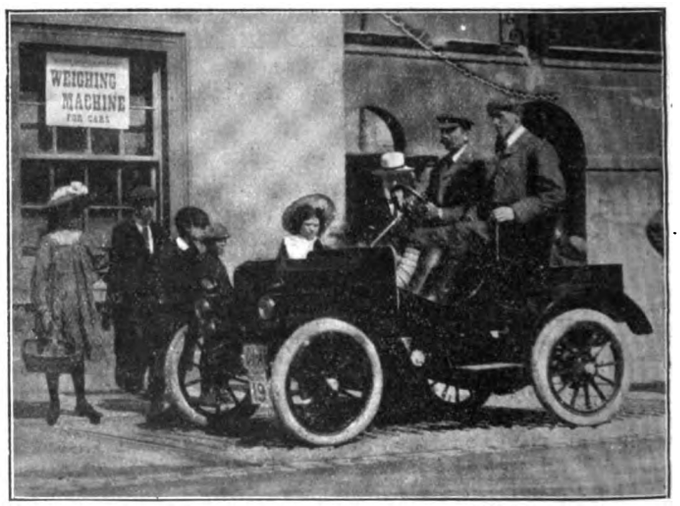


Photo by] The Downshire Car on the Weigh-bridge. *[Argent Archer.*

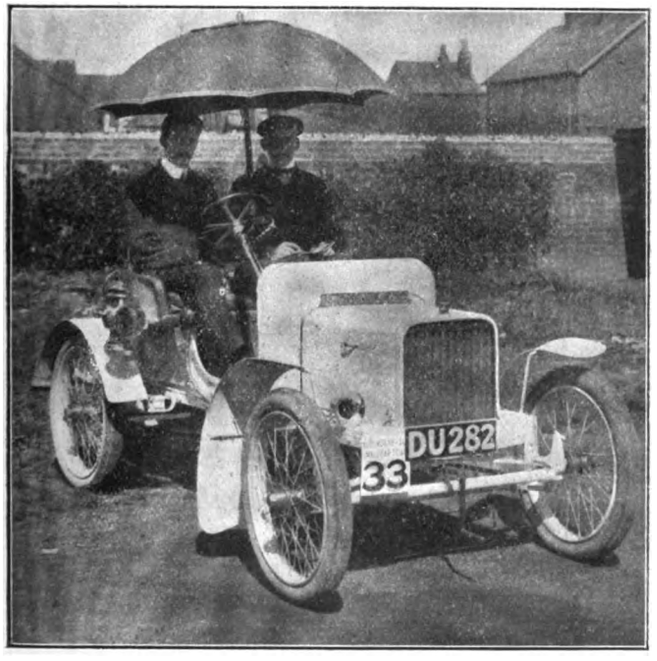
days of blue skies and prolonged sunshine. Automobilists and ought-to-be-mobilists were in high spirits.

MONDAY'S RUN TO LUDLOW.

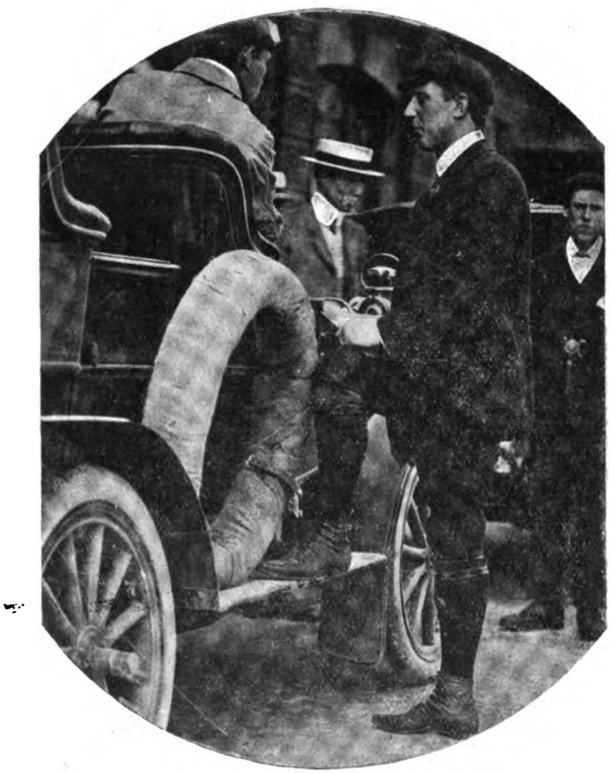
Landladies generally remarked upon the unwonted punctuality with which their respective "young men" left for



Digitized by Google

business on Monday. But, somehow, business that morning had centralised in Broad Street, the starting place for the Trials. It was a novelty for Hereford, and Hereford, as represented by these young men, gave its undivided attention. Close upon eight o'clock recruits were forthcoming in shopgirls,

A Wolseley and an Alldays climbing Dinmore Hill.



shopkeepers, dawdling apprentices, and errand boys who had left brass-cleaning in its various stages of incompleteness. The morning had just a touch of early autumn crispness which prompted activity, so that all the cars were ready in good time and we were all seated for the first run. Soon after eight o'clock boomed out from the cathedral tower the first car sped off towards Ludlow, followed by the rest at about half minute intervals. The exact times at which the first and last cars started out were 8·12 and 8·29 respectively.

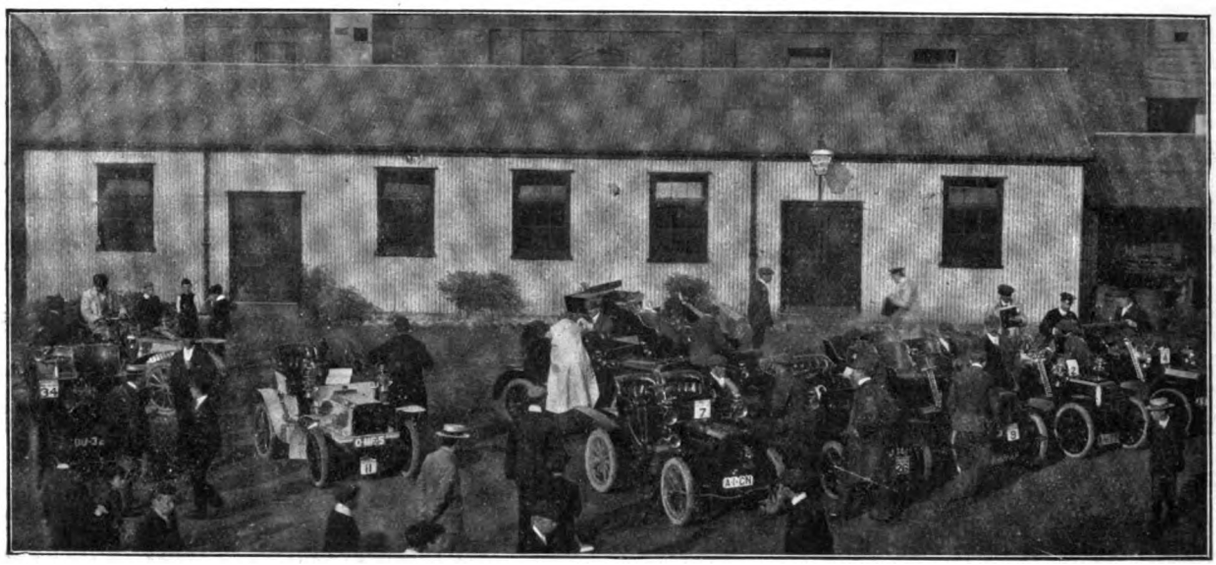
The 8-h.p. Rover and its novel Canopy.

Photos by] [*Argent Archer.*

We were not long in reaching the open country, where the autumnal air was even more pronounced. Most of the fields were shorn of wheat and barley, and the eyes passed from the stubble to the satisfying sweeps of the swede fields and grass lands. Ere Dinmore was reached several pretty villages were passed. To the right of the road rose Sutton Walls, where King Ethelbert was murdered, and below, from among the trees, peeped the spire of Marden Church, where he was first buried. Soon Dinmore Hill—the first of the three specified hill-climbs—lay in front of us. Its one reputation is that it is a "tightener," but it has another claim, and that of being an intensely pretty hill, environed by woodland of the most sylvan character. We did the hill in a capital manner on the Mobile, No. 24. Having gained the top, a fine vista of the northern expanses of the county was obtained, with Leominster in the middle distance. Turner could not have wished more undulating country—waves of land crested with woods, and dips of green from which glimmered here and there a foam fleck of white cottages. A meet setting this for one of England's stately homes—Hampton Court—the residence of Mr. J. H. Arkwright, a descendant of the great inventor. The gardens of the house are very beautiful and the house itself holds a fine collection of drawings by Turner and Cox, besides works by Holbein, Vandyck, and Peter Lely.

Mr. Basil Joy directing Competitors.

Leominster town, which we soon had in view, is an antiquated old place, eloquent of past wealth and present comfort. In ancient days it "was a place." A monastery was built here by King Merewald in 658, which was further endowed by Henry I. The monks it was who made "Lempster market" so famous that the third Henry had to change the market day. In 1207 the town was reduced to ashes by the Welsh followers of William de Braose, Lord of Brecon, whose wife died of starvation a prisoner in Windsor Castle. Despite all the town thrived, and in the reign of Edward the First returned burgesses to Parliament. A distich on the almshouses runs:



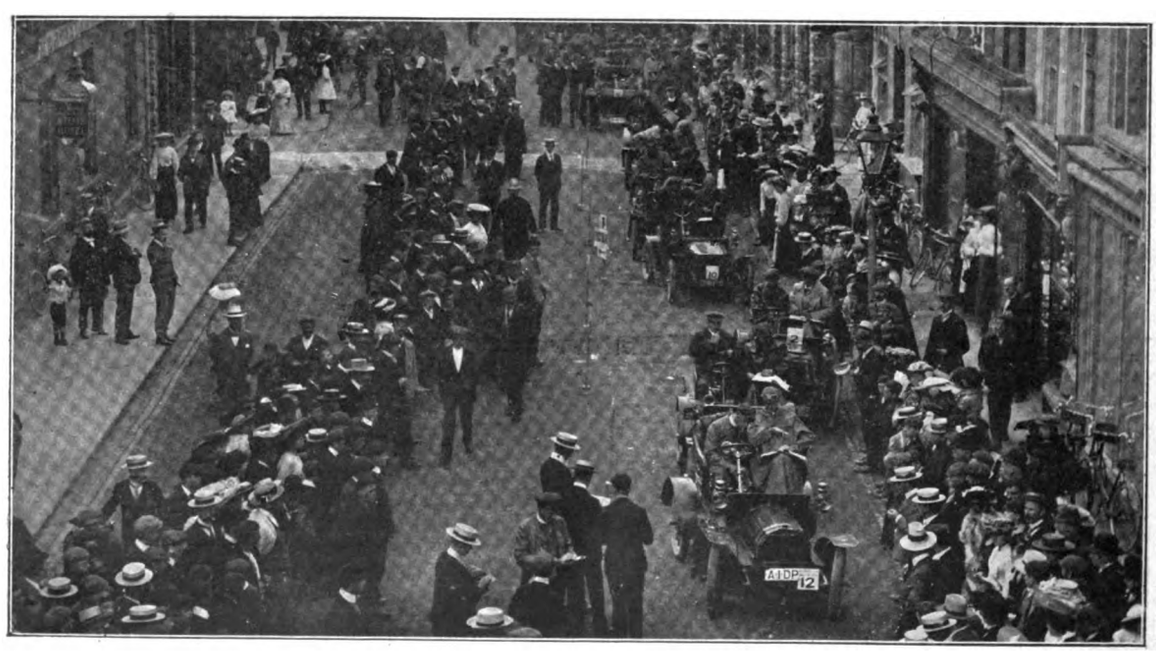
"He who gives away all before he's dead,
Let him take this hatchet, and knock him on ye Head."

Proceeding northward, we got a first glimpse of the Teme at Brimfield, a pleasant village near to Wooferton Junction. From here the scarred sides of the Clee Hills were easily seen on the right. Away to the left was Richards Castle, and beyond, Haye Park, the spot which Milton took as a background for the masque of "Comus."

Digitized by Google

The roads here were beautiful and we soon swung into sight of Ludlow. Just before entering the town we crossed the Birmingham pipe track at Ludford.

High up on the hill, still seemingly enwreathed in the mists of mediævalism, Ludlow faced us. Deep below the Teme gurgled



Preparing for the Day's Run in the Drill Hall Yard.

along under Ludford Bridge, which formed the approach to the gaping mouth of the Broad Street gate above. It was a steep climb up into the town, and one thought those ancestors of ours knew what they were about when they chose this spot for a border stronghold. History has bitten itself deep in the chronicles of Ludlow, and romance has clung to it like the moss on its Castle walls. The origin of the castle itself is shrouded in obscurity, but the general opinion is that it was built about the time of the Norman Conquest. Ultimately falling into the hands of the Crown, it was granted by Henry I. to Payan Fitz John. Many times did it change hands during the border feuds. Richard Plantagenet, Duke of York, chose it as chief place of abode and was greatly beloved of the people. Henry VII. was a frequent visitor to the castle, where his son, Arthur, Prince of Wales, kept a court until his death in 1502.

The whole of Ludlow turned out to watch the trials. Deftly proceeding through the town, we left the venerable old houses behind, and descending to and crossing the Corve, we soon reached the terminus of our morning journey along one of the finest avenues of oaks we would wish to see. The return journey we did in a splendid manner, reaching Hereford in just two minutes under the three hours.

A large number of people gathered on Dinmore Hill to witness the hill climb. The weather continued fine and the roads were very dusty. A much more punctual start was made in the afternoon for a second run to Ludlow.

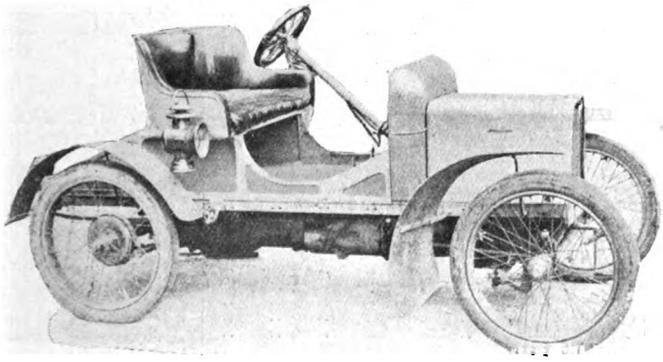
TUESDAY'S TRIP TO WORCESTER.

Thirty-three cars got away in good time. Our journey was through the hop-producing district of the county, and how greatly the appetising vine is cultivated was soon evident. Away in front, stretching across the eastern horizon, were the Malverns,

Digitized by Google

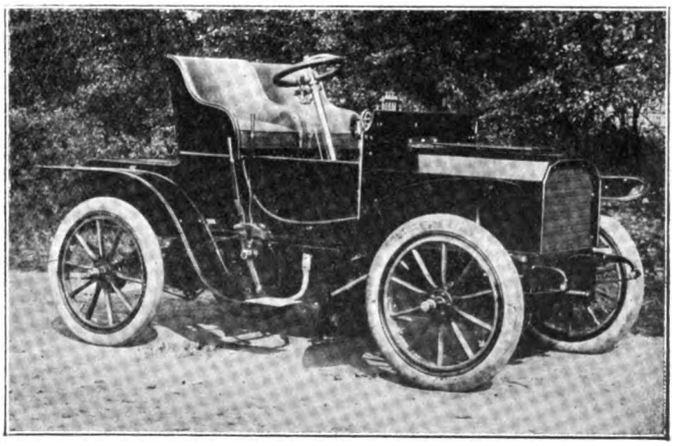


robed in a grey mist, and right up to these, it seemed, were fields on fields of hops. At every cottage gate stood little knots of people watching the cars pass. On the road were many gipsies, arrived for the hop-picking—a motley crowd. Frome's Hill formed the first punctuation mark in what, up to then, had been a very pleasant journey. To some of the cars the white formidable ribbon of road mounting skyward spelt trouble, and was the source of many stoppages and much humour. A number of labourers had been specially engaged, and were much in requisition to push the cars up the hill; only fourteen

The 7-h.p. Downshire Car, entered by Messrs. Chambers and Co. (*See page 589, last issue.*)

out of the thirty cars went over without assistance. The Mobile, No. 24, unfortunately had to stop to have a nail taken out of its tyre, otherwise it would have made the ascent without a stop. There was all the countryside out to see the sight, and plenty of good-humoured banter went on. After this the travelling was comparatively easy. To the right of us lay Bosbury, where Edna Lyall was buried, and just before we got to Stiffords Bridge we passed Hope End, the spot where another literary figure, Mrs. Barrett Browning, spent her early days. We skirted the Malverns to the left, gaining a fine view of these famous hills. Hardly had one ceased admiring these than the city of Worcester sprang into view. It began to rain here.

As gusts of wind blow smoke out of breathless corners, so the busy advance of mercantile prosperity has swept away much of that atmosphere of old-time from the city of Worcester.



The 4-h.p. Rover Car.

This is a new car constructed by the Rover Cycle Co., Ltd., to the designs of Mr. E. W. Lewis. The single-cylinder engine is 4½ in. bore by 5 in. stroke; normal speed 900 revolutions per minute. The vehicle has no frame, in the usual sense of the term. The engine, clutch, gear box, propeller-shaft casing, and exhaust box, together with the back axle casing, run continuously through from the front of the car to the rear, as it were, in a deep box girder section. To the front part of the engine crank case is bolted a strong aluminium channel bracket, to which, at its front end, is fixed a strong swivel bolt placed in the horizontal plane, so that this bolt engages in a bracket connected to a front cross spring, and can thus oscillate about it when any inequality in the road is met with. The gear box gives three forward speeds and a reverse. Ball bearings are fitted to all the shafts of the gear box, to the road wheels, and to the engine crank shafts. Another novel feature is a new and specially designed metal to metal clutch.

Many of the landmarks are lost, yet its ancient dignity remains. In the Civil War Worcester was loyal, hence its motto, "Civitas in bello et in pace fidelis." Strangely enough, the anniversary of the battle of Worcester is September 3rd. Names which occur to one as associated with the Faithful City are those of Brock and Leader, both of whom hail from here. On the return journey we sped through the townlet of Bromyard, an irregularly designed old place, with streets running hither and thither, and steep and narrow. Invitingly beautiful stretched the Bromyard Downs as we left them behind. The road now ran amidst the most pastoral country and well dotted with hamlets and rural homes, around which grow the humble flowers which, as Maeterlinck has most beautifully expressed it, have sought refuge there. Hop yards again! All along the road from Stoke Lacy to Burley Gate and on to Withington were to be seen the hop gardens for which, with its orchards, Herefordshire is so noted.

In the afternoon there was the hill climb at Frome's Hill, a long, winding, difficult ascent as bad as could be found anywhere. The roadside was thronged with people, and cars, motor-cycles, bicycles, and even perambulators. Miss Levitt's car was second to reach the top, and here she was presented with a beautiful bouquet of flowers from one of the villagers. A big percentage of the cars had to drop their passengers to do the hill, and many of them had to be pushed up.

The 7½-h.p. Humber Car.

The car has a two-cylinder vertical engine, 8¾in. bore by 4in. stroke, normal speed 1,200 revolutions per minute, accumulator and coil ignition, pump circulation, three speeds forward and reverse, transmission by flexible shaft from gear box to live axle, direct drive on top speed, worm and segment steering, a double-acting foot brake fitted to the driving shaft, and internal metal-to-metal band brakes on road wheels actuated by hand lever, tubular steel frame, approximate weight 11 cwts.

WEDNESDAY'S RUN TO LEOMINSTER.

Wednesday morning opened gloomy with prospects of rain. Thirty cars filed into line in Broad Street by the time the morning milkman had arrived. The townsfolk were there as on Monday and Tuesday mornings. The road to Ledbury is a beautiful one in fine weather, but this morning the horizon was limited by a haze which transformed the trees to giants of grey monochrome. It was market day, so that herds of cattle kept down the pace for a while, but when free of these we, on a free lance Oldsmobile, made way, passing *en route* Stoke Edith House, amid the hopfields. The first breakdowns we overhauled were on the other side of Ledbury. Between here and Bromyard we discovered charming hamlets ensconced in most out of the way nooks. We also discovered belated cars in these. Bromyard we left to the right on our way to Leominster, but we failed to catch anything like a view of the scenery, which was enveloped by heavy mist, which ultimately turned into a cold rain. By the time we reached Hereford a persistent downpour evidenced itself, giving no signs of abating; the route had only a scenic interest which unfortunately was not to be seen.

THE PERFORMANCES OF THE CARS.

CLASS A.—CARS COSTING £125 OR LESS.

On the first day the 8-h.p. Horley had two non-stop runs, but, being teamed with a fellow car in class B, shares its loss on the afternoon run. A nut on the induction pipe of the 6-h.p. Speedwell coming loose on its second trip caused a stop; otherwise it would have had a clean record. Unfortunately the 6-h.p. Jackson lost its chance of a non-stop award by being too long in preparation for the second trip. As we anticipated last week, Frome's Hill proved a terror, and all the entries in Class A were stopped on that stiff ascent, the Jackson having trouble with its water connections, the Speedwell suffering from a leaky inlet valve, and the driver of the Horley had to adjust the clutch.

CLASS B.—CARS COSTING BETWEEN £125 AND £150.

The cars in this class suffered on Frome's Hill, but some very good runs were made. The 6-h.p. Jackson had a couple of non-stop runs on the first day, but suffered from being teamed with No. 1. The 6-h.p. Vauxhall car (the lightest car in the trials) had three non-stop runs to its credit on the first two days, including a steady run without delay up the hill. An air lock in the water pipe of the 7-h.p. Oldsmobile led to its early retirement on the first day. The 6½-h.p. Service had a non-stop run on Monday, but has had several stops on the hills. The stiff gradient on Frome's Hill led to the discomfiture of the 6-h.p. Pelham, which had a further stop

The 9-h.p. Speedwell Car.

This two-seated vehicle is fitted with a single-cylinder engine 100 mm. bore by 120 mm. stroke. The transmission is by cardan shaft and bevel gear on to a live axle. Three speeds forward and a reverse, with direct drive on top speed, are provided.

on the first day owing to a broken water pipe. The time taken in repairing a faulty coil led to its losing its chance of a non-stop award. The 8-h.p. Horley was put out of the running for special distinction owing to the breaking of the petrol pipe. On Tuesday afternoon it had a side-slip and suffered the fate that had befallen others of its class on the test hill.

CLASS C, CARS COSTING BETWEEN £150 and £175.

Some very creditable performances have to be reported by vehicles in this class. The twelve cars entered made eighteen non-stop runs on the first day; on the second day eleven were left in the competition and ten non-stop runs were made despite the terrible hill. The 7-h.p. Swift, the 6-h.p. Siddeley and the 6-h.p. Wolseley made absolutely perfect running, no observations of any kind being recorded against them. The 6½-h.p. Mobile had slight trouble with the induction pipe on one run and the 7-h.p. Little Star had one stop on Monday morning owing to a broken plug; on the Tuesday it had two non-stop runs to its credit. The 7-h.p. Alldays had equal success on Monday but had to share the troubles of No. 32 in the official reckoning. Curiously enough, on Tuesday the latter—a three-seater—climbed the hill without trouble, while the 7-h.p. had to shed a passenger on that gradient. It is to regretted that the 7-h.p. Downshire fell out of the contest at Ludlow on Monday, owing to the clutch fork being broken. The 7-h.p. Clyde had a stop for tyres on Monday morning, and would have had a non-stop run in the afternoon, but the inlet valve sticking caused a minute's delay. Frome's Hill, too, reduced its record on the second day, as it also did that of the 9-h.p. Brown and the 9-h.p. Speedwell, both of which made non-stop runs on the first day. The 7-h.p. Humberette had a non-stop run up Frome's Hill in the morning, and went forward without stopping in the afternoon, having, however, to jettison its Observer on the upper part of the hill.

CLASS D.—CARS COSTING BETWEEN £175 AND £200.

In Class D the two De Dions, the 7-h.p. Little Star, the 7-h.p. Swift, and the 8–10-h.p. Croxted had non-stop runs on the first two days. But for want of petrol and carburettor troubles, which caused eight minutes' delay on Monday afternoon, similar good fortune would have attended the 7½-h.p. Humberette. The 8-h.p. Rover did well, but unfortunately broke down at Bromyard late on Tuesday afternoon. The 8-h.p. Mobile having made two non-stop runs on Monday, went up Frome's Hill without a halt, although it had to drop passengers on both occasions. A stop, however, had to be made on one part of the journey to pull a nail out of a tyre. The 9-h.p. Oldsmobile lost its chance of a non-stop by breaking a chain and causing a delay of fifty-four minutes on Tuesday morning, but it carried its three passengers up Frome's Hill in good style. The 8-h.p. Royal Enfield was unlucky enough to get out of the running for a non-stop record on the first day, seven stops owing to broken water connections causing a loss of seventy-one minutes. On the second attempt at Frome's Hill it made a good ascent. The 9-h.p Cadillac made good going on the Ludlow run, having two non-stops to its credit, but on Tuesday morning the gear seized and the car retired at Bromyard. The 9-h.p. Anglian car had a stop on Frome's Hill, as did also the 8-h.p. Prosper Lambert, which otherwise had made non-stop runs. The Alldays light car in this class carried its three passengers up Frome's Hill without stopping.

MOTORING IN THE TROPICS.

IN a recent issue of our German contemporary, "Automobil Welt," there appears an article on motoring in tropical countries, with special reference to the conditions in Java, by Herr Max Wenkel, who claims to have spent two and a half years on that island as an automobile expert.

The conditions of automobile use in the tropics are entirely different from those in temperate climes, and a car built for European conditions can hardly be used in the tropics without radical modifications. The first thing that has to be reckoned with is the hot and moist climate; other factors are the peculiar taste of the Indian public, the road conditions and the fuel obtainable. As concerns the latter, it should be mentioned that petrol is produced in Java, but the product is very impure and of varying density; it is entirely unsuitable for spray carburettors, and only surface carburettors can therefore be used in the Dutch East Indies. No particular pains need be taken to secure high fuel economy, as the petrol is very cheap.

The pneumatic tyres must be of especially good quality to withstand the climate of the tropics. No European wood must be used in the body construction, as it would soon be destroyed by various sorts of insects, among which the white ants may be mentioned. The lacquering usual on European motor-cars is destroyed in a short time by the climate. It is self-apparent that a motor-car for the tropics should be provided with protection against the sun's rays. If the vehicle is intended for long trips into the country several other conditions must be observed. In the first place, the tread must not be wider than fifty inches, for in some places very narrow roads and suspension bridges must be passed which do not admit of a wider vehicle. This applies particularly to Sumatra. The weight of the vehicle, too, should not exceed five cwt. Many small brooks are only bridged with bamboo mats, and many larger rivers must be crossed on bamboo floats, which would sink if the car were heavier than the weight above specified.

The vehicle must have plenty of storage room for touring necessities, such as a supply of imperishable food (preserves and mineral waters), mosquito netting, much clean linen, spare tyres, etc. It is, of course, understood that the total supply of petrol necessary for the whole trip must be carried along, or else petrol supply stations established in advance. During the rainy season the roads, with the exception of a few main military roads, are hardly passable. But during the dry season all the roads, especially in Java, are in very good condition for motor traffic. The streets in the larger cities, such as Batavia, Surabaya, Solo and Bandaeng, are excellent, as they are very wide and have a firm surface of cement or asphalt.

The reader may be interested to learn what an amount of red tape is connected with the obtaining of a driving permit. First of all, application must be made to the proper authorities representing the capital of the province in question, such as the Provinces of Batavia, Preanger, or Solo. These provinces are mostly of such size that one may drive through them in a car in a few hours. At the frontier of the new province a new permit is required.

In the application must be stated the length, width and height of the car, as well as the number of seats, the weight of the vehicle and the horse power of the motor. After some four or five months, but probably even later, one receives notice to have the car in readiness at a certain hour for an expert examination.

In Batavia, for instance, the official appointed by the Government is the engineer of a steam crane company, who has no experience of motor-cars or of the explosion motor. The expert, after having walked round the car a few times and posed some very cautious questions, declares the machine to be admissible to public road traffic. But the happy owner is still far from being allowed to drive. The examining official first reports to the authorities that the machine is in good condition. After several months have passed another official appears on the scene to determine the driving skill of the owner. If this examination turns out to the satisfaction of the exalted authorities, another several weeks pass, when finally the driving permit is delivered. However, the owner is still unable to drive, as the authorities have first to make an identification sign of the size of an oven door, which contains in large black letters the name of the province—Meesterkornelis, for instance—and below that the registration number. After having paid £1 for the examination and an additional £1 for stamps and clerical expenses, the right has been acquired to drive on the left hand side of the road at a speed of 7·2 miles per hour.

A Motor-Car Ga age in Java.

Among the Natives.

MOTORING IN THE TROPICS.

It is worthy of note that the automobile must be provided with a bell, as a warning signal, while horse carriages, two wheeled carts, private carriages, trucks and delivery vans carry horns. In the larger cities, as nobody walks but everybody rides, there is an enormous vehicle traffic, and, consequently, an uninterrupted ear-rending concert of noises. In other cities of the same province the regulations are different. In one city, for instance, an automobile owner, upon making application for a driving permit, was asked to present one front wheel and one rear wheel for examination. After a few days the wheels were returned to him with the remark that everything was in order. In Sumatra the authorities simply appointed a road inspector to the post of automobile examiner. Recently, however, the regulations in Java have become much more lenient, a motorist having been given a driving permit free of charge, after a short examination as to his skill in driving and without examination of the vehicle.

Finally, Herr Max Wenkel mentions that the inland population is notable for its very willing and polite manners toward automobile tourists.

GYMKHANA AT HASTINGS.

ALTHOUGH most motorists are out of town, touring perhaps far away from anywhere, and Hastings folks gave but little notice of the intention to hold a motor meet, yet, thanks to the efforts of the Du Cros Brothers and Mr. R. Fuller, one of the most enjoyable events of the season was brought off successfully on Saturday last. On the Friday night a stiff gale was blowing, and there was every sign of a "black day" for the morrow, but the weather, fortunately, cleared and the sun shone with great brilliancy. The sky was blue, without a speck in it; the heat was intense, but the sea was still rough, with great waves rolling in, sending the spray well over the promenade.

The initial feature of the programme was a meet of cars at Warrior Square, and, while waiting for a start to be made, interest was centred on the "Napier Minor," which was sailing on the waves like some sea-bird, and Englishmen's hearts were gladdened by knowing that such a petrol boat should have been built in this country, and that our supremacy of the waves is not likely to suffer any diminution of credit from the introduction of this new motive power on the seas.

About thirty cars took part in the procession, and an object of frequent ovation was Mr. Harvey du Cros, who is standing as Parliamentary candidate for Hastings. The object of the pro-

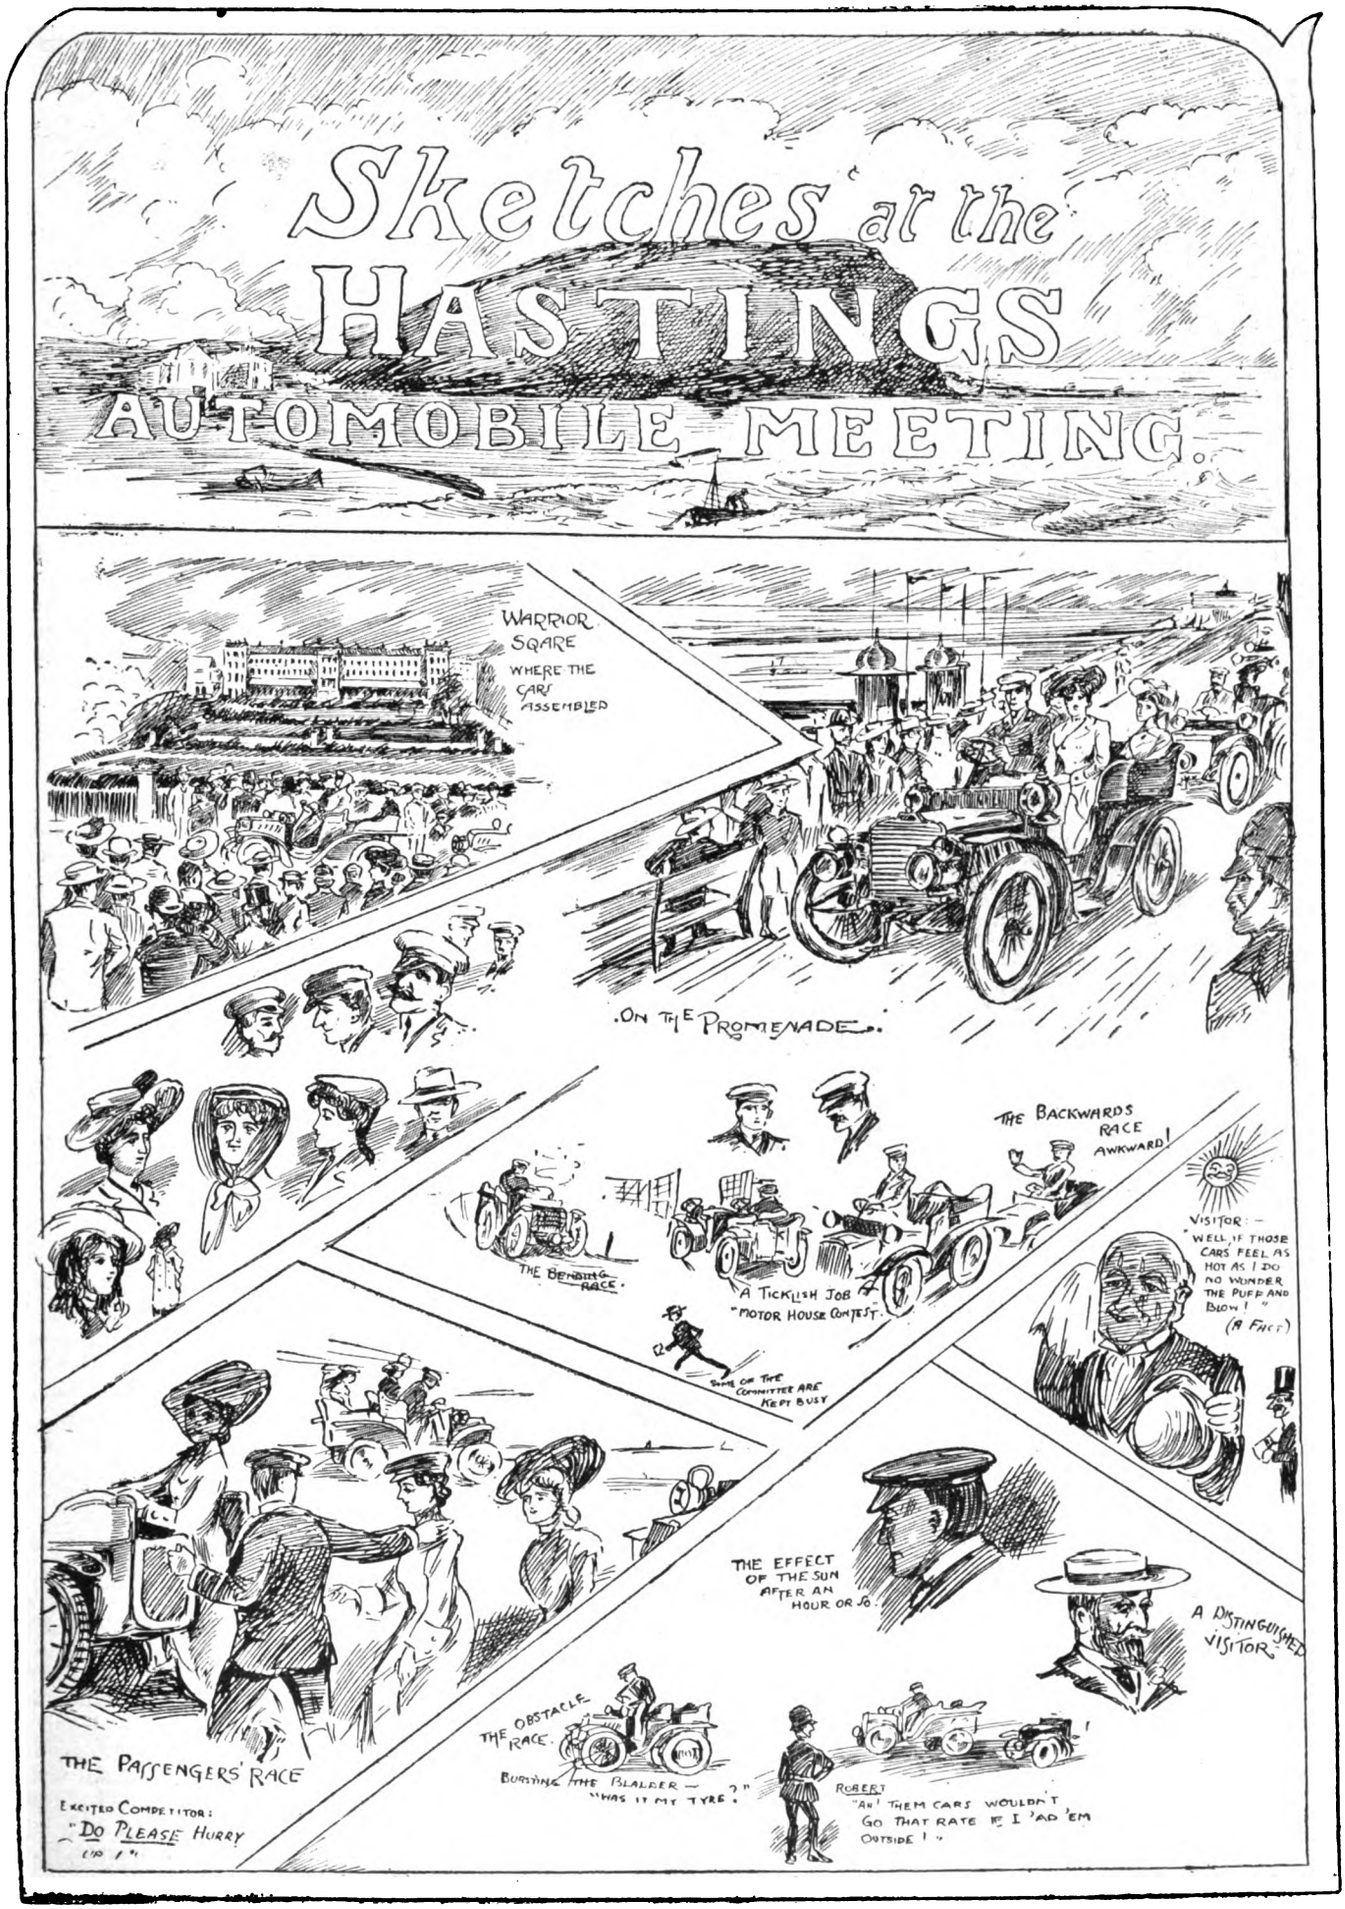
Mr. Roger Fuller's Six-Cylinder Napier, the Winner of the Appearance Competition.

cession was for the purpose of awarding a number of prizes for appearance, and the first car contained the judges and local committee. This was followed by, we suppose, the smallest car in the world, driven by Master G. Du Cros, and manufactured, no doubt as a labour of love, by the youngster's father. The little car had a radiator similar to a Panhard, was gear driven, with a 2½-h.p. bicycle engine, wheel steering and central chain drive. The body was most exquisitely finished, had a hood, mudguards, two side and centre lights, horn, etc. Mrs. G. Du Cros in a laudaulet followed, and other cars with identification marks in the procession were :— I.L. 14; A. 386; A. 6640; A. 1198; D.Y. 58; A. 1734; D. 333; D.Y. 37; A. 1407; D.Y. 82; A. 4492; A. 2 B.Y.; A. 4562; A. 6937; A. 1197; A. 6494; A. 2371; B.A.B.Y.; I.L. 43; D.Y. 15; A. 92; D. 587; D.Y. 37; A. 1947; D.Y. 10; A. 6771; B.Y. 339; A.P. 299; B.Y. 58; A. 3887; E.L. 43; and D.Y. 23.

The procession lasted a long time, and those taking part doubtless saw more of Hastings and St. Leonards than they had ever done before. There were two classes in the competition (1) for cars over £300, and (2) for cars under £300, and three prizes in each class. The awards were as follows :—

Class 1. Mr. Roger Fuller, on a 6-cylinder Napier (1)
Mrs. G. Du Cros, on a Panhard laudaulet (2)
Mr. C. Jarrott, on a Crossley (3)

Class 2. Mr. H. G. J. Allford, on an Argyll (1)
Master G. Du Cros, B.A.B.Y. (home made) (2)
Dr. Dick, on a Vulcan (3)



In the afternoon the gymkhana was held at Bohemia, a suburb of Hastings, high up out of the town, in fact, right on the Downs, with the sea on one side and all around the rolling hills of Sussex, with beautiful landscapes, and numerous windmills, and golden corn still uncut. The sun was powerful, but the heat was tempered with soft breezes from the Channel. There was not many cars, but a numerous attendance of the public. The events were five in number, including a bending race, which meant a ride through an S-shaped nest of poles, competitors losing 20 sec. for each pole touched; a passengers' race—cars having to pass once round the course and then pick up two ladies; a backward race up-hill, the lines being touched meant a 20 sec. penalty; a starting and stopping competition, and, most amusing of all, an obstacle race consisting of the maze, the snare or trap, bursting the bladder, ringing the bell, crossing the water, evading the policeman (here the competitor had to stop at the marked line and dash by the policeman without being touched, proceed to hurdle drive backward through the reverse S, and enter the motor house.) A penalty of 20 sec. was imposed for every obstacle touched, or irregularity. In this event many competitors lost from nine to thirteen minutes and the only cars that had any chance were very small ones, the winner driving a little "Swift." In several instances the competitors got excited and simply went wholesale at the obstacles and rode right through them. The motor-house was extremely difficult, and in nearly every instance, to extricate themselves, the drivers had to drive through the hurdles. Three prizes were awarded for each event and fourteen was the greatest number of entrants, but what was lacking in numbers was made up by the skill of the competitors, and never were heats more keenly contested than when one or other of the four Du Cros were competing against each other. The policeman was suspended from a cross bar, under which the riders had to pass, and, as the pulleys were energetically worked, very few managed to get through without being struck. After numerous heats, the results were declared as follows :—Bending Race.—Mr. George du Cros's 15-h.p. Panhard, 1; Mr. H. du Cros's 7-h.p. Swift, 2; Mr. H. J. Allford's 10-h.p. Argyll, 3. Passenger Race.—Mr. George du Cros's 15-h.p. Panhard, 1; Mr. C. Edge's 15-h.p. Napier, 2; Mr. W. du Cros's 10-h.p. Panhard, 3. Backward Race.—Mr. J. D. Hill's 7-h.p. Panhard, 1; Mr. J. W. Stocks' 12-h.p. De Dion, 2; Mr. C. Edge's 15-h.p. Napier, 3. Starting and Stopping Race.—Mr. C. Edge's 15-h.p. Napier, 1; Mr. G. du Cros's 15-h.p. Panhard, 2; Mr. R. Fuller's 18-h.p. Napier, 3. Obstacle Race.—Mr. H. du Cros, jun., 1; Mr. C. Jarrott, 2; Mr. J. D. Hill, 3. The success of the meeting was so great, and the interest of the spectators so keen, that it is understood a similar meeting will be held next year—not, however, at Bohemia, but along the beautifully paved "front," where speed trials can be indulged in, the Hastings Corporation having the right to close the whole of the promenade for three days each year.

WE understand that Mr. Lewis Stroud has purchased the "Baby Brooke" boat which has lately been prominent in marine motoring circles.

A LEAGUE for the security of the roads and the protection of foot passengers has just been formed in Brussels. At a first meeting, held on Saturday last, it was proposed to petition the Government for a law restricting the speed allowed to motor-cars. Some bitter anti-motorist suggested that the streets should be strewn with nails and broken glass, but wiser counsels prevailed.

SOME carburettors have a fine gauze covering over the extra air inlet, and it will often be found that this device is apt to cause the engine to work indifferently, owing to the fact that the gauze sometimes becomes completely choked by dust and dirt. The best way to remedy this on the road is to pierce fair-sized holes in the gauze with some pointed instrument.

A TWELVE-CYLINDER MOTOR.

THE Putney Motor Company, Limited, have lately completed a very interesting motor intended for a racing launch. It comprises no less that twelve cylinders, and it is rated to give 150-h.p. The twelve cylinders are placed diagonally on the crank chamber at an angle of 90 degrees to one another, making three pairs in each row. The motor is 4ft. 3in. long, 2ft. high, and 2 ft. 8 in. wide. Each pair of cylinders is cast in one piece with no joints, and large water spaces are provided round each valve. The crank chamber is of aluminium with three large inspection covers on the top and one at the end.

The main feature of all Craig-Dörwald motors is retained in this engine, *i.e.*, the crank shaft is so set that it is slightly in advance of the axis of each cylinder. This arrangement, it is claimed, reduces shock and lessens vibration by giving a practically direct thrust on the driving stroke and therefore more power, besides a mechanical advantage at the end of the compression stroke. Three carburettors are employed to furnish the mixtures. They are of the Putney Motor Company's special type, and comprise a controlled inlet valve through which the petrol sprays mix with the air entering through the fixed air inlets. As the engine sucks harder automatic extra air inlets open, while an ingenious system of baffle plates secures each cylinder

getting its proper quantity and quality of mixture. The engine is self-starting, a device for pumping a charge into each cylinder being fitted, so that it is only necessary to switch on the current. The cams can be so arranged that by moving a lever the engine can be stopped quickly and reversed at will. The weight of the engine complete with flywheel is only 950 lbs.

THE War Office have accepted an offer made by Mr. S. F. Edge to place the Napier motor-boat at their service in the forthcoming land and sea manœuvres.

A LARGE new motor depot has just been opened at 20 and 22, Brompton Road, London, S.W., by Dixi Motors, Limited. In addition to dealing in Mercedes cars, the company is introducing into this country a new range of cars known as the "Dixi." The vehicles, which are made in sizes varying from a 6–8-h.p. double-cylinder up to 24-30-h.p. four-cylinder, are, we understand, built by a large gun-making firm in Germany. On Thursday of last week we had a short trial spin on one of the Dixi 12–15-h.p. four-cylinder vehicles with live axle transmission, and we are able to report that the car not only ran very quietly, but is extremely easy riding, there being no objectionable vibration. One of the features of the construction is an automatic carburettor which renders the engine so flexible that the car can be driven at as slow a speed as five miles an hour on the top gear.

CONTINENTAL NOTES.

Another Projected Motor Racing Track.

The latest proposal with regard to a motor racing track is due to M. L. Buirette, Mayor of Suippes and an ardent motorist, who has just submitted a scheme to the Conseil General of the Department of Marne. The suggested track would be located on military land in the Chalons camp and would be thirty-three kilometres long and six metres wide. It is stated that no roads whatever cross the camp, which has, in addition, the advantage of being closed to the public.

◆ ◆ ◆

More Public Services in France.

A meeting has lately been held to discuss the question of establishing a public service of motor-cars between Rambouillet and Saint-Remy-les-Chevreuse. Messrs. Prosper Lambert and Company have lately organised a service between Aix-les-Bains, Leschaux and Annecy.

◆ ◆ ◆

1905 Models.

Already the 1905 models of the leading French motor-car builders are being talked of. The Darracq Company, for example, is credited with having two new types of popular cars on the stocks—a 8-h.p. single-cylinder and a 12-h.p. double-cylinder, which, if rumour be correct, will be of an exceedingly simple character.

◆ ◆ ◆

Public Services in Germany.

A company has lately been formed to establish a service of motor-omnibuses between Partenkirchen and Garmisch. A service is also about to be started between Rorschach, Thal and Rheineck by a small syndicate that has lately been formed by representatives of the various local authorities. Arrangements are in hand, too, for inaugurating a service between Ostrowo and Raschkow, a distance of about seven miles.

◆ ◆ ◆

Dust-Laying Experiments in Vienna.

The municipal authorities of Vienna are making some experiments with a new dust-laying preparation, known as "Simplicit," which has recently been introduced by Messrs. Cooper and Company, of the Vienna Asphalte Works. The preparation is diluted in the proportion of one gallon to ten gallons of water, and is sprinkled by means of the ordinary street watering carts. It is stated to be free from smell, and, so far as the experiments have gone, they have given excellent results.

◆ ◆ ◆

The Efficiency of Transmission Gears.

An interesting series of tests is to be inaugurated in October next at the Laboratoire des Essais Mecaniques of the Conservatoire National des Arts et Metiers, in Paris, viz., a comparative trial of the mechanical efficiency of the transmission mechanism in different types of motor-cars. The object of the tests is to ascertain the system of transmission which shows the least loss of power between that developed by the motor and that given off at the road wheels of the car. Entries for the trial can be made up to the 15th inst. at a fee of £6, and after that date at £12 per vehicle.

◆ ◆ ◆

The Automobile Congress at Breslau.

The congress of German motorists just held at Breslau was a brilliant success. One of the principal items of the programme was a paper by Count Sierstorpff on "Lessons from the 1904 Gordon Bennett Race." The author considered that with complete arrangements for the protection of the public the number of neutralisations can safely be reduced. He also suggested that the German Club should provide a weighing machine in an open field, with the view of preventing a recurrence of the scene at the weighing in at Homburg this year, when a fire occurred in a narrow thoroughfare, and that an official German timekeeper, with the necessary training, should be appointed. He further recommended that the race should be started not later than 6 a.m., in order that the vehicles could, after the race, be weighed in daylight.

Digitized by Google

Numbering in Paris.

The increasing number of motor-cars in Paris, where there are already about 15,000 in use, has caused some anxiety to the Ministry of Public Works and the Prefecture of Police as to how future cars shall be numbered. At first all cars capable of attaining a speed of over thirty kilometres (nineteen miles) per hour were allotted one of the following letters: E, G, I, U, X, and a number up to 999, the series thus providing identification numbers for 4,995 cars. These were soon exhausted, and a second series of 4,995 cars was provided for by doubling the number of letters thus: EE, GG, II, UU, XX. Once again the supply of available numbers is nearly exhausted, and in order to be prepared for further additions provision is being made for numbers for no less than 40,000 cars. This is being done by adopting a small figure after the index letter thus: 999 E^2. When this number is reached the index letter will be changed to E^3, and so on for each 999 cars to E^9, the sequence being afterwards repeated with the other letters.

◆ ◆ ◆

Darracqs, and Gobron-Brillies. The Wolseley Company, too, had entered one of their cars, which was on this occasion in charge of a French driver—Maurice Fournier. In the heavy car class Rougier, on a Turcat-Mery, headed the list, his time, 21 min. 12 sec., being the best of the day. Curiously enough Rougier was the holder of the record for the climb, but lowered this by 3 min. 38 sec., his speed being equal to over forty miles an hour. Duray was second on a Darracq in 21 min. 41 sec., followed by Le Blon (Hotchkiss), Baras (Darracq), Lancia (Fiat). The Wolseley made the climb in 28 min. 46 sec., securing the seventh place in its section and ninth in the general classification. In the light car class the best time was made by Hemery on a Darracq (22 min. 26 sec.). A Darracq, driven by Albert, was also the winner of the voiturette section in 29 min. 59 sec. The honours in the motor-bicycle section fell to Inghilbert on a Griffon, his time being 32 min. 20 secs. After the climb a banquet was held at the summit of the hill, and in the evening the A.C.V. held a reception at its club house in the Place de l'Horloge, Avignon.

◆ ◆ ◆ ◆

A 16-h.p. De Dietrich Car on the Summit of the Lautaret, in the French Alps, 6,500 ft. above the Sea.

[*Allgemeine Automobil Zeitung.*

The Ventoux Hill Climb.

The Ventoux hill-climbing competition organised by the Automobile Club Vauclusien was held on Saturday and Sunday last. The hill, which is situated near Carpentras, is 21·6 kilometres (13½ miles) long; the starting point is 974 feet and the summit 6,215 feet above sea level, the average gradient being about 8 per cent. Saturday was devoted to the weighing in and to the climb by the competitors in the touring section. The honours of the day fell to Ollion, on a Rochet-Schneider, he making the climb in 31 min. 41 sec., his car being in the £640-£1,000 class. Lamberjack, on a Griffon, was first in the motor-bicycle section (time 51 min. 17 sec.). Aubert, on a Cottereau, made the best time (1 hour 15 min. 44 sec.) in the £120-£360 class, and Vimont, on an Aries, headed the £360-£480 category in 54 min.

◆ ◆ ◆

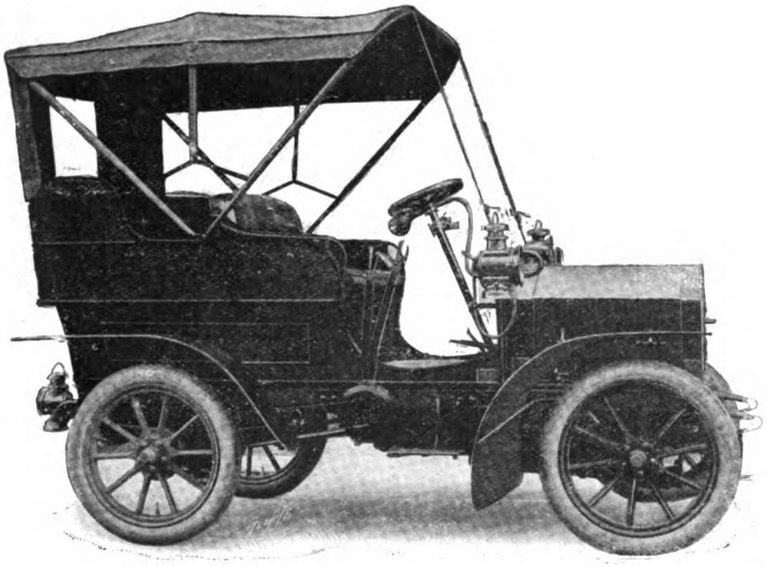
The Racers' Day.

The second day of the Ventoux hill-climb was a "battle of the giants," the entries including all this year's big racing cars, among which may be mentioned the Clement-Bayards, Hotchkiss,

Another Motor-Boat Competition.

A competition for motor-boats using heavy oil for fuel is to be organised by the "Auto" in November next. The test will probably occupy two days, and will be run on the Seine from Paris to Rouen and back.

◆ ◆ ◆



The Gordon Bennett Race.

A report was current in Berlin at the beginning of the week that the French Automobile Club had asked permission of the Prussian Minister of the Interior for the Gordon Bennett race of 1905 to be run over the Homburg course. Enquiries in Paris, however, show that there is no truth whatever in the report. The first rule of the contest, of course, is that it must take place in the defender's country. As a matter of fact, three districts of France have already applied for the honour of providing a course for the race—Provence, Vichy, and Aix-les-Bains. Moreover, there remains the French Ardennes circuit, over which Thery won the eliminating trial in May last.

Digitized by Google

THE "HERON" CAR.

ONE of the latest additions to the motor trade in the Midlands is the Heron Motor Company, of Birmingham, which is introducing a range of "Heron" cars varying in power from 10-h.p. to 16-h.p. The accompanying illustration depicts the 12-h.p. double-cylinder vehicle. The frame is constructed of ash, with steel flitch plates. The motive power is furnished by an Aster motor having mechanically-operated inlet valves. The usual type of high-tension electric ignition is adopted, while a Longuemare carburettor is employed to provide the mixture. The governor is adapted to act on the admission. The water circulation is maintained by a friction-driven centrifugal pump and a honeycomb radiator. Passing now to the transmission, this is by means of a cardan shaft and bevel gear on to a rear live axle. From the motor the power is conveyed through a special form of cone clutch to the gear box, which is adapted to give three speeds forward and a reverse, all controlled by a single lever. On the top speed the drive is direct from the engine to the bevel gear on the rear axle, none of the intermediate gears being in operation. The steering is of the irreversible worm and segment

type, while, as to the brakes, these are all metal to metal, the hand-controlled brakes on the hubs of the rear road wheels being of the internally-expanding variety. The car appears to be soundly constructed, and is equipped with a well-appointed tonneau body, having accommodation for five persons.

MESSRS. CARLESS, CAPEL AND LEONARD ask us to mention that they have reduced the price of their standard petrol one penny per gallon.

THE committee of the Yorkshire Automobile Club is organising a presentation to Mr. A. W. Dougill, their hon. sec., which is being well supported by the members of that active organisation.

THE Elsworth Automobile Company, Limited, has been registered with a capital of £10,000 to acquire the business carried on by Mr. A. Elsworth at Dudley Hill, and 28, Manningham Lane, Bradford; to adopt an agreement between Messrs. A. Elsworth and G. E. Levie, and to carry on the business of manufacturers of and dealers in motor-cars, etc. The first directors are Messrs. A Elsworth, C. S. Dixon, and S. S. Dixon.

MESSRS. ALFRED DUNHILL, Limited, have issued a new price list of their "motorities" which extends to over 150 pages. More than half is devoted to motor clothing, while accessories of every kind are illustrated on the other pages. Several specialities recently illustrated in our columns find a place in this comprehensive catalogue, which doubtless will be given a corner on many a motorist's bookshelf.

SOME USEFUL NOTES.

INLET and exhaust valves require occasional grinding, the necessity being first evident by loss of compression. The exhaust valve will require more frequent attention than the inlet, for two reasons; first, its seat is subject to much higher temperatures, because the valve is held open while the flaming exhaust gases are passing to the silencer, and, second, because the valve is closed by a very powerful spring.

◆ ◆ ◆

IT is advisable to grind a valve when the first evidence of "pitting" presents itself. If the operation is delayed more grinding will be eventually necessary, and more of the valve seat will be worn away in consequence. The head of the exhaust valve is usually slotted like the head of an ordinary screw, and a screwdriver may be used to turn the valve during the process of grinding, after the inlet valve has been removed.

◆ ◆ ◆

VERY fine flour of emery mixed with oil, to prevent the emery from cutting, should be used. Care should be taken to prevent the slightest trace of this mixture finding its way into the cylinder. A good plan is to tie a bunch of waste on the end of a string and push the waste down into the passage between the valve chamber and the cylinder. When the operation of grinding is finished, the waste may be drawn out by means of the string.

◆ ◆ ◆

THE valve should be smeared with the emery and oil mixture, put into place and turned first one way and then the other with a screwdriver. Do not make more than a quarter turn at a time, but do it evenly, exerting very slight pressure. Then lift the valve away from its seat, give it a quarter turn and reseat it, continuing the process of grinding as before. The object of lifting the valve occasionally is to free any foreign matter that might be in the emery powder, and also to make sure that the grinding is done evenly throughout.

◆ ◆ ◆

AFTER having lifted the valve free from its seat four times, and giving it a quarter turn after each, the surface of the valve and valve seat should be carefully cleaned and examined. If the surfaces are perfectly even, with no depression or discoloured spots, the task may be considered finished. If not, continue the operation until this result is attained, applying more emery and oil if necessary. Eight or ten minutes of grinding should be sufficient to remedy a bad case of "pitting."

◆ ◆ ◆

IN cleaning the valve and valve seat, use a soft cloth or piece of waste soaked in paraffin to cut the oil and do the work very thoroughly, removing the last trace of oil and emery before carefully removing the waste from the exhaust passage which was inserted to prevent any emery from entering the cylinders.

◆ ◆ ◆

THE operation of grinding the inlet valve is similar to that described, excepting that the valve and valve seat may be removed from the motor, and the use of a screw-driver will not be necessary, because the valve can be turned with the fingers.

◆ ◆ ◆

WHEN a motorist has become somewhat expert in the running of his car it will be found advantageous to gradually cut down the petrol feed until the point at which the motor runs well, but will not stand a further reduction, is found. The smaller the proportion of petrol the more economically the motor will run and the cleaner it will keep. This can, of course, be carried to extremes and the efficiency of the engine interfered with; but the proper feed can be determined without great difficulty. The same process should be applied also to the cylinder lubrication. When the petrol and lubricating oil are feeding into the cylinder in the smallest quantities that will produce good results, the motor should run for a long time without fouling the sparking plug and on the minimum amount of fuel.

◆ ◆ ◆

A RUBBER connecting pipe may be repaired, if leaking or burst, with a tyre patch well bound with tape.

HERE AND THERE.

A WESTRUMITE COMPANY has just been formed in Paris with a capital of £6,000.

MESSRS. E. BRISTOWE AND COMPANY are opening a new motor garage at 47, St. Peter's, Bedford.

THE Gillett Motor Company, Limited, of Inverness Road, Hounslow, inform us that they are in a position to effect repairs to all types of cars.

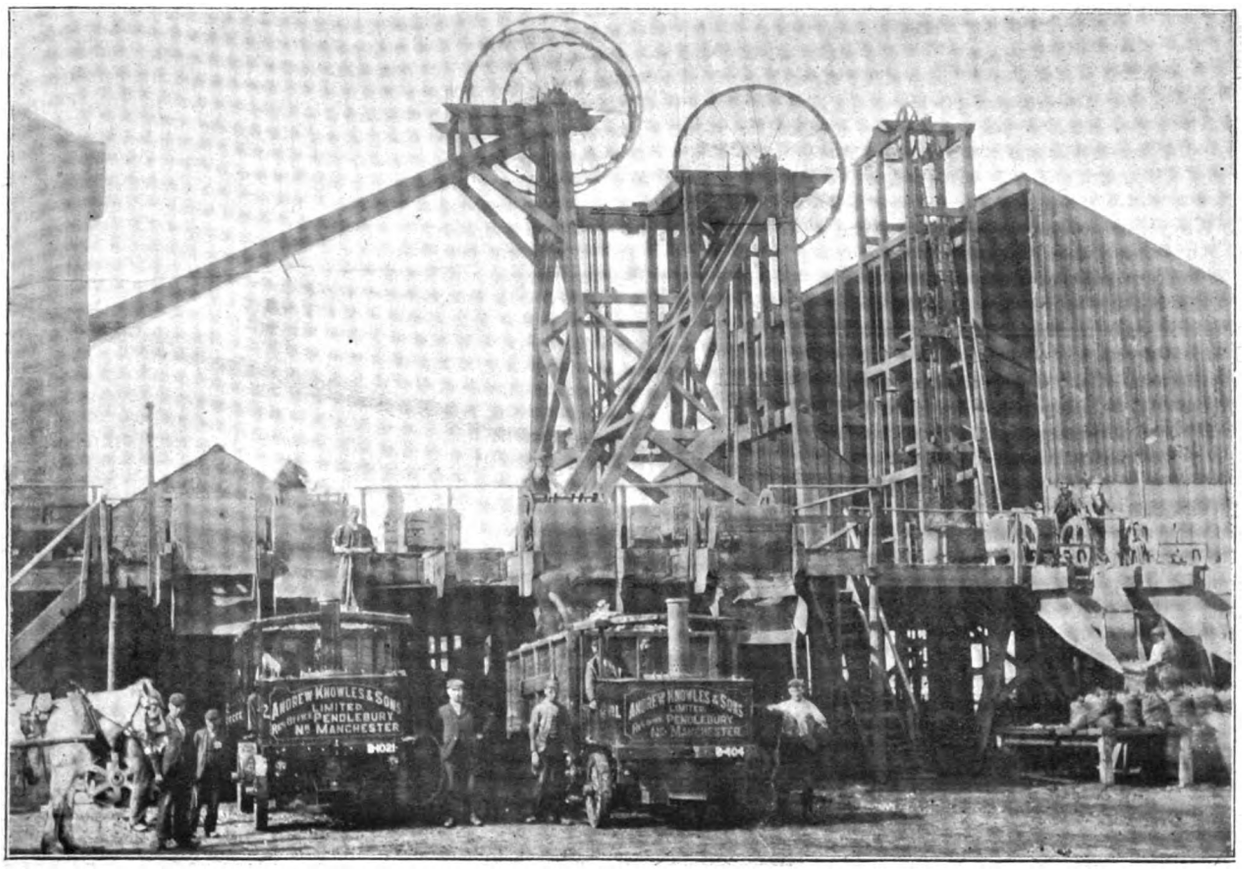
THE North British Rubber Company, Limited, send us particulars of a 20 cwt. steam van which has run a distance of no less than 30,000 miles on a set of their ordinary 3½ inch Clincher solid rubber tyres.

THE accompanying illustration shows two Lancashire steam wagons being loaded up with coal at the colliery of Messrs. A. Knowles and Sons, Limited, Pendlebury, near Manchester. The wagon B 1021 is the identical vehicle which gained the only award at the Royal Lancashire Show at Southport for the patent tipping gear, which has, we understand, proved most successful in practice.

THE Nord Auto, of Faubourg St. Denis, Paris, send us one of their latest lists, giving the prices of accessories and spare parts for De Dion, Panhard, Darracq, and other cars. The list is printed in both English and French.

MR. L. L. WHITMAN, who made the trans-continental trip last summer in seventy-three days in an Oldsmobile, started on August 1st in a Franklin 10-h.p. four-cylinder air-cooled car in an attempt to break the San Francisco-New York record of sixty-one days now held by a Packard car. Mr. Whitman is the first driver to make a second attempt at the ocean-to-ocean tour, and has the advantage of his former experience. He carries with him one extra tyre, three inner tubes, six spare batteries, ropes to wind round the tyres and an axe. So far only three vehicles have made the run from San Francisco to New York.

THE American Motor League has issued a booklet on the construction of macadam roads.



THE King of Greece is the latest head of a Royal House to enter the ranks of automobilists, he having ordered an Opel-Darracq car.

AFTER nearly a year's test of a Merryweather motor steam fire-engine, the Liverpool Corporation has just ordered a second engine of the same type.

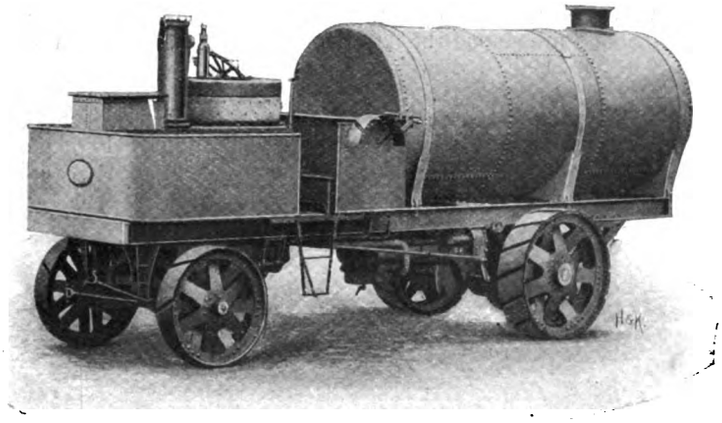
ENDEAVOURS are being made in France to invent a good word for the motor-boat. The "autocanot" and the "canomobile" are among the latest suggestions.

THE United Service Automobile Club, which has recently been formed at Portsmouth, is arranging to hold a motor gymkhana in aid of local Service charities on the 17th inst.

A NEW type of American car has lately made its appearance in London—a 10-h.p. Franklin. The feature of the vehicle is found in the employment of a 10-h.p. four-cylinder air-cooled engine.

Steam Wagons in Colliery Work.

MR. ROWLAND HILL, of the Albion Foundry, Coventry, has been appointed Midland agent for the Stanley silencer.



COLONEL PARKER W. WEST, aide-de-camp to General Arthur McArthur, commanding the Department of California, and a number of officers started from the military camp at Atascadero, Cal., on the 10th ult., in the special car built by the Winton Motor Carriage Company especially for manœuvres of the United States troops at Atascadero, for a three days' run through San Jose and Paso Robles. The car is the first of the kind specially built for military use in the United States. It will be subjected to searching tests to determine its value in military operations, being employed by the Signal Corps for rapid transportation, to make repairs and as a travelling telegraph office. The vehicle is a 20-h.p. touring car, and is capable of carrying eight persons. In the tonneau is a folding table for the telegraph apparatus and in each side of the car are racks for flags, rockets and various appliances used by the Signal Corps.

Digitized by Google

MOTOR-CARS, carrying both mails and passengers, are to be run between Colombo and Puttalam, in Ceylon.

CALLING at the works of the Anglian Motor Company, Limited, at Beccles, the other day, we noticed a handsome 20-h p. "Aries" car with canopy they have just completed for Lady Portarlington.

MESSRS. J. THORNYCROFT AND COMPANY, LIMITED, have lately completed the special steam motor tank wagon shown in

the accompanying illustration. So far as the *chassis* is concerned it is of the standard type, designed to carry a load of seven tons. The tank, which is constructed of steel, is so attached to the frame that it can readily be detached when necessary; it is 12ft. 6in. long by 5 ft. diameter, and has a capacity of 1,550 gallons.

THE new German automobile regulations are to be placed before Parliament early next year, although it is not yet known whether the rules will be issued as Imperial law or submitted to all the separate States for publication from the various headquarters.

THE United Motor Industries, Ltd., have sent us a copy of the 1905 list of their Castle induction coils. A number of improvements have been incorporated into these coils, whilst the workmanship, both interior and exterior, is better than ever, which is saying a good deal. A new platinum screw and check is a little idea that will appeal to practical automobilists.

THE Victoria Rubber Company, Limited, Victoria Indiarubber Mills, Edinburgh, have sent us a sample of the "Grippa" tyre amalgam for repairing cuts and gashes in motor tyres, they have lately introduced. The value of the amalgam consists, it is claimed, in the fact that it combines the properties of being firmly resilient at normal temperatures, and perfectly soft when heated, which enables it to be employed, in a simple manner, as an elastic and permanent stopping for gashes of any shape or form in rubber tyres.

THE New York Automobile Trade Association has adopted a resolution to the effect "That this association is heartily in sympathy with the earnest efforts being made by various persons and associations to mitigate the evil of reckless speeding in dangerous localities, and to foster a strict observance of the rules of the road. While we favour the fullest development of the automobile, and feel an interest in trials of speed where due precautions are observed, at the same time we condemn the wanton and unlawful indulgence in excessive speed, which endangers the car, the driver and the public."

FOR taking water from the public hydrants at Oldham the owner of a Manchester motor-lorry has been summoned. The case is adjourned.

AT Norwich a motor-car has recently been of assistance to a local policeman in arresting a couple of thieves who drove off in a horse and cart.

MESSRS. BURBERRY, of the Haymarket, S.W., have issued a novel price-list of their motor garments, which will give pleasure as well as information to a good many motorists of both sexes. Some excellent skits, as well as illustrations, enliven the catalogue, in which utility and novelty are well combined.

IN the automobile run from New York to the St. Louis Exhibition, Mr. W. B. Herbert, of Detroit, driving a Cadillac, was officially the first motorist to arrive at St. Louis. The last day's run was through Southern Illinois, where the roads from Springfield to St. Louis were in a frightful condition. Rain had converted them into almost bottomless pits of mud, necessitating the use of chains on the driving wheels to permit of any headway.

WHEN in Blackpool recently we had occasion to take advantage of the facilities offered by the Central Motor Garage, which now occupies an extensive area in Abingdon Street, in the centre of the popular seaside resort. In addition to accommodation for a large number of cars, plant has been put down to enable repairs of all kinds to be carried out. Several inspection pits are available, and we also noticed an ingenious platform on which cars requiring repairs can be mounted, so enabling two or more men to work on the vehicle at one time. A good stock of accessories is kept on hand, while petrol is supplied at a reasonable price. That the garage has already earned an excellent reputation was evidenced by the busy state of affairs prevailing at the time of our visit.

HEREWITH we illustrate a steam express motor-van recently supplied by the English Steam Wagon Company, of Hebden Bridge, to Messrs. Pickford's, Limited, for their town parcel

express service. One of these vans took part in the May-day Parade on the Thames Embankment a few months ago, but had not seen sufficient service to warrant a first prize, though we understand a second prize was given to the same. The engines are of enclosed compound type with cylinders 3½ in. and 6 in. diameter by 5 in. stroke; the boiler is of a special fire-tube type, designed for quick steam-raising; the transmission arrangement has already been described in the *Journal*. We understand that several of these vans are regularly making runs of thirty-six miles per day to schedule time.

MOTOR CYCLING NEWS.

DESPITE the exceedingly short notice, the Auto-Cycle Club intends to send a team to represent England in the forthcoming international race for motor-cycles which is to be held in France on the 25th inst. The Motocycle Club of France has agreed that no country can be represented by more than three riders sent by the one recognised club. To enable the club to secure a team, it has invited the makers of the machines which success-

The Auto-Cycle Club's Reliability Trial.—The Rex Motor Bicycle and Tricycle ridden by Messrs. H. Williamson and E Hayes respectively.

fully underwent the recent ordeal of the reliability trials to supply machines and riders. The competing machines have to be British built throughout, and must weigh not more than 50 kilos. (110 lb.) without petrol, oil, accumulators, or spare parts, but an allowance of three kilos. will be made for machines with magneto ignition. The selected machines must be presented to the Auto-Cycle Club for weighing and inspection by Monday, the 19th inst.

◆ ◆ ◆

AFTER checking the returns of the various timekeepers throughout the whole of the route, the judges in the Auto-Cycle Club's 1,000 miles trials have made the following awards :—

MOTOR BICYCLE CLASS.

3-h.p.	Bradbury ...	1st Class Certificate and Gold Medal.
2¾ „	Humber ...	„ „
3 „	Quadrant ...	„ „
3 „	Rover ...	„ „
3½ „	Brown ...	„ Silver Medal.
3½ „	King ...	„ „
3¼ „	Rex ...	„ „
2¾ „	Chase ...	2nd Class Certificate and Silver Medal.
3 „	J. A. P. ...	„ „
2½ „	Alldays	2nd Class Certificate.
3½ „	Lagonda ...	„
2 „	Leader ...	„
2¾ „	Noble ...	„
3½ „	Alldays	3rd Class Certificate.
3 „	Altena ...	„
2¾ „	Bat ...	„
2½ „	Griffon ...	„

PASSENGER CLASS.

3½-h.p. Phœnix Trimo 1st Class Certificate and Gold Medal.

TRICYCLE CLASS.

3¼-h.p. Rex Tricycle 2nd Class Certificate.

Hill climbing tests in the foregoing competition were held on Stepney Hill, Scarborough. The length measured out was 1,600 yards, with an average gradient of 1 in 19, and the worst gradient 1 in 9. The total rise is 266 feet. This hill was in a very wet and greasy condition, and ten machines succeeded in climbing it at a speed exceeding fourteen miles per hour. The other test hill was Marlborough Hill, on the Bath road, the length being 1,000 yards, average gradient 1 in 20, worst gradient 1 in 12, total rise 152 feet. Six machines succeeded in climbing this hill up to the legal limit.

◆ ◆ ◆

INTENDING entrants for the competition for the twenty-five guineas trophy presented to the Motor Cycling Club by Mr. Albert Brown are reminded that no further entries can be received after the first post on Monday next. The event takes place on the 10th inst.

◆ ◆ ◆

MR. G. BROWN, who was a successful competitor in the Manchester Motor Club's 100 Miles Non-stop Reliability Trial, used a pair of Palmer tyres which have done service for two seasons, covering 10,000 miles. He has only been troubled with one puncture, side slip being totally absent.

◆ ◆ ◆

THE Motor Cycle Union of Ireland held their concluding hill-climbing competition of the season on Saturday. The hill selected for the test was that leading from the Waterfall gate at Powerscourt demesne, and, by special permission of Lord Powerscourt, the start took place inside his gate. The competing manufacturers were divided into three classes according to the cylinder capacity of the engines fitted. In the light class the engines were limited to 70 by 70 mm., in the intermediate class to 76 by 76, and in the heavy class to engines under 84 by 84 mm. The results of the competitions were as follows :—

CLASS A.

			min. secs.
1.	T. W. Murphy ...	2-h.p. Triumph ...	1 25 4-5
2.	L. Summers ...	2-h.p. Triumph ...	1 28 3-5
3.	F. A. Wallen ...	2-h.p. Triumph ...	1 29 3-5

CLASS B.

1	C. B. Franklin ...	2¾-h.p. F.N.	1 11 2-5
2.	L. Summers ...	2-h.p. Triumph ...	1 23
3.	T. W. Murphy ...	2-h.p. Triumph ...	1 29

CLASS C.

1.	C. B. Franklin ...	2¾-h.p. F.N.	1 9 1-5
2.	A. Summers ...	3-h.p. Triumph ..	1 15 1-5
3.	J. G. Drury ..	2½-h.p. Triumph ...	1 17 4-5

◆ ◆ ◆

Motor Cycling in Ceylon.—A Trio of Riders at the Hanwilla Tea Estate.
Photo by [*Mr. E. Gordon Brooke.*

◆ ◆ ◆

FIVE clubs competed in the inter-team contest for the Motor Cycle Challenge Cup on Saturday. These were the Guildford Motor Club, the Motor Cycling Club, the Peterborough Motor Club, the Coventry Motor Cycle Club, and the Southern Motor Club. The start and finish were at Bicester, the length of the course being 100 miles. The result was that the Coventry Motor Cycle Club's team was first and that of the Motor Cycling Club second.

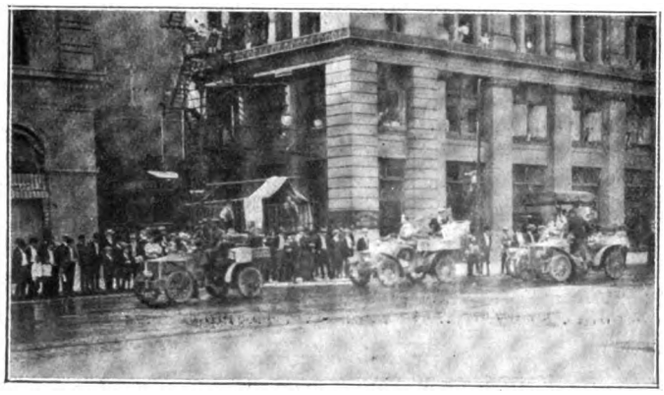
CORRESPONDENCE.

ENGINE TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—Replying to "Mutel's" letter in the last issue of the *Journal*, your correspondent may rest assured that he is by no means alone in his trouble with his crank, as all engines with two cylinders that have the built-up cranks give trouble, these continually coming out of truth even when fitted with centre bearings, as is the Buchet. It is impossible to fit feathers in the crank pin, as these are required to be movable for the purpose of truing the crank before being finally tightened up, but the main shafts are usually provided with feathers.—Yours truly,



F. J. T.

ADVICE WANTED.

To the Editor of *The Motor-Car Journal.*

Sir,—As a constant reader of your valuable *Journal*, it distressed me very much to read the awful experience of your correspondent "J. S." Might I seriously and humbly suggest that you advise him in your next issue that he had better, as he suggests, take out that engine and *boil* it (steaming is no use). I would further suggest that after boiling he should well dry it and salt to taste, adding a little sand if required, then put in an airtight glass case (very important to be airtight) and send to Port Arthur. Having done this, let him proceed to obtain a pair (or more) of four-legged animals called donkeys or asses, and, having arnessed them, attach to the car. He will after that have no difficulty in finding the box of "jeers."—Yours truly,

Verdant Green.

The Three White Steam Cars which successfully made the Run from New York to St. Louis.

THE HORSE POWER OF PETROL MOTORS.

To the Editor of *The Motor-Car Journal.*

Sir,—I have noticed in the *Journal* at various times a number of comments from correspondents on the horse power ratings of petrol motors. There seems to be considerable confusion in the minds of the ordinary laymen as to what a horse power means. It is rather hard to understand why one builder rates his engine at 8-h.p., another, with cylinders of same size, at 10-h.p., and another at 6-h.p.

While visiting the various shows at the early part of the present year I obtained the size of cylinders and the ratings given by eight prominent builders of cars, and found the number of square inches of piston to horse power varied from 2·16 to 2·80. Now suppose these motors to be running at the same piston speed regardless of stroke, how can the motor with only 2·16 square inches of piston develop the same power as the one with 2·80 square inches of piston per horse power?

It is well known that in steam engines horse power is calculated from area of piston in square inches, speed of piston in feet and the mean effective pressure of steam. Stroke of piston does not enter into the calculation, as a six inch stroke will develop the same power as a twelve inch stroke at the same piston speed and same steam pressure. I cannot see why the same rule will not apply to gas engines. It is taken for granted that all the prominent motor builders have determined by experiment and otherwise the proper proportions of inlet and exhaust valves, the proper ratio of compression space to piston area, etc., and if the motor is fairly well constructed and fitted the variation in horse power for a given area of piston should be nil. I think I can understand how the different builders can develop different horse powers with the same size cylinders. All the tests for power are no doubt made under the most favourable conditions. One builder will run his motor under test at an immoderate speed for a short time, and then give out the statement that his motor develops 20 brake horse power. Another builder, being more conservative, runs his motor under test at a more moderate speed, and gives out the statement that under brake test his motor develops 18-h.p. In order that we may arrive at some degree of uniformity, I venture to suggest a different plan of rating. First determine about what area of piston should represent 1-h.p. (say, about 2·75 square inches); then, by taking the combined area of one, two, three or four cylinders, whichever is used in the car, it would be easy to determine the horse power. Another matter that I think would bear investigation and discussion is the proportion of piston area to weight of car and load. I should be glad to see this question discussed in your valuable journal.—Yours truly,

W. M. Wilson.

THE CAUSE OF ACCIDENTS.

To the Editor of *The Motor-Car Journal.*

Sir,—During the past few weeks the daily papers have been full of reports of motor accidents, and one remarkable feature of these reports has been that in the vast majority of them the cause of trouble is stated to have been connected with the steering gear. It is explained that "something went wrong with the steering gear," that "some part of the steering gear broke," and that in consequence "the car became unmanageable." Now, while a mishap to the steering gear is very likely to cause a serious accident, it is hard to believe that the steering gears of so many cars are so carelessly constructed that they break or drop to pieces on the road, and I am rather inclined to think that the greater portion of these accidents are simply the result of reckless driving, mostly by comparative novices, who, to free themselves from blame, put it on the steering gear. In some of the accounts it is evident that the explanations of how it happened have been fabricated. Thus, one report states that "in rounding a sharp curve a short distance from the entrance to ———, a pin in the steering gear fell out and the machine ran wild. Unable to control the car, Mr. —— , his guest, and the mechanician held on to the sides of the machine. After tearing down hill for a quarter of a mile, the car failed to make a sharp curve and brought up head on against a telegraph pole."

It is plain from the above that it was simply a case of "going all out." If the steering goes wrong, this does not cause the car to "tear," but rather retards it, and if it had been going at a moderate pace, it could have been brought to a stop much inside of a quarter of a mile. At twenty miles an hour, the legal speed limit, the average car can be stopped by the brakes in a distance of sixty feet. The most probable explanation is that the curve was taken at too great a speed, the car began to skid on the down grade, and the driver lost control of the car and ran into the telegraph pole.

It was suggested in France some time ago that in case of a serious accident, the Automobile Club should send an expert to the scene to investigate the cause and make a report to the club. Since it is a great injustice to the industry that accidents should, in the public Press, be ascribed to failure of some parts of the machine, when in reality they are the direct cause of reckless driving, would it not be advisable for the A.C.G.B.I. to have an inquiry made into the causes of all serious accidents, at least those which occur in or near large centres?—Yours truly,

Manufacturer.

ESPRIT DE CORPS.

To the Editor of *The Motor-Car Journal.*

Sir,—As a reader of your valuable *Journal* I wish to draw the attention of fellow motorists to the following interesting incident that befel me the other Sunday. When within one and a half miles from Cobham, my accumulator suddenly gave out; unfortunately Messrs. Peto & Radford had my spare one under repairs, so there I was with a heavy car and no power to move it. My friend proposed to go ahead. Within half an hour a man on a bicycle with a spare accumulator was alongside, and we were soon under way again. I made a point of stopping at the works of my benefactors, Messrs. B. Johnston and Company, Cygnet Works, Portsmouth Road, Cobham, and was surprised to find such fully-equipped works. As I was only charged 1s. for the loan of the accumulator, and think it a useful place for motorists generally, I trust you will insert this letter.—Yours truly,

A. Johanning.

HORSE V. MOTOR.

To the Editor of *The Motor-Car Journal.*

Sir,—It seems to me that "Another Practitioner" has been very badly advised and is now putting all the blame on to the motor. *Re* his tyre troubles, where can his commonsense be to run through a dozen or more tyres in about eighteen months? He might well say motoring is expensive. Had he had a reliable tyre fitted in the first place that difficulty would have been overcome. He has a bill for £80 for "meddling." I am inclined to think that any firm with a reputation to keep up would have something more than "meddling" to show for a bill of this amount. Another firm has sent him a bill for £13 or £14 for filing the clutches and a few "minor" jobs. Why does he not say what constitutes a "minor" job? He does not say what pattern clutches he has, but I imagine they are the friction clutches similar to those fitted to the Progress cars. I have had experience with this type and found that by slightly roughing the two surfaces all trouble was overcome, and the car is running now. *Re* the accumulator, I sympathise with him, but he does not say that it was in good order when he sent it to be recharged, although he would have us believe so. I should like to know the district he resides in. I

Digitized by Google

have travelled all England and have not yet come across the place thirty miles from a repairer. To my mind "Another Practitioner" is one of the only too frequently met class who has bought a motor and does not understand that it requires a man who knows what he is about to look after it, and these must be paid for.—Yours truly,

NO PATIENCE.

LOOK AFTER THE CHAINS.

TO THE EDITOR OF *The Motor-Car Journal*.

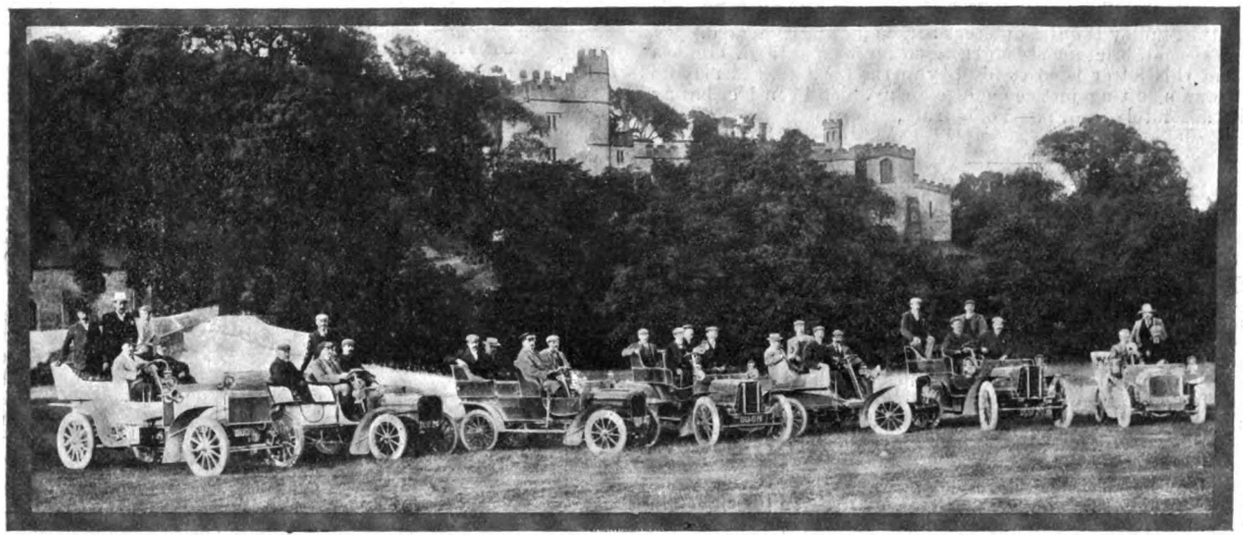
SIR,—The writer of the letter on this subject in the *Journal* of the 20th ult. asks whether chains as a whole are made heavy enough for the work involved. I am not an expert on questions relating to the many niceties of this type of transmission, but after three years' steady running of a car so fitted and having used Brampton's, Coventry, and Renold's makes, have come to the conclusion that the lighter the chain the better the wear, *i.e.*, presuming, of course, that the quality of steel is of the best. If it were merely a question of thickening side plates of links, and increasing diameter of rollers to ensure a longer life and a freedom from breakage, the slight increase in weight, so far as the car is concerned, would be a mere trifle, but curiously enough, an increase of mere metal makes for more rapid wear both in links and sprockets. The Renold chain, though much lighter than the finest quality turned out by most firms, lasts far better, and is quite as strong. When links can be easily lifted with thumb and finger on rear wheel sprockets, *i.e.*, on back of sprocket, one need not wait for clicking on road. Again, good alignment means much for the chain.—Yours truly

WOLSELEY.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see "Enthusiast's" letter in a recent issue of the *Journal*. Steam as a motive power for motor-cars is by no means out of the running. True enough, cars propelled by internal combustion engines have become the popular type in most localities. This popularity of the petrol car does not, however, read the death warrant of the steamer. The latter has some points of advantage that will be apparent so long as petrol cars are built upon the general principles of their present construction. The hydro-carbon, internal combustion motor must be changed considerably to diminish the importance of these advantages of steam. That these advantages are in fact as well as in theory was recently fully demonstrated when Mr. F. E. Stanley, on a light 6-h.p. steam car, galloped up Mount Washington, in America, faster than all but one other car, a 60-h.p. "Mercedes," making the trip.



The triumph of Mr. Stanley on Mount Washington does not mean the unalloyed superiority of the steam car over the petrol vehicle. It means that at hill climbing and some other performances the steam car has advantages that must not be overlooked. It does not mean that the disadvantages which have wrought against the popularity of the steam car have been overcome. These disadvantages exist as they have always existed. In the application of power the steam car is superb. In economy of and convenience in the generation of power it is not so advantageous. This situation is unalterable so long as present systems of operation of motor vehicles maintain. If the steam cars by a bold stroke were altered in principle so that the generation of power were placed on a basis equivalent in economy and convenience to the economy and convenience in the application of the generated power, it would become the ideal vehicle.

On the other hand, were the petrol car so reconstructed that the application of generated power were rendered as economical and convenient as the generation of that power, it would also become the ideal vehicle. Then would the steam and the petrol vehicle become one and the same thing in efficiency.

Under present practice each system has advantages and disadvantages which must be weighed by the probable use of either. The public has properly accorded the petrol machine the greater general average of advantages counted against disadvantages. But the public in so doing has not entirely condemned the steamer.

There may be more in the steam vehicle in years to come than the advocate of the petrol motor cares to admit.—Yours truly,

J. K. FITZPATRICK.

A Group of Humber Cars at Hadden Hall, Derbyshire.

THE OLDSMOBILE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the letter in the *Journal* of the 20th ult., I have pleasure in informing your correspondent "A.H.K." that I have owned and used for the past twelve months one of the 5-h.p. Oldsmobiles, which I have found a capital little car, it being both reliable and easy to keep in running order. Of course, with this car, the same as with any other, I have had little troubles, but nothing has occurred that I have not been able to satisfactorily adjust myself. Regarding the question of the back seat, the springs and axle of this car are quite strong enough to stand the strain of a third person being carried, although the car is really a two-seated vehicle. I have driven three and even four people on my car. In conclusion I may say that I am simply delighted with my little Oldsmobile, and would not exchange it for any other light car on the market. As an enthusiastic motorist, if there is any other information that I can give your correspondent I shall be only too pleased to do so upon hearing from you.—Yours truly,

J. MACGREGOR.

TYRE BURSTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For the last few weeks the motor press has teemed with letters on the subject of the effect which the bursting of tyres has on the steering of a car. The discussion was started by the experiments conducted by Mr. S. F. Edge, and has been followed with great interest by a large number of your readers, including myself. I was therefore particularly interested to read the following, which is an extract from a letter just received from a friend of mine, a most experienced driver, who, while speaking of a burst which occurred in his front wheel tyres, says "when the tyre blew off I was travelling down hill at about twenty-five to thirty miles per hour, and I never felt the slightest movement of the car either to one side or to the other, and it kept under perfect control until I stopped it, in about twelve yards. I think it may therefore be freely accepted that tyres bursting will not cause accidents, unless the driver loses his head on hearing the bang."—Yours truly,

H. W. BARTLEET.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Superheat," I have been using a Locomobile for more than three years and I have not had a fire tube burst yet. Being made of copper, the deterioration is very slight; nevertheless such a burst is possible, so I have had a couple of iron taper plugs made with a fine thread; these would cut their way into the ends of the tube and stop the leak. It is impossible for either end of the boiler to blow out, as the

Digitized by Google

fire tubes hold both ends together. As to upkeep. This depends on how the car is used. If the engine is kept well lubricated and used in a common-sense sort of way, the upkeep would be very small indeed, and 1d. per mile would go a long way towards covering it.

The tyres on most of these little cars are single tubes. These should be covered with stout bands. Mine cost 25s. each, but I have never had a puncture yet, and of course the tyres themselves are as good as new. If these bands are well made they will last about 5,000 miles.

For reliability, quietness, and perfect control, these little cars will beat any petrol car at present on the market.—Yours truly,

A.H. 59.

To the Editor of *The Motor-Car Journal*.

Sir, — I have read the letter from "Enthusiast" in the *Journal* of the 20th ult. with much interest. There is, as he says, a prejudice against steam cars, and I certainly agree with him that it is unwarrantable. No one attempts to run down the large type of steam car as embodied in the White or Miesse, and I can assure your readers that, though a light car, the Stanley is just as efficient. During the last two years this car has proved so satisfactory that there has been found no improvement needed in the principle of the car, although in the latest models the minor details and methods of placing various parts are altered. Some friends who have recently visited me from the States were astonished to find how little the car was met with in this country, and could not understand the reason, as it is so very popular in the States. The real reason is, because people will not even take the trouble to look at or examine it, the fact of it being a steam car being, in their opinion, a sufficient reason for this attitude, and yet they know absolutely nothing about it. If they are comparing it with the old Locomobiles, I can only say the Stanley is quite different and cannot be compared.

I hold no special brief for steam cars, so far as making a profit is concerned, and this letter is written solely in the hope that it may do something towards getting justice done to a car which I consider has an individuality absolutely its own.—Yours truly,

W. E. G.

TYRES!

To the Editor of *The Motor-Car Journal*.

Sir,—I shall be glad to have your readers' experiences with tyres running under similar conditions to my own. I am running a 20-h.p. car. I never exceed more than about thirty miles per hour. It weighs 25 cwt. unladen, and the wheel base is 8 ft. 10 in. in length. The body is an ordinary tonneau, with seating accommodation for two in front and three behind, and the extreme width of the back part of the tonneau is 5 ft. about. The wheels are 30 in. diameter, and are fitted with 4 in. tyres. I have only run the car 1,500 miles, and have already had three bursts of the outer cover, all beyond repair. The makers tell me my wheels are altogether too small for the size and length of the car, and that I shall have nothing but trouble till I put larger wheels on. They say my existing sized tyres have burst, not because they were faulty in design or workmanship, but simply because they won't stand the wear and tear put on them. Personally, I am inclined to doubt that being the case, but shall be glad to have your readers' opinion on the subject.—Yours truly,

Perplexed.

BELT TRANSMISSION.

To the Editor of *The Motor-Car Journal*.

Sir,—I am glad to see that a correspondence on the subject of belt transmission has been started in your columns.

There is no doubt that this system, if properly applied, has many advantages over mechanism employing sliding gears, and chains, or bevel pinions, which require constant and efficient lubrication. Its chief claims would be cheapness, freedom from complicated working parts, with their liability to get out of order, greater silence and smoothness in running, and also a considerable saving in weight.

What has hitherto militated against the success of the leather belts has been the habit of makers of using them far too short and narrow, considering the strains to which they were put.

I am so perfectly convinced that a car driven by one long belt, four to six inches wide, would answer perfectly, that I have designed a transmission gear, which I hope to have fitted to a car, in which one belt only is used to drive a car at two or more speeds. It would never require tightening, and yet employ no sliding gear, jockey pulley, or friction clutch.—Yours truly,

C. A. Byrom.

TAIL LAMP TROUBLES.

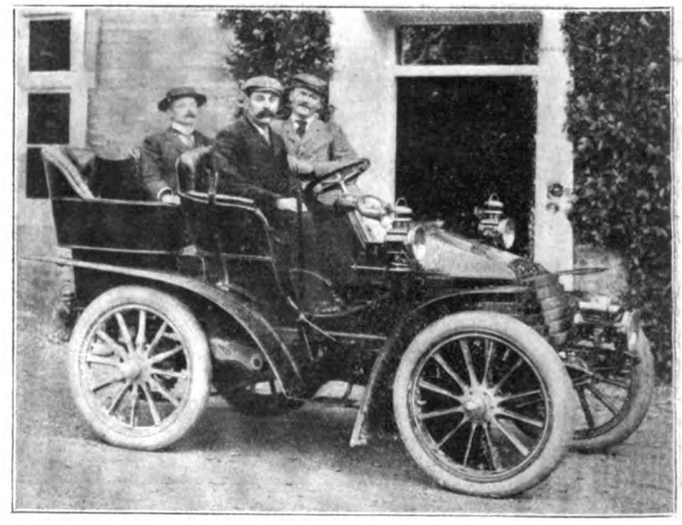
To the Editor of *The Motor-Car Journal*.

Sir,—I venture to invoke the aid of fellow motorists in helping me to overcome the trouble with my tail lamp, which is continually jolting out. The lamp is a good one, burning paraffin, but, notwithstanding that I have made the bracket holding it as rigid as possible, the light jolts out to such an extent that night riding is anything but a pleasure. Returning from a spin to Guildford the other day, we lit up the lamps at Ewell, and between that point and Merton no less than half a dozen stops had to be made to re-light the tail lamp. I feel sure that I am not alone in this trouble, as I have passed many motorists on the road engaged in a similar operation. Any suggestion on the point would be greatly appreciated by—Yours truly,

Rosthern.

GEAR FOR DECAUVILLE CAR.

To the Editor of *The Motor-Car Journal*.



Sir,—I am the owner of a 10-h.p. Decauville, and find the gears anything but satisfactory, inasmuch as they last for very few miles in a hilly district. Furthermore, they are extremely noisy, and I am informed by the engineer who looks after the car that this is because of the length of shaft in the gear box. Can any reader recommend me a complete gear outfit suitable for a 10-h.p. Decauville, which will at once be silent and effective?—Yours truly,

H. D.

Tyre Repairs.—"Player" writes: "I shall be glad if any of your readers who have used the See fluid for vulcanising patches on inner tubes would say if this is effective, and if so, how they make it so."

The Napier Motor.—Messrs. D. Napier and Son write with reference to Mr. S. F. Edge's 20-h.p. Napier car, 5 in. by 5 in. engine:—"We wish to place it on record that this size of engine has been regularly manufactured by us since 1902, and has been fitted in cars supplied to Messrs. S. F. Edge, Limited, as 20-h.p. cars, with a guarantee to give 30-h.p. on the brake.

Nail Catchers.—"Troubled One" writes:—"Some weeks ago you published an interesting article descriptive of a number of nail catchers for pneumatic tyres that have lately been introduced. If those motorists who have given any of these devices a practical trial would favour you with particulars of their experience of the same, they would, I think, be of much interest to many readers of the *Journal*."

Mr. F. Richardson, Hon. Sec. of the South Lincolnshire Automobile Club, at the wheel of his 10-h.p. Wolseley Car; Dr. Miller, Captain of the Club, is seated by his side, and Dr. E. H. Cragg, Hon. Sec. of the Lincolnshire Club, is sitting behind.

The Home Office has just issued a census of automobiles registered between January 1st and April 1st. Probably if the officials of the department read the papers they would know that on July 30th we gave the complete returns up to date. Hence the omission of these belated official figures from this issue.

We are reminded that the question of protection in case of fire in garages is one which is of undoubted interest to all motor-car users by the receipt of a photograph from the Locomobile Company of Great Britain, Limited, showing the extensive battery of apparatus in their garage for extinguishing fire. The photograph shows four large chemical fire extinguishing apparatus throwing a jet a great distance, and a large number of buckets. The latter are all painted red, with the word "Fire" in large letters upon them. They are, of course, filled with sand and are hung in prominent positions upon the walls of the garage and works, and under no circumstances are they allowed to be used for any other purpose.

CLUBS AND ASSOCIATIONS.

LEICESTER.

By the invitation of Sir Arthur Hazlerigg, Bart., the members of the Leicester Automobile Club visited Noseley Hall on Saturday afternoon. Twelve cars and a motor-cycle made the journey, some of them going *via* Billesdon and others *via* Kibworth. Tea was served in the Hall, from the windows of which a fine view was commanded, and afterwards a telegram was despatched to Sir Arthur, who is in Scotland, thanking him for his hospitality, regretting his absence, and conveying the good wishes of the automobilists to Lady Hazlerigg and himself. An unofficial item of the programme was the training of one of Sir Arthur's hunters to stand the unaccustomed rush and noise of the motors. At the request of the head groom, the cars were sent past the horse several times, and after showing great fright at first it gradually gained confidence, and showed no timidity at the finish.

LINCOLNSHIRE.

Another of those interesting gatherings for which the Lincolnshire Automobile Club has become noted took place on Saturday afternoon, when Captain J. A. and Mrs. Cole entertained the members in their grounds at Roxholme Hall. Between thirty and forty cars assembled from all parts of the county, in addition to two from Nottinghamshire. The Lincolnshire cars included two Georges Richards, a 16-h.p. driven by Mr. J. Coombes, of Lincoln, and a 12-h.p. belonging to Lieut. Nevile, R.N. Mr. and Mrs. George Linnell and Mr. E. Richardson came on Wolseleys, Capt. Newsum and Dr. Sharp on Richardsons, Mr. C. W. Pennell was on his 16-h.p. Martini, and his brother, Mr. W. R. Pennell, on a 10-h.p. Locomobile; Dr. Brooks, Mr. R. M. Wright, and Mr. H. Marshall were on Clement cars, Mr. George Godson on a M.M.C., Mr. Haddon Owen on a Daimler, Mr. Cyril Nelson on a De Dion, Dr. Gilpin

A Lincolnshire Motor Meet at Roxholme Hall.

on a 8-h.p. Peugeot, Capt. Lyall on a Panhard, Mr. W. A. Tomlinson on a Bardon, while Mr. F. P. Curtis, Mr. A. W. Holloway, Dr. Miller and Dr. Mason drove over on Baby Peugeots. Some of the cars brought as many as six passengers. Capt. Cole thoughtfully arranged a novel driving competition for the delectation of his guests. Ladies took a prominent part in the competition, the idea of which was to start a car from a given point, each gentleman driver having a lady passenger, who was obliged to alight at another point of the route, fill a glass with water, return with it to the car, and carry it in one hand while riding into the Park—the winner being decided by the quickest time and the quantity of water remaining in the glass at the stopping-place. Mr. R. M. Wright, who drove Mrs. Brook in her husband's 9-h.p. Clement, made the quickest time, and was declared the winner. The distance was about half a mile, and included two stops. The following times were recorded:—

		m. s.
Mr. R. M. Wright ...	9-h.p. Clement	1 26
Dr. Gilpin... ...	8-h.p. Peugeot	1 32
Mr. W. R. Pennell ...	10-h.p. Locomobile... ...	1 33
Dr. Sharp	12-h.p. Richardson... ...	1 39
Capt. Lyall...	7-h.p. Panhard	1 42
Mr. W. A. Holloway ...	Baby Peugeot	1 45
Capt. Newsum	18-h.p. Richardson... ...	1 50
Mr. C. W. Pennell ...	16-h.p. Martini	Disq.

Capt. Cole personally superintended the starting. Mr. Rees Jeffery took the times; Major Barrow was judge, and Dr. Lowe assisted at the water table.

SCOTTISH.

The western section of the Scottish Club will hold a hill-climbing competition at Kirkfield Hill, near Lanark, on Saturday, 10th inst. The competition will take place from a standing start over about 821⅔ yards of road. Cars, which may be entered by members of the Scottish Automobile Club (western and eastern sections) only, must be registered as and be the *bona-fide* property of the member making the entry, and each vehicle must be driven by a member of the club.

CASES DISMISSED.

Mr. H. Belcher, of Beeston (Notts), was charged at the Snaith (Yorks.) Police Court, on the 25th ult., with furiously driving a motor-car so as to endanger the lives and limbs of passengers on the highway in the parish of Whitley Bridge (Yorks.) on August 2nd. The evidence showed that the defendant drove through the parish of Whitley Bridge at the rate of twenty-five to thirty miles an hour. Mr. Wells Lucas, of Nottingham, who defended, contended that it was necessary for the prosecution to prove that some particular person had been endangered or injured, and quoted cases in favour of his contention. The magistrates held that, as it had not been shown that someone had been endangered, the summons must be dismissed.

Harry Bibby, of Ansdell, was summoned at Lytham on Thursday for driving a motor-car in a manner dangerous to the public. Mr. Nicholson said that on Thursday, the 12th ult., defendant was driving the car at St. Annes. When he was in the square, where four roads meet, the car collided with a butcher's cart. The speed was about 14 miles an hour. P. S. Blackburn said there was considerable traffic about at the time. When defendant came to St. Annes Road he gave only one toot of the horn. Immediately before the car struck the cart, in his opinion, he was driving to the danger of the public. According to Robert Rogers the car was going at twenty miles an hour; Roy Higgins estimated it at 15; John Pye at 17 or 18; Robert Boothman at 30. Mr. E. R. Lightwood (chairman) said the Bench considered the case a proper one for the police to have brought, and they would like to point out that there were continual complaints of the way in which motor-cars were being driven along Clifton Drive. At the same time they did not think that in the present case defendant was driving at a pace dangerous to the public. The case was dismissed.

CONVICTIONS AGAINST MOTORISTS.

Place.	Summoned for	Fine.
Tredegar	Furious driving	40s., etc.
Penge	Reckless driving, failing to sound horn, and not producing licence	£4 11s. 6d.

SIDE-SLIP IN MOTOR-CARS.

THIS was the title of a paper read last week by Messrs. H. Darwin and V.C. Burton before the Engineering Section of the British Association at Cambridge. The authors stated that one of the chief causes of side-slip was that the hind wheels, being driven and locked, lose their directive control. When that was the case the motion of the car was unstable, and it swung round so as to face in the opposite direction to which it was moving. By using a model on an inclined plane which had been made slighly wetted Mr. Darwin showed that if the locked wheels were in front the car travelled in the right way, but when the rear pair were locked it swung round in the manner indicated. He said that if they locked the back wheels they were sure to come to grief, and this would happen however great or however small was the friction between the wheels and the road. He thought they would get a cure for this in steering by the hind wheels and driving by the front wheels. In hind-wheel steering the short car had an advantage, and if this method were adopted cars should be short and not long as at present. The general conclusion at which he and Dr. V. C. Burton had arrived was that hind-wheel driving was objectionable, because driving-wheels were very likely to slip. With front-wheel driving the motion would be more stable.

In the discussion which followed Professor Fitzgerald considered that the braking being on the back wheels of the car was the principal cause of the car swinging round when retarded or when braked running downhill. Mr. A. R. Sennett said he had been impressed with the value of rigidity between the front axle and the body of the car. It was to the use of the perch pin that side-slip was almost entirely due. Motor-cars were not the only vehicles that had side-slips. Strange antics were sometimes performed by London omnibuses. The reason was that the friction round the perch pin was so very slight that there was nothing to keep the body of the vehicle straight. Braking the front wheels he considered a dangerous thing, as it accentuated the risk of side-slip. It was the same with a bicycle. Braking the front wheel of a bicycle was a most unscientific thing, as it threw all the weight on to the crutch and was a fruitful cause of accident. As to motor vehicles, he thought the most scientific thing was to have all the wheels drivers. The next best thing was to have the front wheels drivers and the back wheels merely trailers.

Professor Boys, who also took part in the discussion, did not feel at all satisfied with the idea of steering with the back wheels, and he was afraid they had not yet arrived at the cure for side-slip.

POLICE TRAP.

THE police have a measured quarter mile from the foot of Kingston Bridge along the road to Hampton Court.

ANOTHER attempt to reduce the John o' Groat's—Land's End motor-cycle record is, we understand, being made this week.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, *39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, SEPTEMBER 10, 1904. [No: 288.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

DOGS are an ever-present source of danger to the motorist—unless, like the Pomeranian carried by Miss Levitt in the Small Car Trials, they are well trained and perfectly accustomed to regard the motor-car with a friendly ease. Quietly passing through a village at a very moderate speed, the motorist is never free from the worry associated with the sudden advent of some snappy canine specimen from an unobserved position right under the automobile. It is all very well to suggest remedies; but the incident is so spontaneous that accidents may happen practically without warning. If the motorist escapes from danger and turns to denounce the dog, he is, in turn, made the object of ridicule and abuse from the owner of the barking creature.

◆ ◆ ◆

Dog Causes an Accident.

THE other day a somewhat serious motor-car smash occurred near Spalding, mainly through the driver trying to avoid a dog. A large one came barking at the car, and Mr. Bles, of Manchester, who was the owner of the car, in trying to avoid the animal, swerved the machine, and the front axle broke close to the wheel. The car was precipitated with great force into the ditch on the side of the road, and the mechanic steering was thrown several yards into a cross hedge in the adjoining field. Mr. Bles escaped with very little injury, the driving wheel of the car preventing him from being thrown out, but he received a severe blow in the stomach. Had he driven straight ahead the dog would probably have been killed. Then the owner would have come forward to claim compensation. But the motorist has no remedy against the person to whom the troublesome animal belongs.

◆ ◆ ◆

Dr. Barton's Airship.

FROM the deck of the Barton airship we have recently been able to survey the members of the Aeronautical Institute assembled at the Alexandra Palace to inspect the device that is now awaiting favourable climatic conditions to allow its inventor to ascend into the clouds. The airship is over 120 feet in length, and is constructed of bamboo, steel, and aluminium. Above this will be a balloon of projectile shape, the over-all measurements being 175 feet long, 60 feet high, and 40 feet wide. Towards each end is a 50-h.p. Buchet motor driving two propellers with six blades. Between these are three sets of aeroplanes which act in a horizontal direction for the purpose of raising or lowering the ship. On these Dr. Barton bases great hopes for the success of his idea.

◆ ◆ ◆

Waiting his Opportunity.

To test the mechanism the motors were set going while we were aboard, and an enormous draught was set up in the confined space of the airship shed. The rudder, 204 square feet in area, answered splendidly, the aeroplanes were shown to be effective, as was the device for counteracting the effect of members of the crew passing from one part of the deck to another by means of pumping water to and from tanks at the bow and stern respectively. A question of interest with regard to the silencer has been discovered, and the failure of a gauze silencer, which was blown off by the explosion, has led to the adoption of a tube twenty feet long, which will be suspended from the airship to keep the flame well away from the balloon. The airship is finished; all that is now wanted is the inflation of the balloon and a favourable day for Dr. Barton to make his trial trip into the clouds.

◆ ◆ ◆

Cricketers and the Car.

CRICKETERS, as true sportsmen, are well inclined towards the motor-car—a means of locomotion with which to make "runs" into the country. Mr. C. B. Fry can drive a car as well as a ball, and Mr. Lionel Palairet, of Somersetshire, is becoming as familiar with the garage at Bridgwater as with the county ground at Taunton. Two other cricketers, Trott, of Middlesex, and Braund, of Somerset, have also been a-motoring, but on Saturday the car whereon they rode collided with a cart, and the former was thrown out, receiving a shock as he struck the ground. Braund jumped, and alighted with an expression similar to that worn by the batsman when the appeal "How's that?" to the umpire results in another chance. It was with considerable relief that he found himself unhurt. There is luck in motoring as in cricket.

◆ ◆ ◆

Motor Fire Engine for Leicester.

THE Wolseley Tool and Motor Car Company, Limited, have just completed an automobile chemical fire engine for the Leicester Corporation Fire Brigade Committee. The vehicle has been constructed to comply with the requirements of Superintendent Ely, the chief officer of the fire brigade at Leicester. The vehicle has a specially-built chassis with a 9 ft. 6 in. wheel base and 4 ft. 9 in. track. The employment of the standard Wolseley horizontal type of engine renders a very large proportion of the chassis available for the fixture of the various fire brigade appliances. The wheels are of artillery pattern, the rear ones being 40 in. diameter and shod with Sirdar solid tyres, and the front 36 in. diameter and fitted with 5 in. Colliers. The rear wheels are specially reinforced with wire spokes to withstand very severe side strains. The chassis is fitted with a 24-h.p. horizontal petrol motor running at 750 revs. per minute. The cooling is on the usual "Wolseley" lines with the addition of a fan fixed inside the radiator. The engine is geared to speeds up to twenty-five miles per hour, and the transmission mechanism is in accordance with standard "Wolseley" practice.

◆ ◆ ◆

A Credit to British Industry.

THE rear part of the vehicle is fitted with a fifty gallon chemical cylinder, and hose reel mounted above it. Besides other first aid appliances the vehicle carries two 9-foot ladders and two hand extincteurs. There is accommodation for six firemen, including the driver. The engine has a very handsome appearance, being finished in accordance with fire brigade practice, and with its bright metal work and double-beat fire gong, big brass lamps, etc., presents a very workmanlike appear-

Digitized by Google

ance. There is no doubt that the adoption of the automobile in connection with fire-brigade work will be of great advantage to the communities in which they are located, and we look forward to a considerable extension of their use in this country during the next few years.

◆ ◆ ◆

Duty Free Alcohol.

FOLLOWING his recent announcement in the House of Commons as to the probable appointment of a committee to inquire into the use of duty free alcohol for industrial purposes, the Chancellor of the Exchequer has just selected those to make an inquiry, the object of which is clearly stated in the terms of reference as follows:—"To inquire into the existing facilities for the use without payment of duty of spirits in arts and manufactures, and in particular into the operation of Section 8 of the Finance Act, 1902, and report whether the powers conferred on the Commissioners of Inland Revenue by this section permit of adequate facilities being given for the use of spirits in manufactures and in the production of motive power, or whether further facilities are required, and, if it should appear to the Committee that the present facilities are inadequate, to advise what further measures could be adopted without prejudice to the safety of the revenue derived from spirits, and with due regard to the interests of the producers of spirits in the United Kingdom."

◆ ◆ ◆

Lamp Posts in Surrey.

So many of our authorities do the right things in the wrong way that it would have been an excellent innovation could a different method have been reported from Surrey with regard to the warning posts now sprouting up throughout the town of Guildford. A local motorist writes to express the fear that the supply of masonic-headed lamp-posts is being overdone in the district. Of course they are recommended by the Local Government Board, but it is really difficult to distinguish them from ordinary lamp-posts. The posts should be painted a distinguishing colour as well as the triangles. The want of system that prevails in the county will probably be fatal to their usefulness.

◆ ◆ ◆

Motorists should help.

SIR HENRY PRIMROSE will be chairman of the alcohol committee, upon which Mr. Scott Montagu, Sir William Crookes and others will sit. Mr. Thomas Tyrer, who has made the matter a subject of special study, will give the committee the advantage of excellent technical knowledge, and, altogether, we are hopeful that this appointment will result in something practical which will be to the advantage of British industry in general, and to the development of automobilism in particular. Readers who have given the matter any thought, and have any special ideas upon the subject, are invited to communicate with Sir Henry Primrose, K.C.B., at Somerset House, so that arrangements may be made for the committee having the benefit of their knowledge. Should the committee report in favour of alcohol for motive power and industrial purposes being free of duty, there is no doubt an impetus would be given to an important aspect of automobilism.

◆ ◆ ◆

The Protection of Pedestrians.

OF the making of leagues and the formation of associations there is no end, and the latest novelty of this kind is the Highways Protection League, which seems to be based on similar lines to the other organisation at Brussels, to which reference was made in our Continental Notes last week. One object is to prevent annoyance to the public using the highways and investigate cases of danger or injury—whether to life, health, or property—or of annoyance or discomfort, caused by the highways being used in a manner inconsistent with the rights of the public. The society intends to take up vigorously all cases of oppression against pedestrians, and to generally enforce a good standard of conduct on the highways.

Roads in Ireland.

A DISCUSSION has again broken out in Ireland with reference to the state of the main roads, as well as a good many of the subsidiary arteries of traffic. The Donegal County Council, we note with interest, has ordered two steam rollers, and the chairman has expressed his view that more will shortly be arranged for, and that the time is not very far distant when every rural community in that county will have its own steam roller. As the result of a deputation which recently waited upon the County Council of Donegal, headed by the Earl of Leitrim, it has been decided to ask the Local Government Board to allow an increase of ten per cent. for the margin of the allowance by the Local Government Act on the road expenditure in rural districts. There is no doubt that in some of the sparsely populated counties, where the registrations of motor-cars have been few indeed, something will have to be done to arouse local authorities to bring their roads into a proper state for automobile traffic. It is gratifying to notice, however, that the authorities in such a touring county as Donegal are becoming fully alive to the situation.

A Sermon on Motoring.

On the occasion of the annual cyclists' church parade at Folkestone, where the first of these gatherings was held, the vicar preached against motoring as well as in favour of cycling. True he recognised the automobile as the friend of the heavily-laden horse, and rejoiced that its coming had lessened the cruelty often practised on God's creatures. But then, what of the poor pedestrian, he who ambles aimlessly along the roadway instead of keeping to the footpath, and who never knows which way to turn until the motor is on his track? Surely the whizzing car is an annoyance to him, and it can hardly be said—according to the reverend gentleman—to be a pleasure to those who ride. On that point there is more than one opinion.

◆ ◆ ◆

Slowly near Schools.

Within a hundred yards of schools in Forfarshire notice boards are to be erected by the County Council warning motorists to proceed cautiously till about the same distance the other side of the school. This is a provision with which no user of the road will have cause for quarrel. Children going to or coming from school often congregate about the gates, a habit which no amount of parental warning is likely to eradicate in one or two generations. Hence motorists should proceed slowly when within measurable distance of schools—especially when the youngsters are about. The wise regulation of the Forfarshire Council should be followed by other authorities this side of the Tweed.

◆ ◆ ◆

A New Accumulator for Electrical Cars.

We understand that a new accumulator known as the Ekstromer is shortly to be put on the market by a London syndicate, which is also contemplating taking up the construction of electrical motor-cars. No particulars of the cell are at present available, but among the claims made for it are its low first cost, the large output in proportion to weight, and the capability to withstand sudden rapid charges and discharges at very high rates. The battery is stated to be especially adapted for motor vehicle propulsion, and in this connection it may be mentioned that an electrical victoriette fitted with a battery of 48 Ekstromer accumulators has been twice driven from London to Reading and back, each time on one charge, the mileage covered being respectively 84½ and 89 miles. Recently a more ambitious test was essayed, that of driving to Bath on one charge. The route followed was *via* Maidenhead, Reading and Marlborough, the run being successfully accomplished. The net running time for the 107 7-8 miles was 8 hours 10 min., giving an average speed of 13½ miles per hour. At the start of the trip the voltmeter showed an E.M.F. of 108 volts, and at the end 92 volts. As it is stated to be safe to run them down to 82 volts, the distance run on one charge could easily have been increased. A partial recharge was obtained at Bath, on which a return run of 101 miles was made.

◆ ◆ ◆

1 in 200.

Dr. Sophia Jex-Blake has made the interesting computation, based on the number of automobiles registered in the United Kingdom, that the proportion of motorists to the general public may be taken as something less than one in 200. Probably the proportion is less than this liberal estimate; but, even if that is so, the figures are very satisfactory in view of the fact that until 1896 motor-cars were mere illegalities—so far as practical utility was concerned—in this country. She asks if the safety of 199 persons is to be sacrificed for the pleasure of one, and then makes the astounding statement that "no one can drive an average horse without a groom who can jump to his head at a moment's notice," because of the excessive speed at which motor-cars are driven. This is an exaggeration which will be apparent to Dr. Jex-Blake should she make a little careful observation in her own county of Sussex, where the police show far more prejudice towards motor-cars than do the horses.

◆ ◆ ◆

Successful Motor-'buses.

At the last meeting of the Eastbourne Town Council, Councillor Simmons, as chairman of the electric light committee, moved the adoption of the electric light committee's report, and in doing so he referred to the motor-'bus balance-sheet in a spirit of congratulation. The committee, he explained, were endeavouring to mend their ways as rapidly as they could, but they had not yet, perhaps, quite succeeded. It was gratifying to see that there had been no loss on the working of the 'buses; in fact, he would go a little further, and say they

Digitized by Google

had made a profit. They had already allocated £350 to the sinking fund, and £137 had been paid as interest on the capital, the profit since March, deducting £25 loss, being £50. If it had been a commercial undertaking the 'buses would have paid a dividend of 5 per cent., and allowed £254 to be set apart for depreciation. He also eulogised the services of the new traffic manager, and hoped that before another season the council would have given the committee permission to order another two double-deck 'buses.

◆ ◆ ◆

In Ireland.

THE local authorities in Ireland responsible for the maintenance of the roads seem disinclined to give more than their sympathy to those associated with the movement for the development of motor traffic in the country. In the county of Antrim the Midland Railway Company are prepared to adopt the Pirrie-Iveagh scheme if the County Council will give some definite assurance that the roads shall be properly maintained after the motor-vehicles have commenced running. Unfortunately, so many members of that body are bowed down with the burden of economy that they cannot look beyond a narrow radius and see the convenience and prosperity likely to be brought into the district by the automobile movement. Perhaps, after all, they are not wholly to blame. They want to see the evidence of facts, and it is about time something tangible arose out of the Pirrie-Iveagh proposals.

◆ ◆ ◆

An Indian Motor Union.

AT a meeting held at the offices of the Bombay Motor-Car Company at Bombay it has been decided to form a Motor Union for Western India. Lieutenant-Colonel M. Collie, I.M.S., Dr. A. H. Deane, Messrs. B. H. Hewett, E. R. Smetham, F. R. Hill, and Arthur Hoare were appointed members of a provisional committee to draw up rules for the Union, the objects of which are to encourage and develop the motor and other allied industries; to supply a centre of information and advice on matters pertaining to motor vehicles; to afford to its members support in the protection and defence of their rights whenever menaced; to allow members opportunities of reading periodicals and other literature pertaining to the industry; to afford information and advice connected with the automobile movement; to watch the progress of automobilism and generally to protect and encourage the same; to cultivate reciprocal relations with kindred institutions in other places; and to organise exhibitions, competitions, and excursions—a very comprehensive programme indeed.

◆ ◆ ◆

A New Sport.

MOTOR-BOATING provides a novelty for the lover of the water who has hitherto progressed with only moderate rapidity through his favourite element. As Mr. Parker Newton remarks in a recent "Munsey's Magazine," the new thing of the sporting season of the present year is the motor-boat—the natural sequel of the automobile. The races which have lately been held prove that it is something more than a fad. Almost every yachtsman who has the money to spare wants one of the craft, and the fact that their possession need not be limited to the millionaire class has already led to their presence on many of our rivers as well as along the coast. As a Naval Power this country is naturally interested in anything likely to be serviceable on the water, and not only naval authorities, but shipping authorities as well, are watching the progress of the motor-boat. It should also prove adaptable to the purposes of the lifeboat and the coastguard services.

◆ ◆ ◆

The Visit of the Institute of Journalists to the Hozier Engineering Company's Works on a Fleet of Argyll Cars. (*See page* 586.)

ON the 24th inst. an ascent of two balloons is being arranged by the Aero Club from the grounds of Pitmaston Moor Green, Birmingham, the residence of Mr. J. A. Holder.

A SCORE of motor-vans and many more motor-cars are playing a useful part in the army manœuvres in Essex, while "Napier Minor" travelled from Southampton to Brightlingsea, a distance of about 200 miles, in 12 hours 45 minutes at the call of the War Office.

SINCE the exhibit of the Hercules steam motor waggon at the Agricultural Hall, in March last, the makers have received so many enquiries from the London district that they have opened a showroom at 117, Long Acre, W.C., where a 5-ton wagon of the latest type, fitted with patent compensating axle, also with Rowcliffes and Perkins' "Samsonia" wheels, is exhibited, and an expert is in attendance to explain the advantages of the system. Amongst the claims made for the Hercules wagons, special attention is called to the adaptation of the road wheels to travel over uneven ground. The front compensating axle is arranged in a manner to permit of a considerable amount of oscillation being given to the front axle when travelling over rough ground, without affecting the level of the platform body; at the same time the wheels maintain the same vertical position in relation to the road, so that the wheel always offers a flat face to the road.

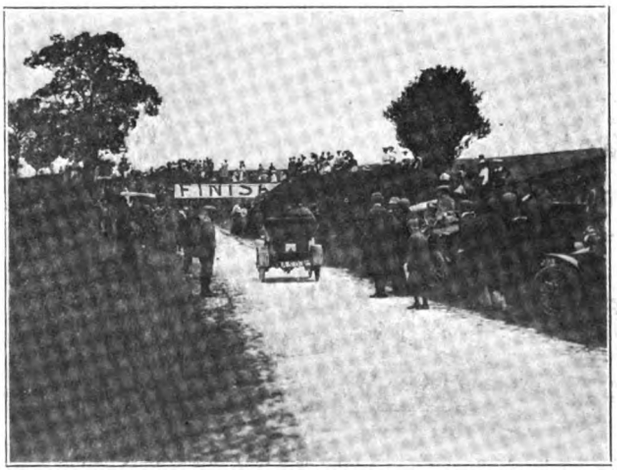
The Small Car Trials.

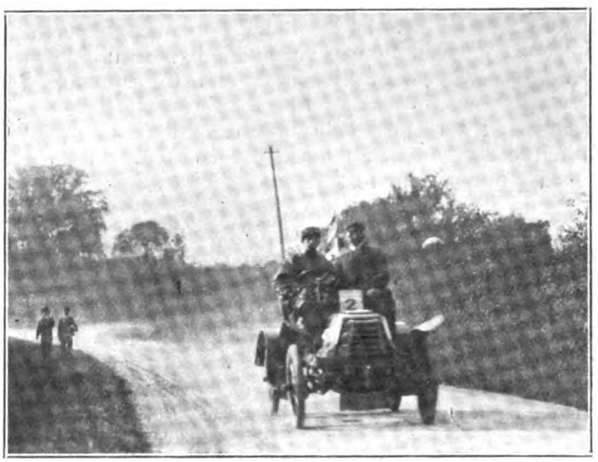


LAST week's *Journal* chronicled the runs which had taken place from Hereford in the first part of the week, and we were also able to include therein our Special Correspondent's report of the first run on the Wednesday. The trip in the afternoon was even more miserable than in the morning the threatened rain falling for two hours, with the result that very few people watched the hill-climb on the north side of Dinmore. Considerable excitement was infused into the climb by a herd of cattle getting mixed up with the competitors. The farmers also took the opportunity to break their horses into getting used to the cars. Later in the evening the weather cleared up.

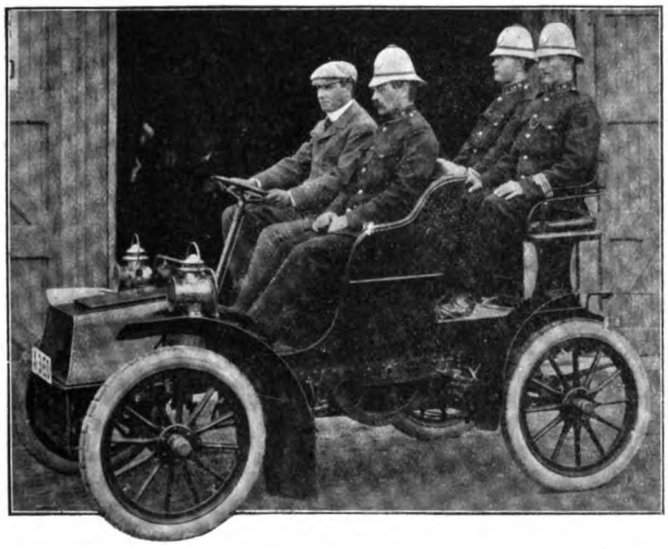
On the Wednesday two non-stop runs were made by the Vauxhall, the two Wolseleys, the two Humberettes, the two Alldays, the Siddeley, the two De Dions, the Mobile, and the Croxted. Ignition troubles worried the Jackson and the Horley, while the Speedwell, having made a non-stop run in the morning, stopped on the hill near the Chase Inn in the afternoon. The Service car stopped on some of the hills, and the Pelham dropped a passenger on the hill near the Chase Inn on the second trip. The 8-h.p. Brown found a stiffish hill near Bromyard, and the 7-h.p. Clyde also discovered it to be difficult to negotiate. The Royal Enfield had to retire in the afternoon owing to a broken oil pipe for the cylinder lubrication, while tyre troubles overtook the Anglian later in the day. The Prosper Lambert had a broken inlet valve, and, in the afternoon, the Little Star ran short of petrol.

THURSDAY'S RUN TO LEDBURY.

Thirty cars remained on this day to proceed on the trials, the route of which was from Hereford *via* Tarrington to Ledbury, thence to Long Green, and back to Ledbury and Hereford by way of Eastnor. The rain of the day before rendered the air pure, the sky clear, and the roads free from dust—it was a day of long enchanting views. There were no formidable gradients on the roads, but a few nasty corners had to be negotiated, and in one place—between Eastnor and Long Green—it was not exactly macadam. A pretty scene presented itself at Stoke Edith, near Tarrington, where a cricket match was being played in front of Stoke Edith House, the mansion of Mr. Paul Foley. Along the roads the cottagers were lined; some, with every generous intention, threw apples and plums into the cars, a most dangerous practice, in which there were some narrow escapes from a nasty hit. To be struck with their generosity was not a metaphor for once. The Malverns, chased across by light and shadow, were in sight all day. From Ledbury the road wound in and out through a land of orchards laden with apples rosy red as the cheeks of the excited children



The Climbing Test on Frome's Hill.



Testing the Hand Brakes at Bishop's Frome.

The 6-h.p. Speedwell, Winner of the Award in Class A on its last Run.

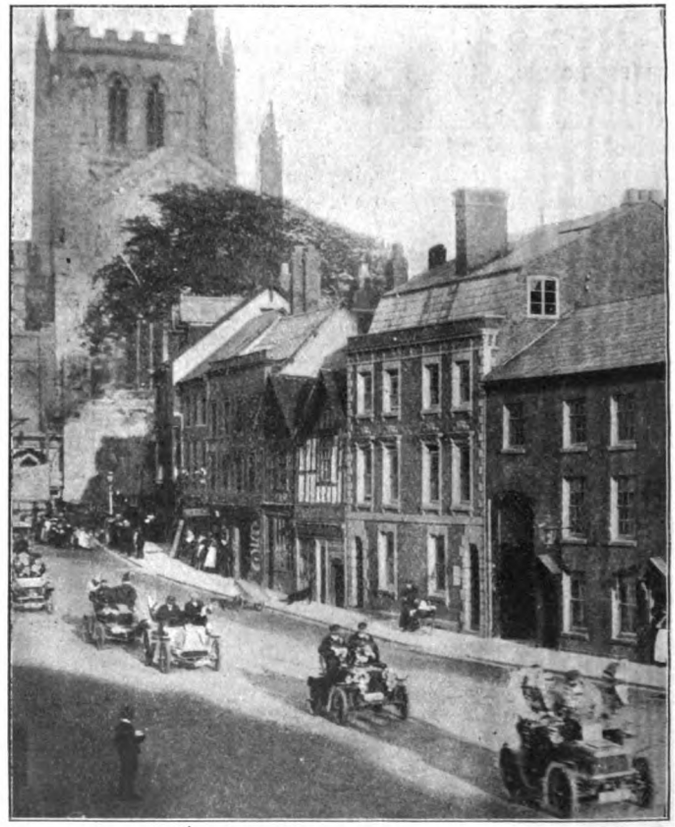
Digitized by Google

who lined the village streets. At all the schools the children were let out to see the cars pass by. Even the partridges were forsaken for a day. From Long Green we swung towards Eastnor by a winding rising road from which we looked back over the vast Severn Valley, away into the heart of the Midlands Here lay all that was typically English. Leaving this behind, we ran beneath the Malverns into Ledbury, passing on our way the truly grand residence of Lady

Members of the Hereford Constabulary enjoying a Spin on a Cadillac Car.

Henry Somerset—Eastnor Castle—a many-towered and turreted pile amidst arcadian scenery. The second journey was very dusty. We were seated in a three-seated Alldays car, which ran beautifully without a stop throughout the whole day.

Thursday saw the following among the non-stoppers:—One Jackson, 6-h.p. Speedwell, two Wolseleys, two Mobiles, Brown, Star, two Humberettes, two Alldays, Siddeley, two De Dions, Croxted and Prosper Lambert. On the first outward journey to Ledbury the Horley retired owing to the breakage of its exhaust valve flange, while the Vauxhall car had the misfortune to break its connecting rod. The Service was delayed by punctures. A broken petrol pipe delayed the Pelham seven minutes. The air rod fouling caused the 8-h.p. Horley a delay of forty-five seconds in the morning, while dirt in the carburettor was a source of annoyance to the driver of the 9-h.p. Speedwell. In the afternoon the 7-h.p. Clyde had a stop of nine minutes to replace the key in the inlet valve. The 9-h.p. Oldsmobile had trouble with the exhaust valve on the second journey, and the sticking of the inlet valves spoilt the record of the Swift for the day. A screw tap being lost on the Little Star caused a loss of 3½ minutes, while the list of misfortunes was completed by the Anglian's stoppage of one hour forty minutes in consequence of tyre troubles.



In the evening a smoking concert was held at the Green Dragon Hotel, when the Canine Society was appropriately inaugurated. Miss Levitt's black Pomeranian dog had become so popular that several of the drivers bought toy dogs and decorated their cars therewith. At the concert several had china dogs on their coat lapels. The joke was crowned when Miss Levitt sent a parcel of dog biscuits as a sweet morsel for the delight of her friends attending the concert.

In South Hereford.

The venue for the Friday's run was partly in South Herefordshire, an entirely new district of the county for the visitors and one which they regretted they had not seen before. We obtained a seat in the well-knit "Mobile" which took us to Ludlow so well on Monday. There were indications of rain, grey squadrons of storm cloud skirting the horizon, but none fell during the day; instead, the roads were exceptionally dusty. After four miles along the flat we ascended the Callow pitch, a steady incline of one mile, which upon being covered revealed a valley of enormous size and of charming loveliness. The eye traversed down undulating slopes into the softly swelling middle distance and onward to the abrupt barriers of the Black Mountains. Immediately in front was seen the smoke of Bryngwyn, the handsome mansion of Sir James Rankin, M.P. The town of Ross and the neighbourhood called for enthusiastic comment, the winding roads, the clustered elms, the occasional glimpses of vales, and the woods all created an ineffaceable impression. The country between Ross and Ledbury was pregnant with beauty, and, although the roads were circuitous in the extreme, their loveliness more than rewarded us. Much Marcle Hill, which we passed on the right, was the scene (chronicled by Leland) of a landslip which lasted for many days, carrying away both houses and trees in its course. Only recently there was a similar slip here, but of no great magnitude. From Ledbury the route was the same as on the previous day.

On Bishop's Frome an unexpected brake test was held, the gradient of the stretch of road whereon it was held being 1 in 7·8. The vehicles were first called to a standstill, and then ordered to run backwards, the brakes being applied separately. The intention was to test the capacity of each for holding the vehicle, and the way in which the cars stood the test revealed the good brakes with which they had been provided by the makers. Later in the day, on Ayleston Hill, on the outskirts of the city, another trial took place, the brakes having to be applied as the vehicles were moving forward.

The "smoker" of Thursday night, which was so immensely enjoyed, was followed by another on Friday evening at the

Photos by] The Final Procession into Hereford. [*Argent Archer.*

Mitre Hotel, when the Mayor of Hereford presided, supported by a large number of prominent citizens. Again there was the same interchange of expressions of pleasure both from the visitors and the visited. Mr. Joy, in response to the toast of his health, alluded to the great assistance which had been

Digitized by Google

rendered him on all hands, and especially from the police. Motorists' opinions of the Herefordshire police are that they are paragons of politeness.

The Trip to Kington.

It was a morning of *lapis lazuli* sky, arched over on huge precipices of cumulous cloud more like than not the marble heights of Carrara. The climax of beauty was reached in the route we took. Put prosily, we went to Kington *via* Yazor and Lyonshall on to Walton and returning *via* Knill and Titley to Kington and Hereford, but one felt it was an excursion into Arcady. Up and down, and in and out, through tunnels of green along tessellated roads of gold and purple—shadow and sun—past gardens of hollyhocks, anemones and stocks, by rectory gardens aflame, and over hilltops from which, in contrast, could be seen the blue hills of the songland of Wales—borderland and fairyland. At Credehill we passed some ancient camps named after Creda, first king of the Mercians. A little further on a view of the Brinsop Hills was obtained, which we might almost claim as Wordsworth country, for here he used frequently to come. At Brinsop Court can be seen a cedar of Lebanon said to have been planted by Wordsworth and Southey. In the Sarnesfield churchyard, which we left behind, lie the remains of John Abel, the architect of most of the ancient town halls and stately manor houses in the county. Away over the Wye, on the left, we could see the Moccas Woods, where lies Owen Glendower, the rebel chief and raider. The name strikes no terror now. Near Sarnesfield we met with a free lance Humber car in trouble. In passing another car, the left front wheel struck a huge stone in the grass, breaking both front wheels. Mr. Letts, of Messrs. Jarrott and Letts, kindly took up a couple of stranded pressmen, and with this load we continued the journey. The over-weighted car behaved splendidly. Lyonshall and Kington are two large villages, ancient and forgotten. Kington, however, can boast a railway station, which came in very handy for some unfortunate pressmen who were on a stranded Rex. About four hundred years ago Kington was not a part of Herefordshire, but was in the Welsh kingdom of Powys. In the afternoon we made the same journey. We had the offer of a seat in the Mobile, a car which was a favourite with all the pressmen.

Three of the Competing Cars—The 8-h.p. Rover, the 7-h.p. Clyde, and the 8-h.p. Prosper Lambert.

A Familiar Scene in High Town, Hereford, during the Week of the Trials.

On the return journey a surprise was sprung on many of us. At the last moment it had been decided to have a procession through Hereford, and for this purpose the cars were stopped a mile out of town. A band in a brake came up and headed the line of beflagged cars.

Miss Dorothy Levitt did not arrive in town to take part in the procession, and the long time which elapsed before she came in caused some consternation. Everyone was genuinely sorry, that, after such a record, her car should break down and cause her to lose the non-stop award. The needle valve of the carburettor of the De Dion she was driving got loose and cut

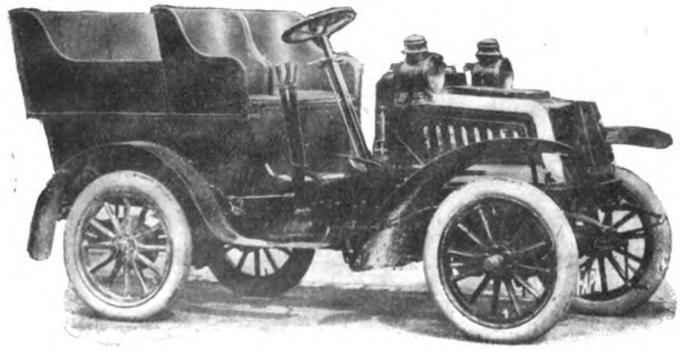
Digitized by Google

off the supply of petrol. Miss Levitt, who had had to prepare her car herself for each daily run, at once commenced to look for the cause of the trouble, but unfortunately it took thrice the allotted official time to locate, and disqualified the vehicle for the non-stop run. When she did arrive she was hailed with cheers and her car was stopped outside the City Arms Hotel, where

The 6½-h.p. Service Car. (*See page* 539, August 27th issue.)

she was made the recipient of a handsome bouquet of roses and lilies from a number of chauffeurs who "admired her sportswomanlike qualities."

Some of the free lance cars were elaborately adorned with flowers, a noticeable one being the Oldsmobile. With the band in full swing, the procession, which was quite half a mile long, went round Hereford. The streets were crowded. As we passed up King Street to the Drill Hall, the sunlight broke over the housetops and fell in a golden mist upon the bright cars, lending a glory to the whole cavalcade. It was the glory of a glorious week, which the visitors and the people in the old cathedral city will ever remember as one of the happiest ever spent.



The judges have recommended the following non-stop awards:—

CLASS A.

First award: The 6-h.p. Speedwell, No. 2 (7 non-stop runs).
No second award.

CLASS B.

No car eligible for the non-stop award.

The 8-h.p. Horley Four-seated Car.

CLASS C.

First award: the 6-h.p. Siddeley, No. 18 (12 non-stop runs).
Second award: the Wolseley team, Nos. 20 and 10 (12 and 11 non-stop runs respectively).
Third award: the 6½-h.p. Humberette, No. 16 (11 non-stop runs).
Fourth award: the Alldays light car, No. 17, 1 of team (9½ non-stop runs).
Fifth award: the 7-h.p. Little Star, No. 15, 1 of team (9 non-stop runs).
Sixth award: the 6-h.p. Mobile, No. 11 (8 non-stop runs.)
Seventh award: the 9-h.p. Speedwell, No. 13 (6 non-stop runs).
Eighth award: the 8 h.p. Brown, No. 12 (5 non-stop runs).

CLASS D.

First award: The 8-10-h.p. Croxted, No. 30 (12 non-stop runs).
Second award: The 7½-h.p. Humberette, No. 34 (11 non-stop runs).
Third award: The Alldays Light Car, No. 32, 1 of team (9½ non-stop runs).
Fourth award: 7-h.p. Little Star, No. 38, 1 of team (9 non stop runs).
Fifth award: The 8-h.p. Mobile, No. 24 (7 non-stop runs).
Sixth award: The 9-h.p. Anglian Light Car, No. 31 (5 non-stop runs).

The following cars which completed the whole of the distance, though ineligible for the non-stop awards, are reported by the judges as worthy of special mention:—

Very highly commended.—The team of 6-h.p. De Dion cars, Class D., No. 22 (12 non-stop runs), and No. 23 (11 non-stop runs).
Highly commended.—The single-cylinder Swift, Class C., No. 14 (10 non-stop runs), and the 7-h.p. Swift, Class D, No. 26 (10 non-stop runs).

Announcements with regard to the Gold, Silver, and Bronze medals will not, we learn from an official source, be made till next week.

THE HILL CLIMBS.

GENERAL BOOTH concluded his 1,500 miles motor missionary tour at Aberdeen on Tuesday.

Digitized by Google

A PETROL CAR WITHOUT A CHANGE-SPEED GEAR.

MANY minds are at work with the view of producing a petrol car in which the use of a change-speed gear will be rendered unnecessary. With the adoption of the multi-cylinder engine and the increased range of motor speeds obtainable by the use of automatic carburettors, there are now many cars on the market in which the bulk of the driving is done on the top, direct, gear, a low gear being only required for starting and for use on very steep hills. To do away altogether with the gear-box is, however, the great object of petrol car designers, and the news that a car with no gear-box already exists will no doubt be received with surprise and interest. It is in Brussels that the novel vehicle has seen the light, but so far M. R. Goldschmidt, its designer, has allowed few if any details to leak out. We are able to state, however, that the car he has built is fitted with a four-cylinder engine of from 40-h.p. to 50-h.p., which is stated to be so flexible that it is possible to run the car at any speed from zero to maximum, without using a change speed gear of any kind. From the information available, the idea seems to be a development of the Chenard-Walcker system of varying, not the lift, which is always the maximum, but the time the inlet valves are kept open. One of the most interesting features of the vehicle is that by a special arrangement of cams it is possible to reverse the direction of rotation of the engine when it is necessary to

Plan of Petrol Car with no Gear Case.
[*La Vie Automobile.*

drive the car backwards, so that the vehicle has neither a change speed nor reverse gear of the type usually found on petrol cars. We hope to give further details of this interesting departure as soon as the work of taking out the various patents has been completed.

PRINCE JOACHIM ALBRECHT of Prussia will follow the forthcoming autumn manœuvres in Germany in a motor-car.

FROM two roads in Scotland motor-cars have been prohibited by order of the Secretary of State, viz., the road from Monachylemore to Inverlochlaig, and that from Gartchonzie Road-end to Trossachs Pier, Loch Katrine.

FROM Patcho, Ltd., Bradford, comes a sample of the Patcho vulcanising fluid they have lately introduced for fixing patches on the inner tubes of motor tyres. It is claimed for the preparation, which is easily applied, that there is no possibility of a patch fixed by it coming off.

IT appears that the recent "hold up" of motorists at Boston, U.S.A., to see if they were complying with all the provisions of the Massachusetts Act relating to motor-cars, is to be repeated periodically. It is proposed, in addition to inspecting the automobiles not yet examined by the police, to see to what extent those already recorded have remedied the defects the police discovered.

CONTINENTAL NOTES.

Public Services in Germany.

A small company is in course of formation at Northeim to start a public service of motor vehicles between that town and Echte. Arrangements have also been completed for a service of motor-'buses between Grosszschocher, Eythra, Zwenkau, and Gautzsch, near Leipzig.

◆ ◆ ◆

An Austrian Automobile Testing Laboratory.

As mentioned in this column recently, the Austrian Automobile Club intends to establish a somewhat similar institution to the "Laboratoire d'Essais" of the Automobile Club de France, only on a broader basis, in order to more thoroughly further automobilism throughout the Austrian Empire. It is proposed that the institute shall not only be fitted out with all the plant necessary for testing motors, etc., but also for brake, tyres, chain and gear trials. Experiments and demonstrations of different types and constructions of cars are also to be a feature.

◆ ◆ ◆

Motor-Boats.

As with motor-cars, the horse-power of motor-boats is advancing rapidly. Last year vessels with 40 to 60-h.p. were considered monsters. In this year's races boats with motors of a capacity of as high as 100-h.p. have taken part, while now it is reported that several of the French makers are preparing boats of 200-h.p. for the 1905 racing season.

◆ ◆ ◆

Hill-Climbing in Belgium.

Under the auspices of the Automobile Club of Namur and Luxembourg, a hill-climbing competition was held last week over a 2·8 kilometre course on the Citadelle hill at Namur. The average gradient is given as six per cent. The best time of the day was made by M. Miesse on a Baudouin car, time 3 min. 15 3-5 sec., he being first in the general classification and the winner of the under £600 category. The motor-bicycle class was won by M. Marnette on a Sarolea in 3 min. 44 4-5 sec.; the under £240 section by M. Fischer on a Vivinus in 4 min. 3 1-5 sec.; the under £400 class by M. Oppermann on a Malevez-Michotte in 4 min. 22 4-5 sec., and the under £800 class by M. de Lamine on a Rochet-Schneider in 3 min. 26 2-5 sec.

◆ ◆ ◆

The Speed of Motor-Boats.

Evidence of the growing popularity of motor-boating is seen in the fact that a member of the Conseil General of the Nord Department of France considers it time that legislation was enacted restricting the speed of motor-boats, and is bringing forward a resolution to that effect.

◆ ◆ ◆

Motor Vehicles in the German Military Manœuvres.

An extensive test of motor vehicles is to be made in the German autumn military manœuvres, which are to take place in the Homburg district. It is stated that no less than twenty-two fast cars and thirty-four motor-cycles will participate in the operations.

◆ ◆ ◆

Motor-Boat Racing in Switzerland.

Considerable interest is being shown in the motor-boat races which are to be held on Lake Lucerne on the 10th and 12th inst. The first day is to be devoted to cruisers and the second to racers. For the latter a number of well-known boats have been entered, including the Georges Richard "Trefle-a-Quatre," "Mercedes IV.," "Hotchkiss," "La Rapée III.," and "Berliet IV."

◆ ◆ ◆

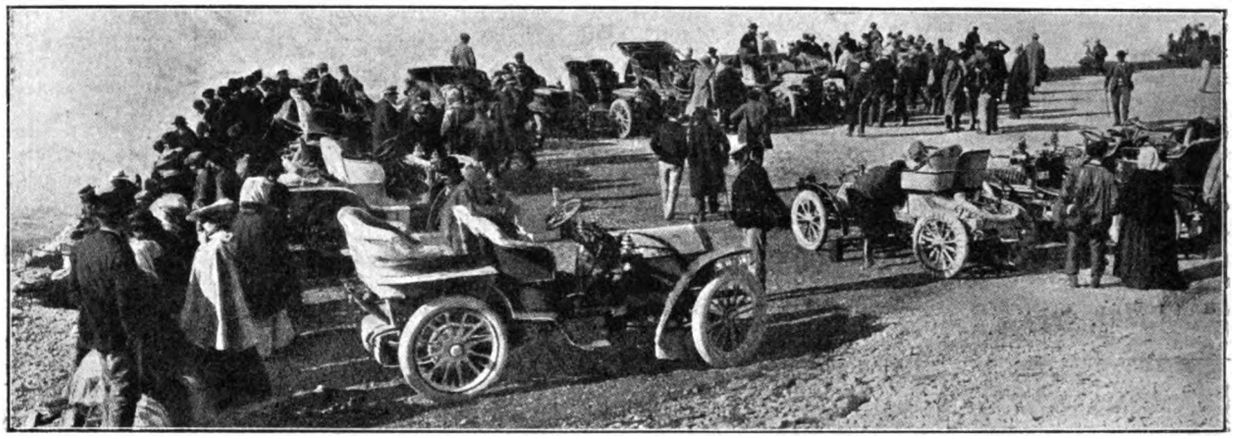
Motor-Cars for Military Purposes.

Some successful experiments in the mobilisation of automobiles in case of war have just been made at Brescia by the Italian military authorities in conjunction with the Italian Automobile Club. Thirty private motorists took part in the event, they being given the task of conveying messages from one imaginary military camp to another, and discharged it

Digitized by Google

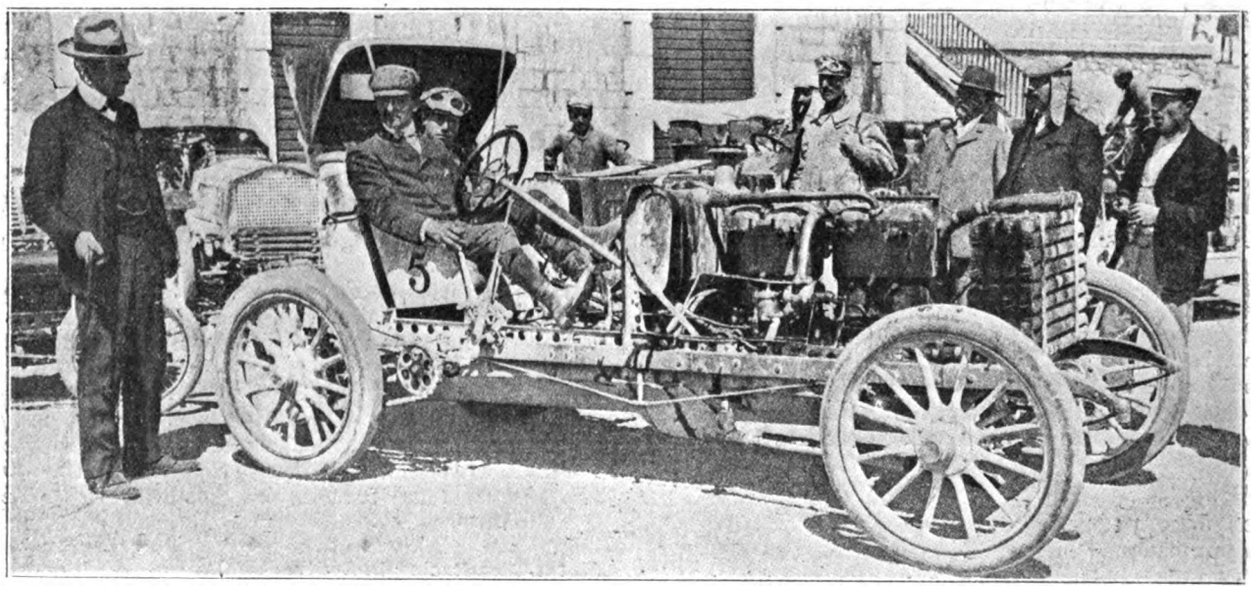
with the utmost dispatch. The distance to be covered was between 400 and 500 kilometres. There was only one accident, a car being damaged by a collision with a telegraph post. Several cars conveyed provisions, and two carried guns. As a result of the experiments it is conjectured that the Italian Minister of War will henceforth attach the same importance to motor-cars as to railways in the matter of transport.

◆ ◆ ◆



The Brescia Circuit.

In connection with a cycle and motor exhibition at Brescia, Italy, a 370 kilometre race was held on Sunday last, on an 185 kilometre circuit between Brescia, Verona, and Peschiera, and back again to Brescia, the course having to be covered twice. the second position, Lancia being declared the winner in 3 h. 12 min. 56 sec. Florio was third and Duray fourth. The light car section was won by Hemery in 3 h. 34 min. 27 sec., Raggio's time being 50 min. longer.



◆ ◆ ◆

Motor-Boat Racing at Monaco.

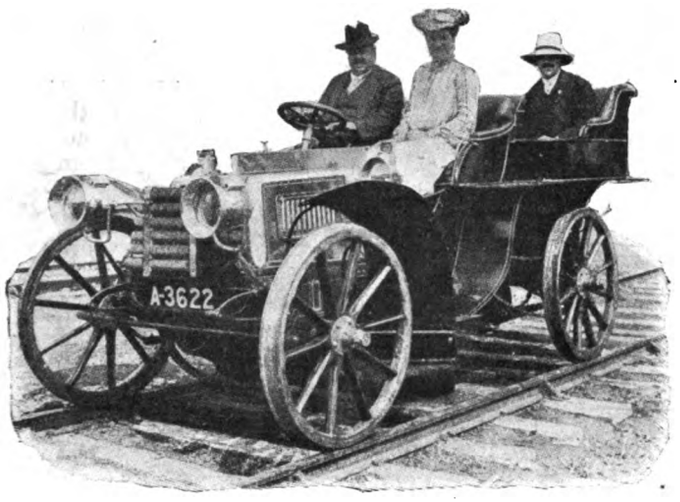
The Monaco motor-boat race meeting, which proved so successful in April last, is to be repeated next year on a much larger scale. The meeting will extend from the 2nd to the 16th April. For the first four days the boats will be placed on exhibition, after which three days will be devoted to preliminary trials. The racing proper will commence on the 9th April and will continue daily for a week.

The Scene at the Summit.

Rougier on his Turcat-Mery, which made the Fastest Time.

THE VENTOUX HILL CLIMB.

The start was made at 5.30 a.m., the competitors in the heavy car section being Lancia (75-h.p. Fiat), Duray (80 h.p. Darracq), Teste (100-h.p. Panhard), Florio (60-h.p. Mercedes), Nazari (70-h.p. Panhard), and Cagno (75-h.p. Fiat). In the light car section only three started—Hemery on a 50-h.p. Darracq, and Raggio and Parodi, each on 24-h.p. Cieranos. In the first round Cagno fell into a canal at one of the turns, and, although unhurt, had to retire. Nazari and Parodi also gave up. The best time was made by Teste on the 100-h.p. Panhard, but a protest was lodged that he had broken the rules by filling up his petrol tank in one of the neutralisations. For this the judges decided to add 3 min. to his time, placing him in



The International Motor-Bicycle Race.

Challenges for the international motor-bicycle race, to be held by the Moto-Cycle Club de France on the 25th inst., have been received from Germany, England, Austria, and Denmark. There will thus be, with the French team, fifteen competitors on the road. Fifteen entries have been received for the eliminating contest for the French team, which is to be held on the 13th inst., these including three Buchets, three Peugeots, three Griffons, three Lamaudières, an Arglon, a Rigal and a Mayeski. The race is to be held over a 54 kilometre circuit in the Dourdan district, the course having to be covered five times, making a total distance of 270 kilometres (about 170 miles).

Digitized by Google

HERE AND THERE.

It seems strange to British motorists to learn that Mr. C. J. Glidden, of Boston, U.S.A., who is engaged in a tour of the world by motor-car, is to be allowed to use the railway tracks instead of the ordinary roads in America. In fact, three transcontinental railroads offered him the use of their rails for his ride to the Pacific on condition that he followed train orders and carried a conductor and an engine driver, so as to comply with the rules. He originally selected a route *via* Texas to California, but later changed it to the northern route *via* the Canadian line. West of Winnipeg he will cross the great Canadian prairies and

will enter the Rocky Mountains *via* Kicking Horse Pass. The total distance of the rail route will be upwards of two thousand miles. The car—a Napier—will be driven only during the day, and will be run on to sidings at nightfall to enable the passengers to rest in hotels. According to the proposed schedule, an average speed of about thirty miles an hour will be maintained on the route. Before the start is made, special forgings will be fitted to the steering gear to keep the wheels pointing rigidly ahead, and only the control of the car will occupy the driver's attention, no steering being necessary. The accompanying illustration shows the vehicle fitted with a set of wood wheels with steel flanged tyres. The felloes are made in halves and the steel tyres are fastened to them with countersunk screws from the outside.

Sir F. R. Wingate, the Sirdar of the Soudan, intends to take a motor-car with him on returning to Egypt.

Count Khevenhuller, Austrian-Hungarian Ambassador in Paris, has lately acquired a 16-h.p. De Dietrich car.

The records in the automobile licence department of the New Jersey Secretary of State's office show that 6,997 vehicles have been licensed under the automobile law of the State.

A new "Guide to London" has been issued by Messrs. Keliher and Co., which, with its route maps, will have some value to provincial motorists visiting the metropolis for the first time.

Mr. A. F. King, for some time manager of the fitting and repairs department of Messrs. De Dion-Bouton, Limited, has taken over the management of the Lancaster Motor Garage at Lancaster Gate, W.

One of the latest accessories to be put on the market by Messrs. Alfred Dunhill is a novel petrol gauge which shows at a glance the exact quantity of petrol contained in the tank. The device is being made for both motor-cars and cycles.

Mr. Thomas Shaw, of Dundee, who recently secured the Glasgow to London, Edinburgh and Inverness non-stop records, used a 15-h.p. car fitted with Palmer Cord touring tyres. Throughout 3,000 miles he only suffered one puncture, this being caused by a horseshoe nail.

In reference to the paragraph in a recent issue of the *Journal* regarding the "All's Well" lubricating oil for petrol motors, the Bowring Petroleum Company, Limited, ask us to mention that they also manufacture various grades of oils for the lubrication of steam and electric motors.

United Motor Industries, Limited, have been appointed sole selling agents for Werner motor-cycle parts, fittings, and accessories generally. They have also taken over the repair department of Werner Motors, Limited, and have a well-fitted workshop with a staff of men thoroughly familiar with all the different types of Werner machines.

Long Beach, one of California's seaside resorts, is very careful of its asphalt pavements. To further protect them it has decreed that "no horse, vehicle, automobile, or motor-cycle shall remain standing for more than fifteen minutes" on any street so paved. It is explained that the provision was made necessary by "the rotting of the pavements, due to oil drippings from the machines."

Messrs. Jarrold and Sons have issued a series of road maps of East Anglia which should be most useful to motorists on tour in that district. Norfolk, Suffolk, Essex, and Cambridge are the counties included in the series; while the Lowestoft and Cromer localities have separate maps devoted to their main roads. The same firm have also issued street maps of Norwich, Lowestoft, Cambridge, and Yarmouth.

The Auto-Lubrine Company, of Fairfield, Manchester, whose motor lubricating oils are already well known, have just brought out a new preparation known as "Blanchine" for removing grease, etc. While it is stated to be invaluable to motorists by reason of the fact that it instantly cleans the most soiled hands, it is also useful for cleaning metals and machinery, removing tarnish, rust, dirt and stains in short order.

Mr. C. Friswell has just returned from a motor-car tour through France and Switzerland, over the Alps and passing through Neuchatel, Interlaken, Lucerne, Zug, Zurich, Berne and Belfort, including the Brunic Pass and Les Verrieres de Joux, which are two of the steepest mountains in Switzerland where there is a road at all. He spent two or three days at the Peugeot works in Audincourt, Valentigny and Beaulieu, from there to Lille, where he spent another two days, and then on to London. The tour was done on the new 18-24-h.p. Peugeot, and during the time the machine was in use Mr. Friswell never put a spanner on it, nor was he stopped on the way for any cause whatever.

Messrs. Moss and Woodd have sent us the accompanying illustration, showing one of their Orion motor vehicles which has been running for Messrs. Maple and Company for the past four weeks. They also send us a statement of the work done by the

car, which shows that it has been used daily, with the exception of Sundays, the runs extending to Cambridge, Southampton, over the Hog's Back, Clacton, and many other places. On the 22nd ult. the vehicle was subjected to a test on Netherhall Gardens, N.W., up which it successfully carried a load of two tons.

Mr. E. M. Goldburgh, of Forest Gate, E., has sent us particulars of a novel form of sparking plug he has lately devised. As will be seen from the illustrations, the central insulating core of the plug is formed with suitable passages to contain two conducting wires, which protrude at the lower end of the plug and form sparking points for the explosions. The return wire passes through the side of the core near the upper end thereof, and there forms an external

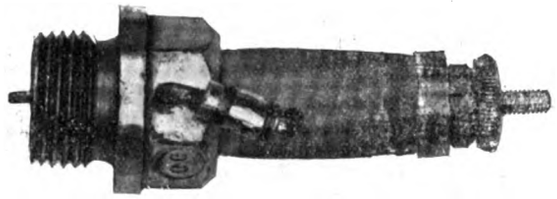

Fig. 1.—General View of Plug.

Fig. 2.—View showing Position of Wires in Self-Testing Plug.

sparking gap in conjunction with a short pointed wire secured to the metal shell of the plug. The external sparking gap is protected by a transparent casing. The special advantage of this device is that it allows the working of the plug to be ascertained without detachment. A further useful improvement introduced by Mr. Goldburgh is a sparking plug and terminal protector with a view to obviating short circuiting at the connection or binding rod owing to the presence of a conducting liquid, such as water or oil. The metal cap or shoulder is replaced by, or covered with, an insulating material in such a manner as to allow only the short binding screw to project to receive the eye or loop of the conducting wire. This nut consists of insulating material, and may advantageously be closed at its outer end.

The "Albert Brown" Motor-Cycle Trophy to be competed for to-day (Saturday).

We understand that the Dunlop-master patent expires on Friday next.

The members of the Institute of Journalists, who met last week in congress at Glasgow, had a trip from their headquarters at the Grand Hotel to the works of the Hozier Engineering Company, Limited, at Bridgeton. The cars shown in the photograph reproduced on page 578 are all "Argylls" lent for the occasion by owners in Glasgow and the West of Scotland.

MOTOR CYCLING NEWS.

—♦—

Those motor-cyclists who linger by the roadside on the occasion of the Auto-Cycle Club's run from London to Exeter on the 15th and 16th inst. will find a heavy bill awaiting their arrival in the Devonshire city. Among the new rules to be enforced is one providing that any competitor reported as having been seen stationary by the roadside will be fined 1s. for each stoppage, and the last three arrivals will be fined 5s. each. These fines, in addition to the amount already voted for the prize fund, will enable the club to present suitable mementoes of the trial to those who succeed in making a non-stop run.

♦ ♦ ♦

In the motor-cycle trials reported last week, the only M.M.C. motor in the trials was fitted to the 3½-h.p. King, which gained a first-class certificate and silver medal.

♦ ♦ ♦

The final run for the 200 miles non-stop trial of the Motor-Cycle Union of Ireland has been held, the course, as on the first occasion, being from Dublin to Waterford and back. Five members started, namely, T. W. Murphy, F. A. Wallen, H. T. Harman, of Birmingham, G. Mayne, and W. J. Thompson, of Mallow. A variety of misfortunes occurred to all the competitors with the

Mr T. W. Murphy and his 3-h.p. Singer Motor-Bicycle.
Photo by [*Lafayette.*

exception of T. W. Murphy, who, on a 3-h.p. Singer motor-bicycle, succeeded in making a non-stop run well within the limits of time laid down by the conditions of the competition, and consequently he holds the cup for one year, and also wins the gold medal.

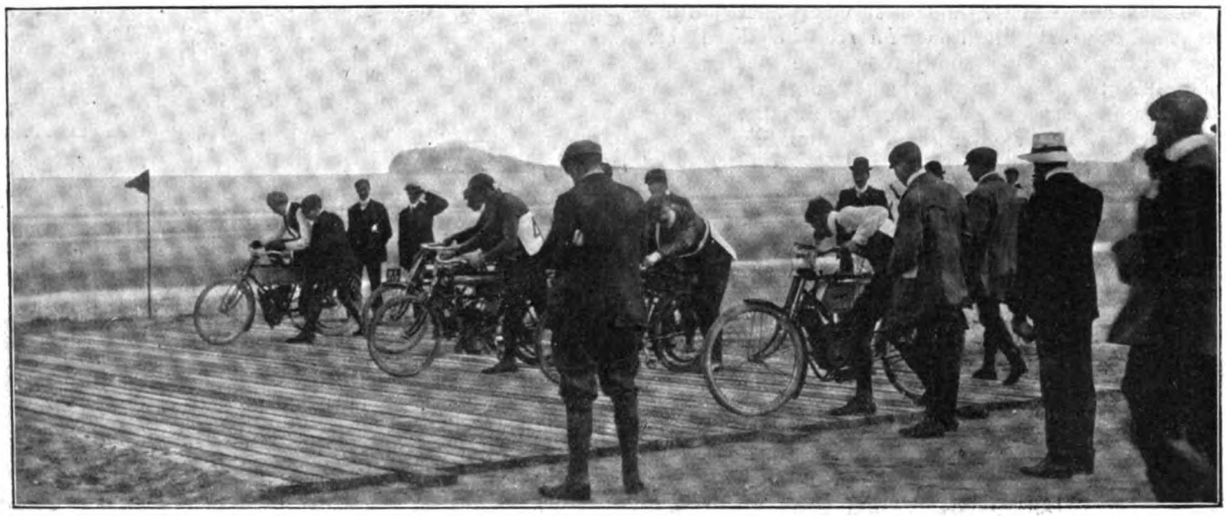
♦ ♦ ♦

The committee of the Auto-Cycle Club has entered the following machines and riders to represent England in the international cup race for motor-cycles which takes place in the department of the Seine-et-Oise, on the 25th inst.:—J.A.P., W. Hodgkinson; Lagonda, H. P. Harding; Quadrant, T. Silver.

♦ ♦ ♦

The motor-bicycle relay ride from Stuttgart to Kiel which is being organised by the German Motor Cyclists' Union is to take place on the 19th and 20th inst. The total distance is about 480 miles, and this is to be divided into eight sections of, roundly, sixty miles each. Only machines up to 3-h.p. are to be allowed to take part in the event.

♦ ♦ ♦



On the 29th ult. Mr. R. Blakoe, of Penrith, made a good performance on a 2½-h.p. motor-bicycle. Starting at 5.58 a.m. to ride to Edinburgh and back within twelve hours, he reached the capital at 10.56 a.m., left at 11.15 a.m., and arrived in Penrith at 4.37 p.m., having completed the 240 miles in 10 hours 39 minutes.

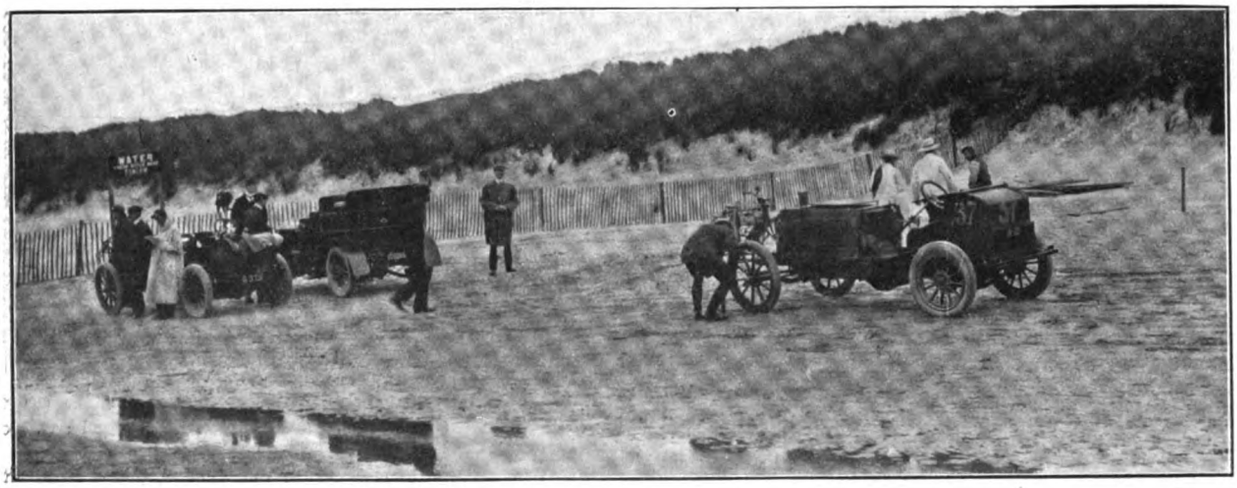
THE MOTOR RACES AT PORTMARNOCK.

BY a happy inspiration which prompted the committee of the Irish Automobile Club they selected the Velvet Strand at Portmarnock for the inauguration of the two days' motor festival. It was felt at the close of the Gordon Bennett event last year that a more sustained interest in automobilism would be the better ensured by the promotion of a series of diversified speed contests, in which a number of cars of varying power and characteristic features would be the competitors. To this end the Phœnix Park, and later on the Castlewellan (co. Down) and the Cork trials were arranged. The success of these events has proved the forerunner of several others since arranged in other parts of the United Kingdom. It came then to be considered what steps were to be taken to preserve Dublin's interest and reputation for sport promotion. The Motor-Cycle Union of Ireland had ventured to select the Portmarnock Strand for a speed trial, and the result proved satisfactory and encouraging. The committee of the Irish Automobile Club noted the result, and though at the time negotiations were in progress for a repetition of the Phœnix Park success of last year, it was felt that Portmarnock would be the trump card if these failed. Unfortunately in some respects this proved to be the case, for difficulties which proved insurmountable were propounded, and the proposed events fell through. The choice of Portmarnock has proved an excellent one, but it should not be overlooked that much has been due to the kindness of the owner of the foreshore, Mr. J. Jameson, who in a sportsmanlike manner facilitated the arrangements to the utmost.

Favoured by good weather and cheered by a crowd computed at about 10,000 persons, the events were followed with interest throughout Tuesday. A shower which fell during the afternoon did not militate against the running, and it was interesting to note that the strand seemed none the worse for the wetting. In an interval between the racing-car events and the running in Class H the Hon. C. Rolls, whose 100-h.p. Mors car did not show to advantage in its heat, made an independent time test, and succeeded in covering the mile in 59 4-5th sec. This excellent time will serve to show that the course was not a markedly slow one, though it must be added that sand racing must be essentially slower than the going on a harder track would be. Towards the close of the day it began to show signs of increasing moisture, but this may be attributed to the effect of the incoming tide.

The Start of one of the Motor-Bicycle Heats.



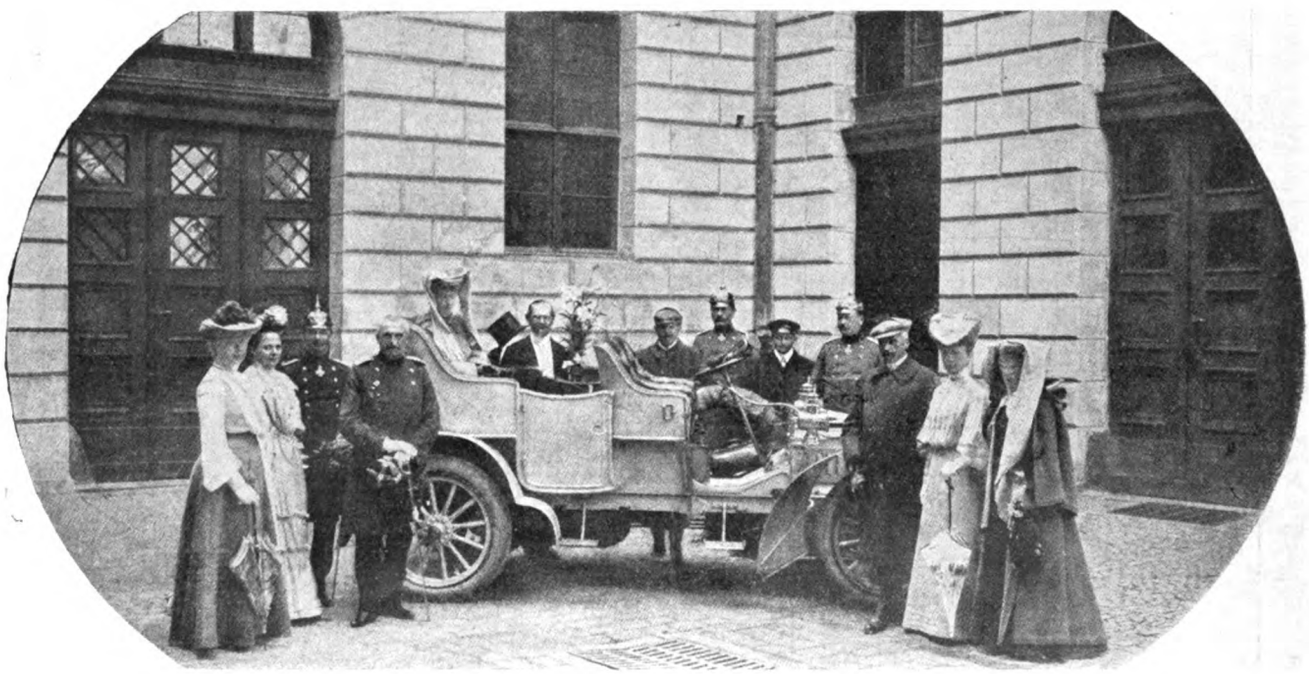


Photo by] The Racing Cars Getting Ready.—Mr. J. W. Stocks Pumping-up the Tyres of his Napier. *[Lafayette.*

Much disappointment was expressed when it became known that neither Messrs. S. F. Edge, Chas. Jarrott, nor Mayhew were to take part in the event. Another whose absence was regretted was Miss Daisy Hampson, of Southport. Her performance on the giant 60-h.p. Mercedes was among the looked-for items in the programme, but at the last moment she too was unavoidably prevented from being present. In the racing section the Hon. C. S. Rolls' 100-h.p. Mors, which was run in competition with Mr. Rawlinson's Gordon Bennett Darracq racer, did not acquit itself well, and appeared to be running on two cylinders.

Digitized by Google

The 60-h.p. Mercedes of Mr. Lee Guinness seemed to be the favourite, as it covered the course almost as silently as a touring car of only half the power. Sir A. Macdonald's 28-h.p. Daimler also ran well. He has been an indefatigable worker for the event, and must share the credit for its success. Mr. Alex. Govan brought over the new four-cylinder 16-h.p. Argyll, and Captain H. P. Deasy sent a 16-20-h.p. Martini car, which was handled by Mr. Williams. Mr. H. Sturmey had two of the Duryea cars in competition in two classes, and the running of the 10-h.p. three-wheeler was remarkable. Mr. A. Rawlinson, of Darracq renown, had quite a contingent of those cars, and his race with Mr. Rolls was among the events of the day.

The events, which were over a distance of one mile, with a standing start, passed off in perfect harmony, and, so far as we could learn, without any mishap, though on our return journey we found one small car being lifted out of a roadside ditch, but the occupants and the car seemed uninjured. The arrangements made by the Irish Automobile Club worked satisfactorily, and the press representatives were provided with every assistance under the special care of Mr. B. Barrett. The same excellent police arrangements which obtained for the Gordon Bennett race were again in evidence, and, taken all round, the Portmarnock events must be voted a success and a precedent for the future.

Princess Royal of Sachsen-Meiningen and Suite on the 20-h.p. N.A.G. Car on which she has recently accomplished a 1,000-miles tour.

CLASS A.—The Wheatley Challenge Bowl. For Motor-Cycles up to and including 170 lbs. (Holder, H. Martin.)

First Heat.—C. B. Franklin, Dublin, 2¾-h.p. F.N., 1; G. Drury, Dublin, 2½-h.p. Triumph, 2; L. R. Oswald-Sealey, Dublin, 2¾-h.p. Excelsior, 3; Won by a quarter of a mile. Time, 1 min. 31 4-5 sec.

Second Heat.—W. R. Ireton, Belfast, 3-h.p. Riley, 1; F. A. Wallen, Dublin, 3-h.p. Triumph, 2; C. J. H. Lewis, Dublin, 2¾-h.p. F.N., 3. Time, 1 min. 28 sec.

Final.—C. B. Franklin, 2¾-h.p. F.N., 1; W. R. Ireton, 3-h.p. Riley, 2; J. G. Drury, 2½-h.p. Triumph, 3. Time, 1 min. 32 3-5 sec.

CLASS E, for Two Seated Touring Cars, costing £200 or under.

First Heat.—H. Sturmey, 10-h.p. Duryea. 1; Major Thornhill, 6-h.p. Wolseley, 2; A. Gayun, 6-h.p. Mobile, 3. Time, 1 min. 41 4-5 sec.

Second Heat.—J. Edwards, 6-h.p. De Dion, 1; H. B. Hill, 6-h.p. De Dion, 2. Time, 2 min. 32 1-5 sec.

CLASS B (amateurs only) for Motor Cycles up to and including 150 lb. weight.

First Heat.—F. A. Wallen, Dublin, 3-h.p. Triumph, 1; C. J. Lewis, Dublin, 2¾-h.p. F.N., 2; Bertie Barrett, Kingstown, 2¾-h.p. F.N., 3. Time, 1 min. 38 4-5 sec.

Second Heat.—C. B. Franklin, 2¾-h.p. F.N., 1; J. G. Drury, 2½-h.p. Triumph, 2. Time, 1 min. 47 1-5 sec.

Final Heat.—C. B. Franklin, 2¾-h.p. F.N., 1; J. G. Drury, 2½-h.p. Triumph, 2; C. J. Lewis, 2¾-h.p. F.N., 3; F. A. Wallen, 3-h.p. Triumph, 4. Time, 1 min. 35 1-5 sec.

CLASS F.—For Touring Cars costing over £200, but not over £400, to carry four passengers.

First Heat.—H. Kennedy, 12-h.p. Darracq, 1; S. F. Robinson, 9-11-h.p. Clement-Talbot, 2.

Second Heat.—H. Sturmey, 12-h.p. Duryea, 1; Malcolm Gray, 10-h.p. Wolseley, 2; W. R. M'Taggart, 10-h.p. Argyll, 3. Time, 2 min. 8 sec.

Third Heat.—F. Churchill, 14-h.p. Hallamshire. Walk over. Time, 2 min.

CLASS G.—For Touring Cars costing over £400 but not more than £600, to carry four persons.

First Heat.—A. Huntley Walker, 15-h.p. Darracq, 1; H. Sturmey, 15-h.p. Duryea, 2. Time, 2 min.

Second Heat.—Alec Govan, 16-h.p. Argyll, 1; A. Rawlinson, 15-h.p. Darracq, 2. Time, 1 min. 49 4-5 sec.

TEN GUINEA CUP. Open to all residents in Ireland.

First Heat.—T. L. Plunkett, 28-h.p. Daimler, 1; Major Thornhill, 6-h.p. Wolsely, 2; R. Lane-Joynt, 20-h.p. M.M.C., 3. Time, 2 min. 7 4-5 sec.

Second Heat.—W. R. McTaggart, 16-h.p. Argyll, 1; J. "Edwards," 6-h.p. De Dion, 2; S. T. Robinson, 9-11-h.p. Clement-Talbot, 3. Time, 1 min. 45 3-5 sec.

Third Heat.—A. Lane-Joynt, 20-h.p. M.M.C., 1; Malcolm Gray, 10-h.p. Wolseley, 2; Dermot Mooney, 10-h-p. Argyll, 3. Time, 2 min. 10 2-5 sec.

Final.—T. L. Plunkett, 28-h.p. Daimler, 1; W. R. McTaggart, 16-h.p. Argyll, 2. Time, 1 min. 36 1-5 sec.

RACING SECTION.—200-Guinea Perpetual Challenge Cup. For racing cars weighing not more than 19 cwt. 3 qr. 20 lb. (1,000 kilos.)

First Heat.—A. Rawlinson, 40-h.p. Darracq, 1; C. Rolls, 100-h.p. Mors, 2. Time not taken.

Second Heat.—A. Lee Guinness, Gordon Bennett Darracq, 1; Mark Mayhew, 75-h.p. Napier racer, 2. Time, 59 4-5 sec.

Third Heat.—S. F. Edge, 6-cylinder Napier 1; Maurice Egerton, 60-h.p. Panhard, 2. Time, 58 sec.

CLASS H.—For Touring Cars costing over £600, but not more than £1,000.

First Heat.—T. L. Plunkett, 28-h.p. Daimler, 1; Sir A. Macdonald, 28-h.p. Daimler, 2; Capt. Deasy, 16-h.p. Martini, 3. Time, 1 min. 47 4-5 sec.

Second Heat.—Percy Martin, 28-h.p. Daimler, 1; R. Lane-Joynt, 20-h.p. M.M.C., 2; A. Lane Joynt, 20-h.p. M.M.C., 3. Time, 1 min. 26 4-5 sec.

Third Heat.—A. Huntley Walker, 30-h.p. Darracq, 1; A. Rawlinson, 30-h.p. Darracq, 2. Time, 1 min. 40 4-5 sec.

CLASS J.—For Touring Cars, irrespective of price, to carry five passengers.

First Heat.—A. Lee Guinness, 60-h.p. Mercedes, 1; Percy Martin 28-h.p. Daimler, 2. Time, 1 min. 24 3-5 sec.

Second Heat.—A. Rawlinson, 15-h.p. Darracq. Walk over. Time, 1 min. 19 1-5 sec.

CORRESPONDENCE.

REPAIRS IN THE NEW FOREST.

To the Editor of *The Motor-Car Journal.*

Sir,—I have recently been motoring in the New Forest, and my experiences in the matter of repairs may be useful to others. Before giving instructions for any repairs there, always ascertain the cost. On my journey down I broke the small bottom leaf of one of my hind-wheel springs. For replacing this and sticking on a loose patch on a cover (which latter I could have done in two minutes) I was charged a sovereign! The cost of making the large top leaf, which carries the shackles, is only 14s. 6d., so the charge for the bottom one appears excessive. I am informed that the Imperial Motor Works, whose depot is in the chief street at Lyndhurst, are good for repairs, but have not had an opportunity of trying them. Petrol at Swanage cost 1s. 4d., which must be very profitable to the seller.—Yours truly,

W.

THE HORSE POWER OF PETROL MOTORS.

To the Editor of *The Motor-Car Journal.*

Sir,—I have just read Mr. Wilson's letter in the last issue of the *Journal.* As everybody knows, horse-power, as applied to motor-cars, is a remarkably elastic term. The rating given to an engine may at times be tolerably accurate, but the chances are that it is either too low or too high. To rate a car moderately, and then demonstrate that it possesses a considerable excess of power and is able to accomplish more than the indicated power leads the user to expect, is to score a big point in its favour. Conversely, to rate high, and then to fall short of the promise held out, or even to just equal expectations, has an opposite effect. At a time when the trend was altogether toward big cars there was a manifest advantage in putting out a vehicle which, in spite of its moderate power, was quite able to equal the performances of others rated much higher.

On the other hand, light cars are for obvious reasons rated at their full power. An 8-h.p. car offered at the same price as one of 6-h.p. seems better value; and the fact that there are no means of verifying the claims, of determining whether the asserted power is really available, is lost sight of. With touring cars it is different. More than one maker is rating his car at a certain "indicated" or "nominal" figure, with the parenthetical remark that it will actually develop considerably in excess of this. Should the innovation meet with a favourable reception it is certain that the practice will become general. As to its success there seems to be no room for doubt. At the outset it is probably a little more difficult to sell a big car—or any kind of car rated under its actual horse-power. Buyers are apt to think that they are not getting their money's worth if they pay the same price for the 16-h.p. car as for one of 20 or 24-h.p. But if this initial difficulty can be overcome the rest is smooth sailing. For a car of a certain power to do better work than one of different make but the same rating is manifestly a triumph; but when a low-powered car does as well or better than a high-powered one, the triumph is infinitely greater, and is certain to be keenly appreciated. Whatever the outcome may be, however, it is likely that a more rational and conservative manner of estimating horse-power will result. At present the term has little meaning. Trade and public juggle with it in an irresponsible fashion that is far from edifying. The difficulty of calculating the horse-power actually developed at the road wheels is great enough in itself without having an additional element of uncertainty thrown in.—Yours truly,

W. F. Tomlinson.

NAIL CATCHERS.

To the Editor of *The Motor-Car Journal.*

Sir,—In answer to "Troubled One's" inquiry in the last issue of the *Journal,* I may say my experience of a nail pulling device has been extremely satisfactory. I have driven a car fitted with light chains fixed to the mudguards by means of small screwed eyes, the same as used on pictures, directly above the wheel centres, for some months, and have been remarkably free from tyre troubles.

The single chains hang quite loosely on the tyres and do not cause any perceptible wear whatever, but they keep the tread of the tyre perfectly clean. I have only known one nail to escape them, and this was so rusty that when the chain tried to pull it out it broke off, leaving a piece embedded in the outer cover.

The chains themselves will be found to wear through in the course of time, but are so easily replaced that this objection need not be considered.—Yours truly,

A. 5443.

STEAM CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—In the *Journal* of the 27th ult. "Superheat" states his intention of running a Locomobile for commercial purposes. My advice to him is, "Don't attempt the impossible." I purchased a Locomobile a few months ago, attracted by its apparent ease of control and the absence of vibration. It was supposed to have cost £275 when new, and as it looked smart and in good condition, I thought I had a bargain for £85. It was a 6-h.p. four-seated car and had the usual string of well-known qualifications and improvements. It possessed a paraffin burner, and it soon convinced me of its ability to burn paraffin; it appeared to have drinking diabetes, and I quickly learned it was unsafe to venture far from an oil supply. The oil pumps could not cope with its voracious appetite, so it drained the paraffin from the air pressure tank every few miles, which meant going through the whole tedious process of lighting up afresh with copious draughts of methylated spirits. On one occasion when we did get it running it steamed twenty-one miles in four hours, and as a result the woodwork of the car caught fire.

It was also fitted with what I notice is specially emphasized by advertisers of steam cars, viz., an auxiliary hand pump." This afforded me all the muscular exercise I required—I would watch the water gradually sink lower and lower in my Klinger gauge, and then, with a sigh, would dismount for ten to fifteen minutes' gymnastic exercise with the hand pump. Sometimes a friend would assist at the opposite side, and while we sawed away like the two toy figures at the crank, an interested crowd of spectators would entertain the company with jokes at our expense. I had the pump re-bored and a new plunger fitted, but our energies still became exhausted in our efforts to keep the boiler supplied. The climax came when I left the car for a few minutes outside my house, and on returning to it found the boiler leaking like a sieve; it had scorched owing to the car being on an incline and the gauge not indicating the contents of the boiler correctly.

I had it towed away, and when the boiler was re-tubed, I exchanged my £85 steamer for a motor-bicycle. The present owner has just spent £18 in having the boiler again re-tubed, it having scorched the second time he used it, and as I now spin along on my trusty bike, with trailer attached, I sometimes see a steamer by the roadside, with the front seat removed and a tangled mass of taps and tubes exposed to view; and as I look I shudder and pass on.—Yours truly,

A Wiser Man.

ADVICE WANTED.

To the Editor of *The Motor-Car Journal.*

Sir,—I have just seen "J. S.'s" letter in the *Journal* of the 27th ult. He has my deep sympathy. As long as his car was chain driven no doubt all was well; the trouble seems to be that it has got off the chain, and is getting obstreperous. Quite right to look after it if the wheels go in opposite directions; it will be a powerful "break" indeed and quite automatic. Any handle will do in this case; grip the nearest one. Should "J. S." be rendered speechless he will have his revenge on those wheels, no doubt they will be rendered spokeless. To find the box of gears "J. S." could hunt among the bits scattered around after the break. No, "J. S.," "the pot at the bottom of the car" is not the gear-box; it is for keeping the luncheon warm, and the amazing noise you sometimes hear therein is caused by the Rocquefort cheese patronised by so many motorists trying to get out on the top speed. I agree with "J. S." that his car is electric magneto after hearing of its shocking behaviour. As to touching the magneto, let me earnestly entreat "J. S." not to do so. People have been blown to atoms ere this by such injudicious conduct. However, he need not be alarmed by the handle being flung through the window. A friend of mine only wound up his once and it flung him through the window. Nor need he infer from this that chain drives are explosive. Chains do sometimes "go off" suddenly if anything "snaps" them, but a safety bolt should remedy this. I would advise "J. S." to take out the engine as he suggests. Do not, however, put in a 20 ampère battery. Rather put in a battery of cheap Swiss clocks; he can then wind them up twenty thousand times and get full value for his money. I do not think steaming advisable, but a hot cloth on the carburettor might allay the irritation which seems to have extended to the magneto. In conclusion, might I ask if the mechanic who taught "J. S." was "J. S." also? If so, there was a pair of them, and the trouble is accounted for.—Yours truly,

R. A. Illery.

LOOK AFTER THE CHAINS.

To the Editor of *The Motor-Car Journal.*

Sir,—In answer to "A. T.'s" query in the *Journal* of the 27th ult., *re* chains, I have never heard of such experiences as "Six-and-a-half Years' Experience" relates. I know several motorists who have chain-driven cars, and I have not even heard them complain of trouble, and I have this season driven a 15-h.p. car 3,000 miles fitted with Brampton chains, and they are nearly as good as when put on new.—Yours truly,

Chain Driven Car.

THE COURTESY OF THE ROAD.

To the Editor of *The Motor-Car Journal.*

Sir,—Seeing the note in your *Journal* recording the courtesy experienced by Dr. Hall, of Milford, it may interest you and your readers if I recount an incident which happened to me a few weeks back. I was held up at the foot of the hill just beyond the George Inn, Morden, at half-past ten at night, and was faced by the prospect of getting home very early in the morning. I had with me my wife and a young fellow from the garage. A car passed and I was asked if I was in trouble. My affirmation of the fact brought the car to a standstill. There were six people on the car,

Digitized by Google

which was a magnificent vehicle of about 16-h.p. The owner requested is friends to get down, his chauffeur fished out his spare chain, my car was hitched up to the stranger and hauled up the hill to the George Inn, where I left it for the night. (Let me, in parentheses, say a good word for mine host of this well-known house, who, and his obliging yardman, gave me every attention. Twenty-four hours' safe and excellent garage cost me 1s.) "Now," said the owner of the other car, "if you will tell me where you want to go, I will take you." Squeezing the three of us in with his three friends in the tonneau, whilst he sat on the floor in front of his friend and chauffeur in the fore part of the car, making nine up, we were whisked through dark lanes at a rattling pace, and in half an hour were set down at Balham. The kindness of the owner, Mr. Henry Smith, of Battersea Park Road, to us, who were absolute strangers, cannot, I think, be over praised. It was that high and exceeding consideration which, as Sir Philip Sydney has said, is "seated in the heart of courtesy."—Yours truly,

G. L. POLSUE.

MOTOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly inform me, through the medium of your valued journal, what should be the relative distance from the bottom of the stroke that the exhaust valve should begin to open? In my motor (Clement) it begins to open when the piston has descended seven-eighths of its stroke and finishes closing exactly as the piston reaches the extreme end of its upward stroke. Should it close also at seven-eighths of the upward stroke?—Yours truly,

EXHAUST.

["Exhaust" may rest assured that his valve is set quite correct, so long as it is not held open over the top of the stroke. In the case of an inlet valve it should commence to open immediately following the closing of the exhaust, and close at the bottom of the stroke.]

The Procession of Cars at Hastings. *(See last issue.)*

Photo by, [*Mr. W. P. H. Couchman.*

THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was the owner of two motor-cars numbered W. 6 and W. 7. These were completely destroyed by fire. W. 7 was replaced by a car exactly similar, and the number was retained. I am replacing W. 6 by a larger car of a different type, and, wishing to retain the number, applied to our Town Clerk here for a form of particulars, expecting the transfer would cost 5s. He says the registration fee is £1, and suggests that, to strictly comply with the Act, a similar fee should also be paid for W. 7. I think this is straining the Act somewhat. What do you think?—Yours truly,

C. D. L.

[We sympathise with our correspondent, and feel that this is one of the feeble points of the Act; but the Town Clerk is quite within his legal rights. There is no straining of the Act in the matter, although the Act probably strains the reasonable man's view of common sense.]

HILL CLIMBING BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the extraordinary time accomplished by Rougier on the 45-h.p. Turcat-Mery car in the hill climb up Mount Ventoux on Sunday, the 28th ult., I have been making some interesting calculations which may be of some interest. Most of the leading makers were competing, and the car driven by Rougier was the same car which he drove in the Gordon Bennett race in Germany.

The Mount Ventoux race is a hill-climbing competition, the hill being roundly 22 kilometres in length and rising 1,600 metres. When the time taken in climbing the hill, viz., 21 min. 12 sec., is looked into, it will be found that the car rose at an average speed of well over 5 ft. per second, faster than the fastest lift in the world. Remembering also that the road up the mountain has some very sharp bends, which mean practically stopping the car in order to get round, and the four first kilometres are on the flat, it is fairly correct to say that Rougier's vertical speed was over 6 ft. a second—really an extraordinary performance, which requires looking into to be properly appreciated.—Yours truly,

CHAS. JARROTT.

MISFIRING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a twin-cylinder 12-h.p. De Dion car which has lately given me much trouble through one cylinder missing fire. After cleaning and adjusting contact screw it will go all right for a time—from a few minutes to a day, but usually not longer. The contact blade seems to rest longer on the screw of cylinder that is working right than on the other. I am using a six-volt accumulator, having tried four volts with no difference.—Yours truly,

F. R.

[We would advise our correspondent to see to his coil, as his misfiring troubles are no doubt due to this. A short in the primary winding or condenser would cause a constant burning of the contacts, as would too high a voltage. The latter will often cause a short in the coil, this generally only being sufficiently insulated to take a low voltage.]

QUERIES *RE* DE DION CLUTCHES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be greatly indebted to any reader of the *Journal* for advice on the following matter. I have an 8-h.p. De Dion car, two speeds and reverse, with expanding fibre-covered clutches. When the car is running, a jarring sound, like that of tight bearing, is heard. The slower the car goes the worse it is. When the driving wheels are jacked up and the change speed handle is in the free position, the engine, when started, drives the driving wheels strongly at high speed, as if the clutch had been put in. Any contraction of the clutches by the regulating screw renders them ineffective for practical use on the road. In order to prevent them driving when in "free" position as described, they have to be contracted to their utmost. The low speed clutch is quite effective for hill climbing, but the high speed one slips badly. All the axles run true, any worn bushes being made good. I have had four new screw spindles for expanding segments, and new clutch fibres, turned true in lathe after being fitted. Everything seems in perfect order and works freely: but excessive wear of the gear is taking place through both clutches driving at same time. The gear box after a ten miles run is quite hot.

I have had one of the lever arms in connection with change speed handle made shorter, so that the same amount of movement of the handle causes about three times the amount of the former movement in the clutches. Sometimes the noise is absent, but during the last two runs it has been very bad indeed. Is there any special kind of fibre for these clutches? I have hard vulcanized fibre on them now, but it seems to heat and swell with use. I have had at various times a good deal of trouble with these clutches slipping—in fact, that is the only trouble I have had with the car.—Yours truly,

A. H. R.

TAIL LAMP TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Rosthern's" letter of the 3rd inst., I can well sympathise with him, as I have had the same trouble myself. After trying three different kinds of lamps, I finally adopted a four-volt lamp. I found this was the only satisfactory lamp, as it does not jolt or blow out. It seems hard to have paid so much for lamps, and then have to despise them, but I am sure your correspondent will find this the most satisfactory way out of his trouble. The lamp I fitted I run off my spare accumulator. The light given is as good as any average lamp on the market, with the advantage of being a steady light.

This lamp could, I am sure, soon be altered at a cost well under three shillings. Should he wish to know how I altered mine, I would fully explain with pleasure.—Yours truly,

F. W. S. H.

[There are many readers who would be glad to have the method fully explained, and we shall welcome a further letter from our correspondent on the subject. He might also state if the lamp uses much current; that is, is the accumulator quickly run down.]

RECKLESS DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being in my ninth year as a motorist (in Sussex and Roxburghshire), never having been fined since the use of motor-cars was legalised in this country, and never having caused an injury to any person, may I be allowed to make a suggestion for the suppression of all "scorchers" who live in the rural districts? At present the country police take no action to enforce the present excellent law other than to establish "traps," generally on a perfectly straight stretch of road where even the cautious motorist may often safely exceed the legal maximum, and he and the habitually dangerous driver are caught in the same trap. My idea is

Digitized by Google

that the local police should mark down the local "scorchers" (for every man's motor character is easily ascertainable, and is generally the talk of the village), who can be caught easily nearer his own door, and whose habits and hours are often known. After he has been fined once or twice locally he will become cautious in all districts, as his licence will have been endorsed, and he will then become liable to imprisonment (the only real cure, in my opinion). I trust this letter will be read by our Chief Constables, and that they will act as suggested; my proposals could be carried out much more cheaply than the usual "trap," as often the police spend hours watching for the motor which never comes, whereas in my system no more "traps" would be set except for that dangerous and nasty criminal, the "road hog," whose habits would have been easily ascertained. I must admit that my system could not easily be adopted in towns, but surely the "catch" of dangerous rural motorists would do much to lessen risks to everyone concerned.—Yours truly,

THOMAS R. B. ELLIOT.

THE RATING OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At a time when the motoring public are expressing disapproval in no measured terms of the growing inclination of manufacturers to understate the horse-power of their engines, on the ground that it is grossly misleading, and are asking for such Club legislation as will give to hill-climbing and other competitions that real comparative value which should be the essence of their being, it is somewhat interesting to note the condition governing the Hertfordshire Automobile Club's open hill-climbing contest on the 10th inst., as it seems to me to set a premium on misrepresentation. "The cars must be essentially fully equipped touring cars fitted with mudguards and silencers, the maker's horse-power of which must not exceed 25," so reads this condition, and its effect obviously is to admit certain makers, the horse-power of whose engines is considerably understated, and debar other types, the makers of which frankly describe their motors by the actual power developed at normal speed of the engine. Is this likely to induce constructors to rate their engines honestly? The public ask for less mystification and more straightforward rating of cars, and they look to the clubs to bring this about; yet here we have a rule which offers inducement to manufacturers of large engines to write down the horse-power in future lists and specifications in order to become eligible for competition.

My 28-h.p. car, which has this year achieved such striking successes in various contests, is debarred from competing, but higher powered cars than it are welcome simply because they are "listed" at less than 25-h.p.—Yours truly,

E. M. C. INSTONE.

PARAFFIN BURNER.—Replying to W. Hill, full particulars of the paraffin burner referred to in the *Journal* of the 20th ult. can be obtained from Messrs. Fuller, Macleod and Company, Limited, 3, Red Lion Court, Cannon Street, London, E.C.

THE STORAGE OF PETROL.

AT Coventry Police Court, Edward Clarke, of the Salutation Inn, has been summoned for storing petrol without having a licence. The Chief Constable explained that the penalty was £20 a day for each day the petrol was kept. Defendant was found by Police-constable Daniels storing six gallons of petrol in an outhouse which would not be licensed under any circumstances. The magistrate's clerk explained to defendant that human life was involved. Defendant explained that he had erred in ignorance. The Bench imposed a fine of 20s. and costs, and expressed a warning to future offenders.

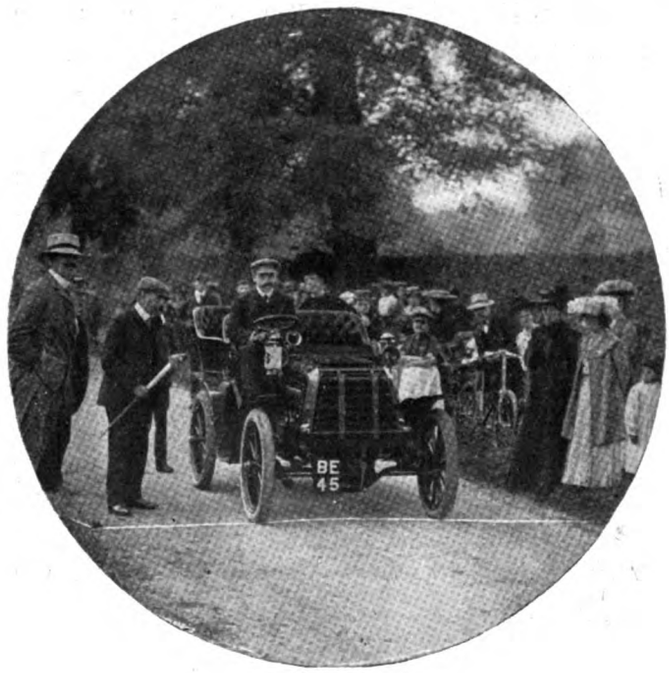
CASE DISMISSED.

ON the 1st inst., at the County Sessions Court, Birkenhead, William Wooller, Liverpool, was prosecuted for having driven a car along Column Road, Grange, West Kirby, at a speed dangerous to the public, on August 14th. P.C. Yale swore that the car was going over twenty miles per hour, and that the defendant when stopped said he was "showing a client how fast the car would go." On cross-examination by Mr. Harold Martin, solicitor, Liverpool, he admitted he had only guessed the distance and time, but posed as an expert at judging speed from having habitually timed cars over measured distances of 220 and 440 yards. Two other witnesses for the police guessed the speed at twenty-five to thirty miles per hour, but did not agree as to the distance travelled. On cross-examination all three admitted that neither they nor anyone else was in any danger and that there was no one coming up either of the cross-roads that debouch on to Column Road at the time. Mr. Martin thereupon submitted that, no person having been endangered, there had been no offence under the Motor Car Act committed, quoting the cases reported in the *Motor-Car Journal* of July 9th last. The magistrates ruled to the contrary. However, after hearing the defendant and his witness, who was in the car at the time, who deposed that the speed was fifteen to sixteen miles per hour only and the car was stopped in ten yards after the constable's signal was seen, and conferring with their clerk, the magistrates, without hearing a speech for the defence, announced that "they paid no attention to any Quarter Sessions decisions, but as there was some doubt on the question of danger they would give the defendant the benefit of it and dismiss the case."

CLUBS AND ASSOCIATIONS.

WOLVERHAMPTON.

ON Saturday last the petrol consumption test organised by the Wolverhampton and District Club took place, but, in consequence of absence from town of many of the members, only seven cars were entered. Wolverhampton to Market Drayton, a distance of twenty-nine and a half miles, was covered with the following results:—



Mr. A. Mills ...	12-h.p. Sunbeam ...	3 passengers ...	14 pints.
Mr. T. G. Gatis...	10-h.p. Enfield ...	2 passengers ...	13½ pints.
Mr. T. Cureton ...	12-h.p. Sunbeam ..	4 passengers ...	13½ pints.
Mr. W. Owen ...	10-h.p. Wolseley ...	2 passengers ...	13½ pints.
Mr. P. S. Bayliss	8-h.p. Panhard ...	2 passengers ...	10½ pints.
Mr. G. Evans ...	10-h.p. Wolseley ...	2 passengers ...	10½ pints.
Mr. J. Davis ...	7½-h.p. Wolseley ...	2 passengers ...	9½ pints.

A very strong headwind was encountered by all the cars.

In consequence of the annual police inspection of the Shropshire police taking place on the 17th inst., the hill-climbing competition at Gatacre Hill, provisionally fixed for that date, will be postponed until the 24th inst. The events will be (1) restricted to club members, (2) open to motorists generally, particulars of which and entry forms can be obtained on application to the secretary.

THE GAINSBOROUGH HILL-CLIMB.

THE hill-climb held on Thonock Hill, Gainsborough, on Thursday of last week, on the initiation of Mr. J. D. Sandars, a vice-president of the Lincolnshire Automobile Club, proved a success in every way.

The Gainsborough Hill Climb.—Mr. Jeffrey's 12-h.p. Darracq at the start.

Nineteen cars faced the starter; only one failed to get up, and that was owing to the driver missing his gear. A course of 1,009 yards had been marked off, and after a gentle rise a gradient of 1 in 8 had to be tackled, followed by another easier rise, then a short steep bit again and an easy run to the finishing line. Men with flags were placed all along the hill guiding the competitors. Mr. Sandars had with him, as a committee, Sir Hickman Bacon, Mr. C. W. Pennell, Dr. Passmore, Major T. Kelsey and Mr. A. A. Padley.

The official timekeepers were Mr. E. V. Ebblewhite and Mr. Dutton, who were stationed at start and finish respectively. Mr. Ebblewhite started the cars, giving the caution "5—4—3—2—1, Go!" and he has to decide the results from the particulars given on the handicap sheet, the handicap being on the formula of the A.C.G.B.I.

Mr. C. W. Pennell made the best time with his 16-22-h.p. Martini. The performance of the second fastest car, a 15-17-h.p. Rose, a Gainsborough built vehicle, was very good. Mr Jeffrey's 12-h.p. Darracq, with two up, did well, while Mr. Herman Marshall's 12-16-h.p. Clement, with four up, beat Mr. J. D. Sandars' 12-16 h.p. Peugeot (one up), the 9-11-h.p. Clement of Mr. Harry Brook, Lincoln, running them close. Mr. G. E. Sandars' little 4½-h.p. De Dion beat his 12-16-h.p. car by 3 1-5 sec. The new 10-h.p. De Dion and the Humberette made very fair times. Mr. T. Spencer, Misterton, whose little 2¾-h.p. home-made car was so much noticed at Lincoln in the famous Thousand Miles Trial, had another home-made car with a Rose 9-h.p. three-cylinder engine, and romped up in 1 min. 59 1-5 sec., but not in competition.

After the contest Mr. J. D. Sandars entertained the whole of the

Digitized by Google

competitors and their friends to a very welcome tea in the grounds of his place at the foot of the hill.

The power, weight, and the time of the various cars are as follows, with the speed in round figures:—

Competitor.	Car.	Weight in cwts.	Cylinder.	Passengers.	Time. m. s.	Miles per Hour (ab't).
C. W. Pennell, Lincoln	16-22-h.p. Martini	22¾	4	4	1 36⅝	23½
W. Rose, Gainsborough	15-17-h.p. Rose	19½	3	4	1 44½	22
G. W. Jeffrey, Gainsborough	12-h.p. Darracq	14½	2	2	1 59	19
H. Marshall, Gainsborough	12-16-h.p. Clement	18	4	4	2 10⅜	18
J. D. Sandars, Gainsborough	12-16-h.p. Peugeot	18	4	1	2 12½	17
Dr. W. H. B. Brook, Lincoln	9-11-h.p. Clement	13½	2	3	2 14¼	16½
Capt. J. A. Cole, Roxholm	12-h.p. Durkopp	18½	4	3	2 23⅜	15½
G. E. Sandars, Scampton	4½-h.p. De Dion	8½	1	1	2 33¼	14¾
G. E. Sandars, Scampton	12-16-h.p. Peugeot	19	4	3	2 37	14¼
A. A. Padley, Market Rasen	10-h.p. De Dion	15¾	2	2	2 37⅝	14¼
R. M. Wright, Lincoln	6½-h.p. Humberette	9¾	1	2	2 47	13¼
Major Fowler, Louth ...	12-h.p. Richardson	17	2	3	2 51¼	13
G. Garnett, Gainsborough	8-h.p. M.M.C.	10¾	1	2	2 59¾	12¾
B. H. Gainsford, Sheffield	6-h.p. Progress	12¼	1	1	3 2½	12¼
D. P. Sharp, Brant Broughton	12-h.p. Richardson	17½	2	4	3 2⅝	12¼
F. Jecock, Gainsborough	8-h.p. Dennis	12½	1	1	3 17	11⅓
E. A. Baine, Gainsborough	9-h.p. Gainsborough	14	3	2	4 22	8½
*T. Spencer, Misterton	9-h.p. (home made) Rose engine	9½	3	2	1 59½	19

* Not competing.

LINCOLNSHIRE.

ON the 22nd inst. the Lincolnshire Automobile Club will meet at West Skirbeck House, Boston, by invitation of Mr. W. Garfit, M.P. The concluding run of the reason will take place at Revesby on the 1st prox.

WEST SURREY.

A RUN was held by this club on the 27th ult. to Virginia Water. Among the members present were Mr. and Mrs. Pullman and Miss Matson, 15-h.p. Durkopp; Mr. and Mrs. Fletcher, 20-h.p. Durkopp; Mr. and Mrs. Praschkauer, Milnes Daimler; and Mr. and Mrs. Buttemer, 10-h.p. Decauville.

On Saturday a picnic was held at Cutt Mill, Elstead, at which about eighteen members and friends attended, including Col. Fairtlough and party, 12-h.p. Darracq; Major Matson and party, 6-h.p. Benz; Dr. and Mrs. Rideal, Benz; Miss Houghton, Mr. Buttemer and party, Mr. and Mrs. Crothers and Miss Crothers, 9-h.p. Argyll.

POLICE TRAPS.

THE police have a measured quarter of a mile in the vicinity of Hampton Court.

AT Southwark, near Brighton, increased police activity is likely to be noticed during the coming week, owing to complaints made at the meeting of the local District Council on Tuesday.

AT Water Newton, on the Great North Road, a police trap has been established.

A CORRESPONDENT informs us that there is a trap on the main road from Farningham Hill to Wrotham, Kent, about 1½ miles from the hill, starting from the road that branches to Eynsford.

ABOUT five miles on the London side of Dunstable the police have established a trap for motorists.

A MOTOR-CYCLE ACCIDENT.

ON Tuesday Dr. T. Jackson, coroner for Croydon, held an inquiry with reference to the death of Henry Hudson. He died in Croydon Infirmary on Friday night as the result of injuries received, it is alleged, by being run over by a motor-cycle at Mitcham on August 14th. The widow of the deceased man said on August 14th her husband left home for the purpose of visiting their daughter at Mitcham, and later in the day she learnt from the police what had occurred. A week before his death he consented to one of his legs being amputated, and she believed the fees of the surgeon were paid by Mr. Driver-Holloway, the driver of the motor-cycle which ran over Hudson. The witness said that the driver's family had done everything possible for her since the accident, and that morning they had obtained work for her son. After a long hearing the jury returned a verdict of "Accidental death," and expressed their appreciation for the manner in which Mr. Driver-Holloway acted towards Hudson after the occurrence.

CONVICTIONS OF MOTORISTS.

Place.	Summoned for	Fine.
North London	No rear number to motor-bicycle	10s., etc.
Romford	Driving to the danger of the public	£3.
Axminster	Above legal limit	£2, etc.
Bristol	Riding motor-bicycle without licence	5s., etc.
Chelmsford	Driving to public danger	£5, etc.
Birmingham	Unilluminated front number plate	10s., etc.
Stourbridge..	Driving backwards	Costs.
Kingston	Excessive speed	£5, etc.
Tewkesbury	No licence	£2.
Bristol	Furious riding	40s., etc.
Sunderland	Not stopping when desired	20s., etc.
Birmingham	Driving motor-'bus on wrong side of the road	Costs.
Teddington	Exceeding the legal limit	£7.
Tunbridge Wells ...	No rear light	10s., etc.
Bridlington	No rear light	2s. 6d., etc.
S.W. London	Irregular identification mark	40s., etc.
Littlehampton	No rear light	£1, etc.
Rugby	Reckless driving	£20.*
West London.....	(1) Driving to public danger and (2) Failing to produce licence	(1) £10 and (2) £2.
North London	No licence	£4.
London (City)	Causing unnecessary obstruction by leaving car in Leadenhall Street, E.C., fifty minutes	10s., etc.
Marylebone	(1) Driving recklessly; (2) failing to produce licence; (3) giving false name and address	(1) Fined 40s., etc. (2) adjourned; (3) dismissed.

* Notice of appeal given.

CASES of the misuse of military motor-cars having been brought to the notice of the Army Council, notice has been issued that only officers on duty and in uniform are to be permitted to ride in them, except on such occasions as staff rides, etc., when they have been authorised to wear plain clothes. Under no circumstances are the cars to be used by unauthorised persons or for other than public purposes.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, *39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ELSEWHERE we publish the report of the judges in the Small Car Trials, and would commend them on the promptitude with which they have enabled Mr. Basil Joy to communicate their observations to the Press—a marked advance on the state of things in some of the earlier Trials. So completely do they deal with the various points upon which prospective buyers of cars want information that comment is scarcely necessary, while the tables contained in the report constitute a really useful index for the guidance of budding motorists. The heading of Table VIII. is perhaps a little faulty; the order of merit having most probably been assigned under the head of "noiselessness," rather than "noise,"—a little distinction that makes a great difference.

◆ ◆ ◆

Track Racing in America.

DURING the week ending with the 29th ult. four important track races took place in the United States—in Cleveland, Omaha, Detroit and St. Louis, respectively, and each was marked by some exciting performances not on the programme. At Cleveland one car broke a wheel and ran into the fence, fortunately without harm to the driver or spectators; in Omaha, a car skidded and went through the fence, wrecking a wheel, but causing no personal injuries; in Detroit, a car was driven into the fence to avoid a collision, the driver receiving slight injuries; and in St. Louis, Barney Oldfield, blinded at the turn by the dust of a preceding car, drove through the fence, killing two men and receiving serious injuries himself. Evidence as to the dangers of track racing is thus rapidly accumulating. The chief factors are the enormous strains on the *chassis* and the blinding dust clouds stirred up at the turns, owing to skidding. With the enormous increase in the power of racers and the consequent greater speed, the ordinary unbanked tracks have become entirely unsuitable for motor racing, and the construction of special banked tracks with tarred, dustless surface imposes itself if track racing is to be continued, and at the same time frequent smash-ups and fatalities are to be avoided.

◆ ◆ ◆

Tyres Again.

IN Scotland, as elsewhere, the tyre question is a great cause of expense in the running of motor services, and at the half-yearly meeting of the North of Scotland Railway Company last week the Earl of Aberdeen made reference to the subject. He said that the service of motor-omnibuses which the company commenced to run between Ballater and Braemar in May last had been largely patronised, and the revenue was satisfactory; but they were experiencing some drawbacks, almost entirely, however, with the tyres, and it seemed evident that the tyre manufacturers had not as yet been able to produce rubber of a quality suitable for omnibus traffic. When the difficulties were overcome and the present cost of tyre renewal materially reduced, they would feel justified in establishing similar services in other districts which were likely to be remunerative. The universal interest now felt in motor-cars by the railway companies should encourage makers of tyres to give scientific study to the subject, and experiments conducted on proper lines should reap a good financial reward.

◆ ◆ ◆

En Route.

SUNDAY last was one of the finest motoring days of the year, there being just sufficient crispness in the air to warrant the abandonment of summer garments for those of a thicker character. The roads are still covered with dust, but not of such density as during the summer months. One of the pleasantest runs out of London is to Brighton, and one of the most comfortable hotels is the "Old Ship." Thither we travelled, the journey down, by bye-lanes and side lanes, being without incident or stoppage. As usual, the garage, one of the most roomy and convenient in the country, was well filled, while outside the "Old Ship" itself several cars were standing. Numbers of vehicles were continually passing, and our Identification Card enabled us to note that cars *en route* were from such far away places as Cornwall, Bute, Dundee, Antrim, Leeds, Somerset, etc. After lunch the return journey was made *via* Steyning, Horsham, Ewhurst (the Surrey Highlands), Merrow Downs, and Ripley to Wisley, where a halt was made for tea. Outside the Hut, as usual, there were numbers of cars standing, and amongst the owners present were Dr. Rutherfoord Harris, M.P., Messrs. S. F. Edge, Napier, Stocks, Swindley, Dangerfield, Cordingley, etc. The remainder of the journey to town was finished in the cool of the evening, as pleasant a day having been spent as the most fastidious could desire.

◆ ◆ ◆

Missing Motorists.

OUR German correspondent informs us that the police in Berlin are searching for the owners of cars bearing the numbers A 677, A 1,504 and P 209, against whom a great many complaints have lately been lodged. It is believed that certain German motorists have been guilty of using false number plates, in order to shield themselves from the consequences of accidents due to furious driving. We hope that the similarity of the above numbers with three in the London district is merely a coincidence, and that the owners of the cars which bear them in this country will not be called upon to prove an alibi!

◆ ◆ ◆

Ten Miles an Hour.

ON the subject of the speed of automobiles a correspondence is taking place in the "Times," in which we trust motorists will take useful part by correcting the errors of those who write without an abundance of thought. It is significant that the editorial columns have also been utilised to discuss the problem, and that the conclusion has been arrived at that "a glance over the complaints soon makes it manifest that a definite proportion of these complaints would be obviated if the

Digitized by Google

Act of 1903 were properly enforced by local authorities. That Act provides that the statutory or generally permitted speed of twenty miles an hour shall be reduced to ten miles within any limits or place referred to in regulations made by the Local Government Board on the application of the local authority. It is clearly the duty of every local authority to consider the requirements, under this provision, of the area over which its powers are exercised, and to obtain the sanction of the Local Government Board to the necessary restrictions. A place of the kind described would certainly seem to be afforded by a

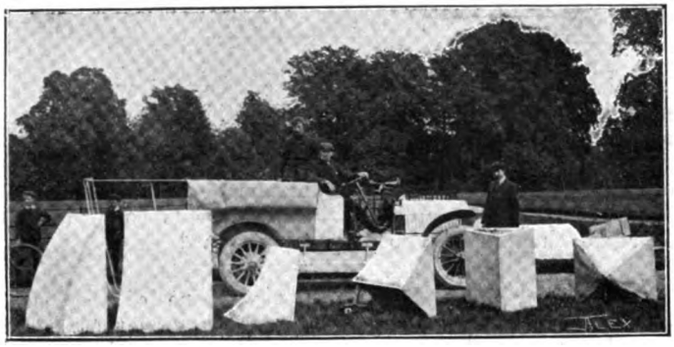

Photo by] Various forms of Bodies used in the Dust Trials. [Campbell and Gray.

village street, which is often narrow and winding, and is always liable to be occupied by children." There is little doubt that the implied hint will be adopted in some localities, in view of which we would suggest that the organisations connected with automobilism should quickly prepare themselves to defend the little that was gained by the 1903 Act. Otherwise the position will become even worse confounded.

◆ ◆ ◆

The Dust Trials.

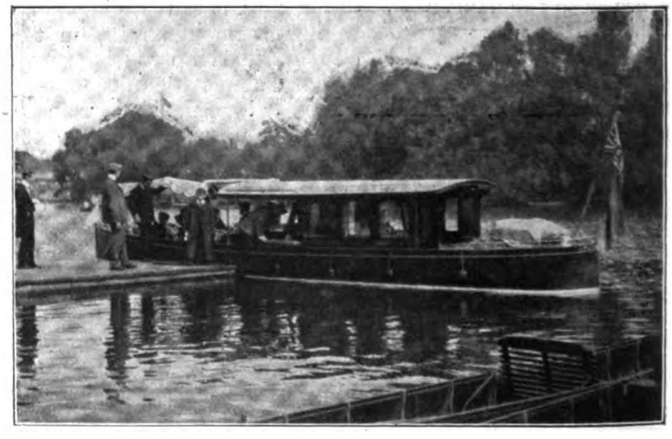
AFTER some inevitable postponements due to the weather, the trials of the Dust Committee of the A.C.G.B.I. took place on Saturday on a private road kindly provided by Sir A. Harmsworth at Sutton Place, near Guildford. The road-sweepings which had been promised by the Guildford surveyor for the purposes of the trial were, for reasons sufficiently obvious, not forthcoming, but some sacks of flour provided an efficient substitute. A *chassis* lent by Messrs. Dennis Bros., fitted with numerous removable bodies and extensions, was used, and, under the supervision of Mr. Crawley and other members of the committee, driven over the flour-strewn patch, ten or twelve yards long, at a uniform speed of thirty miles an hour, photographs being taken in every case of the cloud raised. A light T frame carrying 6-foot lengths of tape was also carried behind the car, with the idea of indicating to some extent the direction of the air currents, while a "standard" dust cloud was provided by Mr. R. W. Buttemer's 10-h.p. Decauville, which covered the course at the same speed at intervals. The trials, which began at 11.30, were continued till 5, upwards of fifty sets of photographs being obtained, and it was sufficiently evident that results of considerable value may be expected from them. No opinion can, of course, be pronounced till the official report is issued, but the impression to the casual observer was that the shapes approaching the Roi des Belges were distinctly worse than plainer and simpler lines.

◆ ◆ ◆

Educating Rural Districts.

SOME weeks ago we expressed the view that the small car trials at Hereford would do a great deal to educate public opinion, as well as the beasts of burden in that district, and from Stoke Lacy Rectory the Rev. H. George Morgan writes, saying that the interest and enthusiasm shown during the trials surpassed anything he had seen in the county for more than thirty years. Hereford is notoriously a slow-going place, and, in fact, only natives of some of the towns and villages seem able to keep awake. It has a most enervating influence on visitors from a distance who spend any time in the district. The fact that between fifty and sixty motor-cars were running all over the county, sometimes in narrow and frequently along sinuous lanes, without a single mishap, shows the safety that can be associated with the modern means of locomotion, and also emphasises the fact that when drivers exercise some amount of moderate care, no danger need lurk in the automobile.

◆ ◆ ◆



Motorists should Be Careful.

MOTOR-CAR drivers, however, will have to be careful, for there seems a recrudescence of that prejudice against motor-cars which marked the early years of advance. Last week we were congratulating ourselves that most of the large centres of population had not seen fit to suggest a speed limit other than that allowed by law; but it would now appear that the authorities of the City of London have not only asked the Local Government Board to restrict the speed of automobiles passing through the area of their jurisdiction, but that the Board has appointed a day, viz., the 27th of September, on which to hold an inquiry into the matter. Before taking his seat on the Bench the other day, the Mayor of Ripon announced that he had been requested by his fellow magistrates to read the following resolution:—"That the present speed of motor-cars in the city is not to the safety of the public. The City Council is requested to fix a speed limit within the city." The matter will be brought before the Corporation at an early date. These two instances are sufficient to show that, whilst motorists generally have exercised discretion, there are still some foolish persons who do not recognise the injustice they are doing the whole movement by furious driving and by flouting public opinion in a very high-handed manner. As the Rev. George Morgan says, motorists, by careful driving and by the exercise of consideration and courtesy, were able to make converts, and we appeal to all users of the road to do something to strengthen the good feeling which has grown up in country districts. Hence it is all the more regrettable that the same consideration has not been shown in urban localities, where the dangers of immoderate driving are even greater than in country districts.

◆ ◆ ◆

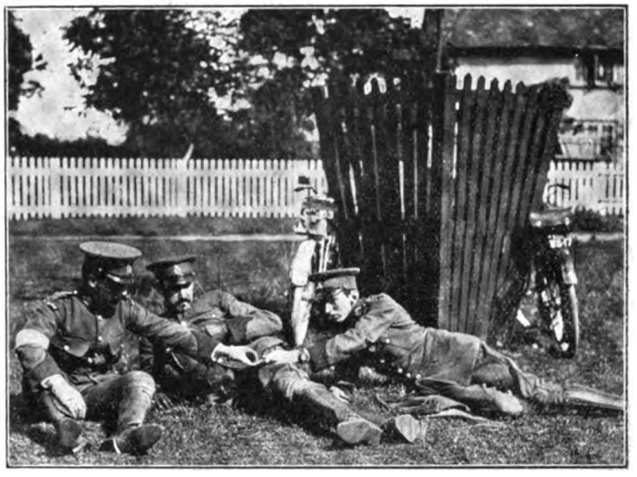
The Motor Boat "Florence."

ON Friday of last week a party of Pressmen and others, to the number of a dozen, met on Paddington Station for the purpose of journeying to Henley to meet the Napier motor-launch, "Florence," and participate in a trip to Kingston. To many this was the first trip in a petrol-driven boat, and as such

was looked forward to with pleasure. Although rain threatened in the morning, as the day wore on the clouds disappeared and the sun broke forth in all its noonday splendour. The first appearance of the launch excited the admiration of the beholders, its subsequent behaviour confirmed the early impressions, and the general opinion expressed was that the "Florence" was the finest and handsomest boat on the Thames

Digitized by Google

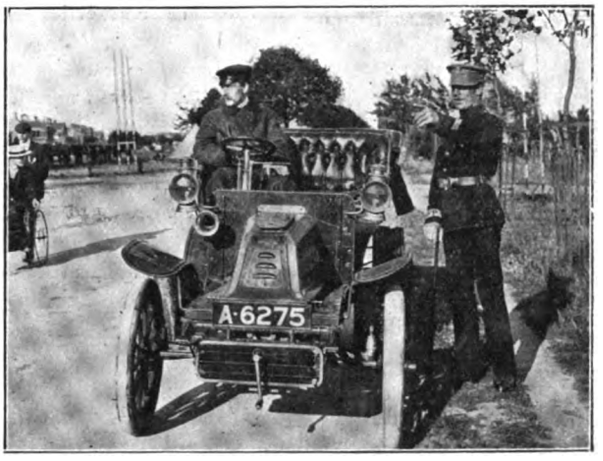
—and withal the most serviceable. The motor occupies but little space, and the boat runs as steadily as any turbine steamer yet built. Aft of the engine is a roomy cabin, 7 ft. 6 in. by 6 ft. 6 in., and fore is ample accommodation for a number of wicker armchairs, the boat having room for from fifteen to twenty passengers. The dimensions of the boat are as follows:—Length, 40 ft.; beam, 6 ft. 6 in.; maximum draft, 2 ft. 8 in.; motor power, 20 m.p.; size of cylinders, 4 in. by 6 in.; cylinder capacity, 75 in.; speed, twelve miles an hour; and price £800.



◆ ◆ ◆

Roads in France and England.

AMONG recent visitors to this country has been Mr. Chas. Weber, an automobile maker of Chicago and Milwaukee, who has been motoring in France and England on an American car. Comparing the wear and tear on his vehicle caused by the roads of the respective countries Mr. Weber said:—"The straight roads of France do not affect American cars, but the many quick, short turns entailed by the winding roads of England, the curves of which are usually hidden by the high hedges, play 'hob' with the transmission gears and steering columns and steering knuckles. I saw several American cars in which these parts had been practically torn apart or racked out of use. At the finish of our tour my steering post was some six inches out of true, but the other parts showed no bad effects whatever."



Major General Scobell (standing), Major-General Baden-Powell and Capt. Marchand (at the wheel) at Witham.

MOTOR-CARS AT THE MANŒUVRES.

En Voyage.

THE launch and general arrangements were in charge of Messrs. John S. Holmes and J. W. Stocks, and the first run to Maidenhead was made in two and a half hours, much time of necessity being spent in passing through the locks. Lunch was partaken of at "Skindle's," and then another pleasant run was made to Staines, where a stoppage was made for tea, Kingston being reached in the dark at half-past eight. The trip was a delightful one; the machinery might have been automatic so far as the passengers were concerned, and the trial was convincing that once this new method of propulsion is better known then it will be "good-bye" to steam and electric launches. The possession of a motor-car for the road and a petrol-driven launch for the river or sea and a man's happiness should indeed be complete.

◆ ◆ ◆

Solids *versus* Pneumatics.

THE seventeenth autumnal meeting of the Institute of British Carriage Manufacturers was opened at Leicester on Tuesday, when Mr. W. H. Hamshaw, of Wimbledon, delivered his presidential address, after which several local works were visited. The congress is largely attended by coachbuilders from all parts of the United Kingdom, as well as from India, and on Wednesday listened to a paper on rubber tyres by Mr. J. M. Maclulich, who gave some historical

Digitized by Google

information of interest just now, in view of the expiry of the Welch-Dunlop patents. In the course of his paper he said that in theory, and therefore in practice, a properly constructed solid rubber tyre was a better hill-climber than a pneumatic tyre inflated to an ordinary pressure, because with a solid tyre there is a direct drive and therefore no waste of power in transmission to the road. This he proved on his own car, and as an example of the superiority of a scientifically constructed solid tyre over a pneumatic tyre when climbing hills, mentioned that last week Mr. W. C. Prideaux, at the Dorset Automobile Club Meet at Bridehead, Dorchester, gained the first prize in the hill-climbing contest on his voiturette, fitted with such solid tyres, in competition with the pneumatic tyred cars. We shall return to this interesting subject next week.

◆ ◆ ◆

Motors at the Manœuvres.

THIS year's manœuvres in Essex have been made remarkable by the number of motor-cars, cycles and steam and petrol lorries employed. Nearly every General of any note was conveyed about the country on a car, and some of the correspondents complained of the popularity of the car as opposed to the horse. Conspicuous amongst the vehicles professionally engaged was an 8-h.p. De Dion car which was used by Pressmen. This car travelled throughout the manœuvres a distance of over

The Military Manœuvres.—The 8-h.p. De Dion stationed by Abbey Fields, Colchester, in readiness for the next move, whilst the unloading of the umpire's tents is being pushed forward in the adjoining field.

700 miles without a single breakdown and without needing any repair or adjustment, notwithstanding that it was on many occasions called on to leave the main road and to take to rough camp fields torn up by heavy transport, and even to open agricultural land. The Commander-in-Chief, the Duke of Connaught, and his immediate staff seemed to be everywhere, and they were rapidly conveyed from one centre to another in a 30-h.p. Napier car. As far as heavy transport is concerned, horses seemed to be rapidly becoming a thing of the past, and a remarkable fact is that the whole of the bread turned out by a large field bakery at Abbey Fields, Colchester, which supplied the rival armies with 21,000 rations a day, was conveyed by steam and petrol lorries, not a single horse being employed in distributing the staff of life.

◆ ◆ ◆

The Value of the Automobile.

THERE can be no doubt that this year's manœuvres will satisfactorily decide the question of the usefulness of motor-cars in all future military operations, as they keep the forces in so much closer touch with the different positions, and enable the generals to more rapidly survey their different points of attack and defence, apart from considerably reducing the time necessary for scouts to convey information to the armies. During the whole of the manœuvres our representative only noticed one car requiring attention out of all the hundred employed, notwithstanding the greater part of the time was conspicuous by heavy rains and muddy roads, which were certainly not improved by the heavy transport and the march of men and horses over the surface.

◆ ◆ ◆

The Middle of the Road.

MR. GIBSON M'LAGAN, a Scottish gentleman who has a gift of writing to the papers, has been suggesting in the columns of a northern contemporary that coachmen should always keep in the middle of the road, thus forcing motorists coming behind to slow down and have no opportunity of passing. "They dare not venture," he says, "to run into a carriage, as they boast to be able to draw up at once." His coachman, who has had some experience in London, is said to have given him this useful tip, and from experience he finds it useful, as automobiles in the rear have necessarily to slow down because of the obstruction. We would advise any motorists meeting coachmen who have taken a hint from this suggestive writer to at once give information to the police, for such wanton obstruction can find no justification. It is, however, the sort of thing with which motorists unfortunately have to put up in many places. Where manners cannot be made the voluntary rule of conduct, the police should certainly enforce the law, so that Mr. Gibson M'Lagan may find himself in serious difficulties if he continues advancing such views north of the Tweed.

◆ ◆ ◆

The Revival of the Pump.

WHILE so many suggestions have been made for the local authorities to give more attention to the construction of the roads, it is interesting to learn, that a proposal has also been mooted to turn the old iron pumps, with their wells, to the use they served in the coaching days. Then the dust nuisance was almost as prominent as now; hence the liberal showering of water upon the roads. It is thought by some that a revival of the pump might well be made, to the advantage of all orders of users of the road. This is only a palliative; a far more radical remedy must be found.

PROFESSOR HELE SHAW has returned from South Africa.

THE Sheffield Automobile Club will meet at Ashopton on Saturday, the 17th inst.

MESSRS. METHUEN AND COMPANY have published "The Complete Motorist," which we hope to review in an early issue.

THE dinner which is being held on the 16th inst. in celebration of the expiry of the Dunlop patents might well be termed a "wake."

MOTORISTS in the Witham district of Essex will be interested to learn that Mr. Geo. J. Fisher is keeping a stock of petrol, oils, and greases at his depot in the High Street, Tollesbury.

ARTICLES of incorporation have been filed with the Canadian Government for the Ford Motor Company, Limited, of Canada, with a capital of £25,000. The works are to be established at Walkerville, where similar cars to those made by the Ford Motor Company of Detroit will be built.

IN Chichester Street, Belfast, the Northern Motor Company have a large and well-equipped garage. They have facilities for charging accumulators by day or night, and make a special feature of cleaning cars properly. A vulcaniser has also been installed for repairing tyres. Centrally situated and of a large extent, this garage should be of great convenience to motorists when in that part of Ireland.

THE Vanderbilt cup race is to be held on October 8th, on the Jericho and Hempstead roads, in Nassau county, Long Island. The course will measure thirty-two and a half miles, and ten circuits will be made. The roads are stated to be, almost without exception, excellent, and though there are some rather sharp turns, it is expected that some high speeds will be attained.

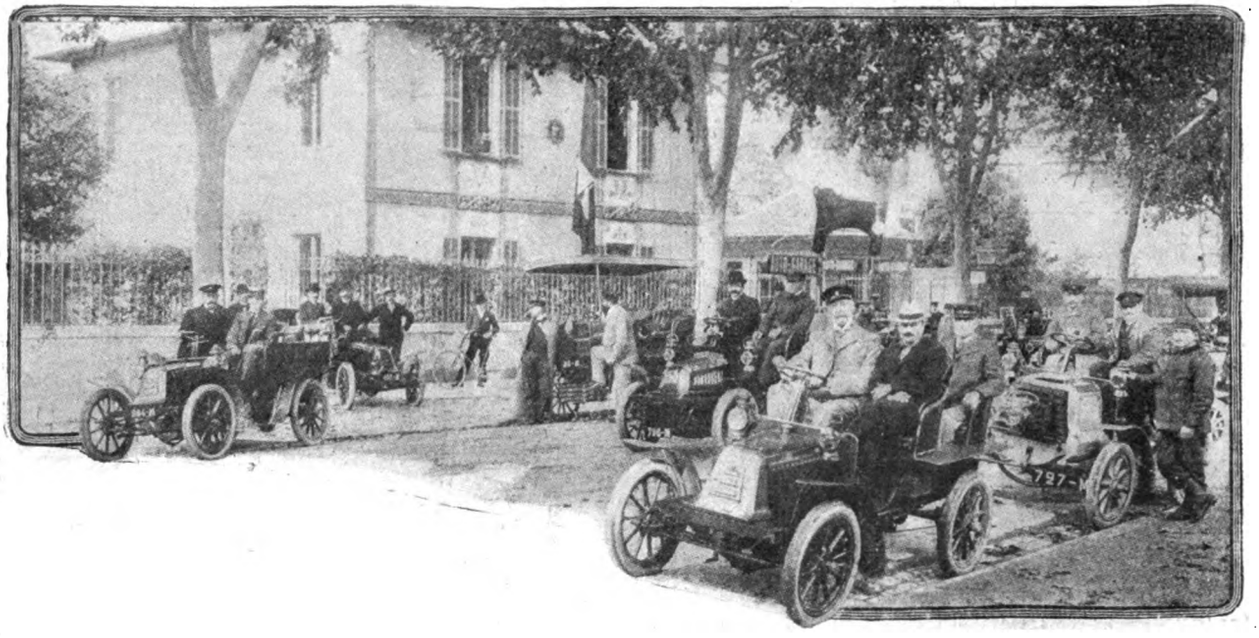
AN AMERICAN MOTORIST'S TOUR IN EUROPE.



MR. PAUL DEMING writes to an American contemporary regarding his recent automobile tour in France and a portion of England, as follows:—"My recent trip through Italy and France on a White steam car was a revelation to me, as it probably is to every American motorist who for the first time motors abroad, of the wonderfully easy and interesting touring that is possible over the unsurpassable roads of Europe. Our party, consisting of my wife and myself, accompanied by a mechanician, arrived at Genoa, February 1st, after a voyage uneventful, except for stops at Gibraltar and Algiers. The city of the famous fortified cliff was reached the day after we had sighted the first land—Cape St. Vincent, Portugal—and during a stop of several hours we easily kept busy sightseeing.

For practically the entire distance to Nice the road winds about the beautiful cliffs that overhang the Gulf of Genoa, which merges into the blue Mediterranean in the distance, with Corsica just visible on the horizon. Sharp turns and steep grades are frequent, and necessitate careful driving, but it is for the most part all that is to be desired. In the towns it was necessary to pass through cobbled streets, and take the utmost care to avoid the children who swarmed out to see us. A railway that crosses and recrosses the highway with patience-destroying regularity is another source of annoyance. At each crossing there are gates, usually in charge of women. Before opening the gates they would always insist on our starting the engine and be ready, and it was not always easy to convince them that our car was not a petrol vehicle and was always ready. At one place we were not permitted to proceed until a train had passed, which at the time we appeared was due in half an hour!

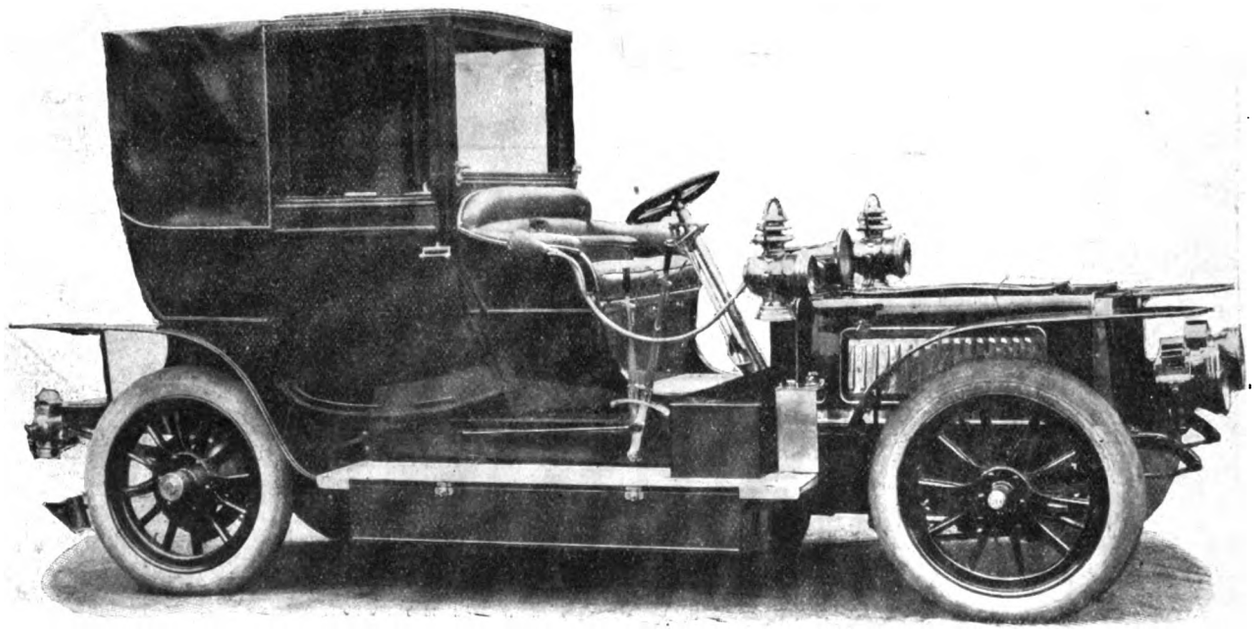
We reached Mentone, on the French border, too late to arouse the customs officer, so had to stay there all night. We arrived in Nice just in time for the famous "carnival," and after spending two weeks enjoying this, and making side trips to Cannes, Grasse, and Monaco, and riding over Napoleon's engineering masterpiece, the Corniche Road, we retraced our way to Genoa.

From this city we went southward, reaching Pisa by night. The roads here were the best we found in Italy; the towns were far apart, and delays for railway crossings infrequent. After a night at Pisa, we entered upon a complete change in scenery. We were now in the mountains, and in every direction from the winding road were tiny towns, nestled in nooks and crannies of the all but inaccessible hills, and each clustered close to the village church, within range of its tinkling bells. So long that day did we let our eyes dwell upon the scenic beauties spread before us, that we finally had to give up the idea of reaching Rome by night, as had been planned. So we put up at one of the very poor hostelries of Civita Vecchia. The next day our road led to Rome. Nothing of exceptional interest was seen *en route*, but, when still many miles from the Eternal City, the dome of St. Peter's guided us to our goal.

We stayed in Rome for ten days, attempting at that time to have at least a fleeting glimpse of the innumerable places of historic interest. From Rome we went to Naples, starting out by the Appian Way, and from there, as our time was rather limited, Mrs. Deming and I went to Venice by train, while the mechanician took the car to Marseilles, whither we afterwards proceeded, having spent ten days in Venice. From Marseilles to Paris we toured in four and a half days, passing through Avignon, Lyons and Saulieu. The road—one of the famous "routes nationale"—was perfect, and the towns were clean and the hotels good. We encountered many other motor-cars on the way, practically all of which were of the touring type.

A Motor Meet outside the Club House of the Nice Automobile Club. [*Motor Age.*

In Paris we stayed eleven days, seeing the many sights in and about that famous city. Then we drove to Dieppe in a day, wasted another day in securing rebate on duties we had paid, and shipped the car to Newhaven by the night boat. We went over on that day boat, and from Newhaven drove to London without incident, except for a pouring rain. From the fleeting glimpses we here had of English roads and villages, we should gladly have stayed much longer, but it was necessary to end the tour at London.



AMONG the rumoured Parliamentary measures of next session is a short bill in the charge of the Earl of Onslow, as President of the Board of Agriculture, having for its purpose to assist the development of motor-car services for the transport of agricultural, garden, and other produce.

THE imports of motor-cars into the United States almost doubled during the first six months of this year, as compared with the corresponding period of 1903. During the six months ending with June there were imported 254 automobiles, valued at about £180,000, while in the first half of 1903 there were only 153 cars, valued at £90,000, imported. Most of the vehicles imported came from France.

THE IDEN PETROL LANDAULET.

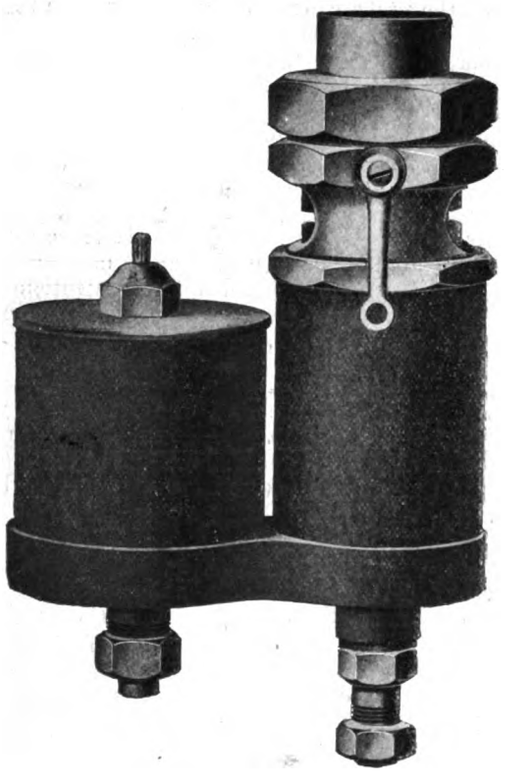
WE are able this week to illustrate a 25–30-h.p. petrol landaulet, the latest production of the Iden Motor Co., Coventry. The main frame of the vehicle is of pressed steel construction, the secondary frame carrying the engine and gear box being arranged in the same plane, instead of below, as usual. The motive power is supplied by a four-cylinder vertical engine, the cylinders being 100 mm. diameter by 130 stroke. Both rotary magneto and accumulator ignition are provided. The valve actuating and governor mechanism is entirely enclosed, while a bearing is provided between each throw of the crank shaft. Special attention has been paid to the question of cooling the cylinders, a special radiator not requiring the use of a fan being employed. The motor is entirely controlled by one lever, and can be throttled down to a speed of four miles per hour. A useful feature is the provision of a valve by means of which the engine can draw in cool air in place of mixture, when running down hill. Three speeds and a reverse are controlled by one lever, the power from the gear box being transmitted by a cardan shaft and bevel gear to a rear live axle. Powerful brakes are provided, these being all provided with a water-cooling arrangement, the water for which can be supplied from the pressure circulating pump. A valve is fitted in the first receiver of the silencer, which can be opened at will, to give either partial or free exhaust when running through open country. The steering gear is of the "Coronet" patent type. The motor and gear box are protected from mud by a shield, which, to avoid raising the dust, is tapered down to the rear. There is a large amount of locker accommodation on the car, and, if necessary, a cabinet can be fitted behind. Arrangements are made for the storing of a tyre over the cardan shaft, without it being seen. The seating in the car is wide and roomy. The doors, which are wider than usual, cannot be closed unless the window frames are dropped. The springs are particularly long and of the laminated Grasshopper type. The axles are of the girder type, while the road wheels are of equal size and shod with 850 mm. by 120 mm. tyres. On the dashboard are fitted a petrol gauge, water gauge, speed indicator, and distance recorder, clock, and voltmeter. As is well known, Mr. Geo. Iden has had a long and varied experience in the construction of both steam and petrol engines, and has devoted himself very closely to the perfecting of every detail connected with this car, the appointments of which are most complete.

The Iden Petrol Landaulet.

SILENT CARS.

TIMES have changed since the days when the average owner of a petrol car did not seriously object to the noise it made. Now he demands a silent car—silent, that is, by comparison with the thunderous, nerve-racking vehicles which were only a short time ago the rule rather than the exception. The motorist who gauges his pleasure by the volume of noise emitted from his silencer has not wholly passed away. Some extremists of this type will even cut out their silencers in order to give the public the full benefit of the exhaust from the engine, with the result that may readily be imagined. But they are in a decided minority, a minority which steadily decreases. It does not take any abnormal amount of discernment to see that the time is likely to come when people of this class will execute a *volte face* and go in for silence quite as strenuously as they formerly did for noise.

At the present time nearly all cars have undergone improvement in this respect. Designers and makers have been quick to see that the public wanted quieter cars, and as they know full well that quiet cars mean efficient cars, and that in following the present fashion they are pursuing the logical line of development, the progress made in this direction is not surprising. In minimising noise power is conserved and used in propelling the vehicle, instead of being wasted; for it has become an axiom that noise is power diverted from its proper use.



Sensitive people like neither noise nor its concomitant, vibration. With them the highest possible praise of a petrol car is to say that it is as quiet as a steam or an electric vehicle; and motorists who have once experienced these qualities are never content to take a backward step and return to the old order of things.

A NEW illustrated catalogue showing the designs of Argyll cars that the Hozier Engineering Company, Limited, are now building, has just been issued. This is a supplementary one, and is intended to show the improvements that have been effected on the designs since their last issue in the beginning of the season. The Argyll brougham with detachable top shown on one of the pages is proving a very popular type of car for autumn and winter work. It is readily converted into an open car and then looks smart and serviceable for summer use. The catalogue should prove of general interest to motorists.

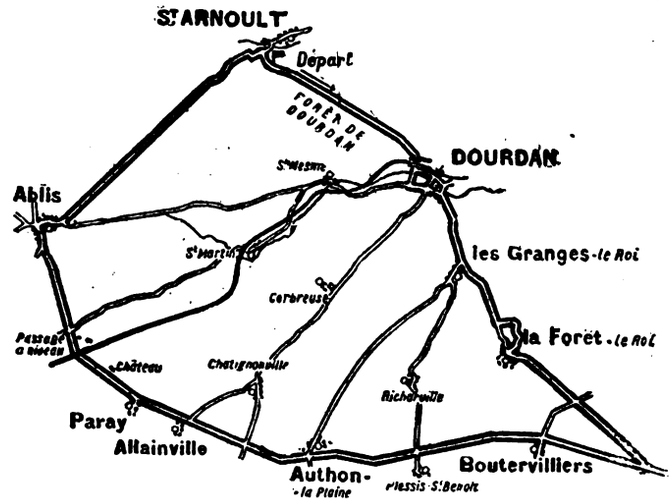
THE BROWN AND BARLOW CARBURETTOR.

MESSRS. BROWN AND BARLOW, LIMITED, of Birmingham, who are devoting much attention to the construction of carburettors for petrol motors, have recently introduced the apparatus illustrated herewith. It is designed to work upon the now well-known float feed principle, and although it comprises no radical departure in design, it includes improvements in many little details, which all conduce to giving satisfaction in working. The carburettor, which has been designed for engines from 3·5 to 4·75 in. cylinder bore, is built up on a stamped base, obviating the use of castings, which are always more or less porous to the action of petrol. The float chamber is made of seamless tube, thus giving the maximum strength with a minimum of weight, and at the same time lending itself to a much better finish than is possible with castings. The jet chamber and the heating jacket are built up in a similar way, except that the necked tube is turned from the solid bar. In thus building up a carburettor the makers claim that they are



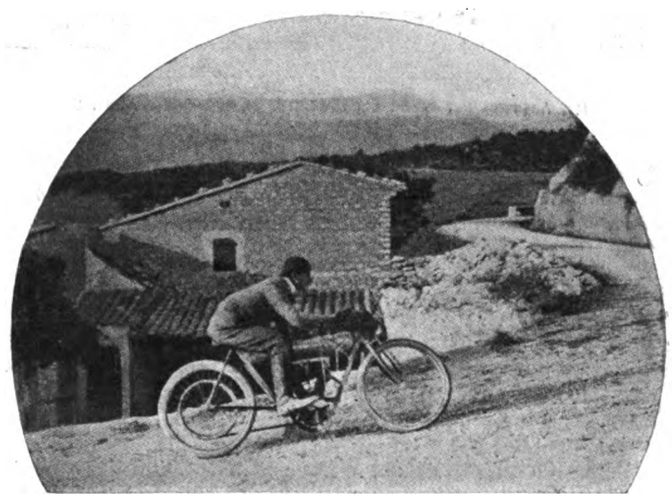
able to get them absolutely true in every way, which is very essential if satisfactory working is desired. The illustration shows a carburettor with a straight throttle fixed, but they are also supplied with a right angle throttle and air valve, which can be set and locked in any position, so making it more convenient when fitting by doing away with the bending of the pipe on the carburettor end.

THE two British-built Duryeas which took part in the Portmarnock trials embodied the firm's latest constructional features for 1905, and after the races were given long test runs on the road. One, after landing at Holyhead, took a course through the hilliest part of Wales to Tenby, returning to Coventry *via* Cardiff with about 700 miles to its credit and five minutes only spent in attention, viz., to tighten the end nut of the magneto. The other was driven to Belfast and taken across to Glasgow and from thence home, Shap Fell and other hills *en route* being taken on the top gear, the attention required being the adjustment of the clutch and the repair of a bad puncture caused by a clog nail in Lancashire.

CONTINENTAL NOTES.

The International Motor-Bicycle Race.

Increasing interest is being shown in the international motor-bicycle race which is to be held on the 25th inst. The course, which is shown in the accompanying map, is 54 kilometres long and has to be covered five times, giving a total distance of 270 kilometres. The starting point is between St. Arnoult and Dourdan. Racing will not be permitted when passing through Dourdan, Le Foret, and Ablis, these places being neutralised,



Map of Course of the International Motor-Bicycle Race.

the time allowances being 8, 3 and 5 minutes respectively. During the whole race 1 hour 20 minutes will be spent in the "neutralisations." The following are the colours allotted to the competitors: France, black; England, green; Denmark, red; Germany, white; and Austria, blue.

◆ ◆ ◆

The French Team.

The eliminating contest to select the French team was held on Sunday last over the Cup course, the start taking place at

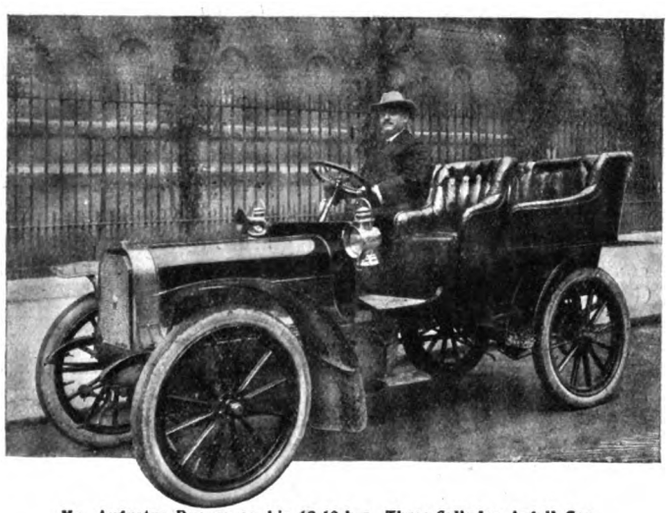
Inghilbert on his Griffon.—One of the French Team in the International Race.

6 a.m., the competitors being sent off at minute intervals. Of the fifteen entries fourteen were weighed in on Saturday, and of these there was not a single absentee. Two riders failed to complete the first round; a further couple were knocked out in the third circuit; only five were left in for the final round, the result being:—1, Lamberjack (Griffon), 3 h. 31 min. 14 sec.; 2, Inghilbert (Griffon), 3 h. 38 min. 34 sec.; and 3, Demester (Griffon), 3 h. 41 min. 21 sec. The fourth and fifth places were taken by riders of Peugeot machines. Lamberjack's average speed works

Digitized by Google

out at over forty-six miles per hour. The French team in the international race on the 25th inst. will thus consist of three Griffon machines.

◆ ◆ ◆



Hill-Climbing in Italy.

A hill-climbing competition, known as the Consuma Cup, was run off on a 15 kilometre course near Florence on Sunday last. The open class was won by Lancia on a Fiat in 13 min. 20 sec. Teste on a Panhard was first in the heavy car section in 14 min. 17 sec., while the victory in the light car category fell to Hemery on a Darracq in 16 min. 8 sec.

◆ ◆ ◆

Motor-Boat Racing in Switzerland.

An interesting series of motor-boat races was held on Lake Lucerne on Saturday and Monday last. The race for "cruisers" not exceeding eight metres in length, and with a maximum of 30-h.p., over a course of 114 kilometres, was won by the Pertuisane, with a Panhard motor, in 3 h. 25 min. 28 sec. The race for "cruisers" not exceeding twelve metres in length, with a miximum of 50-h.p., was a victory for the Marie Madeleine, which is also fitted with a Panhard engine; time 3 h. 11 min. 28 sec. On Monday the first event was a race for "cruisers" up to eight metres in length, this being won by Rapée III. (Panhard engine), in 2 h. 54 min. 7 sec. The race for twelve metre boats was a victory for Fournier's "Hotchkiss"

Mr. Augustus Perono on his 12-16-h.p. Three-Cylinder Argyll Car.

time 2 h. 43 min. 40 sec. In the course of the banquet at the Lucerne Regatta Club, an offer was made to put up a prize of £2,000 for the first man who should succeed in crossing the Atlantic in a motor-boat.

◆ ◆ ◆

More Speed Trials.

The "Velo" is organising a series of kilometre speed trials, to be held on the Dourdan road on October 2nd, the necessary official authorisation having now been obtained. It is expected that some fast times will be recorded.

◆ ◆ ◆

Motor-Vehicles for German East Africa.

The German Kolonial Wirtschaftliche Komite in Berlin is organising a competition among German firms for a heavy motor-vehicle suitable for use in German East Africa. The wagon is not to exceed a weight of two tons, and must be capable of carrying a load of two tons at speeds ranging from three to eight miles per hour and of ascending grades of one in eight.

◆ ◆ ◆

Public Services in Denmark.

A company has just been formed in Copenhagen with a capital of £16,800 to start a number of public services in Denmark, especially in districts not provided with railway accommodation. The new concern has contracted with the Danish postal authorities to carry the mails between certain small towns, and has placed orders for six cars—four with a Danish company and two with a French firm.

◆ ◆ ◆

A German Automobile and Motor-Boat Year Book.

The first edition of the "Jahrbuch der Automobil und Motor-Boot Industrie," issued under the auspices of the German Automobile Union, has just made its appearance. Its compilation is due to Herr Ernst Neuberg, who has apparently spared no pains in making it complete, a point which will be appreciated when it is stated that the work extends to close upon 600 pages and comprises 745 illustrations. Chapters are devoted to commercial and public service vehicles, frames, wheels, axles and tyres, internal combustion engines, electrical and steam cars, while over a hundred pages are allotted to the subject of motor-boats. A useful feature of the work are the abstracts of all the recent patents taken out in England, Germany, Austria and America. The book is, of course, printed in German, and its circulation will consequently be largely confined to the Fatherland, but it should prove a useful work of reference to designers in other countries. Messrs. S. Calvary and Company, Berlin, are the publishers.

◆ ◆ ◆

Renault Redivivus.

Since the fatal accident to Marcel Renault in the memorable Paris-Madrid race, Messrs. Renault Freres have abstained from taking part in any of the big automobile races and speed competitions It is, however, announced that they have built a racing car for an American gentleman, who intends to compete with it in the Vanderbilt Cup race, and that they themselves will again take part in the racing events of the 1905 season.

◆ ◆ ◆

The Gordon Bennett Race.

Germany has now sent in a formal challenge to the French Automobile Club for the 1905 Gordon Bennett race. England and Italy having already notified their intention to compete, there are thus already twelve prospective competitors for next year's event.

◆ ◆ ◆

Motor Racing in Italy.

The Brescia race meeting, the results of which were reported last week, is to be repeated next year, when the event is likely to rank as one of the most important of the Italian racing season, the Chevalier Florio, an ardent motorist, having just offered a cup, valued at £4,000, for competition.

◆ ◆ ◆

Petrol Motor-Boats for River Service.

The Cudell Company, of Aix-la-Chapelle, have lately completed a petrol motor-launch for a public service on the river Saale, at Halle. The vessel, which can carry 120 passengers, is propelled by means of a 24-h.p. four-cylinder engine.

◆ ◆ ◆

The 1904 Gordon Bennett Race.

A meeting of the subscribers to the guarantee fund for the 1904 Gordon Bennett Race was held in Frankfort-am-Main last week, to receive and consider the report of the financial committee of the Automobile Club of Germany. It showed that a heavy deficit had taken place, and 80 per cent. of the guarantee fund will have to be called up. The German Club has undertaken that any profits that might be made by any future race meetings would be handed over to the guarantors.

STILL another brand of motor spirit has made its appearance on the market. It is known as the "Shell," and has been introduced by the General Petroleum Company, Limited. It is being supplied in two qualities, "Shell A," having a specific gravity of about ·700, and "Shell B," about ·715. It is distilled from crude petroleum, and is guaranteed to develop full power under any atmospheric conditions or temperatures possible in Great Britain. We have given the A brand a trial and found it to give results equal to what we have become accustomed to with other motor spirit. It is supplied in the usual oblong two-gallon cans, but, to meet the convenience of an ever-increasing number of users of small cars and motor-cycles, it can also be obtained in one-gallon square tins.

Digitized by Google

MOTOR CYCLING NEWS.

ON Saturday, the 24th inst., the annual motor-cycle contest held under the auspices of the Auto-Cycle Club will take place at the Crystal Palace. It will begin at 2 p.m, when the following cups will be competed for:—Motor-Cycle Cup. For a one hour's race for motor-bicycles with engines having a total capacity not exceeding 70 by 70, or the equivalent volume swept out. *The Motor-Car Journal* Cup. For a five miles handicap for bicycles having a total capacity of 76 by 76, or the equivalent volume swept out. Automotor Cup. For a series of one mile time trials, for machines not exceeding 76 by 76, or the equivalent volume swept out. Mr. J. F. Crundall is the present owner of the first of these cups and Mr. J. J. Leonard of that given by the *Motor-Car Journal*.

◆ ◆ ◆

THE Motor-Cycle Club wound up their season on Saturday at Redbourne (Herts.), with successful reliability trials of motor-cycles of entirely British manufacture, for the Albert Brown trophy. The course extended to 150 miles over roads well calculated to prove staying power. There were sixteen starters, the first in being:—1, William King, Cambridge (King); 2, F. Hulbert (Hulbert-Bramley); 3, F. J. Crundall (Humber); 4, Rupert M. Brice (Brown). Crundall, who was the first to arrive with a tri-car, received a special prize. No fewer than ten rode 150 miles without a stop.

◆ ◆ ◆

THE hundred miles non-stop run of the Manchester Motor Club was held last week, the route being from a spot six miles from Knutsford to Shrewsbury and back to Plumbly. Messrs. G. Brown (Lloyd), F. Bullock (Clement-Garrard), and J. W. Leech (Bradbury) each made non-stop runs and will receive gold medals.

◆ ◆ ◆

THE "Auto" is organising a competition for motor-bicycles with engines of a cubical capacity of not more than one third of a litre. The trials will be held in Paris from the 3rd to the 11th prox.

◆ ◆ ◆

THE most exciting motor-bicycle race ever seen in Ipswich took place at the Suffolk Police Athletic Sports on Wednesday of last week, before an attendance of over 8,000 spectators. The event was a three mile open handicap, Mr. F. Straight being handicapper. There were three heats. In the first heat, Tessier, on a Bat, won easily, as did Tyler, on a Triumph, in the second heat. The third heat was won amidst great excitement by Hodgkinson, on a J.A.P., who beat Egerton, of Ipswich, the only local competitor, on a 2¾-h.p. roadster Pat, by five or six lengths. The latter, however, was qualified for the final by virtue of his being the fastest loser in the three heats. In the final Egerton rode splendidly and won amidst great applause, beating Hodgkinson (who had beaten him in the third heat) by two lengths; time, 5 min. 45 2-5 sec. The course, which is a grass one, was very soft, owing to heavy rain having fallen the day before, and has very sharp corners. One of the competitors was unable to take a corner, and ran into the crowd, injuring two people.

◆ ◆ ◆

ON Saturday last the members of the Motor Union of Ireland held a non stop run to Maryborough and back. The start was from Inchicore Bridge, by the road made familiar during the Gordon Bennett week, to Maryborough and back to Inchicore, total distance ninety-six miles. The contest was open to members who had not won a prize in any motor-cycle competition during the present season. The start was fixed for mid-day, the minimum time at Maryborough 2.30 p.m., maximum 3.20. Here a compulsory stop of forty minutes was enforced, during which repairs and adjustments were permitted without incurring any penalty, while tanks could be filled with oil and spirit. The minimum time for the return to Inchicore was 5.20 p.m., maximum 7.20 p.m. A penalty of five marks deducted from the total to be made for each and every stop, no matter from what cause, save and except that at Maryborough; for all competitors going through from Inchicore to Maryborough without a stop full marks would be awarded, and in a like manner those completing the return journey from Maryborough to Inchicore Bridge would gain equal marks. The event resulted in a tie between Messrs. Turpin, Lewes, Horby, and Cathcart, and the prize will be divided.

Photo by] The Competitors in the Albert Brown Trophy Motor-Cycle Competition. Mr. W. King, the winner, is seen with his machine on the extreme left. [E. W. Ashworth.

◆ ◆ ◆

MESSRS. R. AND J. DICK, whose driving belts are largely used on motor-cycles, draw attention to a few points connected with the subject which are worth noting. The life of belts mainly depends on their being kept at such a tension as just to prevent their slipping. It is also important that the pulleys should be quite in line, otherwise, the pull being unequal, the belt will soon be destroyed. As a remedy for a dirty or greasy belt they recommend that it be wiped with a rag dipped in paraffin, but care must be used not to unduly wet the belt. As regards the varying results riders get out of belts of similar make, it is well to note that much depends on the treatment the belt receives, the weather, and the roads over which the machine is running. It is generally conceded that a belt is all the better for having the tension relieved by slipping it off the pulley at the end of the day's run.

◆ ◆ ◆

ON Thursday and Friday, the 15th and 16th inst., the reliability trial of the Auto-Cycle Club to Exeter and Southampton is being held.

Digitized by Google

THE SMALL CAR TRIALS

REPORT OF THE JUDGES.

THE Trials commenced on Monday, August 29th, and concluded on Saturday, September 3rd, when the cars were assembled, and traversed the city of Hereford in procession. During the twelve runs of about fifty miles each which constituted the Trials the judges watched the performance of the cars and carried out various tests. On two days following the Trials they made further tests, and examined the construction and condition of each car. They now report as follows :—

Out of the 38 entries 35 competitors started, and of these 26 completed the 620 miles. The order of merit as to non-stop runs of all cars which completed the 620 miles is given in Table I., and the class and performance of each competitor appears in Table II., a record of road performances summarised in previous issues.

TABLE 1.—NON-STOP RUNS.

ORDER OF MERIT.

Siddeley, No. 18	12 Non-stop Runs.
Croxted, No. 30	
The Wolseley Team { No. 20, 12 N.S. / No. 10, 11 N.S.	11½ Non-stop Runs.
The De Dion Team... { No. 22, 12 N.S. / No. 23, 11 N.S.	
The Humber Team, No. 16 and No. 34 ...	11 Non-stop Runs.
The Swift, No. 14	10 Non-stop Runs.
The Oldsmobile, No. 25	
The Swift, No. 26	
The Alldays Team... { No. 32, 10 N.S. / No. 17, 9 N.S.	9½ Non-stop Runs.
The Star Team ... { No. 38, 10 N.S. / No. 15, 8 N.S.	9 Non-stop Runs.
Prosper Lambert, No. 37	
6-h.p. Mobile, No. 11	8 Non-stop Runs.
6-h.p. Speedwell, No. 2	7 Non-stop Runs.
8-h.p. Mobile, No. 24	
9-h.p. Speedwell, No. 13	6 Non-stop Runs.
6-h.p. Pelham, No. 8	5 Non-stop Runs.
8-h.p. Brown, No. 12	
9-h.p. Anglian, No. 31	
The Jackson Team... { No. 4, 6 N.S. / No. 1, 3 N.S.	4½ Non-stop Runs.
The Clyde, No. 21	4 Non-stop Runs.

Of the cars which failed to complete the runs a few were, nevertheless, of promising novelty, and some of already proved merit failed in consequence of defects not likely to be recurrent. Of the latter, there were the 7-h.p. Oldsmobile Runabout, in which the cooling system proved defective; the 8-h.p. Cadillac, one bearing of which heated and seized; and the 6-h.p. Vauxhall, which broke its connecting rod. The novelties were the 8-h.p. Rover, which was disabled by the breakage of one ball in a crank shaft bearing, and the 7-h.p. Downshire, in which one of the gear wheels was broken by displacement of a pin. Defective pipe connections were mainly accountable for the other retirements.

A large number of cars appeared to be made up of almost identical parts, individually well designed, but roughly and sometimes flimsily assembled. This was particularly noticeable with regard to parts of tubular frames, back axles, gear box, and engine connections. Several of the tubular frames are made with weak lugs carrying the underframe, and five of these lugs broke during the Trials.

The majority of live back axles differ little in design, except that some have trussing stays to the bevel gear-box, whilst others leave the somewhat heavy weight in the middle of the axle insufficiently supported. The bevel gear-box of some axles is conveniently arranged to permit withdrawal of the bevel pinion without dismantling the axle. The Wolseley, Siddeley, and Prosper-Lambert cars carry the back wheels on extensions of the tubular part of the axle, thus relieving the differential axle of all weight and all stress other than that of torsion—a construction to be commended.

In more than one instance it was found that the axles were neither parallel nor at right angles to the frame, nor did the front wheels track with the hind wheels. Although no appreciable difference in the wear of the tyres was noticed at the end of the 620 miles of running, the result of improper alignment of axles cannot but have a detrimental effect on the life of some or all of the tyres.

In the construction and arrangement of brakes great improvement is shown. The side brakes on a few cars are effectively compensated, but in others, where wire rope with sharp bends is used, the intended compensation is not effective. In several cases the absence of a flange on the inside of the brake drum permits the band to wander from its place.

The foot brakes are generally effective, but several, when applied, tend to displace and strain the gear-box shaft, causing unnecessary wear of the bearings. Adjustments of some kind, though not always accessible, are provided on all cars. The foot brake on the De Dion cars is notably easy to adjust, and two or three cars have right and left-handed shackles for ready adjustment.

The order of merit of the cars in respect of their brakes, as shown by the tests on hills, is given in Table III. This does not take into consideration the design or construction of the brakes, but only their performance when tested unexpectedly towards the end of the Trials.

TABLE III.—BRAKES.

ORDER OF MERIT.

First grade	No. 12	8-h.p. Brown.
	22	6-h.p. De Dion.
	23	Do.
	25	9-h.p. Oldsmobile.
Second grade	14	7-h.p. one-cylinder Swift.
	15	7-h.p. Little Star.
	17	7-h.p. Alldays.
	26	7-h.p. two-cylinder Swift.
	32	7-h.p. Alldays.
Third grade	13	9-h.p. Speedwell.
	18	6-h.p. Siddeley.
Fourth grade	8	6-h.p. Pelham.

A remarkable improvement is shown in the carriage springs and body suspension, and the seating and footboard accommodation is less cramped than hitherto.

TABLE IV.—Consists of dimensions and other particulars, most of which have already appeared in the *Journal* in describing various vehicles.

Many cars have steering gear of the rack-and-pinion type, with the rack not protected in any way from the ingress of dust and mud. All these show signs of considerable wear, and some were nearly worn out. The steering gear is in several cases poorly attached to the frame by a single bracket flange. With a steering rack some distance below, not stayed in any effective way to take the thrust, a twisting strain is thrown on the bracket, and causes looseness. Pins in the links of the steering gear frequently have small wearing surfaces, which give rise to backlash and rattling, but on the whole there is a general improvement in the design and construction of steering gears.

The number of tyre troubles was exceedingly small, as might be expected considering the light weight of the cars, but it must be noted that the road surfaces were exceptionally good.

Twenty-two of the engines which completed the Trials were vertical and four horizontal. Many of the vertical engines have their commutators placed in inaccessible positions close to the front or side of the frame. In the two-cylinder Humber, No. 34, bevel gears are used to bring the commutator into an easily accessible position; in others, the entire commutator is designed for easy detachment. It was noted that the horizontal engine designs lend themselves to convenient arrangements in this respect.

Digitized by Google

One of the most frequent causes of stoppage was defective junctions in pipework. Rubber connections on water pipes are often too short, and the edges of the pipe ends, aided by vibration, cut through the rubber. Petrol and oil pipes frequently broke off at the terminal collars or unions, owing to neglect to anneal after brazing, and to the vibration of long unsupported lengths of pipe. Slack-fitting coarse-threaded unions, which came unscrewed, were numerous. Water pipes attached to tanks without a flange, riveted as well as soldered, in several cases came adrift. The use of brass flanges on exhaust pipe connections caused trouble, and is to be deprecated. The petrol tanks on some cars are inadequate for ordinary requirements, and a few are placed too low to feed the carburettor on steep hills.

Except for broken pipes, no troubles arose through insufficient lubrication. Few cars are fitted with ring lubricated bearings, a feature which might with advantage be more generally adopted.

The number of stoppages on the road caused by defects in inlet valves shows the need of attention to proper design of the cottars and the fittings at the end of the stem.

There was marked superiority in the cleanliness of those cars provided with good aprons or undercasings. One badly-fitting apron, however, caused trouble, and several aprons, leaving large open spaces, were ineffective.

Bowden wires are used in a few cases for throttle and spark connections, and proved unsuitable.

The construction of clutches as to adjustment and end thrust shows considerable improvment, especially in some cars of British design and make.

The electric wiring on most of the cars has received more attention than was usual a year ago, but still leaves much to be desired. The two-cylinder Humber and the De Dions in particular, and also the Swifts, the Mobiles, the Wolseleys, and the Siddeley, have taken special pains to avoid loose wires, with their consequent liability to breakage, more particularly in the case of the heavy high-tension leads. Terminals on British-designed cars were notably better considered than those on the usual foreign type.

The consumption of petrol, as seen from the accompanying Tables V. and VI., varied considerably, the best performance being remarkable, and the average highly creditable.

TABLE V.—PETROL CONSUMPTION PER CAR MILE.

ORDER OF MERIT.

The water consumption on the majority of cars was negligible, no less than fourteen of them requiring less than 1½ gallons, although the country traversed was exceptionally hilly. Tables VII., VIII., IX. and X. show the order of merit of the cars in regard to vibration, noise, ease of manipulation, and comfort of passengers respectively.

Table XI. shows the hill-climbing performances of the various cars on the timed hills, and Table XII. gives their order of merit considered with reference to speed and hill-climbing performance generally. Table XI. also gives the calculated power developed on the driving wheels, taking 60 lb. per ton as the tractive effort or draw-bar pull. This figure was arrived at by experiments carried out on Frome's Hill a few days prior to the Trials. These experiments also showed that the starting effort required on the steepest portion (gradient 1 in 6·25) was about 600 lb. per ton.

25	21	...	7-h.p. Clyde.
26	4	...	6-h.p. Jackson Dogcart.

The awards were published in the *Journal* last week, and the judges recommend the bestowal of the following medals:—

GOLD MEDALS.

To the Wolseley Tool and Motor Car Co., Ltd., for their cars Nos. 10 and 20, for general excellence of design, construction, and workmanship, and for hill-climbing.

To the Siddeley Autocar Co., for their car No. 18, for general excellence of design, construction, and workmanship, and for hill-climbing.

To the Swift Motor Co., Ltd., for their cars Nos. 14 and 26, for general excellence of construction and workmanship, for hill-climbing, and for smoothness of running.

SILVER MEDALS.

To De Dion Bouton, Ltd., for their cars Nos. 22 and 23, for excellence of workmanship, for consistent running, and for hill-climbing.

To Humbers, Ltd., for their two-cylinder car No. 34, for general excellence and attention to detail.

To Alldays and Onions Co., Ltd., for their cars Nos. 17 and 32, for general construction, neatness of design, and smoothness of running.

BRONZE MEDALS.

To the Speedwell Motor and Engineering Co., Ltd., for their car No. 2, for its construction and performance considered with reference to price.

To Brown Bros., Ltd., for the quality and construction of details of their car No. 12.

To the Star Engineering Co., for their cars No. 15 and 38, for hill-climbing and for construction with reference to price.

To Jarrott and Letts, Ltd., for their Oldsmobile No. 25, for ease of manipulation and for details of construction.

To the Holland Park Motor Co., for the design and construction of parts of their Prosper Lambert car No. 37.

To Messrs. F. W. Garner and Co., for their Croxted car No. 30, for its performance and for its construction considered with reference to price.

HON. MENTIONS.

To the Clyde Cycle and Motor Co., for low petrol consumption, of their car No. 21.

To the Mobile Motor and Engineering Co., for their car No. 24, for its general performance as a four-seated vehicle.

The performance of the cars generally has been remarkable. The Judges are, however, of opinion that a greater distance than six hundred miles is necessary to bring out by automatic records the qualities of the cars and their minor but important details. They also draw attention to the fact that although the non-stop performances provide an automatic indication of some of the qualities of the cars and drivers combined, the important matters upon which the ultimate durability, performance and choice depend are chiefly shown by the examination and consideration of details which takes place after the non-stop runs have been completed, and have on this occasion determined the distribution of the medals.

CHASE MOTORS, LIMITED, is the title of a company registered with a capital of £5,000 to acquire the business carried on at 9 and 9A, Station Road, Anerley, as Chase Motors, to adopt an agreement with Messrs. A. A. Chase, F. W. Chase, D. C. Goodwin, and W. Worne, and to carry on the business of manufacturers of motor-cycles, motor-cars, etc.

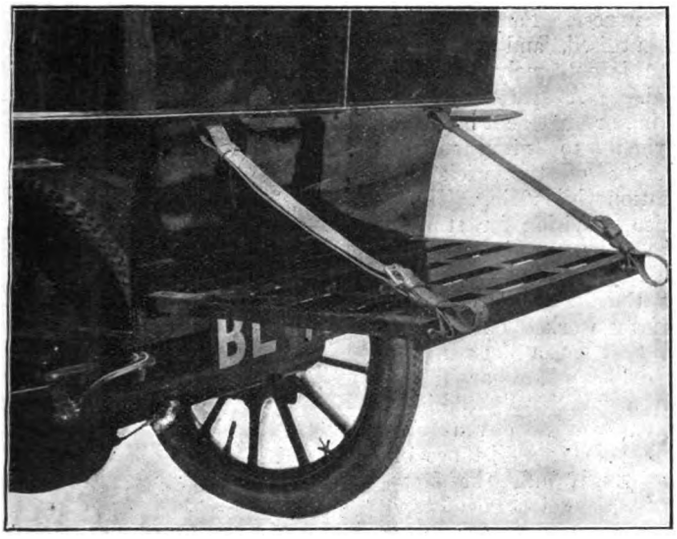
HERE AND THERE.

A PEUGEOT car is being used in the Dutch military manœuvres at present being held in North Brabant.

THE New York Fire Department has purchased a Columbia 35-h.p. petrol car for the use of the Chief of the Brigade.



THE city of Kiel, Germany, is now being supplied with milk twice daily from in the neighbourhood of Pretz by means of motor-wagons.

DURING the month of July last there were exported from the United States automobiles and parts to the value of £36,636, as compared with only £31,947 in the same month of 1903.

MOST of the annoyances that motorists encounter are due to little things. A broken electric connection can be quickly remedied, yet if ignored, small though it be, it exerts an insurmountable influence in keeping the car out of service.

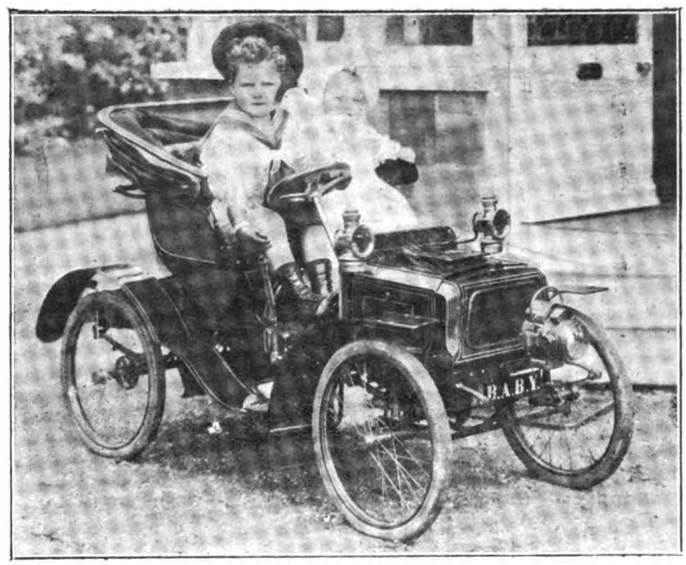
THE growing importance of the automobile movement in Canada is shown by the trade returns recently issued for the season ending April, 1904, which gives the value of automobiles imported into the Dominion from the United States as £35,600.

THE accompanying illustration shows a telescopic luggage grid fitted to a body recently built by the Lacre Motor-Car Co., Limited, for Mr Arnold Hall, of Reading, for his Argyll car.

The feature of the grid is that it forms part of the back panel, and when closed is almost invisible. It is very secure and capable of carrying a great amount of luggage.

THERE are 2,150 automobiles registered with the Secretary of State of Connecticut, U.S.A. Of these Hartford, with a population of 90,000, claims 500, or nearly one-fourth of the whole. On the other hand, New Haven, with a population of 125,000, has less than 300 motorists.

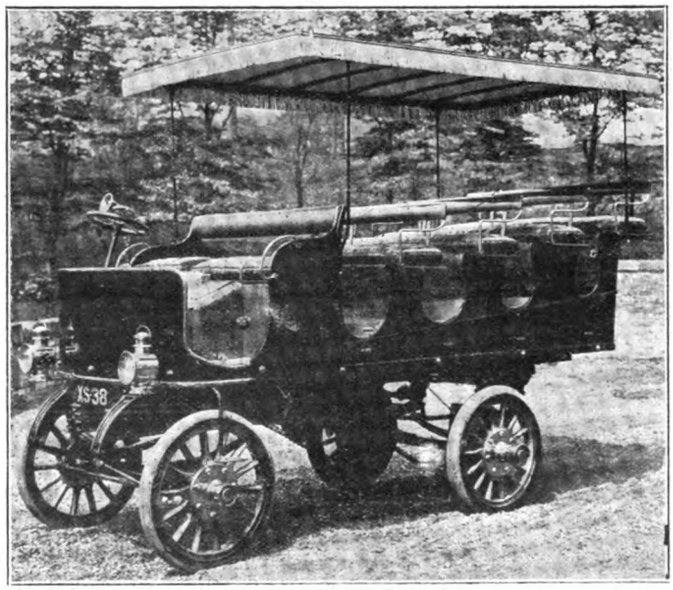
THE Wolseley Tool and Motor Car Company, Limited, have secured an order for a six-cylinder petrol engine to develop, at normal revolutions, 140 brake horse-power. The order has been placed by the General Electric Company, of Schenectady, New York, for the first of their new petrol electric railway coaches.



THE Father L. E. Wahlmier, of Plainville, Kan., has purchased an Oldsmobile for use in his missionary work on the plains. He states that the automobile was a necessity because of the great distances he has to cover in his work, the part of the State in which he lives being sparsely settled, and the parishes widely separated.

MESSRS. BELL AND MOORE'S first auction of motor-cars on the De La Warr track at Bexhill must be regarded as a success, seeing that the sales totalled £2,000. Four cars were sold by auction, and several by private treaty, so that it may be safely assumed that those who intend to dispose of their present vehicles will look forward to the announcement of the next auction at Bexhill with some degree of interest.

THE King has ordered a pair of Parson's non-skids for his new car.



MESSRS. PEMSEL AND WILSON have opened a garage and repair works at Apsley End, on the main road between Watford and Tring.

IT is announced that the Mayor of Ostend has issued an order restricting the speed of motor-cars in the town and on the promenade to five kilometres an hour.

Master George Du Cros on his home-made Automobile.

THE Mo-Car Syndicate, Limited, have lately supplied two public service vehicles of the type shown in the accompanying illustration to the Fleetwood Motor Passenger Carrying Company, Limited, which is running a service between Knott End and Garstang, Lancashire. These vehicles have accommodation for sixteen passengers, a driver and conductor, and are fitted with the Arrol-Johnston standard, horizontal, balanced 12-h.p. engine running at a normal speed of 800 revolutions per minute. The

speed attained is twelve miles an hour with full complement of passengers. The vehicles are fitted with solid tyres, and everything has been done to make them as reliable as possible. It will be noticed that each bank of seats is stepped, so that all the occupants get a clear view ahead in the approved char-a-banc style.

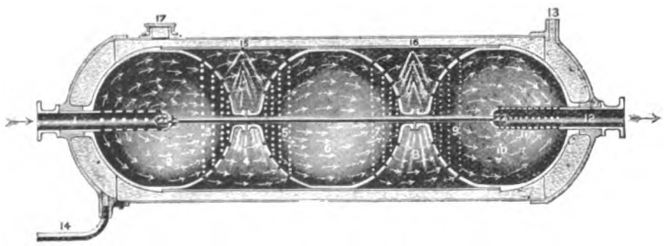
He who likes his own car has a good one.

In Murray Street, Perth, Mr. B. Shiell has opened a garage for thirty cars.

The Bull Hotel, at Redbourne, has a motor pit included in its accommodation for automobilists.

A motor-car shed, with capacity for six vehicles, is being erected by the G.W.R. at Falmouth Station. A public service to Redruth is being contemplated.

An addition to the number of signposts in Herefordshire is being suggested to the county surveyor—one result of the awakening caused by the small car trials.



The above illustration shows the lock nut on the needle valve of the carburettor on the De Dion car driven by Miss Dorothy Levitt in the Small Car Trials, which, by coming loose, unfortunately spoilt her record of non-stop runs. Commenting on this, Messrs. De Dion-Bouton, Ltd., inform us that it is the first time that such a fault has occurred in their experience.

Motor-cycles amounting to an aggregate value of £43,040 were exported from Belgium during the first half of the current year, as against £39,955 in the corresponding six months of 1903.

In the 1,000 miles Motor Cycle Reliability Trial recently held, four of the seven motor-cycles that secured first-class certificates were fitted with "A Won" Clincher motor-cycle tyres, two obtaining gold medals and two silver medals.

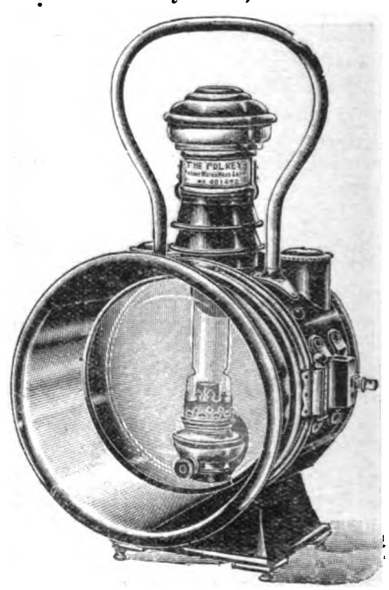
The Imre Engineering Company, whose "Universal" silencer for petrol cars has met with great success, have recently brought out a new form of the device specially designed for use on petrol motor-boats, and of which a sectional view is given herewith. The gases enter at 1, and are broken and allowed to escape into the first bulb through the holes in the nozzle, where the first expansion of the gases occurs in the space 2. After this expansion, the gases escape through perforations, 3, into the chamber, 4, where a further expansion and cooling takes place. It will be seen that water is sprayed into the chamber, 4, through very small holes, 15, which materially reduces the temperature of the gases as they pass into the bulb, 6, by way of a larger number of finer holes, 5. Cooled and expanded, the gases are again broken by passing through the perforations, 7, into the chamber 8, where another fine water spray from very small holes, 16, combined with the expansion, again decreases the temperature so materially that on emerging through perforations, 9, into the bulb, 10, the gases are so thoroughly broken up, expanded, and cooled, that they emerge from the fine holes, 11, into the discharge nozzle, 12, almost, if not as cool as the atmosphere. An additional cooling medium is provided by fitting the silencer with a water jacket, the construction being so arranged

that every portion of the silencer proper is surrounded. It may be remarked that when circulation of the water ceases through stoppage of engines, the fine spray holes, 15 and 16, would allow the water above them to flow into the silencer. The spray holes are, however, so drilled to regulate the depth to which the water would rise in the silencer (about the height of 4), that the water so taken into the silencer is expelled, practically as spray, through 11 and 12, by the pressure of the exhaust gases, on the engine being restarted. The water inlet from the pump is shown at 13, 14 being the outlet, and 17 the filling cap.

A motor-car is to be obtained for the use of the Highways Committee of the Leeds Corporation.

"Looping the Loop" performances by motor-car are at present taking place in Paris and Breslau.

Sir Montague Turner, of Havering, has recently acquired a 16-h.p. Wolseley side-entrance phaeton.



Messrs. Alford and Alder, of Newington Butts, S.E., have been appointed agents in London and the South of England for the Downshire cars of Messrs. Chambers and Co.

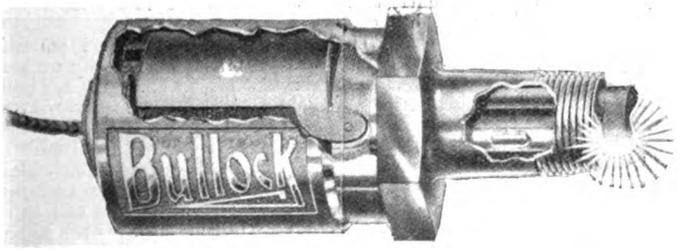
Doubtless the recent trials in Herefordshire will give an impetus to the automobile branch of Messrs. Connelly and Son's business in the county town, which is being superintended by Mr. T. E. Connelly.

The Coventry Motor Bodies Co., Percy Street, Coventry, have started business as motor-car body builders. We learn from Mr. Hobley, the principal, that he has a large amount of work in hand, and already contemplates removing to larger premises.

Messrs. A. Townend and Company, Limited, has been registered with a capital of £1,000 to acquire the business carried on at 11, New North Road, Huddersfield, as A. Townend and Company, and to carry on the business of manufacturers and repairers of automobiles, etc.

The "Polkey" headlight is seen on many a car, its excellent light proving well adapted for the purpose. Paraffin is the fuel utilised, and the light given is extremely well diffused. A patent wick-locking arrangement has been provided to prevent the lowering of the wick by vibration while riding. There is also provision for storing spare chimneys in case of accident, and it is evident that the details have been carefully worked out. It is said that on a dark night the driver of a car fitted with a "Polkey" headlight can easily pick out a telegraph pole at a distance of sixty yards, and the facts that it can be lit immediately and has no smell are good points in its favour. The lamp is made by Messrs. George Polkey, Ltd., of the Hockley Lamp Works, Birmingham.

Dogs appear to have a liking for motoring, more particularly the poodles, but, as their eyes suffer, "lunettes pour chiens" have lately been introduced in Paris. It is now no uncommon sight in the French capital to see a poodle perched on a motor-car gravely peering through goggles.



We learn that a Mr. E. H. Perkins, of Warren, Mass., U.S.A., has begun the construction of a novel car. It is to have six cylinders, four to be used for driving the car, one for generating electricity for ignition and electric lighting purposes, and one for running an air compressor for use in starting and to operate the air brakes.

The Eclipse Motor and Cycle Company, Birmingham, have brought out a little novelty known as the "XL'ALL" puncture stop, to enable ordinary punctures to be repaired without having recourse to solution, patches, or vulcanizing. The stop consists of a metal plug, made in two parts, which are held together by a screw. When the puncture is found a small round hole about 1-8th inch diameter is made in the tube. The bottom disc of the plug is slipped through the hole; the thin washer is then placed immediately above the hole and a small screw fixed into the countersunk hole, the whole being screwed up as tight as possible. The makers state that the outside metal washer does not affect the outer cover in the slightest, owing to its being held in place by the air in the tube only.

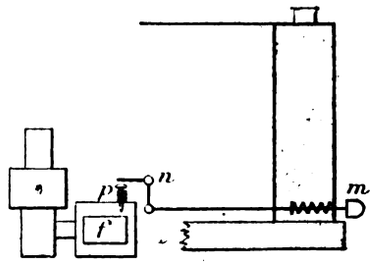
THE BULLOCK IGNITION DEVICE.



A MAGNETICALLY operated primary electric igniter has lately been introduced by the Bullock-Beresford Manufacturing Company, of Cleveland, Ohio. The device consists of a plug screwed into the wall of the cylinder, somewhat similar in form to an ordinary high tension sparking plug, and is used in conjunction with a battery and a contact device on the cam shaft of the engine. One of the plug terminals is earthed, and the other is connected through the contact maker to the battery. Self-contained within the plug is a low voltage, electro-magnetic device, the magnetic influence upon which its operation depends being produced by wiring within its enclosing case. Briefly described, it is a simple sparker which by means of a movable electrode produces a spark that might be expressed as a cross between a jump spark and a make and break. The movable electrode comprises a platinum pointed arm on the end of a rotary shank whose outer end is so connected to a movable piece that the vibration of the latter causes a similar and concomitant vibration of the electrode. This vibration being extremely rapid, a stream of sparks, which are in effect one continuous flame, occurs between the points of the movable and stationary electrode as long as the circuit remains closed. A positive spring system insures the return action of the vibrating parts, whose initial movement is, of course, produced by the electro-magnetic influence due to the passage of the low voltage current through the wiring. Assuming that the engine is at the ignition point and current flows through the wire winding on the body part of the device, this causes the same to become magnetised and attract the annular armature, the movements of which are communicated to the moving member which controls the electrodes and extends from one end of the igniter to the other. Owing to the construction, no leakage of gas takes place through the opening provided for this moving member. The body of the device carries a winding of a very few turns of coarse copper wire embedded in fire-proof cement. The insulated electrode is firmly and rigidly constructed, both electrically and mechanically, so that it is impossible for it to become short-circuited or earthed, and the terminal wire is held securely in place in an ingenious manner. The device is wound to operate with 12 volts, and the makers recommend that at least eight dry cells or a 12-volt dynamo be used in conjunction with it. On account of the use of a low voltage current, supplied either by a battery or a dynamo, no high tension induction coil is necessary, this not only reducing the parts liable to cause trouble, but simplifying the wiring. There is one wire from the igniter to the battery and one earth wire from the battery to the motor. A suitable contact maker on the cam shaft of the motor is connected up to the circuit, as is also an ordinary switch for interrupting the current. An important advantage claimed for the low voltage at which the igniter operates is that it shows less tendency toward leakage of current over wet or dirty surfaces, or on account of oil and soot collecting on the sparking points. Economy

of current consumption is another advantage of the system, for, according to figures presented by the makers, the Bullock igniter, when on a closed circuit, consumes from ¼ to ½ ampere, and produces at this velocity of current from 75 to 150 electric flashes or sparks per second. With a suitable contact maker, making a firing contact of ono-tenth of a revolution, the rate of discharge of current is correspondingly reduced.

SOME USEFUL NOTES.

AFTER a car has been standing for some time it is usual to agitate the float in order to allow a supply of fresh petrol to flow into the carburettor. To do this, the side door in the bonnet has in most cases to be opened and in others the whole bonnet has to be raised. A useful little device to obviate this is now being fitted to the Richard-Brasier cars. Referring to the sketch

which is taken from "La Vie Automobile," a light rod, m, with spring, is fixed so that it passes through one of the holes in the honeycomb radiator or lies against the frame; the rod terminates in a small bell crank lever, n, one end of it being over the upper end of the float spindle. Thus a few pushes on the rod, m, secures a supply of fresh petrol in the carburettor and away starts the engine on the first turn of the adjacent starting handle.

◆ ◆ ◆

A MOTOR-CAR is like any other machine in many respects, and should be treated accordingly. It should be used with due regard to the work for which the manufacturers designed and built it. A light runabout is not a touring car, and is not, properly speaking, a four passenger vehicle. There is no doubt that the light car will stand up under a good deal of touring, with proper care, but the wear and tear on the machinery is bound to be greater than when the car is used under normal conditions, and it should not occasion surprise if more than usual attention and more frequent renewals are required.

◆ ◆ ◆

THEN there is the extra passenger question. Almost any two-seated car can be fitted with an extra seat for the accommodation of one or two passengers more than the normal capacity of the vehicle, and no trouble will be experienced on smooth roads; but on rough or hilly roads the matter assumes a different aspect. The same springs cannot be made to carry four passengers with the comfort and safety with which they will carry two, for the overloaded springs will leave most of the work of absorbing shocks to the tyres, and a rough journey may be expected. With a heavy car of the touring type it will, of course, be different, as the proportionate weight of the passengers is less and the springs are larger and have a greater range of movement. Consequently if one wants to take out a couple of extra passengers in a light car, smooth and level roads should be chosen. If much touring is to be done, or if it is desired to carry more than two passengers most of the time, a heavier type of vehicle should be used.

◆ ◆ ◆

IF a valve or the porcelain in a sparking plug breaks care should be taken to ascertain whether any of the pieces have got into the cylinder. If so, they should be removed before attempting to run the motor, as it does not take a piece of steel or a few chips of hard porcelain a very long time to so cut a cylinder that it must be renewed. As a rule, cylinder walls are not of sufficient thickness to permit reboring if it is necessary to take off more than the merest suspicion of a cut, and a few chips caught by the piston can make fairly deep grooves the entire length of the stroke.

THE Heron Motor Company have taken large premises at 89 and 91, John Bright Street, Birmingham, and have equipped a factory with tools for the execution of all kinds of repairs.

CORRESPONDENCE.

TYRE BURSTS.

To the Editor of *The Motor-Car Journal.*

Sir,—I have read with interest Mr. W. H. Bartlett's letter in the *Journal* of the 3rd inst. in regard to the bursting of tyres. Whilst admiring his optimism and being anxious myself to fall in with his view that, no matter what the speed or the weight of the car, no danger is involved through the tyres bursting, nevertheless I am compelled to disagree with him. In the majority of cases, in the hands of a fairly expert driver, I agree that accidents need not be occasioned through either the front or rear tyres bursting, but Mr. Bartlett must be perfectly well aware, as other automobilists are aware, that accidents have been occasioned through the bursting of tyres, and hence every care should be taken in periodically examining the tyres in order that no mishaps of this description should occur.

I, myself, in the last Circuit des Ardennes race, saw one of the rear tyres on Rigolly's Gobron-Brillie car burst, and a tremendous swerve took place; so great, in fact, that the other rear tyre was torn off in consequence, and in a second the car, which was travelling at a very high rate of speed, was practically out of hand. Had it not been for the masterly manner in which Rigolly handled it, a very serious accident would have taken place.

Accidents can happen from tyres bursting, in spite of any statement to the contrary, although I agree that in ninety-nine cases out of a hundred there is no danger; nevertheless the hundredth case may result in a serious accident, and hence it behoves every automobilist to see that his tyres are safe and sound before setting out for a run.—Yours truly,

Chas. Jarrott.

ENGINE STARTING TROUBLES.

To the Editor of *The Motor-Car Journal.*

Sir,—Two months ago I received a new 11-h.p. car, but, though I had a driver or teacher for about three weeks, I was never able to start the magneto. Then I had a low tension auxiliary fitted, with no better results. The company said it only wanted "knack," so I practised for five weeks and rarely started the car. After the driver left I was never able to start it once. Then the company sent an expert, who put in seven hours with but little if any improvement, so he came again and put in another seven hours. Now sometimes, after eighteen or twenty tries, I can start on half turn. Both driver and expert could always if they cranked round two or three times, but that is hot work at any time. The expert pronounced both ignitions correct, but fancied the carburettor did not work well. I am used to single cylinder, two and four-cylinder engines.

Can you or your readers give me any hint what to do to overcome this annoyance, as it is not much fun to turn the crank daily and get no benefit except a strained back?—Yours truly,

R. Hannen.

[We fancy our correspondent's trouble is due to the carburettor, providing the ignition is quite correct. In all probability the suction does not prove sufficient to enable the engine to get the required amount of petrol. This can be remedied by shutting off the air-ways and let engine suck harder at the petrol, thereby enabling it to get the required charge. Failing this, we should be inclined to think that the magneto was not working correctly, the spark being too weak unless the machine be driven at high speed, which can only be remedied by giving the engine several sharp turns.]

RECKLESS DRIVING.

To the Editor of *The Motor-Car Journal.*

Sir,—As a motorist and horse owner, may I suggest a very simple, certain, and cheap way of stopping the furious driving of motor-cars? It is to lay down about half a cart load of gravel across the road so as to make a slight bank. The horse traffic would not perceive it, and it would not hurt motorists conforming to regulation speed, but the "scorcher" going faster would break his car's springs and considerably disturb the occupants of his car, and would soon be made amenable. I make this suggestion in the best interests of motorists, for it is this craze for speed that has brought odium on all motorists.—Yours truly,

Ernest C. F. James.

TYRES.

To the Editor of *The Motor-Car Journal.*

Sir,—In reply to "Perplexed's" letter in the *Journal* of the 3rd inst., I would like to state that when I had read half-way down the letter, I guessed at once by the enormous weight of the car that the reason of his tyres bursting was that they were undersized in circumference. The makers are quite correct in what they state, and for that weight of car I should advise "Perplexed" to go in for at least a 32-in. or 34-in. tyre, with a 5-in. tread, anyway on the back.

For satisfaction and reliability, I would recommend the Clincher Michelin. I have driven over 6,000 miles on them on a car weighing 17 cwt, and bad roads, and the tyres are no worse for wear, having had only one puncture through a horseshoe nail.—Yours truly,

H. Hughes.

ADVICE WANTED

To the Editor of *The Motor-Car Journal.*

Sir,—I read in your paper of the 3rd inst. a reply to a letter from "J. S." I think "Verdant Green" is very wrong to give such frivolous advice to one who is evidently trying to learn a most intricate subject, and "J. S." should be enlightened.

As a motorist of two weeks' standing I venture to think I am able to help him. There is no handle to work the brake, that is why we hear of so many dreadful accidents through brakes not acting. "J. S." must turn round when he gets to a steep descent and run backwards (the bump is much softer this way). The gear-box is at the side of the car usually, or is sometimes placed under the front seat. Often the spirit tanks take up all this latter space, and in this case the only place for the gears is under the tonneau seats, though this is very awkward when one wants to get any tools out. Fortunately I have not had to do this yet, as the weather has been too bad to run my car ever since I bought it.

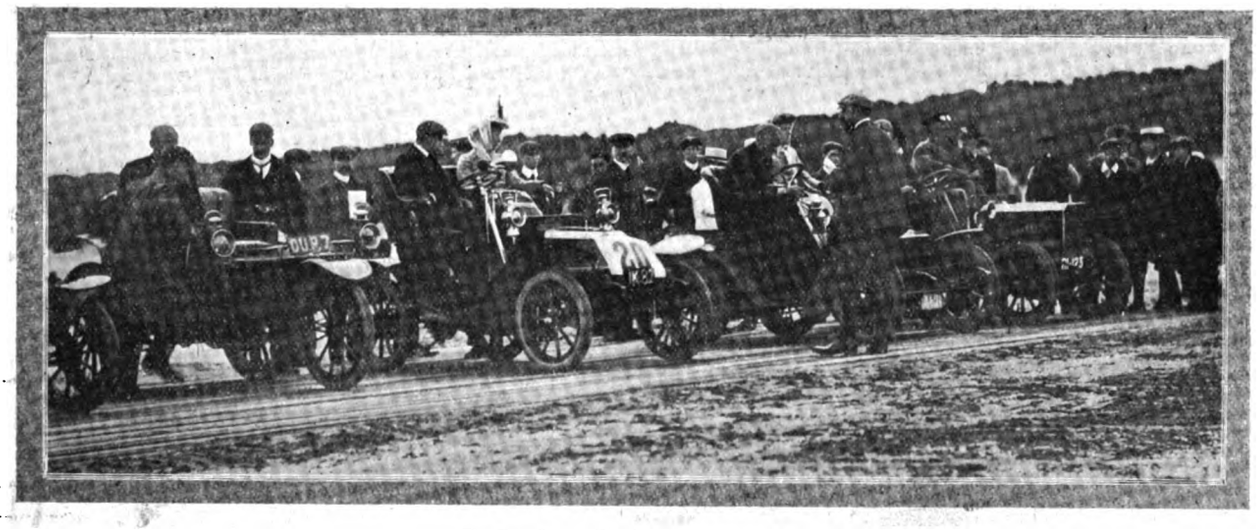
"J. S." is wrong in saying he touched one of the magnetos; it must have been an exhaust valve, as the man who sold me my car said I must not touch them when the car is running, or it may have been the needle in the carburettor—this would be bound to hurt if he pressed the sharp end against his finger.

If the car won't start after the first six turns he must look at the spark. This is done by opening the lid of coil box and seeing if a lot of sparks are by the screw; if there are no sparks, move the switch over to the other side and try again, most likely it will be all right this time,

Digitized by Google

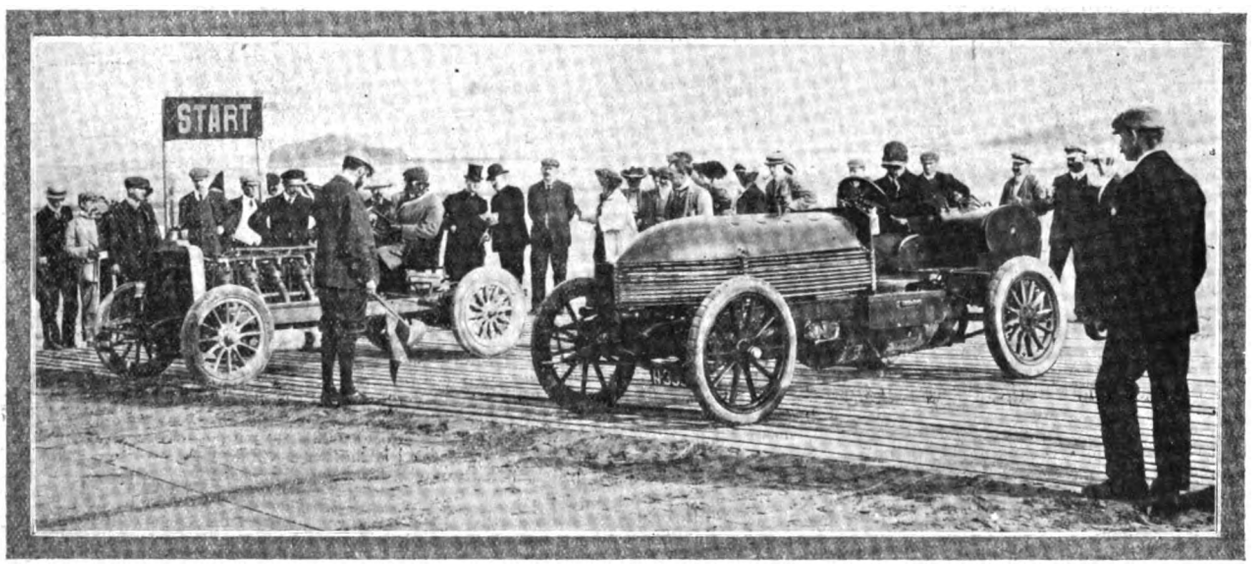
then mount in the seat, see that the speed lever is in the free notch and start away.

It is very simple, and I cannot understand "J. S." going wrong, and how his starting handle could go through his front window I can't conceive; he must have been very near his house, and the handle must have been a long one. My handle is fixed on, and so are al the others I have seen.



I don't quite know what "J. S." means by chain "drives." Mine was cinder, but, as it would cut the tyres, I had it all asphalted.

I shall be glad to help any motorist who has not had so much experience as myself, and would recommend him to read a book about motoring; he can thus have it all at his finger ends.—Yours truly,



EXPERT.

misrepresenting the capacity of the engine, but purely through ignorance of the actual or possible horse-power of the motor employed, but even so the question is one of great importance to both builders and users of motor-cars.

The question of the power developed by internal combustion motors has already been a somewhat vexed one from the theoretical point of view, lacking that elegant correspondence with theory which the steam engine affords; but as the practical application of the brake tests offers no more difficulty in the one case than in the other, there is little excuse for the very wide discrepancies which attract unfavourable attention on looking over the various makers' catalogues. The adoption of some form of standard, if only a conventional and empirical one, which would enable the specifications of cars to be more easily comparable, *inter se*, is certainly much to be desired.

The Two-Seated Touring Cars Ready to Start.

Mr. A. Rawlinson's Darracq v. Mr. S. F. Edge's Six-cylinder Napier. The new form of Bonnet and Radiator of the latter is worthy of notice.

THE PORTMARNOCK MOTOR RACES (*See page* 613).

THE HORSE-POWER OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to see the correspondence on this subject, for every motorist knows that the horse-power ratings of petrol motors are not at all times reliable; that they are often overrated, and that a standard system of rating which would convey a more comprehensive idea of the capacity of the motor and form a basis for comparison would be the actual filling of "a long felt want."

It is no doubt true that the horse-powers of many of the motors in use are rated, not by how much work they are capable of doing, but by how much work it is considered they ought to do. The rated, or rather, the advertised, power of a motor depends, therefore, to some extent on the designer, as well as on the motor, a sort of personal factor being introduced. Of course, this may not be done with intention of

One obvious cause of this lack of uniformity is the fact that the modern light motor vehicle has evolved—more or less simultaneously—from two different sources. The heavy car of a few years back was usually built with a slow-speed engine, and its horse power catalogued on that basis, though capable of a considerably higher output if run at a higher speed. Then, as weights were cut down and powers went up, one type of light car developed from this source, but the tradition of cataloguing the engine under the maximum power remained.

On the other hand, the evolution of the high-speed engine from its beginnings as a cycle motor was accompanied by the practice of listing its horse-power according to its maximum performance on the brake test, a performance not often reached in actual work; and the other type of light car, which owes its origin more or less directly to this source, often continues to be an example of the same practice.

Digitized by Google

The maker may plead with some plausibility that in the absence of any standard agreed upon he is, on the one hand, taking the only natural standard in quoting the maximum output of his engine, or that, on the other, he prefers to quote a power well within what the motor is capable of under adverse conditions, it obviously being better for him that his car should, say, be called a good 10-h.p. than a poor 12-h.p.

From the foregoing it can readily be seen that the present confusion and want of system in this matter should be reduced to order, even if this can only be done by an arbitrary standard. Obviously such a standard could be dispensed with by listing every engine at its maximum power by factory test; this, however, would probably be less satisfactory to purchasers, who are in the habit of expecting a margin of power above that listed, than the adoption of an arbitrary standard somewhat after this manner:—Let the maximum brake horse-power be taken; then let the brake horse-power at two-thirds or three-quarters of that speed be measured, this la ter to be the nominal horse-power and speed. Thus the usual margin would be allowed, but it would be a definite and an accepted one, and some uniformity in the classification of engines would be attained.—Yours truly,

F. J. REYNOLDS.

TAIL LAMP TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—I have also been unable to find any lamp that would keep alight behind my 6-b.p. De Dion, with the exception of a Lucas bicycle candle lamp. I was determined, however, to make use of one of the many handsome lamps I had collected, so selected one which shows a white light on each side in addition to the rear red light. All I did was to purchase a four-volt B.C. lamp, with holder, and three yards of flexible wiring, cost 4s. I then removed the oil reservoir from the lamp case and cut a round hole in the middle of the bottom of lamp case, just large enough to allow the holder to be inserted but not big enough for the screw collar to pass through. The collar was then screwed down and the lamp was complete. I connected one end of the flexible wiring to the pole of accumulator and the other to an ordinary interrupter on dash board, which was in turn connected to the + pole of the accumulator. As far as I can make out this system takes about ·08 ampere with four-volt accumulator.—Yours truly,

B. 453.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In the *Journal* of the 3rd inst. there is a letter from "Rosthern" regarding tail lamps. I had the same experience as many others, viz., that no tail lamp I could fix on would keep in, and I adopted the following, which I think "Rosthern" will find an absolute cure, although it will entail the purchase of another lamp. Get one of Lucas's Cetyphote lamps, No. 317, detach the face from the body, and, as it is only held on by a small screw through the back of the face, there is no difficulty in doing this; also unsolder the small thick tube which holds the burner. Into the remaining portion of the tube solder a small piece of brass tubing thick enough to allow the inflator tubing to fit tightly on to it, then fix the burner on the rear bracket in such a way that when the burner is in position there should be a small portion of a similar size of tubing projecting at the rear of the bracket; fix the face on above the burner, but when screwing this on to the bracket it is best to put a small bolt through the bracket having a leather washer between the lamp face and the bracket, then put a nut at the back of the bolt and screw it up tight; a jam nut will also be an improvement. Fix the body of the lamp in any favourable position, preferably near the steering seat, fix the inflator tubing, one end to the small tube projecting from the lamp and the other end to the burner at the rear. The inflator tubing I find best for this purpose is that sold by, I think, the Continental Rubber Company, and has practically no canvas in it. It is sold in yard lengths, but these can be connected with a small piece of brass tubing inserted about an inch in each end. Test all the joints to see that they are tight.

The above arrangement will be found to work with absolute satisfaction, I have one in use myself; but I have two faces, one at the front and one at the back of the machine, working from the same lamp. It has never been blown out, and I have tested the arrangement thoroughly. The burner supplied with the lamp gives rather a large flame for the rear light, but I understand that smaller burners can be obtained from the manufacturers of acetylene gas house lighting apparatus; in any case, it is better to have too large a light than none at all.—Yours truly,

A. O. F.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In reply to "Rosthern's" letter in the *Journal* of the 3rd inst. *re* tail lamp troubles, I may say that I have had exactly the same trouble in finding a lamp that would not jar out. I have had half a dozen lamps at prices from 10s. 6d. to £1 1s., and never had one that would burn for an hour without going out. At last I bought a good cycle lamp which had a strong spring, and put a piece of red glass in the left side of the lamp, so as to show red behind when the light was on the number plate, and I find this works to perfection. I have used it for several months and have never had it jar out or blow out once. I may add that I bought the lamp at a cycle dealer's auction sale for eighteenpence, and it took me about half an hour to fix the glass in, but it has been worth pounds to me.—Yours truly,

R. R. S.

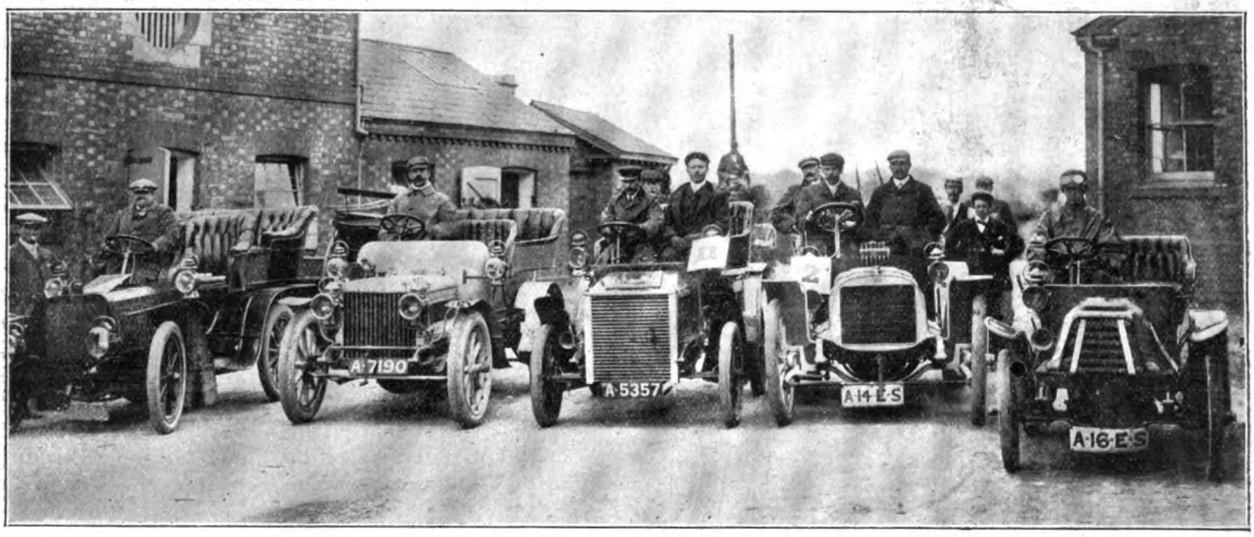

Photo by The Hertfordshire Club's Hill-climbing Competition. The Cars weighing in at Boxmoor. [*Argent Archer.*

QUERIES *re* DE DION CLUTCHES.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—In answer to "A. H. R.," he evidently does not understand the adjustment of the most perfect of gears. There was no need to take the gear box down simply to adjust the long internal expanding screw. If he would write to Messrs. J. Child Meredith and Company, of Summer Hill, Birmingham, he would get the diagram of adjustment for a shilling.—Yours truly,

J. T. A.

TO THE EDITOR OF *The Motor-Car Journal.*

SIR,—in answer to "A. H. R." *re* De Dion clutches, I would suggest the following treatment, which I have found effectual. Make certain that the fibres are in good condition and level when the change speed handle is in "free" position. Now slack off the regulating screw until they are apparently ineffective for use on the road, and fill the gear case with lubricating oil. In a very short time it will be found that the clutches have expanded to their proper adjustment and may even have to be

Digitized by Google

further reduced by the regulating screw. When the exact position for the regulating screw has been found, no further adjustments will be found necessary, provided the gear case is really kept full of lubricating oil.—Yours truly,

B. 453.

To the Editor of *The Motor-Car Journal.*

Sir,—Replying to "A. H. R.'s" letter in the last issue of the *Journal*, his trouble is no doubt due to the clutches, the fibre having become swollen through being soaked with oil, thereby causing the tightness complained of. If, before making the clutches, the fibre is soaked in oil (even boiling oil might be used), it will greatly lessen the chances of this happening. The slip mentioned on top speed I should imagine to be due to the clutch not being quite correctly fitted, or owing to the fact that both clutches were partially engaged, thereby causing a drag on the drive.—Yours truly,

J. T. H.

THE RATING OF CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—I was much interested in the letter by Mr. E. M. C. Instone in last week's *Journal*. His reference to the growing tendency of makers to understate the horse-power of their engine should cause agents to be more insistent on accuracy. He could contribute something tangible to the discussion if he would inform us how he would prove that his own 28-h.p. car is exactly of the power listed by the makers. Such a demonstration would assist others in gauging the "powers" of other engines. Otherwise it might happen that, in winning a race against a car of the same described horse-power, there would be an inclination to regard the engine as of 30 or even 35-h.p. I notice that at Portmarnock Mr. Martin's 28-h.p. car beat a 20-h.p. of another make. At Bexhill the latter beat a 60-h.p. vehicle. Verily we want some authoritative declaration on the subject.—Yours truly,

Rose Dartell.

GEAR FOR DECAUVILLE CAR.

To the Editor of *The Motor-Car Journal.*

Sir,—Having seen the letter from "H. D." in the *Journal* of the 3rd inst. *re* gear for Decauville car, I should strongly advise him to write to Mr. W. H. Scotton, of All Saints Road, Ipswich, who will give him all particulars of his patent gear. I have one on my own car (a 9-h.p. Aster) which has now run hundreds of miles, and I may say it is practically perfect. The gears are all in mesh, very quiet in running, and, from its mechanism, impossible to damage in changing, and so simple that any amateur can change, it being impossible to miss.—Yours truly,

H. A.

CATTLE ON THE ROAD.

To the Editor of *The Motor-Car Journal.*

Sir,—As a reader of your valuable paper, I wish to draw the attention of fellow motorists to the following incident. The other Saturday evening I was journeying from London to Leicester on a car. A few miles before reaching Market Harborough, on turning a bend in the road, I ran into about twenty oxen which had been left to graze on the roadside. At the time of the incident I was only travelling twelve miles per hour; what would have been the result if I had been going at a fast pace?—a serious accident, probably with fatal results; but, luckily, I managed to escape with about £3 worth of damage to the car. I think that if the county police were to attend more to matters of this kind, instead of trying to trap motorists, it would be better. Are travellers' lives to be risked so cheaply in allowing herds of cattle to graze and wander on main roads at night unattended?—Yours truly,

J. W. Morris.

LOOK AFTER THE CHAINS.

To the Editor of *The Motor-Car Journal.*

Sir,—With reference to chains, I have been using Brampton's on a 10-h.p. Panhard. The car I am using having run 3,400 miles, and that independent of trial runs, etc., I might conclude, I suppose, they have done particularly well, seeing that half that distance has been done in Scotland, being so hilly, and to all appearance seem fairly good still, though the rollers are showing considerable wear. Would this be a fair life for chains?—Yours truly,

A. B.

THE OLDSMOBILE.

To the Editor of *The Motor-Car Journal.*

Sir,—The letters under the above heading have interested me, and my personal experience may be of interest to some of your readers. In the spring I bought an Oldsmobile, and at first had great trouble with it; I have since found out the reason. I saw it driven, and thought one had only to turn the handle to start it and then to work the lever; but, like every beginner, I had back fires and a number of minor troubles, and it was partly with an idea of selling the car I called in an expert, who gave me four lessons, the first two explaining the parts of the engine (in doing so he took most of it to pieces), then two lessons on the road. Since then I have travelled many hundred miles and never had the slightest trouble. My advice to anyone buying one of these useful little cars is to thoroughly understand the engine, the oiling, spark, gears and timing, and then to have some lessons in driving. I have a back seat, and always carry four, and I have climbed Westerham, Wrotham and Shooter's Hills. On one occasion I hauled a large car into Eltham (five miles) and still had my four passengers on board.—Yours truly,

A Lover of Kent.

STEAM CARS.

To the Editor of *The Motor-Car Journal.*

Sir,—A feature which I am sure tells heavily against the steamer, especially in the eyes of the moderate country dweller, who uses his car more frequently and for shorter trips than the townsman, is the tedious process of getting under way.

For example, I was expatiating the other day to a friend on the superior merits, as it seems to me, of a steamer to a petroler; and his reply was, "Granting all you say, yet a steamer would not do for me, for I often have my car out several times a day, and getting up steam repeatedly would be too much bother."

It has been suggested that the time necessary for this operation might be also utilised for filling tanks, oiling, etc.; but, apart from what seems to me the bad practice of putting off these details to the last moment, it might very well be that they were not needed, owing to the car having just come in from a short run.

Makers, I think, seem too often to assume that a car is only used for long journeys, in which case the time spent in getting up steam would not be grudged; but, as I have said above, there is a large and increasing number of cars which are chiefly used for short and frequent runs; and a type which does not start readily is seriously handicapped in the market, so that it would seem to be well worth the while of steam car makers to endeavour to make the process of lighting up as short and convenient as possible.—Yours truly,

Mr. W. G. James on his 14-h.p. Crypto Car.

Faber.

SINGLE TUBE TYRES.

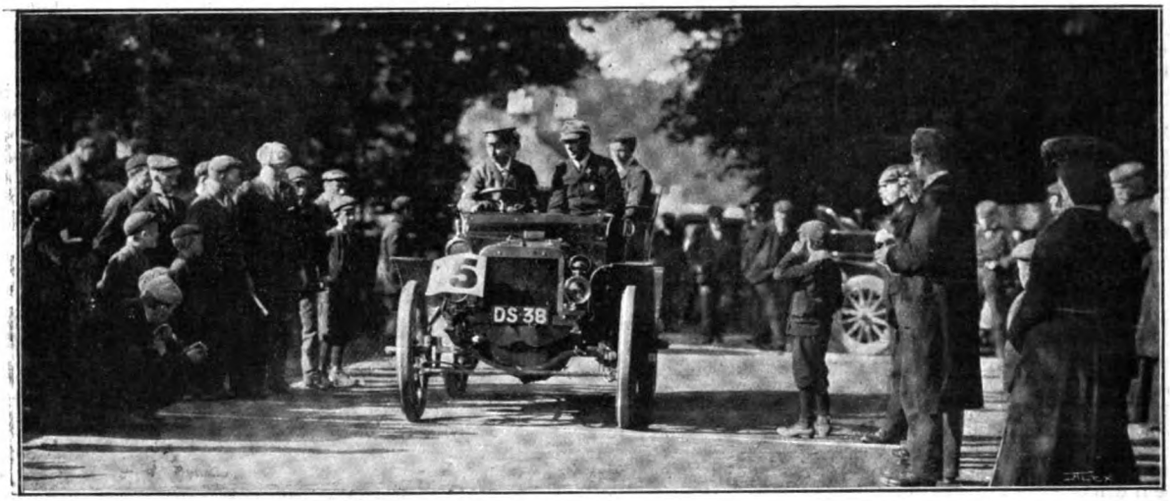
To the Editor of *The Motor-Car Journal.*

Sir,—Using tyres hard, I should be glad if your correspondent, "A. H. 59," in the issue of the 3rd inst., would enlighten me a little *re* their protection. Where does he get his protecting band, and how is it put on? Any hint will be of value to the users of single tube tyres, as that is the great trouble and expense in using cars.—Yours truly,

W. A.

The Small Car Trials.—Mr. J. Chambers, of Messrs. Chambers and Company, writes:—"In reference to the Hereford trials, and the unfortunate accident to our Downshire car in Ludlow, I may state that I ran her to Hereford the same afternoon, using third speed only, the first and second being deranged, and after fitting a new part, supplied from Belfast, did a non stop on the afternoon run on Friday, the 2nd inst., including Bishop's Frome. On Saturday, the 3rd inst., the car was driven to Liverpool with two up and heavy luggage without an involuntary stop in five hours' running time. The accident was primarily due to our car being one of the first made, and was only on the road for four days before the trials."

Tail Lamp Troubles.—"Well Pleased" writes:—I have found that a good way to stop the lamps shaking out is to put some cotton wool in the bottom of the lamp and then fill with oil.



Starting Handle Found.—We believe the police at Albany Street, N.W., have a starting handle found in Abbey Street, N.W., which they are anxious to return to its owner.

Digitized by Google

CLUBS AND ASSOCIATIONS.

SCOTTISH.

A HILL-CLIMBING competition took place over the Kirkfield Hill, Lanark, on the afternoon of Saturday, under the auspices of the Scottish Automobile Club (Western Section). The competition was purely a sporting one, and was confined to the vehicles owned by members of the Scottish Automobile Club, and members of the Club only were eligible to drive the cars. The contest took place from a standing start over 821 2-3 yards of road with an average gradient of about 1 in 9, the steepest stretch being about 150 yards of 1 in 7·8. A large number of members of the club and interested spectators were present, over fifty cars being ranged on the side road, and the arrangements worked out admirably. The police gave every facility and assistance. The times were taken by Messrs. Alex. Blair, Jas. H. Inglis, and A. G. Rennie. This was done by synchronized chronographs, and an electric timing apparatus was also employed, a special telephone being fitted up between the start and finishing points. For both the timing apparatus and the telephone the Club were indebted to the kindness of Mr. Inglis. Single cylinder cars carried two, and all others four adult passengers. All the arrangements were admirably directed by Mr. R. J. Smith, the hon. secretary, and other officials of the Club. The following were the results:—

YORKSHIRE.

THE committee of the Yorkshire Automobile Club have now definitely decided to hold their speed trials on Saturday, October 1st. The trials will be held at Wentworth Woodhouse by permission of the president, Earl Fitzwilliam, and will be strictly limited to entries from members of their own private cars.

JOINT MEET AT RAGLAN.

A CLUB RUN has been held at Raglan, Mon., at which the members of the South Wales and Monmouth Automobile Club met the members of the Hereford Automobile Club. After a very enjoyable run the members of both clubs took tea at the Beaufort Arms Hotel, Raglan. Several visited the ruins of the old castle. Among those present were Colonel L. Scudamore (Panhard), Captain Otho Shaw (40-h.p. De Dietrich), Captain Englefield (12-h.p. Darracq), Messrs. W. Groom (5½-h.p. Rexette), Hall (8-h.p. M.M.C.), Chave (9-h.p. Rex), H. West (22-h.p. Daimler), Graham (16-h.p. Brush), Duchemin (20-h.p. Decauville), J. J. Neale (12-h.p. New Orleans), Lennox Robertson (11-h.p. Clement), Parker Thomas (14-h.p. Talbot), Gray (F.I.A.T.), D. W. Graham, J.P. (Mercedes), C. Peaty (6-h.p. De Dion), J. T. Willows (8-h.p. De Dion), Peaty, jun. (4-h.p. Werner fore carriage), Willows, jun. (3-h.p. De Dion fore car), Perry (6-h.p. De Dion), and Hopkins (Oldsmobile).

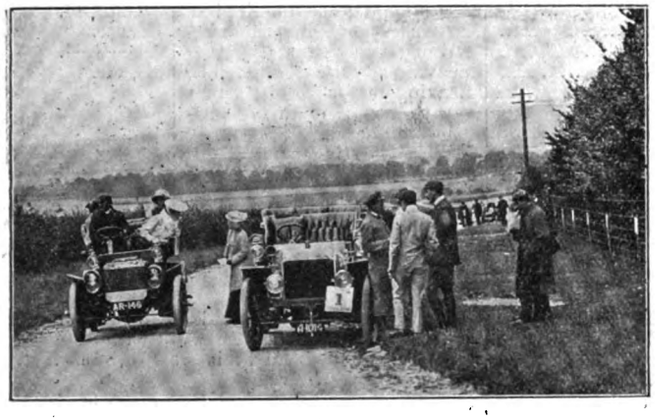
WOLVERHAMPTON.

FULL particulars of hill-climbing competitions to be held at Gatacre Hill, Stourbridge-road, Bridgnorth, by the Wolverhampton Club, on the 24th inst., together with entry forms, can be now obtained from the secretary, Mr. S. R. Rhodes, Carlton Chambers, Lichfield Street, Wolverhampton. Prizes in both the club and open handicaps consisting of orders addressed to any Wolverhampton tradesman to supply articles desired to specified values, will be awarded to the winners, in addition to which trophies of the respective values of £25 and £10 10s., given by the Star Engineering Co. and the Wolf Motor Co., Ltd., respectively, in the club and open events will be competed for.

MANCHESTER.

THE Manchester Automobile Club had a run on Saturday to Lawton Hall, in Cheshire, and, though a good many of the members were away from home, a score of cars turned up and seventy members and their friends sat down to tea. The Hall is full of historic interest and associations. Before the Restoration, it appears that Charles II. was concealed for some time in the Hall of Lawton, during which period he stood sponsor at the baptism of his host's eldest son, born in 1656, marking this auspicious occasion by presenting to his godchild an exquisite drinking cup. Subsequently he presented to the family his own portrait by Sir Peter Lely, and also that of the Duke of Monmouth, both of which still adorn the walls of the lofty large dining hall. Another of his gifts was the picturesque octagonal pigeon tower still in existence. Beneath a passage leading from the small drawing room to the library is a vault, said to have been the hiding-place of Charles II. Near by is a magnificent oak-panelled room, known as the King's room.

LINCOLNSHIRE.



A MEET of the Lincolnshire A.C. was held at Little Grimsby Hall on Thursday of last week on the occasion of the invitation of Mr. W. Haddon Owen. There were acceptances from nearly thirty cars, but it rained hard, and the gale added to the inconvenience. Still several of the regular patrons of the meets of the club were there, including Major F.

on the 1st and reported in last week's *Journal*, have now been made known, the handicap resulting as follows:—

1. Mr. R. M. Wright, Lincoln, 6½-h.p. Humberette.
2. Mr. W. Rose, Gainsborough, 15-h.p. "National" car.
3. Mr. G. E. Sandars, Scampton, 4½-h.p. De Dion.
4. Mr. G. W. Jefferey, Gainsborough, 12-h.p. Darracq.
5. Dr. W. H. B. Brook, Lincoln, 9–11-h.p. Clement.
6. Mr. C. W. Pennell, Lincoln, 16–22-h.p. Martini.

The first and second prizes consist of two beautiful silver jugs.

HERTFORDSHIRE.

On Saturday the Hertfordshire Automobile Club held a hill climbing competition at Aston Hill. The weather was magnificent, and a large concourse of spectators was present, including Mr. Alfred C. de Rothschild, who hospitably entertained the members of the club and the competitors to a "champagne tea." The hill is 1,150 yards long, and the average gradient 1 in 9, the surface being rather loose in one or two parts. Everything passed off without a hitch, the police keeping the hill clear of all horse traffic. Messrs. N. B. Kenealy and E. T. Pryor were judges, Mr. F. Straight timekeeper, and Messrs. E. Kenealy and A. Hunt starters. The marshals were Dr. Gruggen, Mr. J. Harwood, and Mr. J. Hunt, and Mr. C. Wood was in charge of the flagmen.

THE MOTOR RACING AT PORTMARNOCK.

The first day's proceedings having passed off so successfully, it was quite expected that the public taste was whetted for the second day's event. This proved to be the case, and, favoured by even better weather than on the previous day, and with the course in a drier condition, the events passed off with even greater *eclat*. To add to the interest, most of the finals were to be run off, and in some of the events these provided very exciting finishes. The 100-h.p. Mors was on its best behaviour, and the Hon. C. S. Rolls had the satisfaction of pulling off his heat against Mr. A. Lee Guinness. The triple contest between Mr. A. F. Macdonald, the Hon. C. S. Rolls, and Mr. Lee Guinness was the event of the day, and excited the greatest interest.

The following are the results of the several heats and finals:—

Class C.—For motor-bicycles up to and including 150 lbs. weight.

First Heat.—C. B. Franklin, 2¾-h.p. F.N., 1; J. G. Drury, 2¼-h.p. Triumph, 2; H. S. Huet, 3½-h.p. Minerva, 3. Won easily. Time, 1 min. 30 3-5 sec.

Second Heat.—Evan Jones, 2¾-h.p. Humber, 1; F. A. Wallen, 2. Time, 1 min. 45 1-5 sec.

Final.—C. B. Franklin, 2¾-h.p. F.N., 1; Evan Jones, 2¾-h.p. Humber, 2; F. A. Wallen, 3-h.p. Triumph, 3. Time, 1 min. 32 1-5 sec. Won easily.

Class E.—For two-seated cars costing £200 or less.

Final.—H. Sturmey, 10-h.p. Duryea, 1; J. "Edwards," 6-h.p. De Dion, 2. Time, 1 min. 53 4-5 sec. Won easily.

Class D.—For motor-cycles, weight unrestricted.

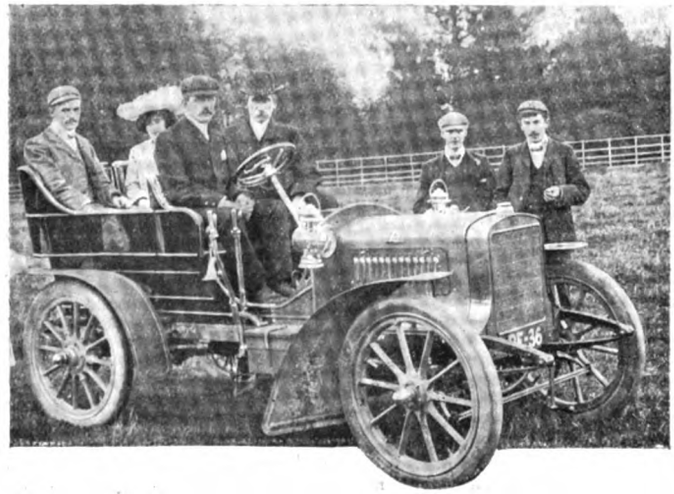
First Heat.—C. B. Franklin, 2¾-h.p. F.N., 1; Evan Jones, 2¾-h.p. Humber, 2; Oswald-Sealy, 2¾-h.p. Excelsior, 3. Time, 1 min. 31 sec. Won easily.

Second Heat.—W. R. Ireton, 3-h.p. Riley, 1; J. G. Drury, 2¼-h.p. Triumph, 2; H. S. Huet, 3½-h.p. Minerva, 3. Time, 1 min. 33 4-5 sec. Won easily.

Final.—C. B. Franklin, 2¾-h.p. F.N., 1; Evan Jones, 2¾-h.p. Humber, 2; W. R. Ireton, 3-h.p. Riley, 3. Won easily in 1 min. 29 1-5 sec.

Class F.—For touring cars costing over £200 but not more than £400, to carry four passengers.

Final.—F. Churchill, 14-h.p. Hallamshire, 1; H. Sturmey, 12-h.p. Duryea, 2; H. Kennedy, 12-h.p. Darracq, 3. Time, 1 min. 57 3-5 sec.



Class G.—For touring cars costing over £400 but not more than £600, to carry four passengers.

Final.—A. Huntley Walker, 15-h.p. Darracq, 1; A. Rawlinson, 15-h.p. Darracq, 2. Time, 1 min. 58 1-5 sec. Tight finish.

Goff Challenge Cup, value 20 guineas. To be won twice in succession or three times in all. A handicap.

First Heat.—T. L. Plunkett, 28-h.p. Daimler, scratch, 1; Major C. Thornhill, 6-h.p. Wolseley, 550 yards, 2; A. J. Hardy, 5-h.p. Peugeot, 650 yards, 3. Time, 1 min. 36 4-5 sec. Won easily.

Second Heat.—Dermot Mooney, 10-h.p. Argyll, 375 yards, 1; W. D. Saunsbury, 9-h.p. Argyll, 450 yards, 2; Rt. Hon. Sir H. Plunkett, 10-h.p. Panhard, 250 yards, 3. Time, 2 min. 7 3-5 sec.

The Gainsborough Hill-Climbing Competition.—The 15-17-h.p. "National" Car.

Final.—T. L. Plunkett, 28-h.p. Daimler, 1; Major Thornhill, 6-h.p. Wolseley, 2. Time, 1 min. 32 2-5 sec.

Class L. (Semi-Final).—For racing cars not more than 1,000 kilos. (19 cwt. 3 qrs. 20 lbs.).

First Heat.—Hon. C. S. Rolls, 100-h.p. Mors, 1; A. Lee Guinness, Gordon Bennett Darracq racer, 2. Won by 50 yards. Time, 57 2-5 sec.

Second Heat.—S. F. Edge, 6-cylinder Napier racer, 1; A. Rawlinson, Gordon Bennett Darracq racer, 2. Time, 56 2-5 sec.

Class L. (Final).—S. F. Edge, 6-cylinder Napier, 1; Hon. C. S. Rolls, 100-h.p. Mors, 2; A. Lee Guinness, Gordon Bennett Darracq racer, 3. Time, 57 2-5 sec. (an exciting finish).

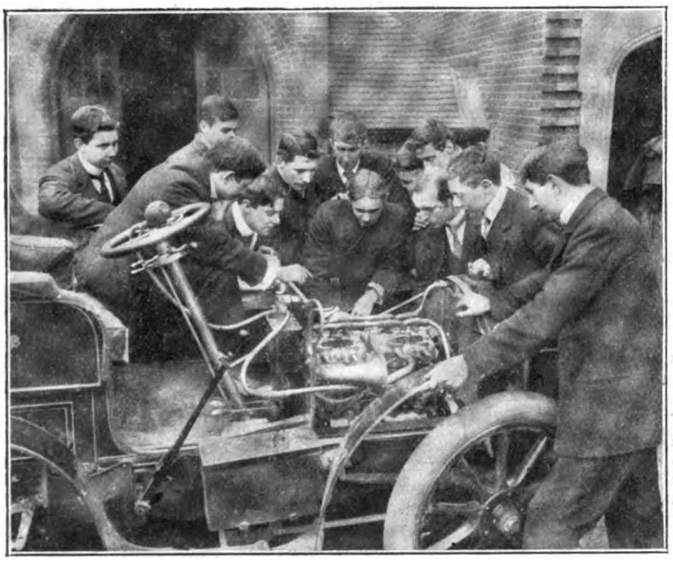
Class H. (Semi-Final).—For touring cars costing over £600, but not more than £1,000, to carry four passengers.

Digitized by Google

First Heat.—Percy Martin, 28-h.p. Daimler, 1; S. F. Edge, 20-h.p. Napier, 2. Time, 1 min. 24 4-5 sec.

Second Heat.—T. L. Plunkett, 28-h.p. Daimler, 1; A. Huntley-Walker, 30-h.p. Darracq, 2. Time, 1 min. 39 1-5 sec. Won by a few inches.

CLASS H. (Final).—Percy Martin, 28-h.p. Daimler, 1; T. L. Plunkett, 28-h.p. Daimler, 2. Time, 1 min. 31 1-5 sec.



CLASS J. (Trial Heat).—For touring cars irrespective of price, to carry five passengers. A. Lee Guinness, 60-h.p. Mercedes, 1; A. Rawlinson, 40-h.p. Darracq, 2. Time, 1 min. 19 2-5 sec. Won by about 40 yards.

CLASS K.—For racing cars weighing less than 650 kilos. (12 cwt. 3 qrs.). A. Rawlinson, 30 h.p. Darracq, 1; G. Wilton, 30-h.p. Darracq, 2.

Time Trials.—(Flying Kilometre).—A. Rawlinson, 28 4-5 sec.; A. Rawlinson, 29 3-5 sec.; A. Lee Guinness, 30 sec.; C. S. Rolls, 32 4-5 sec.

CASE DISMISSED.

BEFORE the Samford Bench of Magistrates Mr. J. R. Egerton, of Ipswich, was charged that he "did on a certain public highway, at Copdock, drive a certain motor-car at a speed dangerous to the public, on August 4th." Mr. L. H. Vulliamy appeared on behalf of the defendant, and after the witnesses for the prosecution had been heard addressed the Bench. The chief point was that actual danger to the public must be proved before there could be a conviction under section 1, sub-section 1, of the Motor Car Act, 1903. It was no offence under that section to drive a car at an excessive speed unless there was evidence to prove actual danger to some person. In the evidence for the prosecution, one of the

The Motor Class at Battersea Polytechnic.—A Practical Lesson.

witnesses said that the car was travelling 20 miles an hour, another 30 miles, and a third witness 40 miles per hour. The evidence, therefore, tended to show that the defendant should have been charged under another section of the Act for exceeding the speed limit. Mr. Vulliamy read reports of cases heard at various quarter sessions, where persons were charged with driving motor-cars to the danger of the public. In the various appeals, when it was proved that there was no actual danger to a person or persons, the charges had been dismissed. Twenty miles an hour was quite a legal speed for a motorist to go in such a place as Copdock, unless it could be proved that danger was caused to a particular person or persons. The Magistrates subsequently retired, and on their return the Chairman said that they had decided to dismiss the case, on the grounds that the car was not driven at an excessive speed and to the danger of the public.

LEAVING WORK WITHOUT NOTICE.

AT the Aberdare Police Court, Richard Littlehales and Thomas Williams have been summoned at the instance of the Aberdare Valley Motor-Car Company, with leaving work without notice. The damages against Littlehales were laid at £2 and against Williams at 10s. Mr. W. D. Phillips prosecuted on behalf of the company. Mr. David Hughes, the manager of the company, said that owing to a dispute between him and the fitter, a man named Douglas, he dismissed Douglas, and Douglas called upon the defendant not to take out his car but to stand shoulder to shoulder, man to man. Defendant thereupon declined to take out his car and had since absented himself from work. He and the rest of the drivers had also come in on Saturday night at 8 o'clock instead of half-past 11. The defendant Littlehales said he did that because his car was not safe to run, but could not explain why all the drivers came at the same time. He denied that they agreed to do so on the Monday, but he admitted that they talked of it on the Monday morning. Both defendants were ordered to pay the full amount claimed with costs.

Bray.....	(1) Driving dangerously; (2) Carrying no light	(1) 5s.; (2) 5s., etc.

* Notice of appeal given.

POLICE TRAPS.

AT Southborough, near Tonbridge, is a vigorously worked police trap.

AT Brighton Road, Croydon, the police have a trap, and motorists passing that way should be careful, lest peradventure they are caught therein.

MOTORISTS continue to be trapped on the Hampton Court road. This is the third time of warning.

THE police have a trap in Hyde Park, and a well-known motorist has been caught therein.

THE police have established a trap in the Bayswater Road, W., in which to catch Metropolitan motorists.

THE FATAL MOTOR-CYCLE ACCIDENT.

BEFORE the Croydon county magistrates, on Tuesday, Mr. Densham presiding, Mr. G. D. Holloway, of Beddington, surrendered to his bail to answer the charge of causing the death of Henry Hudson, by knocking him down with his motor-cycle. Chief-inspector M'Kay informed the Bench that at the coroner's inquest the jury had returned a verdict of "Accidental death"; in those circumstances the police had no further evidence to offer. The chairman said that, this being so, the Bench had decided to acquiesce in the jury's verdict.

THE

Motor-Car Journal.

VOL. VI.] LONDON, SATURDAY, SEPTEMBER 24, 1904. [No. 290.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT the last meeting of the Dudley Town Council the Teams Committee reported that the Borough Surveyor produced replies from many towns as to the use of motor-vans, and after considering the same the committee could not recommend the adoption of motor-vans by the Corporation. Councillor G. F. Thompson moved the adoption of the report. The Borough Surveyor, he said, made inquiry of thirty or forty towns as to the motor-vans, and there was a concensus of opinion that they could only be worked economically where they were continually running, whilst the cost of repairs—which was fixed by the makers—was a very serious item. Councillor Adshead seconded, and the report was adopted. It would appear that this is a decision based on very inadequate knowledge, for some of the reports are from towns where practically no experience has been gained.

◆ ◆ ◆

A Gymkhana at Portsmouth.

ON Saturday an automobile gymkhana confined to motoring officers of the Services was held at Portsmouth. In the glass-of-water race Major A. H. Cox was the winner. In the tortoise race of fifty yards Lady Arbuthnot, 5-h.p. Oldsmobile, won in the ladies' class, with Mrs. Allen, 14-h.p. Renault, second; while among the gentlemen Captain Dixon secured first, that is to say, last place, by driving his 6-h.p. Eagle at the speed of an active snail, Professor Dykes, on a 6-h.p. Humberette, unwillingly attaining a slightly higher velocity. Lady drivers were prominent in the gymkhana, and one event was a test of their mechanical proficiency. They had to drive round the course to a line fifty yards from the finish stop and change a sparking-plug, and then proceed to the tape. Mrs. Vereker won, Lady Arbuthnot being second.

◆ ◆ ◆

Against Motor Cars.

THE agitation against motorists in rural districts is growing at too rapid a rate to be pleasing, and from all parts of the country we hear ominous rumours of local prejuduce being aroused against automobilists. As we have so often emphasised in these columns, this adverse public opinion is being ignored by the persons who use the road without any regard for the consideration of others, and provincial clubs will shortly have to consider whether, in addition to advising motorists to be careful, they do not add the warning of publicity to those members who ignore their policy. The District Council of Shifnal, in Shropshire, has been discussing the matter, and it has been decided to call the attention of the County Standing Joint Committee to the subject. The Rotherfield Parish Council in the south, too, is taking steps to petition the county authorities to get the Local Government Board to put into operation the restricted speed limit with regard to motor-cars. The Belper District Council is attempting to move its county authority in the matter; King's Lynn is considering the problem, and Newport (Mon.) is definitely asking for a restriction on the speed limit. These are but a few instances, which were brought to our notice on one day this week. They show that it is really time motorists recognise that their own interests are in the direction of keeping strictly to the law as regards furious driving.

◆ ◆ ◆

Energy in Defence.

THAT there is need for a thoroughly active and wideawake organisation in the interest of motorists is becoming increasingly apparent. In some places motorists are having their licences endorsed in quite an illegal fashion, and in others local prejudice is finding vent in police traps, which secure the attendance of innocent persons in a police court. A general movement seems afoot, calculated to adversely threaten the progress of business next season, and so widespread is the agitation against automobilism that the time seems ripe for a consideration of the positions for defence.

◆ ◆ ◆

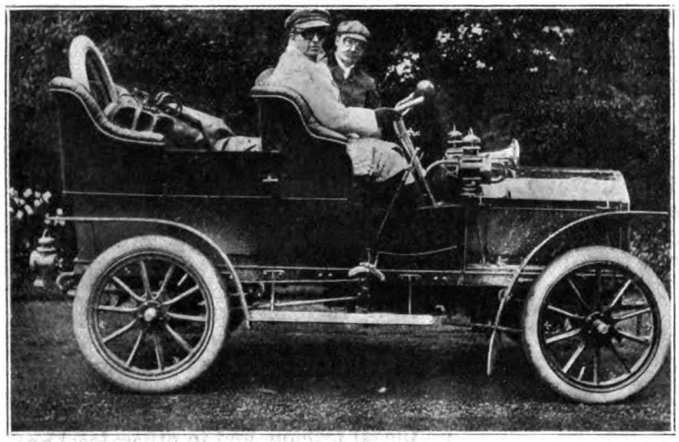
Existing Organisations.

THE central organisation, with its racing cares, its attention to trials, its social functions and its other troubles, has so much to do that little heed can be given to the wrongs of individual motorists. The Motor Union has seemed inert to the ordinary layman suffering from legal wrongs. It has appointed correspondents, and has much to do in looking after errors perpetrated by magistrates in some country districts. Interest in its proceedings is unfortunately lukewarm, and, although distance may lend enchantment to the view of provincial motorists, they are beginning to realise it is too far removed from the ordinary happenings of the automobile world. They want something to knit them together in local strength, otherwise they are isolated and can only brood over grievances—supposed and real—in a silence which bodes ill for the future success of the automolile organisations.

◆ ◆ ◆

Local Work.

LAST week it was announced in the *Journal* that the motorists of Bristol were organising. That is good news, for neither the Somersetshire nor the Gloucestershire County Clubs can adequately safeguard the interests of motorists in Bristol city. On the motion of Mr. Robert Stotesbury, who presided, it was resolved, "That in the opinion of this meeting of motor vehicle owners in Bristol and district, a club or association should be organised to act in conjunction with similar clubs or associations and to carry out the objects as now before the meeting, both for the benefit of its members and for the furtherance of the automobile movement." This was seconded by Mr. Percy Ogden, supported by Messrs. S. Webber, C. Enstey, T. Genge and A. H. Wyatt. Mr. C. H. Dodd, the chairman of the General Purposes Committee of the Motor Union, urged support for the new movement, and the resolution was carried unanimously. A provisional committee was elected, of which Mr. T. R. Davey was appointed chairman. We wish



Digitized by Google

well to the new organisation, and trust that other localities will quickly follow in the wake of Bristol.

◆ ◆ ◆

A Network of Societies.

WHEREVER a dozen motorists reside in a town or district some kind of local organisation should be formed to protect their mutual interests. There are many things that can be done when joint work is possible and which would be absolutely impossible in the case of isolated units. Not only has the education of local councillors in motor matters to be undertaken, but judicious questioning at election times can often be made the means of improving the tone of public bodies towards motorists. With a society to become the vent for public declaration of wrongs in every town, the work of the central bodies in London would be materially facilitated.

On a Highland Tour (*see opposite page*).

Motor-Car Imports and Exports.

WHILE the number of foreign motor-cars imported into this country in August was less than in the same month of last year, the value of the imports showed a marked increase, thus indicating that the vehicles now reaching this country are of higher power than formerly. The number of cars imported last month is returned at 594, of a value of £243,729. Parts were responsible for £44,139, bringing up the total for August to £287,868, as against £278,128 in the preceding month and £193,364 in August, 1903. So far this year, that is to say, for the first eight months, the imports stand at £1,833,826, or approximately £335,000 more than in the same period of last year. Passing now to the exports of British automobile productions, the returns continue somewhat disappointing, only fifty-three vehicles being shipped last month, these with the "parts" being valued at £24,558, while for the eight months ending with August the exports are returned at £186,023, or about £20,000 below the total recorded for the corresponding eight months of last year.

Pneumatic Tyres.

IN the paper he read at the Conference of the Institute of British Carriage Manufacturers at Leicester, to which we referred last week, Mr. J. M. MacLulich gave the following hints with regard to the care of pneumatic tyres. They should be kept in a temperature of about sixty degrees in a dark place, and, if possible, out of a draught, and should never be exposed to the rays of the sun before they are used (the sun has not so much effect upon tyres after use); if they are, they will lose their elasticity and become brittle, and small cracks will appear, which will gradually grow larger. Immediately after use, pneumatic tyres should be cleaned from wet and mud, and cuts in the covers should be closed, so as to prevent water getting in and rotting the canvas, which is the cause of many burst covers. Oil or grease should not be allowed to get on the rubber, as it destroys the nature of it. The pump for inflating the tyre should always have a pressure gauge upon it, and the tyres should be pumped sufficiently hard, if they are to last any reasonable length of time; on bicycles about 30 lbs. to the square inch: on voiturettes about 50 lbs. to the square inch; on light cars about 75 lbs. to the square inch; and on heavy cars about 100 lbs. to the square inch; and racing motor-car tyres are frequently pumped to about 120 lbs. to the square inch, that is, speaking generally. It is, of course, an advantage on a motor-car, with pneumatic tyres fitted, to have all the wheels of equal size, as it means carrying fewer spare covers and tubes, all the tyres being interchangeable, and the larger the diameter of the wheel, the less wear and tear there is on the tyres.

◆ ◆ ◆

Solid Tyres for Public Services.

WITH regard to public service motor-omnibuses, which are coming so much into favour, it was found with single tyres that the swaying motion was so great it was impossible to prevent the 'bus slipping, and the wear and tear on the tyres was excessive. Mr. MacLulich therefore introduced twin tyres, which have since been adopted generally; the bulk of rubber in each tyre is reduced, therefore, the tendency to roll on the tyre is less, and side slip is checked in its initial stages by the edges of the two tyres instead of one. He has recently recommended and introduced triplet tyres as being more economical than twins. These have now been adopted by the Eastbourne Corporation, and whereas the motor-omnibus tyres used to cost 6d. per car mile, they are now contracted for at about 2d. per mile.

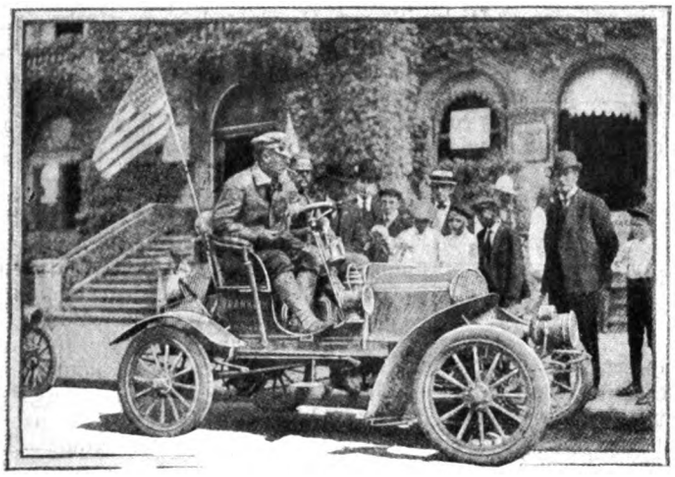
A Terrible Collision.



MOTORISTS fight shy of tramcars whenever possible, and avoid tram-lines as they would a police trap. That there is infinite danger is apparent from the accompanying photograph of a car wrecked in a terrible collision with a couple of tramcars at Shepherd's Bush, W. Mr. J. Grace, of Harlesden, was driving his 8-h.p. car, and overtook a tram, steering to the middle of the road in order to pass it. As the automobile swung out into the centre of the tram route the occupants saw for the first time that a tramcar bound for the terminus was bearing swiftly down upon them. But to the driver there seemed a chance to cut through between the two meeting tramcars. He took it, and at top speed dashed for the rapidly-diminishing gap, but unfortunately he had misjudged the pace of the tramcars. In another instant the motor-car was caught in the trap and was completely wrecked, not a square foot of woodwork or metal remaining intact. The side of one of the electric trams

Debris of the Wrecked Motor-Car.

was crushed in, and when the trams were drawn apart the three occupants of the motor-car were seen lying amidst a mass of wreckage. One of the passengers is now in the West London Hospital, the others having been taken at once to their homes.

The Transcontinental Car on arrival at New York.

A 1,000 Miles Tour.

NOT so very long ago an uneventful run of one thousand miles on a motor-car was a novel and unique experience. Nowadays it is accounted as only testifying to the reliability of the vehicle making such a trip and finds little of the public heralding that was wont to be accorded to such exploits. A motorist who has just done 1,000 miles on a Sanderson-Aster car over some of the mountainous passes north of the Tweed, in weather of varied character, writes graphically of his experiences. "After spending a night in Edinburgh, we set out to Pitlochry, *via* Stirling and Perth. This route was selected in preference to the direct road to Perth, *via* Granton and Burntisland, owing to the inconvenient running of the ferry across the Firth of Forth. The first portion of the journey (to Stirling) is through the mining district of Scotland, and carries us far too near Glasgow to be pleasant. The road in parts, particularly in the vicinity of Linlithgow and Falkirk, is defective, but generally of a fairly good character. After passing through Stirling we reached Dunblane and stopped to lunch within a stone's throw of the Cathedral that Ruskin praised in such unmeasured terms."

In the Highlands.

THERE are evidently good roads for reliability trials in the district. After a spin of twenty-five miles from Stirling, the road ascends nearly five hundred feet in three miles, practically a steady, continuous rise from base to summit. Beyond Perth the Highlands are entered, and there is a glorious run to Pitlochry. Along the whole route the road runs by the side of the Highland Railway, and, though many quick turns render careful driving essential, the surface is perfect. Then, after a couple of days spent in sight seeing by motor-car, a day was devoted to hill-climbing around Pitlochry. "We determined," continues our motorist, "to reach the Trossachs through the wild Glen Dochart and the west side of Loch Lomond. We drove along the very indifferent road skirting the north bank of Loch Tay to Killin, then on through Glen Dochart and past the loch bearing the same name to Crianlarich, and passed through Glen Falloch to the head of Loch Lomond. From Killin to that point the road is exceptionally bad, loose metal playing havoc with any tyres but the very best, and the sheep which wander about the road without let or hindrance render the duty of the driver anything but a sinecure. From Ardlui, at the head of Loch Lomond, the road is magnificent right round the foot of the loch and on to Aberfoyle. A good road leads from the latter to the Trossachs, but for some reason known only to the local authorities, it is closed to all motor traffic, and we therefore were compelled to retrace our steps, and, branching off past Lake Menteith, make our way to the Trossachs *via* Callender. When we reached Rinaclack we were tempted to try a short cut over the mountain and past Lake Rusky to the main road from Dunblane to Callender. To those who would follow in our footsteps, my advice is 'don't!' It may not be the worst road in Scotland—there are certain sheep tracks that I have not explored, and therefore I am not competent to judge, but I can say in very truth it is the worst I ever saw. However, all things come to an end, and at length we reached the King's highway once more. Passing through Callender, we skirted Loch Vennachar, and drew up at the Trossachs Hotel, on the banks of Loch Achray, in time for dinner, after a run of 130 miles, the car still going splendidly, without the slightest sign of the rough usage to which it had been exposed during the day." And at the end of a thousand miles of such touring our correspondent was as enthusiastic as when he began.

Racing at Blackpool.

BEXHILL, Southport and Hastings have each had their automobile attractions, and now the popular resort for Lancashire people intends to hold a two days' race meeting on its promenade. The Corporation has just sanctioned a race meeting to be held on the promenade between the Central and Victoria piers on the 14th and 15th prox. Alderman J. Bickerstaffe, the Chairman of the Blackpool Advertising Committee, made the proposal, and several prizes have been promised by local people. Coming at the end of the week the event will doubtless attract a large attendance of sightseers from Lancashire towns.

Foliage.

FOLIAGE adds a charm and a danger to our English roads. Riding down the Westerham Hill the other day, a cyclist lost control of his machine and sustained fatal injuries. A friend accompanying the unfortunate man said they did not notice the hill until they were on it. There is a notice board, but it was hidden by the foliage of trees. This is not the first serious accident occasioned by such a cause, and local authorities must recognise their duties should be concerned with the protection of the lives of users of the road. What are the uses of notice boards if allowed to be hidden by the foliage?

A Transcontinental Record.

THE distinction of being the only person to have twice crossed the North American continent in a motor-car may now be claimed by Mr. L. L. Whitman, who, accompanied by Mr. C. Carris, arrived at the Automobile Club of America in New York at 1.10 p.m. on September 3rd, after having made the trip from San Francisco, a distance by road of 4,500 miles, in 32 days 23 hours 20 minutes. The car used was an air-cooled Franklin of 10-h.p. Mr. Whitman's record supersedes the

Digitized by Google

record of sixty-one days made last year on a Packard car. Remarkably fine weather favoured the tourists, and this fact is responsible in a large measure for the good time made. Practically all the running was done during the day, the average daily runs being nearly one hundred and forty miles. The machine stood the work extremely well, and mechanical troubles were few and far between.

◆ ◆ ◆

Steam Roller v. Motor Car.

SOME few months ago the Great Western Railway Company inaugurated a motor-car service in Cornwall, and during the summer season this has proved highly popular among visitors to the pleasant places of that county. Unfortunately, however, differences have arisen between the company and the Rural District Council of Helston, with the result that the automobiles are being withdrawn this week, and the service between the Lizard and Helston will no longer be carried on. The reason given for the abandonment of the service is that, the Council having decided not to steam roll the road, it will not be practicable to continue the service. It is a pity that such a decision should have been come to, and the local council ought to regret its decision, for such a convenience as the G.W.R. had inaugurated was not only a boon to the district, but a source of prosperity. Probably, when too late to influence the company, the Council will reverse its sense of economy.
